City of Herriman Annex

To participate in this multi-jurisdictional hazard mitigation plan (MJHMP) update for Salt Lake County (SLCo), the governing body of the city of Herriman passed a formal resolution, a copy of which is maintained at the local government offices.

Planning Process Contact Information

Table 1 provides information on the point of contact during the updating of the MJHMP.

Name	Title	Jurisdiction
William Reyes	Emergency Manager	Herriman
Jonathan LaFollette	Public Information Officer	Herriman

Jurisdiction Profile

The following is a summary of key information about the jurisdiction and its history:

Date of Incorporation

Herriman was officially incorporated as a city on June 1, 1999. This allowed residents to establish local governance and services, giving them greater control over their city's future. It marked the beginning of a significant development, laying the groundwork for Herriman's ongoing expansion and transformation into a thriving, dynamic city.

Location and Description

Adjacent to Herriman City on the west are the Oquirrh Mountains and the Bingham Canyon/Rio Tinto Copper Mine. To the south is Camp Williams, nestled in the South Hills, which separates Herriman from Utah County. Adjacent to Herriman on the east is Riverton, and to the north is South Jordan. Herriman has developed commercial and residential areas and significant agricultural holdings. It has 2,412 acres

of open space and 214 acres of park space within its boundaries. This open space is reserved for recreational purposes and has many multi-use trails.

Population

The 2022 American Community Survey 5-Year Estimate from the U.S. Census Bureau records the population of the city of Herriman City in 2024 as 61,328, up from 56,212 in 2020, reflecting a 9.1% increase.[1]

Demographics

Herriman, Utah, is a growing community characterized by its relatively high median household income of approximately $115,198, indicating a prosperous population. The city has a poverty rate of about 5.8%, suggesting that most residents enjoy a stable economic situation. In addition, the demographic profile reflects a youthful population, with a median age of around 27 years for males and 29 years for females. This combination of economic stability and a younger demographic points to a vibrant community that is likely to continue growing and evolving in the coming years.[2]

Brief History

Originally called Butterfield, the town was established in 1849 by Thomas Jefferson Butterfield, John Jay Stocking, Robert Cowan Petty, and Henry Herriman. In 1854, an adobe fort was constructed in the area to protect settlers from hostile native tribes. Fort Herriman, as it was called, was soon disbanded, yet the small settlement remained for more than 130 years. Residents earned a living through dryland farming, sheep and cattle ranching, and as employees at the nearby mines and smelters. Many people from outside Herriman grazed their livestock here. For a period, Herriman was home to some of the largest sheep operations west of the Mississippi River.

Climate

Herriman has an average annual temperature of 53.7°F, with hot, dry summers reaching highs in the upper 90s and cold winters with lows in the teens. Each year, the city receives 20 inches of rain, with most precipitation occurring in the spring and fall, and 68 inches of snow, which contributes to seasonal runoff and potential flooding risks.

Public Services

The city provides most public services. Important to hazard mitigation, the city has stormwater, health, secondary water, GIS, public safety, and “Be Ready Herriman” services. The city adopted its General Plan in July 2022.

DRAFT

Governing Body

The city has an elected mayor and four districts, each having an elected official. The city has a strong manager-council form of government.

Development Trends

Once considered a distant rural area, Herriman has emerged as one of the most desirable and fastest-growing communities in the region. From its incorporation in 1999, the city's growth surged, particularly between 2000 and 2010, when Herriman moved from the 111th to the 32nd largest incorporated place in Utah. (Herriman City Community Development)

Today, Herriman continues to see significant residential and commercial growth, The future development of the Herriman TRAX Station/Transit-Oriented Development District and the Northwest Annexation Area will introduce mixed-use, residential, and commercial spaces, while the extension of U-111/Bacchus Highway will increase traffic and further growth.

To support this growth, Herriman is investing in infrastructure improvements, including the Mountain View Corridor, expanded trails and bikeways, and new parks like the Northwest Regional Park. The city is also implementing hazard mitigation measures in new developments to address environmental risks like flooding and wildfires, ensuring sustainable development and safety for the community.

Jurisdiction-Specific Hazards and Risk

Herriman faces a range of natural and human-caused hazards that pose varying levels of risk to the community. Using the Calculated Priority Risk Index (CPRI),a comprehensive assessment tool for evaluating and prioritizing risks, local officials have assessed these risks based on factors such as probability, severity, warning time, and response capacity. The results for each hazard, including its risk factor (RF) value, are shown in Table 3. The results are based on the criteria in Table 4 and the equation that follows it. The CPRI helps organizations and individuals make informed decisions about risk management and mitigation strategies. It systematically identifies potential issues, allowing for a more efficient allocation of resources and proactive risk prevention. By prioritizing critical risks, stakeholders can enhance their risk management effectiveness, resulting in better outcomes.

Given Herriman's geographic location, earthquakes, wildfires, and radon exposure emerge as the most significant threats, with earthquakes ranking highest (RF 3.2) due to the city's proximity to the Wasatch Fault. Wildfires (RF 2.7) remain a critical concern, particularly in the dry summer months when high winds exacerbate fire spread. Additionally, radon exposure (RF 2.3) is a persistent, less visible hazard due to the region's geological composition.[3] While lower-risk events such as thunderstorms, hail, and high winds frequently impact the area, the city continues to enhance its emergency preparedness and mitigation

[3] https://geology.utah.gov/?s=herriman+radon, https://www.deseret.com/2014/7/15/20544842/geologic-hazard-maps-for-western-salt-lake-valley-released/.

strategies to address all potential threats. By leveraging historical hazard data and predictive modeling, Herriman aims to allocate resources effectively and safeguard residents from future disasters.

Table 3: Calculated Priority Risk Index Values for the City of Herriman

Type of Hazard Event	Probability of Future Events	Spatial Extent	Severity of Life/ Property Impact	Warning Time	Duration	Response Capacity	Risk Factor Value
Avalanche	1	1	1	1	1	1	1
Drought	2	2	2	1	3	1	1.9
Earthquake	2	4	4	4	4	2	3.2
Extreme Heat	2	2	1	1	3	1	1.6
Extreme Cold	2	2	1	1	3	1	1.6
Flooding	3	2	2	3	3	1	2.4

Radon	3	1	2	1	4	2	2.3
Heavy Rain	3	2	1	2	2	1	1.9
High Wind	2	2	1	2	2	1	1.6
Lightning	2	1	1	4	1	1	1.6
Severe Winter Weather	2	2	1	1	2	1	1.5
Tornado	1	1	1	4	1	2	1.4
Wildfire	3	3	3	2	3	1	2.7
Dam Failure	2	2	3	2	1	2	2.2
Civil Disturbance	1	1	1	3	1	2	1.3
Cyberattack	2	2	1	4	1	2	1.8
Hazardous Materials Incident (Transportation & Fixed Facility)	2	2	1	4	1	1	1.7
Public Health Epidemic/ Pandemic	2	2	1	1	4	1	1.7
Terrorism	1	1	1	4	1	1	1.3

DRAFT

Table 4: Criteria for the Calculated Priority Risk Index

Risk Index Factor	Degree of Risk Level		Factor Weight for Degree of Risk Level	Factor Weight for Degree of Risk Level
Probability of Future Events	1	Unlikely	Less than 1 percent probability of occurrence in the next year or a recurrence interval of greater than every 100 years.	30%
	2	Occasional	1 to 10 percent probability of occurrence in the next year or a recurrence interval of 11 to 100 years.	
	3	Likely	11 to 90 percent probability of occurrence in the next year or a recurrence interval of 1 to 10 years.	
	4	Highly Likely	91 to 100 percent probability of occurrence in the next year or a recurrence interval of less than 1 year.	
Spatial Extent	1	Limited	Less than 10% of the planning area could be impacted.	10%
	2	Small	10%–25% of the planning area could be impacted	
	3	Significant	25%–50% of the planning area could be impacted.	
	4	Extensive	50%–100% of the planning area could be impacted.	
Severity of Life/Property Impact	1	Negligible	Less than 5% of the affected area's critical and non-critical facilities and structures are damaged/ destroyed. Only minor property damage and minimal disruption of life. Temporary shutdown of critical facilities.	30%
	2	Limited	More than 5% and less than 25% percent of property in the affected area is damaged/ destroyed. Complete shutdown of critical facilities for more than one day but less than one week.	
	3	Critical	More than 25% and less than 50% of property in the affected area was damaged/ destroyed. Complete shutdown of critical facilities for over a week but less than one month.	
	4	Catastrophic	Over 50% of critical and non-critical facilities and infrastructures in the affected area are damaged/ destroyed. Complete shutdown of critical facilities for more than one month.	
Warning Time	1	Self-defined	More than 24 hours	10%
	2	Self-defined	12 to 24 hours.	
	3	Self-defined	6 to 12 hours.	
	4	Self-defined	Less than 6 hours.	
Duration	1	Brief	Up to 6 hours.	10%
	2	Intermediate	Up to one day.	
	3	Extended	Up to one week.	

DRAFT

Risk Index Factor	Degree of Risk Level		Factor Weight for Degree of Risk Level	Factor Weight for Degree of Risk Level
	4	Prolonged	More than one week.	
Response Capacity	1	High	Significant resources and capability to respond to this kind of event; staff are trained, experienced, and ready.	10%
	2	Medium	Some resources and capability to respond to this kind of staff; some staff may be trained, experienced, and ready while others may need additional support.	
	3	Low	Limited resources and capability to respond to this kind of event; additional staff or staff training needed.	
	4	None	No resources and capability to respond this kind of event; additional outside support would be required.	

RISK FACTOR (RF) EQUATION

RF Value = [(Probability x 0.30) + (Spatial Extent x 0.10) + (Severity of Life/Property Impact x 0.30) + (Warning Time x 0.10) + (Duration x 0.10) + (Response Capacity x 0.10)]

Hazards with an RF value greater than or equal to 2.5 are considered high risk. Those with RF values of 2.0 to 2.4 are considered moderate risk hazards, and those with an RF value less than 2.0 are considered low risk. The highest possible RF value is 4.

Hazard Event History

Examining hazard event histories provides valuable insights to inform decision-making and help prioritize resources for risk prevention and response efforts. Table 5 lists the hazard events impacting the city of Herriman planning area since the 2019 plan update, including those recorded in the Storm Events Database from the National Centers for Environmental Information. Drought, extreme heat, and severe winter storms occur in Herriman, although no specific details on damage have been recorded.

DRAFT

Table 5: History of Hazard Events in the City of Herriman[4]

Type of Hazard Event	FEMA Disaster #	Date(s)	Damage or Impacts	Description
Hail	N/A	05/16/2021	No significant damage reported	Scattered severe thunderstorms brought hail and strong winds.
Thunder-storm Wind	N/A	07/22/2021	None reported	An active monsoon surge brought several days of thunderstorms and heavy rain, damaging wind gusts, and hail across the state.
Thunder-storm Wind	N/A	07/03/2023	$1,000 property damage (1-inch tree limbs broken; shingles blown off)	Following scattered convection all afternoon, a more cohesive squall line formed over Utah's West Desert region, producing strong to very strong gusts of very dry winds.
Thunder-storm Wind	N/A	08/02/2023	None reported	A deep monsoonal event impacted Utah, with widespread thunderstorms and flooding. Very heavy rainfall affected areas like West Valley City, Honeyville, Draper and Herriman.
Thunder-storm Wind and Flooding	N/A	08/02/2023	$5,000 property damage (tree fell on a car) This storm triggered additional flooding in Herriman from August 3-15, causing runoff-related damage to homes and infrastructure.	A deep monsoonal event impacted Utah, with widespread thunderstorms and flooding. Heavy flooding occurred in Herriman between August 3 and 15, 2023, with significant runoff from an undeveloped area saturating the ground and causing flooding. The storm impacted 4-5 homes in one area, with some properties experiencing severe flooding due to runoff along the slopes. The slope from the dog park contributed to the flooding of a surrounding home. Overflow from ponds added to the damage in the area. Cleanup and repair efforts for the affected spillways cost approximately $9,414.15.
Hail	N/A	08/02/2023	None reported	A deep monsoonal event impacted Utah, with widespread thunderstorms and flooding.

[4] National Centers for Environmental Information, "Storm Events Database." https://www.ncdc.noaa.gov/stormevents/listevents.jsp?eventType=ALL&beginDate_mm=01&beginDate_dd=01&beginDate_yyyy=2019&endDate_mm=12&endDate_dd=15&endDate_yyyy=2024&county=SALT%2BLAKE%3A35&hailfilter=0.00&tornfilter=0&windfilter=000&sort=DT&submitbutton=Search&statefips=49%2CUTAH.

Type of Hazard Event	FEMA Disaster #	Date(s)	Damage or Impacts	Description
Flooding	N/A	08/03–15/2023	Runoff-related damage to homes and infrastructure	Significant runoff from an undeveloped area saturated the ground and causing flooding. The storm impacted 4 or 5 homes in one area, with some properties experiencing severe flooding due to runoff along the slopes. The slope from the dog park contributed to the flooding of a nearby home. Overflow from ponds added to the damage in the area. Cleanup and repair efforts for the affected spillways cost approximately $9,414.15.
Thunder-storm Wind	N/A	07/13/2024	None reported	A strong mid-level ridge resulted in excessive heat, followed by thunderstorms that produced strong wind gusts. A wind gust of 67 mph was recorded.
Earthquake	DR-4548-UT	March 2020	Minor ground shaking in Herriman from M 5.7 Magna earthquake	The Wasatch Fault is considered overdue for a major earthquake, with a 57% chance of an M 6.0 or greater earthquake occurring in the next 50 years.
Public Health Epidemic/ Pandemic	DR-4525-UT	2020–2023	Business closures and economic loss, temporary school closures	COVID-19 Pandemic

National Flood Insurance Program Summary

The City of Herriman participates in the National Flood Insurance Program (NFIP). Table 6 displays statistics related to the NFIP.

Table 6: National Flood Insurance Program Status for the City of Herriman[5]

Init FHBM Identified	Init FIRM Identified	Current Effective Map Date	Adopted Date	Date Joined NFIP	Tribal Status
08/30/1977	12/18/1985	11/19/2021	2021	03/12/2002	No

Table 7: National Flood Insurance Overview for the City of Herriman

Community ID	Number of Losses	Total Net Payment	Active Policies	Total Coverage
490244	1	$14,071.50	29	$8,072,000

[5] FIRM = Flood Insurance Rate Map, FHBM = Flood Hazard Boundary Map

The city of Herriman has designated the Community Development Director as the Floodplain Administrator. The current flood damage prevention regulations were adopted on 5/14/2025. The current Flood Insurance Rate Map (FIRM) is dated 11/19/2021. The Building Department is responsible for permitting, while the City Engineer reviews Floodplain Development Permits. These permits require significant details of the project that can be used by the Floodplain Administrator to make substantial damage/substantial improvement determinations. When the permit is approved with conditions, applicants will be informed via the permitting process of what additional steps, such as coming into compliance with current codes and standards, are required. Additionally, the Building Department conducts inspections of all additions/remodels prior to construction beginning. These inspections are also an opportunity to identify substantial damage/substantial improvement structures.

Jurisdiction-Specific Vulnerabilities and Impacts

Table 8 provides information on the vulnerable assets within Herriman, including its critical facilities and infrastructure that may be impacted by identified hazards. It also describes the potential impacts on the community arising from those vulnerabilities. By understanding the risks associated with these assets, local authorities can develop proactive strategies to mitigate vulnerabilities and ensure the safety and functionality of these important assets during hazard events. This data is invaluable for decision-making and prioritizing resources for emergency response and preparedness efforts, ultimately contributing to more effective risk management and greater resilience within the community.

Vulnerable assets in Herriman City include two fire stations, one emergency operations center (EOC), one police station, and nine schools. Community centers such as the Herriman Library, J.L. Sorenson Recreation Center, and outdoor recreation sites such as Butterfield Park, Blackridge Reservoir, J. Lynn Crane Park, Rosecrest Park, and several other parks and trailheads are also important assets. Rose Creek, Butterfield Creek, and Copper Creek are notable waterways in the city. Major transportation routes include Mountain View Corridor, 13400 South, Main Street, Rosecrest Road, Rose Canyon Road, and 6400 West. The Jordan Valley Water Treatment Plant is located in southeast Herriman, which also serves several other cities in the county. The Zions Bank Training Center is a large sports facility with high capacity in the southeast area of the city. There are residents of unincorporated Salt Lake County who access their homes through Herriman City via Hi Country Estates and Shaggy Mountain Road.

Table 8: Jurisdiction-Specific Vulnerabilities and Impacts in the City of Herriman

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
Avalanche	People	*Vulnerability:* While Herriman itself is generally considered low-risk for avalanches, residents who venture into nearby mountainous areas, such as the Oquirrh Mountains, may face avalanche dangers during winter months. *Impacts:* Avalanches can cause injury or death to individuals caught in their path. Outdoor enthusiasts, including hikers and snowmobilers, should be aware of avalanche forecasts and exercise caution when exploring these regions.

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
	Structures	*Vulnerability:* Within Herriman, structures are not typically at risk from avalanches due to the city's location. However, properties situated near steep slopes or in adjacent mountainous terrains could be susceptible under unique conditions. *Impacts:* Most areas in Herriman do not have the slope angle, aspect, or snow accumulation necessary to produce avalanches. Under unique conditions, avalanches could cause damage to structures. Proper land use planning and adherence to building codes are essential to mitigate potential risks in these areas.
	Economic Assets	*Vulnerability:* Outdoor recreation businesses and businesses near affected roads are vulnerable to avalanches. *Impacts:* Avalanche-related disruptions in nearby recreational areas can impact local businesses in Herriman that rely on tourism and outdoor activities. Road closures or safety concerns may lead to decreased visitor numbers, affecting the local economy.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Vegetation and wildlife are vulnerable to avalanches. *Impacts:* Avalanches in surrounding mountainous regions can alter natural landscapes, affecting wildlife habitats and recreational trails. While Herriman's immediate environment may not be directly impacted, changes in nearby ecosystems can have indirect effects on the community's natural resources.
	Critical Facilities and Infrastructure	*Vulnerability:* Herriman's critical infrastructure is not directly threatened by avalanches. *Impacts:* Emergency services may need to respond to avalanche incidents in nearby areas, emphasizing the importance of preparedness and coordination with regional agencies.
	Community Activities	*Vulnerability:* Winter recreation activities are vulnerable to avalanches. *Impacts:* Community members engaging in winter sports or backcountry activities in adjacent mountainous regions should be educated on avalanche safety. Local programs promoting awareness and training can enhance public safety during the winter season.
Drought	People	*Vulnerability:* All residents are vulnerable to drought. *Impacts:* Herriman residents may face water use restrictions during drought periods, affecting daily activities such as landscaping and gardening. Prolonged drought can also lead to increased health concerns due to dust and reduced air quality.
	Structures	*Vulnerability:* All structures are vulnerable to drought. *Impacts:* Extended dry conditions can cause soil shrinkage, potentially impacting building foundations and leading to structural issues. Implementing drought-resistant landscaping and proper irrigation systems can help mitigate these effects.
	Economic Assets	*Vulnerability:* All local businesses, particularly those related to agriculture or landscaping, are vulnerable to drought. *Impacts:* Local businesses, particularly those in agriculture and landscaping, may experience financial strain due to water shortages and increased operational costs. Drought conditions can also deter new developments, affecting the city's economic growth.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
	Natural, Historic, and Cultural Resources	*Vulnerability:* Vegetation and wildlife are vulnerable to drought, which also increases wildfire risk. *Impacts:* Drought can stress local vegetation and wildlife, leading to habitat degradation. Historic sites may suffer from reduced maintenance due to water limitations, and cultural events might be curtailed to conserve resources.
	Critical Facilities and Infrastructure	*Vulnerability:* All city facilities, including water supply systems, are vulnerable to drought. *Impacts:* Public facilities may face water restrictions. Water supply systems may be strained during droughts, necessitating conservation measures and infrastructure upgrades. Emergency services might also face challenges in responding to drought-induced issues like wildfires.
	Community Activities	*Vulnerability:* Parks and recreational facilities are vulnerable to drought. *Impacts:* Public parks and recreational facilities may impose restrictions on water usage, affecting community events and activities. Educational campaigns promoting water conservation can help maintain community engagement during drought periods.
Earthquake	People	*Vulnerability:* All residents are vulnerable to earthquakes. *Impacts:* Although Herriman is not situated directly on major faults, it is likely to experience impacts from a major earthquake elsewhere in Salt Lake County. Residents could face injuries from falling objects. Workplaces, schools, and facilities may be affected, interrupting daily routines. Populations in older buildings or those with limited mobility may be more vulnerable during seismic events.
	Structures	*Vulnerability:* All structures are potentially vulnerable to earthquakes. *Impacts:* Many of the structures within Herriman have been built more recently, according to modern seismic codes, but they may still experience damage to contents, fixtures, or other materials. Buildings constructed before modern seismic codes may be susceptible to damage during earthquakes. Retrofitting older structures and adhering to current building standards are crucial for minimizing potential harm.
	Economic Assets	*Vulnerability:* Businesses throughout Herriman and the region are vulnerable to earthquakes *Impacts:* An earthquake could disrupt local businesses, especially if infrastructure is damaged. Businesses in Herriman are likely to experience losses from an earthquake. Buildings and contents may be damaged, and businesses may be slow to reopen while repairs are completed. Damage to roads and utility systems, such as power, water, and communication, may also limit businesses' ability to operate. The flow of goods may be severely limited, and employees may not be able to travel to work. Spending may also be reduced due to losses experienced by consumers. The local economy, reliant on retail and services, could face significant disruptions during seismic events. Ensuring business continuity plans and insurance coverage can aid in economic recovery post-event.
	Natural, Historic, and	*Vulnerability:* Ecosystems, historic structures, and cultural sites are vulnerable to earthquakes.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
	Cultural Resources	*Impacts:* Natural resources like geological formations and local ecosystems can be disrupted, leading to habitat loss. Historic structures and landmarks often lack modern seismic retrofitting, making them susceptible to damage. Cultural resources, including community centers, may also be at risk due to their architectural styles and inadequate building codes, compromising their integrity and the heritage they represent. Seismic activity in Herriman can impact natural landscapes and historic sites, leading to erosion or structural damage.
	Critical Facilities and Infrastructure	*Vulnerability:* All critical facilities and infrastructure in Herriman are vulnerable. *Impacts:* Schools, healthcare facilities, and emergency services buildings within Herriman are vulnerable to earthquakes due to age and construction standards. Bridges and overpasses that lack modern engineering safeguards are also at risk. Damage to emergency response facilities and vehicles may delay response and contribute to the vulnerability of residents. In addition, water supply systems and power lines are susceptible to disruption from ground shaking. The absence of retrofitting in older structures increases these vulnerabilities.
	Community Activities	*Vulnerability:* Public gatherings, school events, and large festivals within Herriman are vulnerable to earthquakes due to the area's geological conditions and urban infrastructure. Vulnerability stems from factors such as the buildings' age and structural integrity, inadequate emergency preparedness, and high population density, which can lead to increased risks and casualties during an earthquake.
Extreme Heat	People	*Vulnerability:* All residents are vulnerable, but some are more susceptible to the effects of extreme heat. *Impacts:* Extreme heat can cause dehydration, heat exhaustion, or heat stroke. Vulnerable populations during extreme heat include adults over 65, individuals with pre-existing health conditions, and young children, as they struggle to regulate body temperature. Socioeconomically disadvantaged individuals may lack access to cooling resources, while outdoor workers are at higher risk of heat-related illnesses due to physical labor without adequate hydration and rest. Extreme heat can hinder students' learning.
	Structures	*Vulnerability:* All structures are at risk from extreme heat. *Impacts:* Residential buildings with inadequate insulation and ventilation and commercial buildings lacking reflective roofing and proper shading may be vulnerable. Materials like metal and glass can amplify heat retention, while areas with limited green space typically experience higher temperatures.
	Economic Assets	*Vulnerability:* Agriculture and recreation businesses are vulnerable to extreme heat. *Impacts:* Agricultural operations can have reduced yields and higher water demand due to heat stress. The outdoor recreation industry may see decreased participation during heat waves, affecting local businesses that rely on visitors. In addition, the energy infrastructure could face strain from increased cooling demands, leading to outages.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
	Natural, Historic, and Cultural Resources	*Vulnerability:* Plants, wildlife, and historic and cultural sites are vulnerable to extreme heat. *Impacts:* Local plant species and wildlife habitats can suffer from drought conditions, leading to reduced biodiversity. Historic buildings may degrade due to high temperatures, causing materials to deteriorate and paint to peel. In addition, parks and recreational areas may experience overuse and risk their preservation, as residents seek relief from the heat.
	Critical Facilities and Infrastructure	*Vulnerability:* Healthcare facilities, schools, transportation systems, and power infrastructure are vulnerable to extreme heat. *Impacts:* Healthcare facilities may experience increased demand because of heat-related medical issues, while schools can suffer from the strain on cooling resources. Transportation systems are at risk of damage, such as buckling roads and warped train tracks. Power grids may be strained by higher demands for electricity for cooling, leading to potential outages.
	Community Activities	*Vulnerability:* Outdoor recreation and events are vulnerable to extreme heat. *Impacts:* Activities like outdoor sports, fairs, and agricultural practices are vulnerable to extreme heat. These events can pose risks, particularly for participants such as youth athletes and elderly residents who may suffer from heat-related illnesses. As a result, some events may be canceled.
Extreme Cold	People	*Vulnerability:* Extreme cold occurs throughout the city, and all residents are vulnerable. Some may experience higher risks. *Impacts:* Extreme cold can lead to hypothermia or frostbite. The elderly face increased risks due to health issues and mobility challenges, while children may be susceptible if they lack proper winter clothing. Individuals experiencing homelessness or financial hardship often lack access to heated shelters and resources for protection against the cold. Those with pre-existing health conditions may worsen their symptoms at low temperatures.
	Structures	*Vulnerability:* Extreme cold is a risk to all structures in Herriman. *Impacts:* Residential homes, commercial buildings, and unheated spaces like sheds may be vulnerable. Homes with poor insulation or inadequately sealed windows and doors are prone to significant heat loss. Older buildings lacking modern energy efficiency standards may also suffer from freezing pipes and structural damage. Public infrastructure, such as bridges and roads, can also be impacted.
	Economic Assets	*Vulnerability:* Agricultural and other local businesses are vulnerable to extreme cold. *Impacts:* Agriculture, infrastructure, and energy-related businesses may be at risk. Agricultural operations, such as greenhouses and livestock farms, may experience crop and livestock losses, impacting revenue. Icy roads can disrupt transportation networks, affecting logistics and supply chains, while power lines risk outages from ice accumulation, impacting local businesses. Energy-intensive facilities may face higher operational costs due to increased heating needs.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
	Natural, Historic, and Cultural Resources	*Vulnerability:* Vegetation, wildlife, and cultural sites are vulnerable to extreme cold. *Impacts:* Due to prolonged cold, local vegetation and wildlife habitats may suffer from plant stress and reduced food availability. Historic structures, especially those not built for severe weather, can deteriorate from below-freezing temperatures and ice. Culturally significant sites, including monuments and public art, may also be damaged, while infrastructure such as water pipes and roadways may be compromised during extreme cold events, leading to service disruptions and safety hazards.
	Critical Facilities and Infrastructure	*Vulnerability:* Water, transportation, and power infrastructure are vulnerable to extreme cold. *Impacts:* Water treatment plants can face frozen pipes and equipment failures. Icy conditions may increase accident risks on transportation infrastructure, and power generation facilities may struggle to meet heating demands. Residential and commercial buildings lacking proper insulation are also at risk of heating system failures, endangering occupants.
	Community Activities	*Vulnerability:* All community events are vulnerable to extreme cold. *Impacts:* Youth sports, festivals, and outdoor markets are vulnerable to extreme cold. Harsh temperatures can deter participation, impacting community engagement. At-risk groups, such as the elderly and young children, face health risks like frostbite and hypothermia, further limiting outdoor involvement. In addition, poorly insulated buildings or inadequate heating in community centers can make gatherings uncomfortable.
Flooding (and Heavy Rain)	People	*Vulnerability:* Flooding primarily affects residents in low-lying areas near rivers and streams, especially during heavy rainfall or snowmelt. In Herriman, this is most likely in Special Flood Hazard Areas along Rose Creek, Copper Creek, and Butterfield Creek. *Impacts:* Residents could be displaced from homes due to flooding. In the case of flash flooding or swift-moving waters in high runoff situations, individuals can be swept away and drown. Individuals without reliable transportation may struggle to evacuate quickly, while low-income families often lack resources for flood-prevention measures. The elderly and those with disabilities may face mobility challenges, increasing their risk during emergencies. Overall, factors such as geographic location, economic status, and physical ability contribute to the community's varying levels of vulnerability to flooding.
	Structures	*Vulnerability:* Structures vulnerable to flooding primarily include those in low-lying areas or near Rose Creek, Butterfield Creek, or Copper Creek. *Impacts:* Residential properties in flood plains and commercial buildings without proper drainage systems or flood-resistant designs face significant risks during heavy rain or snowmelt. Older structures may be more susceptible due to outdated construction standards. Overall, a combination of location and construction features contributes to their vulnerability to flooding.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
	Economic Assets	*Vulnerability:* Businesses near waterways, floodplains, or in low-lying areas are vulnerable to flooding. *Impacts:* Commercial properties, especially retail centers and warehouses near rivers or low-lying areas, are at high risk during heavy rainfall. Residential developments in flood-prone zones also can suffer damage, impacting property values. Public infrastructure, such as roads and utilities, may experience disruptions, leading to costly repairs. Agricultural land can be affected by excess water, reducing crop yields.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Waterways, riparian habitats, and cultural sites are vulnerable to flooding. *Impacts:* Natural areas like wetlands and streams are at risk of habitat destruction, while historic sites and landmarks may sustain structural damage. Cultural resources, such as parks and public spaces, can become unusable, affecting community events. Factors contributing to their vulnerability include inadequate flood management, urban development that alters water flow, and the increasing frequency of extreme weather events due to climate change.
	Critical Facilities and Infrastructure	*Vulnerability:* No critical facilities in Herriman were identified within flood zones. Transportation and utility networks are vulnerable to flooding. *Impacts:* Roads can be damaged, inundated, washed out or otherwise made inaccessible due to flooding. This can disrupt emergency services, require schools to evacuate, block transportation routes, and isolate communities. In addition, inadequate drainage systems and urban development encroaching on floodplains increase these risks.
	Community Activities	*Vulnerability:* Parks and open spaces, and community events are vulnerable to flooding. *Impacts:* Due to the area's geography and infrastructure, outdoor events, sports, and farmers' markets are vulnerable to flooding. Parks and open spaces can quickly become inundated during heavy rainfall or rapid snowmelt. Residential neighborhoods near rivers, roads, and bridges are at risk of flash floods, which can disrupt transportation and emergency services.
Landslide/ Slope Failure	People	*Vulnerability:* In Herriman, residents living near the foothills of the Oquirrh Mountains and along canyon benches are at elevated risk from landslides and slope failures. *Impacts:* Residents can be injured by landslides, or may be displaced if their homes are damaged by a landslide. This risk is driven by a combination of steep terrain, soil saturation from intense storms or snowmelt, and urban development encroaching into geologically unstable zones. Areas where stormwater systems are underdeveloped or poorly maintained further increase exposure, particularly for individuals in older housing stock or those unfamiliar with signs of slope movement. Limited local warning infrastructure and uneven public awareness contribute to greater vulnerability among hillside neighborhoods.
	Structures	*Vulnerability:* Structures constructed along hillsides or on terrain affected by previous slope instability, such as in the Butterfield Canyon and South Hills areas, face elevated threats.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		Impacts: Structures can be damaged or destroyed by landslides. Homes with shallow foundations, improperly engineered retaining walls, or built prior to modern geotechnical standards are especially at risk. Drainage inefficiencies and unreinforced slopes in rapidly expanding subdivisions can lead to sudden ground movement, endangering not just individual properties but also adjacent infrastructure.
	Economic Assets	*Vulnerability:* Businesses near slopes and community financial resources are vulnerable to landslides. *Impacts:* Herriman's hillside developments, utility corridors, and collector roadways may suffer economic losses if landslides disrupt access or damage buried infrastructure. Repairing landslide-prone streets or restoring slope-stabilized water mains and electrical conduits can place a significant burden on the local budget. Recurrent damage can also lower nearby property values and delay real estate transactions.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Habitats and landmarks are vulnerable to landslides. *Impacts:* Landslides can harm Herriman's ecological corridors and native plant habitats in open space preserves. Unstable slopes also threaten historic remnants from early settlement or mining operations in nearby canyons. Community landmarks and parks adjacent to elevated terrain, such as W&M Butterfield Park, are susceptible to erosion, slope washouts, and trail damage during storm events.
	Critical Facilities and Infrastructure	*Vulnerability:* Utilities and roads are vulnerable to landslides. *Impacts:* Utilities crossing sloped terrain face potential service interruptions or structural compromise from slope failure. Steep areas without robust vegetation or engineered slope protections are more prone to runoff and soil displacement during spring melts or heavy precipitation. Emergency response access can be impeded by road damage or blocked routes following a slide.
	Community Activities	*Vulnerability:* Outdoor recreation access is vulnerable to landslides. *Impacts:* Popular outdoor spaces used for hiking, mountain biking, or community events may become hazardous during or after slope instability events. Recreation trails, trailhead parking lots, and hillside picnic shelters may require closure or repair following heavy weather, limiting resident access to key community amenities.
Radon	People	*Vulnerability:* Herriman is located in a geologic zone with elevated radon potential due to uranium-bearing soils in the region. Residents living in homes with basements or slab-on-grade foundations are particularly susceptible to indoor radon accumulation. According to utahradon.org, 58% of homes tested had dangerous levels of radon. *Impacts:* Exposure to radon increases the risk of lung-cancer. Households with young children, seniors, or individuals with chronic health conditions face greater long-term health risks from exposure. In newer subdivisions built rapidly during growth booms, many residents may be unaware of radon testing or mitigation needs.
	Structures	*Vulnerability:* All structures in Herriman are vulnerable to radon. Homes and buildings constructed over high-radon soils are at increased risk.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		Impacts: Residences with foundation cracks, crawlspaces, or unfinished basements can allow radon gas to infiltrate from the ground. Older homes, built before widespread adoption of radon-resistant construction practices, are particularly vulnerable.
	Economic Assets	*Vulnerability:* Property value is vulnerable to radon. *Impacts:* The presence of radon can impact property values and hinder real estate transactions in Herriman. Homeowners may face additional costs for mitigation systems and health monitoring. Rental properties and commercial buildings also face liability if radon levels exceed safe thresholds, particularly in structures lacking consistent maintenance or up-to-date air quality systems.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Soil, groundwater, and historic and cultural sites are vulnerable to radon. *Impacts:* Soils and groundwater in the Herriman area can naturally trap and transport radon, especially in areas near old mining sites or granite-rich terrain. Historic stone buildings or preserved pioneer-era structures may retain radon in enclosed spaces if not properly ventilated. Community heritage sites that attract visitors may require indoor air testing to ensure safety.
	Critical Facilities and Infrastructure	*Vulnerability:* Public buildings, critical facilities, schools, and assisted living centers are vulnerable to radon. *Impacts:* Public buildings may harbor elevated radon levels if air exchange systems are insufficient. Facilities serving vulnerable populations, including daycares and assisted living centers, should undergo regular monitoring to ensure compliance with safety guidelines. Occupants such as employees, students, or residents are vulnerable to the health effects of radon. Some of these buildings were developed before radon was a routine construction consideration.
	Community Activities	*Vulnerability:* Community events are generally low risk for radon exposure as radon is typically a long-term exposure risk. *Impacts:* Basement-level community spaces and home gatherings pose a risk if radon mitigation systems are absent. Activities in churches, schools, and event halls with below-ground areas may increase exposure without adequate ventilation. Construction and remodeling projects must consider soil gas intrusion and incorporate radon barriers and ventilation into design.
High Wind	People	*Vulnerability:* Residents of Herriman are exposed to strong canyon winds, especially in the evenings and during transitional seasons. *Impacts:* Children, older adults, and individuals with mobility limitations may face difficulty seeking shelter during sudden wind events. Outdoor workers and individuals in temporary housing or RVs are particularly vulnerable during high-wind warnings.
	Structures	*Vulnerability:* All structures are vulnerable to high winds. *Impacts:* Wind can damage roofs and break windows. Single-story homes with light roofing materials, outbuildings, and carports may be damaged by wind gusts common in Herriman's open western landscapes. Commercial buildings with large signs or glass façades also face the risk of damage. Poorly anchored sheds, fences, and trampolines frequently become windborne debris during storms.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
	Economic Assets	*Vulnerability:* All businesses are vulnerable to high winds. *Impacts:* Businesses with exterior signage, temporary shelters, or unreinforced structures face interruptions from wind damage. Local farms and small-scale agricultural operations, especially those with greenhouses or metal-frame storage units, are vulnerable to collapse or tearing. Utilities such as overhead lines and service poles may experience outages, disrupting commerce and daily activity.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Trees, parks, outdoor art, and historic structures are vulnerable to high winds. *Impacts:* Trees lining Herriman's parks and greenbelts may be uprooted or lose large limbs, affecting the local landscape and increasing fire fuel load. Outdoor public art, wayfinding signs, and flag displays are prone to damage or loss. Historic wooden structures or pioneer-era remnants without reinforcement may suffer wind damage, further threatening their preservation.
	Critical Facilities and Infrastructure	*Vulnerability:* All critical facilities are vulnerable, as well as power, communication, and road infrastructure, are vulnerable to high winds. *Impacts:* Emergency response facilities and city buildings can experience damage from high winds. Essential infrastructure can be impacted by sustained winds or falling debris. Older public buildings without wind-resistant design may sustain structural damage or broken windows. Emergency vehicle access routes can be obstructed by fallen branches, street debris, or overturned fencing. Power lines and communication towers can be damaged, which can further disrupt emergency response.
	Community Activities	*Vulnerability:* Outdoor events and recreation are vulnerable to high winds. *Impacts:* Outdoor community events at parks, school fields, or open-air markets in Herriman are often impacted by strong winds. Canopies, tents, and play equipment can be blown over or damaged, increasing injury risks. High winds may also discourage participation in community programming, affecting seasonal recreation schedules and public engagement.
Lightning	People	*Vulnerability:* Lightning can occur anywhere in the city, so all residents are vulnerable. Some outdoor activities place residents at higher risk. *Impacts:* Lightning can cause serious injury or death to those in proximity to a strike. Outdoor recreationists, hikers in Rose Canyon, and participants in local sports leagues are particularly exposed to lightning risk. Youth athletes, spectators, and outdoor workers often lack immediate access to shelter, putting them at elevated risk during sudden thunderstorms. Those without access to weather alerts may not receive adequate warning.
	Structures	*Vulnerability:* All structures are at risk from lightning strikes. *Impacts:* Tall buildings, church steeples, cell towers, and barns located in elevated or open terrain around Herriman may be struck by lightning. Structures with metal roofs, rooftop antennas, or no grounding system face elevated risk. Lightning can also damage HVAC systems, appliances, and wiring if surge protection is inadequate.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
	Economic Assets	*Vulnerability:* Businesses throughout Herriman are vulnerable to lightning. *Impacts:* Damage to power lines and telecommunications infrastructure during thunderstorms can disrupt local businesses. Facilities with outdoor operations may suffer equipment loss. Parks and recreation facilities may need temporary closure or repair, resulting in reduced use and revenue.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Wildfire risk, historic sites, and outdoor markers are vulnerable to lightning. *Impacts:* Lightning strikes in dry terrain can ignite grass or brush fires, threatening Herriman's open spaces and nearby developments. Historic wooden buildings, particularly older churches or log structures are at risk of fire or structural damage if struck. Outdoor monuments, flagpoles, and trail signage are also vulnerable to strikes or indirect electrical effects.
	Critical Facilities and Infrastructure	*Vulnerability:* Public buildings, schools, and community centers, power, and communication infrastructure are vulnerable to lightning. *Impacts:* Schools, community centers, and utility facilities must ensure appropriate grounding and surge protection to prevent service disruption. Cell towers and radio repeaters serving Herriman's emergency communications are especially at risk. Public safety operations could be interrupted by lightning-related outages if systems are not adequately shielded.
	Community Activities	*Vulnerability:* Outdoor events and recreation are vulnerable to lightning. *Impacts:* Outdoor events, such as summer concerts, youth sports, or community races, may need to be canceled or delayed due to thunderstorm risk. Lightning near public pools or water parks, such as those at local splash pads, can pose life-threatening danger if evacuation procedures aren't in place.
Severe Winter Weather	People	*Vulnerability:* Severe winter weather can affect the entire city, making all residents vulnerable. *Impacts:* Winter storms in Herriman can isolate neighborhoods, particularly those in higher elevations or along steep grades. Older adults, people with disabilities, and individuals who lack vehicle access may be unable to seek supplies or medical care during extended snowfall. Families in mobile homes or in older houses with poor insulation may face heating shortages. Slips and falls or vehicle collisions can cause injuries.
	Structures	*Vulnerability:* All structures are vulnerable to severe winter weather. *Impacts:* Flat-roofed commercial buildings and older residential homes may experience structural strain or roof damage from snow accumulation. Improperly insulated homes are susceptible to frozen pipes, ice dams, and inefficient heating. Detached garages and temporary structures are especially vulnerable to collapse under heavy snow loads.
	Economic Assets	*Vulnerability:* All businesses are at risk from severe winter weather. *Impacts:* Retail and service businesses in Herriman may experience delayed shipments, reduced customer traffic, and staffing issues

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		during snowstorms. Snow and ice buildup can also damage signage, loading docks, and parking structures. Public works departments may face increased costs for plowing, salting, and emergency repairs.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Trees, parks, and historic or cultural structures are vulnerable to severe winter weather. *Impacts:* Heavy snow and ice can cause tree limbs to snap in city parks, damaging habitats and landscapes. Historic structures face deterioration from freeze-thaw cycles. Community gathering spaces and public monuments may become inaccessible due to snowdrifts or ice hazards.
	Critical Facilities and Infrastructure	*Vulnerability:* Roads, power infrastructure, and emergency response systems are vulnerable to severe winter weather. *Impacts:* Key roadways such as Mountain View Corridor are essential for emergency access during snow events. Power outages may occur due to falling branches, while snow-laden roofs on schools and public buildings require prompt maintenance to prevent collapse. Public safety services can be delayed due to impassable side streets and driveways.
	Community Activities	*Vulnerability:* Community events, commuting, and school schedules are vulnerable to disruptions from severe winter weather. *Impacts:* Winter weather frequently disrupts school schedules, community events, and local sports leagues. Travel restrictions and hazardous conditions reduce public participation in city programs and religious gatherings. Vulnerable populations may struggle to access warming centers or emergency aid during prolonged snow events.
Tornado	People	*Vulnerability:* While rare, tornadoes in the Salt Lake Valley region—including Herriman—pose a serious threat when they do occur. All residents within a tornado path are vulnerable. *Impacts:* Tornadoes can cause serious injury or death to people caught in their destructive path. Mobile home residents and those who do not have basements are at elevated risk. Individuals with limited mobility, such as seniors or those with disabilities, may struggle to find shelter quickly. Language barriers and a lack of timely alerts can also hinder preparedness.
	Structures	*Vulnerability:* All structures, particularly those directly in the path of a tornado, are at risk. *Impacts:* Homes with lightweight construction, garages, and commercial structures with large-span roofs (such as gyms or warehouses) may be especially vulnerable. Structures that are not anchored to foundations, such as sheds or temporary trailers, face the highest risk of destruction. Many newer homes may not be built to withstand tornadic winds unless local codes require specific reinforcements.
	Economic Assets	*Vulnerability:* Businesses throughout Herriman are vulnerable to tornadoes. *Impacts:* Damage to homes, retail centers, and transportation corridors can cause significant financial disruption. Businesses may face extended closures if structural repairs are needed. Utility loss following a tornado can further impact local commerce and service delivery.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
	Natural, Historic, and Cultural Resources	*Vulnerability:* Trees and habitats, as well as historic and cultural sites, are vulnerable to tornadoes. *Impacts:* Herriman's natural landscapes, including trees and open space trails, may be uprooted or damaged by tornado winds. Historical landmarks or older buildings—especially those with brick exteriors or unreinforced walls—may not withstand strong gusts. Community art installations and public parks could also sustain damage from debris.
	Critical Facilities and Infrastructure	*Vulnerability:* Critical facilities, power infrastructure, and roads are vulnerable to tornado impacts. *Impacts:* Schools, fire stations, and healthcare centers with large open areas may be vulnerable to tornadoes and high winds if not designed to specific hazard standards. Damage to water towers, transformers, and power substations could result in cascading service outages. Roads blocked by debris can also hinder emergency response efforts.
	Community Activities	*Vulnerability:* Outdoor markets, festivals, and sports events face high exposure during sudden tornado warnings, especially if safe shelter is not nearby. *Impacts*: Temporary installations such as tents or inflatables can become airborne hazards. Community centers and schools serving as emergency shelters must be ready to handle post-storm response.
Wildfire	People	*Vulnerability:* Much of the west and south perimeter of Herriman is at moderate to high risk of wildfire. Dangerous wildfires have occurred near Herriman previously. Thousands of residents in or near the wildland–urban interface (WUI) are potentially vulnerable. *Impacts:* Wildfire can cause injury or death for those unable to reach safety from flames. Residents may be temporarily displaced due to evacuations, or displaced long-term if homes are destroyed. Residents near the wildland–urban interface (WUI), individuals with physical disabilities or health issues who may struggle to evacuate, and low-income families who lack resources for fire safety measures may be vulnerable. Older adults might have reduced mobility, making them more dependent on others for assistance. People with respiratory conditions may have negative impacts from poor air quality due to wildfire smoke.
	Structures	*Vulnerability:* Hundreds of homes near the WUI are vulnerable in Herriman. *Impacts:* Residential homes, especially those made of wood or located in heavily vegetated areas may be vulnerable. Properties near the WUI are at higher risk due to surrounding flammable vegetation. Inadequate defensible space, such as insufficient clearing of dry grass and shrubs, increases susceptibility. Roofs made of combustible materials and buildings that lack fire-resistant features are particularly at risk during wildfire events.
	Economic Assets	*Vulnerability:* Businesses near the WUI, property values, and agriculture are vulnerable to wildfire impacts. *Impacts:* Residential properties near wildland areas are at high risk, especially if they lack defensible space and fire-resistant landscaping. Commercial assets, such as retail centers close to forested regions, can suffer damage from flames and smoke, affecting the local economy. Agricultural lands also are susceptible, as wildfires can

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		destroy crops and livestock, leading to financial losses. Vital infrastructure, such as power lines and water pipelines, can be disrupted, causing further economic repercussions. These vulnerabilities are heightened by dry conditions and high winds, which can facilitate the spread of fires.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Vegetation and historic and cultural sites are vulnerable to wildfires. *Impacts:* Natural resources like forests and grasslands are at risk because dry vegetation and accumulated brush can easily ignite. Historic sites made of wood and cultural landmarks can also be affected, particularly when located near wildland areas. The increasing frequency of drought and extreme heat, exacerbated by climate change, heightens these vulnerabilities. Urban development that encroaches on wildland areas increases the risk to these essential resources.
	Critical Facilities and Infrastructure	*Vulnerability:* Utility systems and schools in southern Herriman are vulnerable to wildfires. *Impacts:* Schools, healthcare facilities, and emergency services buildings, particularly those near the WUI, may be vulnerable. Utilities like power lines and gas pipelines also are at risk, as sparks or falling trees can ignite fires. Residential neighborhoods adjacent to natural landscapes are particularly susceptible to embers, which makes them vulnerable during dry conditions and high winds.
	Community Activities	*Vulnerability:* Outdoor events and recreation are vulnerable to wildfire impacts. *Impacts:* Outdoor events like festivals and sports, especially during hot, windy conditions may experience risk. Recreational activities, such as hiking and camping near wooded areas, also pose risks from open flames or sparks. In addition, landscaping with dry grasses and shrubs increases susceptibility during fire season, putting local infrastructure, such as schools and neighborhoods, at risk.
Dam Failure	People	*Vulnerability:* Blackridge Reservoir, Juniper Canyon Detention Basin 3, and JVWCD Upper Reservoir are high hazard dams, meaning they have the potential to cause loss of life from a failure. Herriman Springs and JVWCD Lower Reservoir are significant hazard dams, which may result in property damage. Residents located downstream of key dam structures, including areas influenced by the Blackridge and Yellow Fork watersheds, are among the most at risk in the event of a dam failure. *Impacts:* Residents in dam inundation areas could be injured or killed. They may be displaced if homes are damaged. Households with limited mobility may encounter significant challenges evacuating quickly. Populations with limited access to transportation or emergency alerts, including some lower-income residents in rapidly developing subdivisions, may experience delays in response time during a flood emergency triggered by structural dam issues.
	Structures	*Vulnerability:* Structures in lower-lying parts of Herriman and downstream areas, including homes near natural drainage paths and stormwater detention basins, are vulnerable to rapid inundation.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		Impacts: Critical community facilities such as schools, clinics, and fire stations could be affected if they are located in downstream hazard zones or rely on vulnerable access routes. Risk factors include outdated dam components, spillway limitations, and insufficient public alert systems that may not provide adequate warning during a breach.
	Economic Assets	*Vulnerability:* Businesses near inundation areas are vulnerable to dam failure. *Impacts:* A dam failure in or near Herriman could result in severe impacts to roads, utilities, and service corridors. Floodwaters may damage homes, small businesses, and industrial areas, leading to high repair costs and business interruptions. Irrigated lands and community gardens could suffer extensive losses if water supplies are disrupted or contaminated. Businesses dependent on water infrastructure may face temporary closures and financial setbacks.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Waterways, habitats, and historic and cultural sites are vulnerable to dam failure. *Impacts:* Streams, stormwater channels, and natural reserves near dam spill zones may experience habitat destruction and soil erosion following a failure event. Historical irrigation structures or remnants of early settler infrastructure could be washed out or irreparably damaged. Public gathering spaces, including parks or amphitheaters downstream of reservoirs, may be rendered unsafe or unusable following flood events.
	Critical Facilities and Infrastructure	*Vulnerability:* Water systems and transportation networks are vulnerable to dam failure. *Impacts:* Essential services, including water pumping stations, schools, and healthcare centers could face direct or indirect impacts from dam-related flooding. Inundation of critical facilities may force emergency evacuations, disrupt utility services, and compromise health and safety. In addition, neighborhood access roads could be washed out, delaying emergency responders and impeding evacuation routes for entire subdivisions.
	Community Activities	*Vulnerability:* Outdoor events and recreation activities are vulnerable to dam failure. *Impacts:* Outdoor recreation near reservoirs and detention basins may be disrupted or become dangerous during periods of high risk. Parks located along natural drainage routes or stormwater channels could be flooded with little warning. Community events and day-to-day travel could be severely affected if major routes are flooded, which could isolate neighborhoods and interfere with public services and transportation networks.
Civil Disturbance	People	Low-income individuals may lack the resources for safety, while the elderly or disabled may struggle to navigate emergencies. Young people, particularly teenagers, may be drawn into unrest, influenced by social dynamics. In addition, marginalized individuals may feel targeted or compelled to participate. A lack of community cohesion and trust in authorities can further heighten tensions.

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
	Structures	Government buildings, commercial properties, and infrastructure, such as bridges and transportation hubs may be vulnerable. Government buildings may be targeted for their symbolic authority, while retail stores can attract crowds during protests. Residential neighborhoods also can be affected, especially in areas with heightened tensions. The vulnerability of these structures stems from their visibility and importance to the community, combined with factors such as location and ongoing social issues.
	Economic Assets	Retail establishments, especially shopping centers, are at risk as they often become focal points for protests. Transportation systems can be disrupted by blockades, hindering access to services. Financial institutions may face vandalism or theft, while critical service providers, such as healthcare facilities, could experience strain during unrest. Several economic assets are vulnerable to civil disturbances, primarily due to their visibility and reliance on foot traffic.
	Natural, Historic, and Cultural Resources	Parks and open spaces may suffer from vandalism or destruction during uncontrolled events. Historic sites can become targets, as they symbolize authority or cultural significance. Cultural resources such as community centers and places of worship may also be affected, as they play a vital role in community identity. Their vulnerability lies in the potential for damage during protests.
	Critical Facilities and Infrastructure	Governmental buildings, schools, and healthcare facilities may be at risk, since they often symbolize authority and serve as community hubs, making them targets during unrest. Utility infrastructure, such as water and power facilities, is also at risk of disruption. Its visibility and essential services contribute to its vulnerability during civil disturbances.
	Community Activities	Public demonstrations, parades, and local government meetings are particularly vulnerable to civil disturbances. These events often attract large crowds and can become tense, especially around contentious social or political issues. Factors such as the local demographic, economic conditions, and recent events can heighten these vulnerabilities, making it easier for conflicts to arise during passionate public gatherings.
Cyberattack	People	Older adults often lack familiarity with technology and online security, making them easy targets for phishing scams. Individuals engaging in online banking or shopping without strong security measures also face heightened risks. Families with children may be less vigilant about internet safety, allowing cybercriminals to exploit personal information. In addition, small business owners without robust cybersecurity practices are prime targets for attacks that can disrupt operations.
	Structures	Critical infrastructure, such as power plants, water treatment facilities, and transportation systems, often lack robust cybersecurity measures. Commercial businesses, especially financial institutions and healthcare providers are at risk due to weaker data protection and employee training. Educational institutions may be vulnerable because of limited funding for cybersecurity and outdated software. Obsolete technology and insufficient training enhance the susceptibility of these structures to cyber threats.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
	Economic Assets	Financial institutions, such as banks and credit unions, are at risk of data theft and service disruption. Small and medium-sized businesses often lack robust cybersecurity measures, making them attractive targets. In addition, local government agencies and critical infrastructure, such as water treatment facilities, might have outdated security protocols, posing threats to public safety. The rise of remote work further exacerbates vulnerabilities, as employees accessing networks from home can unintentionally expose systems to risks. Overall, the combination of outdated technology and insufficient cybersecurity practices increases the vulnerability of an area's economic assets.
	Natural, Historic, and Cultural Resources	Natural resources like water management systems and wildlife databases can be compromised, disrupting ecosystems. Historic sites and museums that digitize collections are at risk of losing valuable artifacts and data. In addition, cultural organizations managing events may face threats if their systems lack adequate security. The limited resources of smaller organizations further increase this vulnerability
	Critical Facilities and Infrastructure	Energy and utility services, such as electricity and water systems, which often rely on outdated technology, may be vulnerable. Transportation infrastructure, such as traffic management and public transit, is also at risk due to networked systems. Healthcare facilities that use electronic records and connected medical devices face vulnerabilities that can compromise patient safety.
	Community Activities	Online registration for events, local government services, and educational programs that rely on digital tools may be targeted due to inadequate security measures, outdated software, and insufficient staff training.
Hazardous Materials Incident (Transporta-tion & Fixed Facility)	People	Individuals with pre-existing health conditions, such as respiratory issues, and the elderly are at higher risk due to their compromised health. Children also are more susceptible. Those living near industrial areas or transport routes for hazardous materials face increased exposure risk, while low-income families may lack resources and information to effectively prepare for incidents.
	Structures	Industrial facilities, such as manufacturing plants and warehouses, often store hazardous chemicals which may leak. Residential buildings, schools, and healthcare facilities also are at risk, particularly if located along transportation routes for hazardous materials. Older buildings may lack modern safety features, increasing their vulnerability.
	Economic Assets	Industrial facilities, transportation infrastructure, and nearby commercial properties may be affected. Industrial facilities handling chemicals are at risk of spills or leaks, while roads and railways used for transporting hazardous materials can lead to accidents and contamination. In addition, nearby commercial and residential areas face potential health risks and economic losses.
	Natural, Historic, and Cultural Resources	Waterways and habitats are vulnerable to hazardous materials incidents, which can disrupt ecosystems. Historic sites and structures may suffer damage from toxic exposure, leading to degradation over time. In addition, cultural landmarks risk losing their significance due to

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		contamination events. The proximity of these resources to industrial areas or transport routes exacerbates their risk.
	Critical Facilities and Infrastructure	Chemical manufacturing plants, waste treatment facilities, and transportation networks, such as highways and railroads may be at risk. Their vulnerability stems from factors such as proximity to residential areas, aging infrastructure, and inadequate safety measures. Natural hazards, such as flooding and earthquakes, can further increase risks by damaging containment systems.
	Community Activities	Local markets, school events, and outdoor gatherings are vulnerable to hazardous materials incidents if they are near industrial zones and transport corridors. This risk is heightened by inadequate emergency preparedness, lack of public awareness, and the potential for spills during transport. Large crowds at events can complicate evacuation efforts, increasing the risks for participants and nearby residents.
Public Health Epidemic/ Pandemic	People	Individuals with pre-existing health conditions like asthma and heart disease and adults over 65 may be vulnerable. Low-income families may struggle to access healthcare and vaccinations, increasing their risk. Marginalized communities with limited access to information and those living in high-density conditions also are at greater risk due to the rapid spread of diseases and the challenges in implementing preventive measures.
	Structures	Several structures are vulnerable to public health epidemics or pandemics, particularly due to their ability to facilitate the spread of disease. High-density residential areas, such as apartment complexes, are at risk, as close living quarters can lead to faster transmission. Public gathering spaces, such as schools and community centers, also pose significant threats because large groups are in confined spaces. Healthcare facilities can become hotspots for infections if infection control measures are insufficient. In addition, workplaces with high foot traffic, such as retail stores, contribute to vulnerability.
	Economic Assets	Small businesses in retail, hospitality, and food service are particularly vulnerable to public health epidemics or pandemics. These sectors face risks from fluctuating consumer demand and potential operational restrictions. The tourism industry also is affected, as travelers may avoid high-risk areas. Healthcare facilities can become overwhelmed, straining resources and impacting operations. In addition, local supply chains may experience disruptions, leading to shortages and inflation. Overall, the direct effects of illness, along with prolonged shutdowns and consumer hesitance, leave these economic assets exposed to significant downturns.
	Natural, Historic, and Cultural Resources	Natural resources like wildlife and ecosystems can be disrupted by increased human activity, raising the risk of zoonotic diseases. Historic sites may deteriorate due to reduced visitor access and funding, while cultural resources, such as community events, face cancelations, impacting social connections.
	Critical Facilities and Infrastructure	Public health epidemic or pandemic incidents can affect healthcare facilities, nursing homes, public transportation systems, schools, and food supply chains. Healthcare facilities and clinics may become overwhelmed with patients, while vulnerable populations in nursing homes are at higher risk. Public transportation can facilitate the spread

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		of disease, and schools gather large groups, thereby increasing transmission potential. These facilities often lack adequate resources, including medical supplies and testing capabilities, making them more susceptible to the impacts of a health crisis.
	Community Activities	Large gatherings like festivals and sporting events can facilitate the rapid spread of diseases due to close contact. Public transportation also is at risk, as it serves many people in confined spaces. Schools and childcare facilities are particularly susceptible, given that children can easily transmit infections. In addition, food-related events, such as farmers' markets, can pose risks if hygiene practices are not followed. The interconnectedness of community members and varying adherence to health guidelines further exacerbate these vulnerabilities.
Terrorism	People	Young children and newcomers may lack awareness of potential threats, while the elderly and individuals with disabilities may struggle to respond quickly in emergencies. Marginalized communities often face bias, making them more susceptible to targeting. In addition, those with lower socioeconomic status may lack access to security measures and emergency preparedness resources.
	Structures	Government buildings, transportation hubs, commercial centers, and public spaces are particularly vulnerable to terrorism incidents. Government buildings are symbolic targets, while transportation hubs and commercial centers are attractive due to their potential for high casualties and crowd presence. Public spaces also are at risk due to their open nature and lack of security. Their vulnerability is heightened by inadequate security measures, high occupancy rates, and their locations in densely populated areas, which can amplify the impact of incidents.
	Economic Assets	Infrastructure, commercial establishments, and community facilities may be vulnerable. Critical infrastructure, such as transportation networks and power grids, could disrupt the economy if targeted. Commercial establishments, especially those with high foot traffic, and community facilities like schools and healthcare facilities also are at risk, as they can provoke widespread concern and disruption. Their accessibility and interconnectivity increase vulnerability, meaning that damage to one asset can have a broader economic impact and hinder recovery efforts.
	Natural, Historic, and Cultural Resources	Natural resources like water supplies and parks could be targeted for their significance to the community. Historic sites and cultural resources, such as museums or community centers, also are at risk due to their accessibility and importance to local identity. Their vulnerability is often heightened by inadequate security measures.
	Critical Facilities and Infrastructure	Public transportation systems, healthcare facilities, schools, and utility services like water and power plants may be affected. Their vulnerability arises from high accessibility and the potential impact of an attack, as crowded transportation and public spaces can lead to mass casualties and panic. Attacking utility services could disrupt the town's essential functions, creating chaos.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
	Community Activities	Festivals, parades, and sporting events are particularly vulnerable to terrorism incidents. These events attract large crowds, making it easier for perpetrators to inflict harm and instill fear. In addition, community centers and places of worship serve as social hubs, increasing their risk. Factors such as limited security measures and open access to public spaces, contribute to this vulnerability.

Jurisdiction-Specific Changes in Vulnerability

Hazard events can impact communities, infrastructures, and ecosystems. The severity of these impacts can be influenced by climate change, population patterns, and land use developments. Understanding these factors is crucial for the city of Herriman to develop a resilient community and minimize the impacts of hazards. Table 9 displays the unique changes within the community and the related effects on each identified hazard affecting the city of Herriman.

DRAFT

Table 9: Jurisdiction-Specific Changes in Vulnerability in the City of Herriman

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
Avalanche	Higher temperatures can lead to more rain, destabilizing snowpack and increasing the risk of wet avalanches. In addition, changes in snowfall can cause denser snow layering on slopes, making them more prone to sliding.	Avalanches can influence population patterns by deterring people from moving to or remaining in high-risk areas, leading to decreased density in these locations. The threat of avalanches prompts many to seek safer environments in urban or lower-risk regions. In addition, when avalanches occur, they can disrupt infrastructure, causing residents to relocate.	Although Herriman has experienced increased development and land use, it has not altered the risk of avalanches.	Same
Drought	Climate change affects drought incidents by altering precipitation patterns and increasing temperatures. Warmer weather can lead to longer dry periods and more severe droughts, while changes in rainfall can reduce snowpack in nearby mountains, crucial for summer water supply. Higher temperatures also increase evaporation rates, further straining local water resources.	Drought can significantly influence population patterns by impacting economic opportunities and the quality of life. Water scarcity often leads to reduced agricultural productivity, prompting residents to migrate to areas with more stable job prospects. Increased water costs can make living less affordable, driving some residents away. Conversely, efforts to address drought, such as sustainable development or improved water management, may attract newcomers, resulting in changes in the community's demographic composition over time.	More businesses and residences in Herriman have led to increased water demands and a heightened drought risk.	Increased
Earthquake	Rising temperatures can lead to glacial melting, which affects pressure on tectonic plates and may trigger	Earthquakes can significantly alter population patterns by prompting residents to leave for safer areas after a seismic event.	There has been a lot of new development in Herriman since the previous hazard mitigation plan, which increases	Stayed the same

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	seismic activity through isostatic rebound. In addition, increased rainfall and flooding can erode soils, weakening structural integrity and heightening vulnerability during earthquakes. Although the direct links between climate change and earthquakes are still under investigation, environmental effects may impact the region's seismic risk.	This migration can lead to changes in population density and attract new residents and businesses during the rebuilding process. The perception of the area as a safe place to live may shift, impacting long-term demographics, as some residents return to rebuild while others relocate permanently.	earthquake risk. However, these new developments have been built to 2021 building standards, including earthquake safety measures. These measures mitigate the risk of earthquake damage.	
Extreme Heat	Climate change significantly impacts extreme heat by increasing the frequency and intensity of heat waves. Rising global temperatures lead to longer and hotter summers, affecting residents and local infrastructure while heightening health risks, especially for vulnerable populations. Urban heat islands from reduced vegetation and extensive pavement further amplify these effects.	By causing residents to relocate due to damaged homes or safety concerns. Some may move to areas perceived as safer or seek better job opportunities elsewhere. The economic impact and infrastructure damage can also make certain neighborhoods less desirable, leading to shifts in demographics and the socioeconomic landscape as new residents with different backgrounds move in.	Increased development can lead to more extreme heat due to the urban heat island effect.	Increased
Extreme Cold	By increasing the intensity of winter storms. Higher atmospheric temperatures allow for more moisture, resulting in heavier snowfall and potentially lower temperatures during these events. In addition,	By driving some residents to relocate to warmer areas. Harsh winters can hinder economic activities and deter new residents and businesses, influencing housing demand and the attractiveness of certain neighborhoods. This may	New developments like the Olympia Housing Development put a strain on the electric grid during extreme cold events increasing risk of dangerous power outages.	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	fluctuations in weather patterns may disrupt seasonal cycles, leading to unpredictable periods of extreme cold mixed with warmer spells.	disproportionately affect lower-income families, leading to changes in demographics and socioeconomic stratification in the community.		
Flooding	Higher temperatures increase the frequency and intensity of extreme weather events and alter precipitation patterns. They lead to more intense rainstorms and accelerated snowmelt from nearby mountains, raising water levels in rivers and streams. This combination raises the risk of flooding, especially in areas with inadequate drainage and urban development in flood-prone zones, heightening the potential for damage to homes and infrastructure.	Flooding can significantly alter population patterns by displacing residents from affected areas, leading them to seek shelter elsewhere. This may cause a population decline where flooding occurs, as individuals might hesitate to return due to ongoing risks or property damage. As neighborhoods become less desirable, people may migrate to safer areas, changing demographic trends and putting pressure on housing in those regions. Over time, these shifts can influence urban planning and development, as local governments address flooding risks and changing population needs.	New development is not located in flood zones and is at low risk of flooding.	Decreased
Landslide/ Slope Failure	Climate change increases the risk of landslides through heavier rainfall and temperature fluctuations. Intense rain saturates soil, destabilizing slopes, while freeze–thaw cycles weaken the ground. Changes in vegetation can also reduce	Landslides and slope failures can impact population patterns by making some areas unsafe, leading to displacement and lower property values. This prompts residents to move to safer regions, thereby increasing density in more stable areas. Concerns about future landslides may also deter newcomers from	Increased development on the western edge of Herriman has increased the risk of landslides.	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	stability, leading to a higher potential for landslides.	high-risk zones, shaping long-term demographic trends.		
Radon	Climate change can affect radon levels by altering soil temperatures and moisture conditions. Higher temperatures may increase radon emissions from the ground, while heavy rainfall can change groundwater and soil saturation, impacting radon migration into buildings.	Radon exposure can influence population patterns as increased health awareness may drive families to move away from areas with high radon levels. This shift could particularly affect vulnerable groups, changing demographics and demand in the housing market. Homes with lower radon levels may become more sought after, and public health campaigns can encourage community action, making previously undesirable areas more attractive once mitigation measures are implemented.	Changes in development has not changed risk of radon.	Same
Heavy Rain	Climate change increases the frequency and intensity of heavy rain, as higher temperatures allow the atmosphere to hold more moisture. This leads to stronger storms, flash flooding, and overwhelmed drainage systems.	Heavy rain can shift population patterns by pushing residents out of flood-prone areas and attracting them to safer neighborhoods. Frequent flooding may lead to evacuations and economic disruptions, prompting relocations. Over time, ongoing heavy rains can affect housing demand and community stability, altering the city's population distribution.	More impervious surfaces may lead to an increased risk of pluvial flooding.	Increased
High Wind	Climate change affects high winds by altering atmospheric patterns and increasing extreme weather events. Rising temperatures may lead to more substantial,	High winds can alter population patterns by making certain areas less desirable. Frequent damage may drive residents to safer neighborhoods, deter	Increased development with taller buildings has increased the risk of damage from high winds.	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	unpredictable winds and more frequent thunderstorms, posing risks to infrastructure and air quality.	newcomers, and slow growth in affected regions.		
Lightning	Climate change increases temperatures and alters precipitation, leading to more intense thunderstorms and frequent lightning strikes. Urbanization can enhance this effect, posing risks to public safety and infrastructure.	Lightning can influence population patterns by causing property damage and wildfires, leading some residents to relocate. Areas with higher lightning activity may deter new residents, while safer locations could increase migration as people seek protection from severe weather.	Increased development with taller buildings has increased the risk of damage from lightning strikes.	Increased
Severe Winter Weather	Climate change impacts heavy snow and blizzards by altering precipitation patterns. Higher temperatures can lead to more rain than snow, affecting snowpack levels—additionally, increased storm intensity results in heavier, more unpredictable snowfall.	Increased population equals an increased number of people needing to get to work and quicker snow removal. Heavy snow or blizzards can impact population patterns by influencing where people live and work. Transportation disruptions may lead residents to seek housing closer to jobs, increasing density in some areas while depopulating others. Families might also avoid regions with frequent heavy snowfall, shifting demand to milder areas. Over time, these trends can alter community demographics and economic activity, prompting adjustments in town planning and resource allocation.	New developments like the South Herriman and Olympia require the city to plow more and provide evacuations in the event of heavy snow.	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
Tornado	Climate change may increase the frequency and intensity of tornadoes. Higher temperatures lead to more moisture in the air, creating conditions for severe thunderstorms. Changes in wind patterns and precipitation can also heighten tornado risks, resulting in more destructive storms and greater threats to infrastructure and communities.	Tornadoes can influence population patterns by prompting residents to move to safer areas after damage occurs. This can decrease density in affected neighborhoods while increasing the demand for housing in safer regions. New residents may also move in for recovery opportunities, altering demographics. Over time, repeated tornado threats might push long-term residents to areas with better disaster preparedness, reshaping the town's population distribution.	Increased development has led to more structures at risk from tornadoes.	Increased
Wildfire	By raising temperatures and creating drier conditions, prolonged droughts lead to more dry vegetation, which serves as fuel for fires. Erratic seasons extend the growing period, while more lightning strikes can ignite wildfires. These factors heighten the threat to ecosystems and community safety.	Displaced individuals often seek safer areas, shifting demographics, while declining property values might deter newcomers. Conversely, some may be drawn to rebuilding efforts, impacting long-term growth and community dynamics.	Developments like Olympia in eastern Herriman are at higher risk of wildfire than other neighborhoods in Herriman.	Increased
Dam Failure	Climate change raises the risk of dam failure by causing heavier rainfall and rapid snowmelt. These changes can overwhelm dams and compromise their integrity, highlighting the need for urgent safety assessments	Dam failure can impact population patterns by displacing residents and altering demographics. Evacuations can lead to an influx in safer areas, while destruction may deter new residents and contribute to population decline. Fear of future disasters may also prompt	New developments do not increase the risk of dam failure.	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	and upgrades to protect communities downstream.	remaining individuals to relocate, changing the community's composition and affecting population density and economic activity.		
Civil Disturbance	Climate change can increase civil disturbances by intensifying environmental stresses and social tensions. Rising temperatures may lead to droughts, wildfires, and poor air quality, particularly affecting vulnerable communities. Resource scarcity, especially water, can spark conflicts and protests. In addition, an influx of migrants from harder-hit areas may strain local resources, further escalating tensions. This cycle of unrest is driven by the impacts of climate change on the environment and community dynamics.	By encouraging residents to move for safety, leading to outflows and new arrivals. These events can reveal social issues, impacting community dynamics, employment, and property values, ultimately reshaping demographics, and social cohesion.	New developments do not increase the risk of civil disturbances.	Increased
Cyberattack	Possible attack on the industry, which is seen as producing large amounts of greenhouse gases and burning fossil fuels. Climate change can heighten cyberattack risk by increasing vulnerabilities during extreme weather. Disruptions like power outages offer cybercriminals opportunities,	Cyberattacks can change population patterns by eroding trust in essential services. Compromised systems may cause residents to leave due to safety concerns, while high-profile incidents can deter businesses, leading to job losses. This perception of vulnerability may also make the town less appealing to	New developments do not increase the risk of cyberattacks.	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	but focusing on emergency responses can weaken cybersecurity measures. As organizations adopt new technologies to cope with climate impacts, they may unintentionally introduce additional vulnerabilities.	newcomers, resulting in demographic shifts and affecting local development.		
Hazardous Materials Incident (Transportation & Fixed Facility)	Climate change elevates the risk of hazardous materials incidents by increasing extreme weather events like heavy rain and wildfires. These events can breach storage tanks and heighten material volatility. Vulnerable infrastructure can lead to more spills or accidents, while climate shifts may also introduce new challenges for managing hazardous substances and public health.	By causing evacuations and temporary declines in density. In the long run, unsafe areas may deter new residents, affecting growth and diversity. In addition, negative perceptions can lower property values and economic prospects, leading families to relocate, which impacts local demographics.	New developments do not increase the risk of hazardous materials incidents.	Increased
Public Health Epidemic/ Pandemic	By increasing the spread of vector-borne diseases and raising the risk of waterborne illnesses due to flooding or drought. Worsening air quality can also exacerbate respiratory conditions like asthma, especially in vulnerable populations.	By prompting migration for safety and better healthcare. Vulnerable groups may move to areas with improved services, while economic instability can drive people to seek new employment opportunities. In addition, restrictions like quarantine measures can limit movement and social interactions, reshaping the community's demographics and impacting local economies.	New developments do not increase the risk of pandemics/epidemics.	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
Terrorism	Terroristic activity is sometimes centered around climate change. Climate change impacts terrorism incidents by creating conditions of resource scarcity and social unrest. Increased competition for essential resources, such as water, can fuel tensions, making communities more vulnerable to extremist ideologies. Extreme weather events may disrupt social order and infrastructure, offering terrorist groups opportunities to exploit crises. In addition, climate-driven population displacement can heighten tensions in receiving areas, raising the risk of domestic terrorism. Law enforcement's focus on climate-related challenges can also limit its capacity to address terrorism threats. Ultimately, while climate change may not directly cause terrorism, its effects can create an environment conducive to extremist activities.	Terrorism incidents can alter population patterns by instilling fear and prompting residents to relocate to perceived safer areas, resulting in demographic shifts and potential declines in property values. Some neighborhoods may see an outflow of residents, while others could experience an influx of people seeking refuge from violence. In addition, increased security measures may deter businesses and residents from certain locations, leading to long-term changes in population density and urban development patterns.	New developments do not increase the risk of terrorism incidents.	Increased

DRAFT

Additional Public Involvement

Public involvement in Herriman is vital to fostering community awareness and preparedness. The city actively engages residents through various initiatives and platforms.

One key component is the community newsletter, which effectively disseminates important information, event announcements, and safety tips. This newsletter keeps residents informed about local issues, programs, and opportunities for involvement, ensuring everyone stays connected and engaged with the happenings in Herriman.

Herriman also participates in various Hazard Awareness Campaigns, such as Firewise, StormReady, and Severe Weather Awareness Week. These campaigns educate the community about the risks associated with wildfires, storms, and severe weather events. They provide residents with crucial information on preparing their homes and families for emergencies, promoting safety and resilience.

Schools in Herriman play a significant role in public involvement. Educational programs and activities focused on safety awareness teach students about natural hazards, emergency preparedness, and community responsibility, instilling these values at a young age.

Public meetings and events, like the Health and Safety Fair, offer residents a platform to learn more about health resources, safety practices, and emergency preparedness. These gatherings foster community spirit and encourage dialogue between residents and local officials, enhancing transparency and collaboration.

Furthermore, local news and social media are essential to informing the community. Social media platforms allow for real-time information sharing, updates on public safety initiatives, and engagement with the public. Local news outlets also play a crucial role in covering events and announcements, ensuring all residents can access important information.

Through these various channels of involvement, Herriman fosters a well-informed and prepared community, emphasizing the importance of safety and collaboration among its residents.

Specifically as part of this plan update, Herriman City shared an announcement about the plan update and an opportunity to participate in the public outreach survey via social media and the city website (see Figure 1 and Figure 2). This information was also in the City Journal mailer.

DRAFT

Figure 1: Social Media Post for the Hazard Mitigation Survey

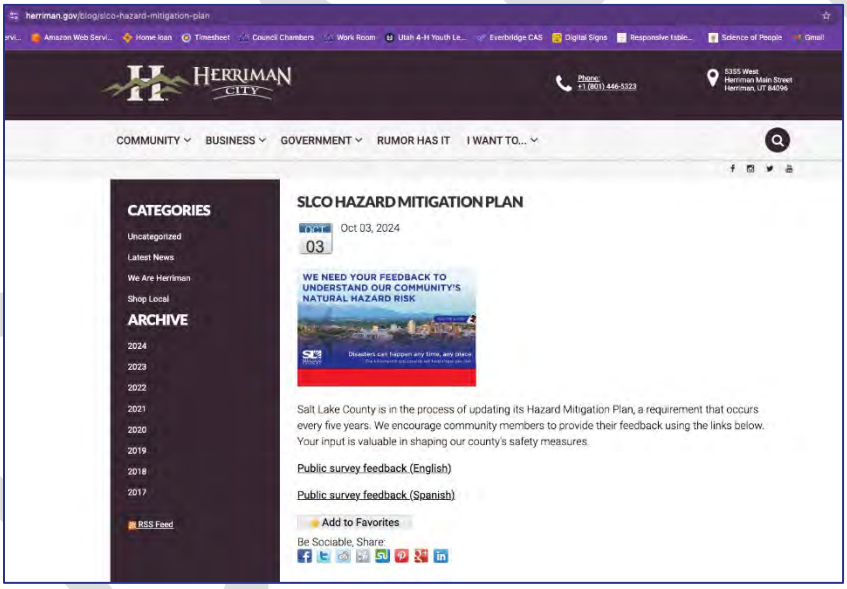

Figure 2: Website Post Announcing Plan Update and Public Survey

Plan Integration

Incorporating the underlying principles of the Hazard Mitigation Plan and its recommendations into other plans is a highly effective and low-cost way to expand their influence. All plan participants will use existing methods and programs to implement hazard mitigation actions where possible. As previously stated, mitigation is most successful when it is incorporated into the day-to-day functions and priorities of government and public service. This plan builds on the momentum developed through previous and

related planning efforts and mitigation programs, and it recommends implementing actions where possible through these other program mechanisms. These existing mechanisms include the following:

- Regularity Capabilities
- Administrative Capabilities
- Fiscal Capabilities

Respective planning stakeholders will conduct implementation and incorporation into existing planning mechanisms and will be done through the routine actions of:

- Monitoring other planning/program agendas
- Attending other planning/program meetings
- Participating in other planning processes; and
- Monitoring community budget meetings for other community program opportunities.

The successful implementation of this plan will require constant and vigilant review of existing plans and programs for coordination and multi-objective opportunities that promote a safe, sustainable community. Regular efforts should be made to monitor the progress of mitigation actions implemented through other planning mechanisms. Where appropriate, priority actions should be incorporated into planning updates. Table 9 lists existing planning mechanisms in which the Hazard Mitigation Plan has been integrated. Table 10 lists the opportunities for integrating elements of this plan into other plans.

Table 9: Previous Plan Integration by the City of Herriman

Plan	Description
Comprehensive Emergency Management Plan (CEMP) (https://www.utah.gov/pmn/files/1172293.pdf)	The CEMP establishes the framework through which Herriman City responds to and recovers from emergencies. It incorporates hazard mitigation strategies to enhance community resilience.
Be Ready Herriman Program (https://www.herriman.gov/be-ready-herriman)	This program focuses on community preparedness, offering meetings, training, drills, and organizing emergency response efforts. It integrates hazard mitigation by educating residents and promoting proactive measures to reduce risks.
Flood Hazard Mitigation Study (https://www.herriman.gov/blog/city-council-recap-2-12-25)	Herriman City has initiated this study to assess potential flooding risks, evaluate infrastructure improvements, and recommend preventive measures. This study is a direct implementation of hazard mitigation actions aimed at reducing flood risks.
2025 General Plan Amendment (https://www.herriman.org/uploads/files/1621/2025GPAmend.pdf)	The amendment outlines long-term development goals and policies. It integrates hazard mitigation by addressing fire risks in adjacent unincorporated areas and promoting sustainable land use planning.
Storm Water Management Program Plan (https://www.herriman.org/u	This plan describes the city's approach to managing stormwater to prevent flooding and water pollution. It includes hazard mitigation

Plan	Description
ploads/files/4318/Appendix-IndexDraft-2024-0213.pdf)	measures such as infrastructure improvements and regulatory policies to manage stormwater effectively.

Table 10: Future Plan Integration Opportunities for the City of Herriman

Plan	Description
General Plan	The General Plan outlines long-term development goals and policies. It can integrate hazard mitigation strategies by incorporating land use planning, infrastructure resilience, and hazard-prone area restrictions.
Capital Improvement Plan	This plan guides infrastructure investments. It can integrate hazard mitigation by prioritizing resilient infrastructure, flood control projects, and seismic retrofits.
Community Wildfire Protection Plan	Provides guidance on fire hazard areas and evacuation zones. It can be further integrated by aligning mitigation efforts with wildfire-prone areas and emergency preparedness initiatives.
Local Emergency Operations Plan	Outlines emergency response and preparedness efforts. It can incorporate hazard mitigation strategies for disaster response coordination, evacuation procedures, and community preparedness initiatives.
Stormwater Management Plan	Addresses stormwater infrastructure and drainage concerns. It can support flood mitigation strategies, stormwater retention projects, and erosion control measures.
Land Use Plan	Defines zoning and development regulations. It can integrate hazard mitigation by restricting development in high-risk areas and incorporating resilient building requirements.

Capability Assessment

Local mitigation capabilities are existing authorities, policies, programs, and resources that reduce hazard impacts or could help carry out hazard mitigation activities.

Planning and Regulatory Capabilities

Planning and regulatory capabilities are the plans, policies, codes, and ordinances that prevent and reduce the impacts of hazards.

Table 10: Assessment of the Planning Capabilities of the City of Herriman

Administrative and Technical Capabilities

Administrative and technical capabilities include staff and their skills. They also include tools that can help carry out mitigation actions.

Table 12: Assessment of the Administrative Capabilities of the City of Herriman

Administrative Capability	In Place? (Y/N)	Is staffing adequate?	Are staff trained on hazards and mitigation?	Is coordination between agencies and staff effective?
Chief Building Official	Y	Y	Y	Y
Civil Engineer	Y	Y	Y	Y
Community Planner	Y	Y	Y	Y
Emergency Manager	Y	Shared duty with other tasks, needs full time attention	limited	Needs improvement
Floodplain Administrator	Y	Y	Y	Y
Geographic Information System (GIS) Coordinator	Y	Y	Y	Y
Planning Commission	Y	Y	Y	Y
Fire Safe Council	N – fire service provided by UFA	N/A	N/A	N/A
CERT (Community Emergency Response Team)	Y	Limited participation	No	Need improvement
Active VOAD (Voluntary Agencies Active in Disasters)	Y	Y	Y	Y
Other? (Please describe.)				

DRAFT

Table 13: Assessment of the Technical Capabilities of the City of Herriman

Technical Capability	In Place? (Y/N)	How has it been used to assess/mitigate risk in the past?	How can it be used to assess/mitigate risk in the future?
Mitigation Grant Writing	Y	Operational costs, stormwater management, flood hazard study	Needs development for accessing federal and state funding
Hazard Data and Information	Y	Identification of areas to prioritize for mitigation actions	Can be used to improve risk assessments and mitigation planning
GIS	Y	Used for mapping hazards, evacuation zones, and risk areas	Can enhance emergency response and land use planning
Mutual Aid Agreements	Y	Used to secure emergency resources and partnerships with local entities (e.g., agreements with local grocery stores to reserve emergency water supplies, shelters with religious buildings, and RSL Academy)	Can be expanded to ensure water, food, shelter, transportation, medical services, fuel, communication, and law enforcement support during emergencies (i.e., pre-arranged contracts for critical resources and services)
Other? (Please describe.)			

Financial Capabilities

Financial capabilities are the resources to fund mitigation actions. Talking about funding and financial capabilities is important to determine what kinds of projects are feasible, given their cost. Mitigation actions like outreach programs are lower cost and often use staff time and existing budgets. Other actions, such as earthquake retrofits, could require substantial funding from local, state, and federal partners. Partnerships, including those willing to donate land, supplies, in-kind matches, and cash, can be included.

Table 14: Assessment of the Financial Capabilities of the City of Herriman

Funding Resource	In Place? (Y/N)	Has it been used in the past and for what types of activities?	Could it be used to fund future mitigation actions?	Can it be used as the local cost match for a federal grant?
Capital Improvement Project Funding	Y	Stormwater management	Y	Y
General Funds	Yes	Funding various city services, including emergency management and animal services.[6]	Y	Y

DRAFT

Education and Outreach Capabilities

Education and outreach capabilities are programs and methods that could communicate about and encourage risk reduction. These programs may be run by a participant or a community-based partner. Partners, especially those who work with underserved communities, can help identify additional education and outreach capabilities.

Table 15: Assessment of the Education and Outreach Capabilities of the City of Herriman

Education and Outreach Capability	In Place? (Y/N)	Does it currently incorporate hazard mitigation?	Could it be used to support mitigation in the future?
Community Newsletter(s)	Y	No	Yes, it could include emergency preparedness tips and seasonal hazard awareness (e.g., wildfire safety in summer, winter storm prep).
Hazard Awareness Campaigns (such as Firewise, Storm Ready, Severe Weather Awareness Week, and School Programs)	Y	No	Yes, expand to include evacuation routes, shelter locations, and emergency response planning.
Public Meetings/Events (e.g., Health and Safety Fair.)	Y	Y	Yes, Health and Safety fair, focus on family preparedness, would like to incorporate Firewise training, evacuation information, and flood preparedness.
Emergency Management Listserv	Y	Y	Could be used to disseminate emergency alerts, preparedness tips, and hazard mitigation strategies.
Local News	Y	Y	Could be used for emergency preparedness awareness, updates on mitigation projects, and public service announcements.
Distributing Hard Copies of Notices (e.g., public libraries, door-to-door outreach)	Y	Y	Could provide preparedness guides, evacuation maps, and safety checklists in multiple languages.
Insurance Disclosures/ Outreach	Y	Y	Could include flood insurance education and incentives for mitigation actions.
Organizations that Represent, Advocate for, or Interact with Underserved and Vulnerable Communities (e.g., local faith groups, community centers like the Columbus Center.)	Y	Y	Could assist in targeted outreach, ensuring inclusive communication for hazard preparedness.

DRAFT

Education and Outreach Capability	In Place? (Y/N)	Does it currently incorporate hazard mitigation?	Could it be used to support mitigation in the future?
Social Media (e.g., Facebook, Twitter, Instagram, X, and YouTube.)	Y	Y	Limited emergency preparedness messaging. Could expand messaging to include interactive preparedness campaigns, real-time updates, and hazard-specific guidance.
Other? (Please describe.)			

Opportunities to Expand and/or Improve Capabilities

Herriman has various opportunities to expand and improve its mitigation capabilities by addressing gaps in planning, staffing, financial resources, and public outreach. Strengthening these areas will enhance the city's resilience to hazards and ensure the long-term sustainability of mitigation efforts. Table 16 lists the opportunities for the city of Herriman.

Table 16: Opportunities to Expand and/or Improve the Capabilities of the City of Herriman

Capability	Opportunity to Expand and/or Improve
Planning and Regulation	• Conduct a **comprehensive assessment** of current regulations, policies, and plans to identify areas for improvement in hazard mitigation. • Update **zoning and building codes** to enhance disaster resilience, particularly for wildfire and flood-prone areas. • Strengthen floodplain ordinances and stormwater management policies to mitigate flood risks. • Ensure mitigation strategies are fully integrated into **the General Plan, Capital Improvement Plan, and Community Wildfire Protection Plan** to align citywide development with risk reduction.
Administrative and Technical	• Evaluate staffing levels to ensure adequate personnel for hazard mitigation roles, including emergency management, GIS mapping, and floodplain administration. • Provide ongoing training for city staff on hazard mitigation, grant applications, and emergency response coordination. • Improve interagency collaboration with local, state, and federal partners to streamline mitigation planning and response. • Expand the use of GIS mapping and hazard data analysis to enhance risk assessment capabilities.
Financial	• Conduct a review of **existing funding sources** (Capital Improvement Funds, General Funds) to determine how they have been used and how they can be optimized for future mitigation projects. • Pursue **additional grant funding**, including Hazard Mitigation Grant Program (HMGP), Building Resilient Infrastructure & Communities (BRIC), and Community Development Block Grants (CDBG), to finance large-scale mitigation projects.

DRAFT

Capability	Opportunity to Expand and/or Improve
	• Explore **public-private partnerships** to fund mitigation efforts, including businesses and nonprofit organizations willing to support community resilience projects. • Assess the feasibility of implementing **stormwater utility fees or special purpose taxes** to fund local hazard mitigation initiatives.
Education and Outreach	• Integrate hazard mitigation messaging into **existing community newsletters, social media platforms, and public meetings.** • Expand partnerships with **local media and schools** to educate residents on risk reduction strategies. • Develop **targeted outreach campaigns** for underserved and vulnerable populations, ensuring accessibility of mitigation resources. • Increase participation in **state and federal preparedness programs**, such as Firewise, StormReady, and Severe Weather Awareness initiatives.

Mitigation Strategy

Mitigation strategies provide proactive measures that are designed to minimize the impacts of hazards on the city of Herriman. These strategies aim to reduce risks, enhance resilience, and improve response and recovery capabilities. Table 17 shows mitigation action alternatives, and Table 18 shows the status of previous mitigation activities. Table 19 is the 2025 mitigation action plan for the city of Herriman.

DRAFT

Table 17: Mitigation Action Alternatives for the City of Herriman

Action	Type of Action	Selected for inclusion in the plan?	If not selected, why not?
Strengthen building codes and enforce stricter construction standards to mitigate earthquake and windstorm damage	Prevention	Yes	N/A
Develop and implement a defensible space ordinance to reduce wildfire risk	Property Protection	Yes	N/A
Expand public education campaigns on flood preparedness, including distributing evacuation maps and emergency kits	Public Education & Awareness	Yes	N/A
Retrofit critical infrastructure (e.g., bridges, utilities, emergency shelters) to withstand seismic activity	Structural Projects	Yes	N/A
Improve stormwater management systems to mitigate flooding in high-risk areas	Natural Resource Protection	Yes	N/A
Enhance emergency communication systems, including redundant alert methods for severe weather and other hazards	Emergency Services	Yes	N/A
Conduct community-wide hazard mitigation drills with public participation	Public Education & Awareness	No	budget limitations and prioritization of infrastructure improvements
Acquire and remove properties in frequently flooded areas to prevent repetitive flood losses	Property Protection	No	Not feasible due to property ownership and funding constraints

DRAFT

Table 18: Status of Prior Mitigation Actions of the City of Herriman[8]

Action	Hazard(s)	Agency Lead	Support Agency(ies)	Status Update
Fire protection: Fuel mitigation in foothills to protect existing development. Install fire breaks, clear fuels in drainage, grazing, property acquisition to protect from new developments	Wildfire	Herriman City EM	SLCo EM, Herriman City EM, Herriman City Public Works	Ongoing – Annual fuel reduction efforts have been conducted in high-risk areas. Additional funding is being pursued for expanding mitigation efforts.
Flash Flooding Protection	Dam Failure, Flood (Urban/ Flash Flooding), Landslide/Slope Failure	Herriman City EM	Utah Dam Safety, SLCo Flood Control, SLCo EM, local jurisdictions	Ongoing – Drainage improvements have been made in select locations. Continued evaluation of flood-prone areas.
Conduct an inventory and assessment of communications equipment and systems and identify needs	All hazards	Herriman City EM	SLCo EM, SLCo Public Works, NGO partners, UFA, Herriman PD, Herriman Public Works, UDEM, VECC, UCA	Ongoing – Inventory completed; assessment of gaps and necessary upgrades underway.
Conduct training and awareness activities on communications equipment, tools, and systems	All hazards	Herriman City EM	UFA, Herriman PD, Herriman Public Works, SLCo Public Works, SLCo EM, NGO partners, UDEM, VECC, UCA	Ongoing – Annual training conducted for emergency responders, with updates on new equipment when available.
Establish agreements to share communications equipment between agencies involved in emergency operations	All hazards	Herriman City EM	Herriman City Communications, Herriman City Public Works, Herriman City PD, UFA, SLCo EM, NGO partners, SLCo Public Works, local jurisdictions, UDEM, VECC, UCA	Ongoing – No formal agreements established yet; discussions in progress

[8] EM = Emergency Management, SLCo EM = Salt Lake County Emergency Management, UFA = Unified Fire Authority, UDEM = Utah Division of Emergency Management, UDOT = Utah Department of Transportation, USSC = Utah Seismic Safety Commission.

DRAFT

Action	Hazard(s)	Agency Lead	Support Agency(ies)	Status Update
Establish multiagency notification capabilities and procedures for emergency personnel	All hazards	Herriman City Planning and Zoning	SLCo EM, UFA, Herriman Communications, Herriman Public Works, Herriman PD, NGO partners	Ongoing – Initial framework in place; testing and refinements needed. Other Jurisdictions have to opt in to receiving Everbridge notifications
Establish redundancy for dispatch centers and other critical communications	All hazards	Herriman City Communications	– Herriman City Communications, Herriman PD, UFA, SLCo EM, SLCo Public Works, Herriman Public Works, VECC, NGO partners	Ongoing
Establish a coordinating group to address long-term communications needs and implementation strategies	All hazards	Herriman City Public Works	Local jurisdictions, SLCo Public Works, Herriman Communications, Herriman Public Works, NGO partners	Ongoing – No formal group established; needs reassessment.
Pursue and implement needed mutual aid agreements	All hazards	Herriman City Public Works	SLCo EM, UFA, SLCo Public Works, Herriman City Communications, Herriman City PD, Herriman City Public Works, NGO partners, local jurisdictions	Ongoing – Several agreements in place, additional partnerships under negotiation.
Provide education regarding all natural hazards through live trainings and web-based, print, and broadcast media	All hazards	Herriman City Building	Local jurisdictions, SLCo EM, SLCo Public Works, SLCo Flood Control, NWS, Herriman City Communications, UFA, Herriman City Public Works, Herriman City PD, SIAC	Ongoing – Public outreach conducted through city website and social media; additional community workshops planned.
Incorporate information about cascading effects of hazards in education programs	All hazards	Herriman City Public Works	Local jurisdictions, SLCo EM, SLCo Public Works, SLCo Flood Control, NWS, Herriman City Communications, UFA, Herriman City Public Works, Herriman City PD, SIAC	Ongoing – Coordination with county emergency management to see if they have materials that available

DRAFT

Action	Hazard(s)	Agency Lead	Support Agency(ies)	Status Update
Develop education programs to target specific groups, including homeowners, developers, schools, and people with special needs	All hazards	Herriman City Public Works	Local jurisdictions, SLCo EM, SLCo Public Works, SLCo Flood Control, NWS, Herriman City Communications, UFA, Herriman City Public Works, Herriman City PD, Jordan School District	Ongoing – School-based programs established with JSD; expansion to other groups needed.
Use maps and similar products on county EM website and other media to educate public on areas at risk of hazards	All hazards	Herriman City Public Works	Herriman City GIS, Herriman City Public Works, SLCo EM, SLCo Public Works, SLCo Flood Control, Herriman City Communications	Ongoing – Updated hazard maps published online
Coordinate with existing public education programs such as the American Red Cross, Ready, Set, Go!, Fire Adapted Communities or Firewise, Be Ready Utah, and the National Weather Service.	All hazards	Herriman City Public Works	NGO partners, SLCo EM, SLCo Public Works, UFA, Herriman City Communications, Herriman City PD, Herriman City Public Works, NWS, FFSL	Ongoing – Partnerships maintained; collaboration on public safety messaging continues.
Establish and enforce appropriate planning, zoning, and building code ordinances	All hazards	Herriman City Public Works	Herriman City Communications, Herriman City Building	Ongoing – Codes reviewed periodically; updates implemented based on new risk assessments.
Ensure current hazard ordinances are available for viewing online	All hazards	Herriman City Public Works	Herriman City Planning and Zoning, Herriman City Building	Ongoing – verify relevant ordinances accessible via city website.
Include dam inundation maps in current county, city, and special service district emergency operations plans	Dam Failure	Herriman City EM	State Dam Safety, SLCo Flood Control, SLCo EM, SLCo Public Works, Herriman GIS, SLCo Surveyor	Ongoing – Integrated GIS maps into emergency plans; conduct periodic updates.

DRAFT

Action	Hazard(s)	Agency Lead	Support Agency(ies)	Status Update
Continue to encourage water conservation using outreach material from all water districts in the county	Drought	Herriman City EM	SLCo EM, SLCo Public Works, water districts	Ongoing – City promotes conservation messaging through local utility partners, message boards, and social media.
Identify structures at risk of earthquake damage	Earthquake	UFA	Herriman City Planning and Zoning, Herriman City EM, SLCo EM	Ongoing – Conduct preliminary assessments; funding possibly needed for full seismic evaluations.
Encourage communities to actively participate in National Flood Insurance Program (NFIP)	Flooding	UFA	SLCo Flood Control, SLCo EM, Herriman City Communications, Herriman City EM	Ongoing – Public encouraged to obtain flood insurance; participation rates increasing.
Determine potential flood impacts, and identify areas in need of additional flood control structures	Flooding	UFA	SLCo Flood Control, SLCo EM, Herriman City EM	Ongoing – Conduct hazard assessment; determine funding needed for additional mitigation projects.
Address identified problems through construction of debris basins, flood retention ponds, energy dissipaters, and other flood control structures	Flooding	Herriman City Public Works	SLCo Flood Control, SLCo EM, Herriman City EM	Ongoing – Some flood control structures completed; additional projects planned.
Establish maintenance and repair programs to remove debris, improve resistance, and otherwise maintain effectiveness of stormwater and flood control systems	Flooding	Herriman City EM	SLCo Flood Control, SLCo EM, Herriman City EM, Herriman City Communications	Ongoing – Routine maintenance program in place; additional funding sought for improvements.
Identify and assess structures for deficiencies	Flooding	Herriman City EM	SLCo Flood Control	Ongoing
Modify structures as needed to address deficiencies	Flooding	Herriman City GIS	SLCo Flood Control	Ongoing

DRAFT

Action	Hazard(s)	Agency Lead	Support Agency(ies)	Status Update
Develop a protocol for working with state and federal agencies to reduce the impact of post-fire debris-flow hazard	Slope Failure	Herriman City GIS	Utah Geological Survey, UFA, SLCo EM, FFSL	Ongoing Coordinate efforts; review response plan.
Coordinate with the Utah Geological Survey and other agencies to understand current slope failure threats/potential	Slope Failure	Herriman City Public Works	Herriman City Public Works, Herriman City Building, Herriman City Planning and Zoning, SLCo EM, UGS	Ongoing – Data collection and mapping efforts ongoing.
Increase public awareness through Firewise program	Wildland Fire	UFA	Herriman City EM, SLCo EM	Ongoing – Implement community outreach efforts; increase participation.
Educate homeowners on the need to create defensible space near structures in the wildland–urban interface (WUI)	Wildland Fire	Herriman City EM	Herriman City EM, SLCo EM, Herriman City Communications	Ongoing – Fire and city provide guidance and site assessments.
Designate and promote county-wide annual initiative for clearing fuels	Wildland Fire	UFA	SLCo EM, Herriman City Public Works, Herriman City EM, Herriman City Communications	Ongoing
Provide waste removal, such as chipping of green waste by public works, following designated fuel clearing day/week	Wildland Fire	Herriman City Public Works and Police Department	UFA, Wasatch Front Waste and Recycling District, SLCo EM, Herriman City Communications	Ongoing – Weekly and Seasonal green waste disposal services offered.
Work with experts and communities to develop or update evacuation plans	Wildland Fire	Herriman City Building Community Development , and Engineering	NGO partners, SLCo EM, FFSL, Herriman City Public Works, local jurisdictions, Herriman City Communications	Ongoing – Evacuation routes mapped; additional GIS and neighboring jurisdictions input needed.
Evaluate transportation network and address needed improvements to facilitate evacuation and emergency response	Wildland Fire	Herriman City Emergency Manager	UDOT, Herriman City Public Works, SLCo Public Works, local jurisdictions, Herriman City Communications	Ongoing – Verify current traffic flow analysis

DRAFT

Action	Hazard(s)	Agency Lead	Support Agency(ies)	Status Update
Identify all facilities, businesses, and residences, particularly in the areas, and assigned addresses according to current county addressing standards	Wildland Fire	Herriman City Engineering and Public Works	SLCo EM, SLCo Addressing, SLCo Surveyor, UFA, Herriman City PD, VECC, Herriman City EM, Herriman City Communications, Herriman City GIS	Complete – updated address information is sent to the addressing department at the county and UFA on a regular basis.
Incorporate improved addresses in fire-dispatch and other databases	Wildland Fire	UFA and Herriman City EM	Herriman City EM, SLCo EM, SLCo Surveyor, SLCo Addressing, Herriman City Communications, VECC, UFA, Herriman City PD, Herriman City GIS	Complete - updated address information is sent to the addressing department at the county and UFA on a regular basis.
Reduce vegetation and fuels around publicly owned structures	Wildland Fire	Herriman City EM	FFSL, UFA, SLCo EM, Herriman City EM, SLCo Parks and Recreation, SLCo Health Department	Ongoing
Implement fire breaks and other protective measures	Wildland Fire	Herriman City EM	Herriman City EM, FFSL, SLCo EM, Herriman City GIS	Ongoing
Assist communities in developing Community Wildfire Protection Plans or similar plans	Wildland Fire	Herriman City EM	UFA, FFSL, SLCo EM, Herriman City GIS	Ongoing
Define the Wildland–Urban Interface (WUI) and develop digital maps of it	Wildland Fire	Herriman City EM	Herriman City GIS, SLCo EM, Herriman City EM	Ongoing
Procure a Drinking water trailer for emergency response.	Emergency Response, Drought, Extreme Heat	Herriman City EM	Herriman City EM, SLCo EM	Ongoing
Continue to enforce building codes, development codes and zoning ordinance	Earthquake	Herriman City Planning and Zoning	Utah Seismic Safety (USSC), Utah Division of Emergency Management (DEM), SLCo EM	Ongoing

DRAFT

Action	Hazard(s)	Agency Lead	Support Agency(ies)	Status Update
Continue Utah Shakeout activities to promote earthquake awareness	Earthquake	Herriman City Communications	SLCo EM, local jurisdictions, UFA, Herriman City PD, Herriman City Public Works, Herriman City Communications, NGO partners	Ongoing
Continue to enforce storm drain master plan requirements	Flood	Herriman City Public Works	Herriman City Communications, Herriman City EM	Ongoing
Establish Firewise community program for Herriman	Wildfire	Herriman City Public Works	SLCo EM, Herriman City Communications	Ongoing

DRAFT

DRAFT

THIS PAGE INTENTIONALLY LEFT BLANK

Table 19: 2025 Mitigation Action Plan for the City of Herriman[9]

#	Action	Hazard(s)	Lead Agency	Potential Partners	Benefits (Losses Avoided)	Cost Estimate	Funding Source(s)	Time-frame	Priority	Comments
1	Fire protection: Fuel mitigation in foothills to protect existing development. Install fire breaks, clear fuels in drainage, grazing, property acquisition to protect from new developments.	Wildfire	UFA	SLCo EM, SLCo Public Works, Herriman City Public Works, FFSL	Reduce potential for wildfire and protect structures from wildfire damage.	Medium	Herriman general funds, Community Wildfire Assistance grant, Fire Prevention and Safety grant	Short-term	High	
2	Determine potential impacts of flash flooding and identify areas in need of additional flood control structures or protection.	Dam Failure, Flood (Urban/Flash Flooding), Heavy Rain, Landslide/ Slope Failure, Hazardous Materials Release	Herriman City Public Works	Utah Division of Dam Safety, dam owners, SLCo Flood Control, SLCo EM	Structure protection and life safety protection. Decreased flood potential from runoff, standing water, dam failure, etc.	High ($5,000,000)	Herriman general funds, HMGP grant, BRIC grant	Short-term	High	
3	Conduct an inventory and assessment of communications equipment and systems and identify needs.	Dam Failure, Drought, Earthquake, Extreme Cold, Extreme Heat, Flooding, Heavy Rain, High Wind, Landslide, Lightning, Public Health Epidemic/Pandemic, Radon, Severe Winter Storm, Tornado, Wildfire, Civil Disturbance, Hazardous Materials Incident, Terrorism/ Cyberterrorism	Herriman City EM in coordination with each city department or agency	Herriman City Communications, UCA, VECC, UFA, SLCo EM, NGO partners	Enhances interoperability. Early notification of impending disaster to decrease loss of life. Improved relationships with the public and stakeholders. Faster delivery of information.	Low	Herriman general funds, BRIC grant, HMGP grant	Short-term	Low	
4	Conduct training and awareness activities for communications equipment, tools, and systems.	Dam Failure, Drought, Earthquake, Extreme Cold, Extreme Heat, Flooding, Heavy Rain, High Wind, Landslide, Lightning, Public Health Epidemic/Pandemic, Radon, Severe Winter Storm, Tornado, Wildfire, Civil Disturbance, Hazardous Materials Incident, Terrorism/ Cyberterrorism	Herriman City EM	SLCo EM, UDEM, NGO partners, local jurisdictions. Herriman City Communications, Herriman City Public Works, SLCo Public Works, VECC, UCA	Enhances interoperability. Early notification of impending disaster to decrease loss of life. Improved relationships with the public and stakeholders. Faster delivery of information.	Low	Herriman general funds, HMGP grant, BRIC grant	Short-term	Low	
5	Establish agreements to share communications equipment between agencies involved in emergency operations.	Dam Failure, Drought, Earthquake, Extreme Cold, Extreme Heat, Flooding, Heavy Rain, High Wind, Landslide, Lightning, Public Health Epidemic/Pandemic, Radon, Severe Winter Storm, Tornado, Wildfire,	Herriman City EM	SLCo EM, Herriman City Communications, Herriman City Public Works, SLCo Public Works, VECC, UCA	Enhances interoperability. Early notification of impending disaster to decrease loss of life. Improved relationships with the public and stakeholders. Faster delivery of information.	Low	Herriman general funds, HMGP grant, BRIC grant	Short-term	Low	

[9] BRIC = Building Resilient Infrastructure and Communities, CWDG = Community Wildlife Defense Grant, EM = Emergency Management, EMPG = Emergency Management Performance Grant, FFSL = Division of Forestry, Fire, and State Lands, FMA = Flood Mitigation Assistance, HMA = Hazard Mitigation Assistance, HMGP = Hazard Mitigation Grant Program, MSD = Municipal Services District, NGO = nongovernmental organization, NWS = National Weather Service, PIO = Public Information Officer, SIAC = Statewide Interagency Advisory Council, SLCo EM = Salt Lake County Emergency Management, SLVECC = Salt Lake Valley Emergency Communications Center, UDEM = Utah Division of Emergency Management, UDOT = Utah Department of Transportation, UFA = Unified Fire Authority, UGS = Utah Geological Survey, USSC = Utah Seismic Safety Commission, WUI = Wildland–Urban Interface, SIAC = Statewide Interagency Advisory Council.

#	Action	Hazard(s)	Lead Agency	Potential Partners	Benefits (Losses Avoided)	Cost Estimate	Funding Source(s)	Time-frame	Priority	Comments
		Civil Disturbance, Hazardous Materials Incident, Terrorism/ Cyberterrorism								
6	Establish multiagency notification capabilities and procedures for emergency personnel.	Dam Failure, Drought, Earthquake, Extreme Cold, Extreme Heat, Flooding, Heavy Rain, High Wind, Landslide, Lightning, Public Health Epidemic/Pandemic, Radon, Severe Winter Storm, Tornado, Wildfire, Civil Disturbance, Hazardous Materials Incident, Terrorism/ Cyberterrorism	Herriman City EM	Local jurisdictions, Herriman City PD, Herriman City Public Works, Herriman City Communications, SLCo EM, SLCo Public Works, NGO partners	Common operating platform for stakeholders, increased situational awareness, improved response time.	Medium	Herriman general funds, SLCo EM, BRIC grant, HMGP grant, local jurisdictions	Medium-term	Medium	
7	Establish redundancy for dispatch centers and other critical communications.	Dam Failure, Drought, Earthquake, Extreme Cold, Extreme Heat, Flooding, Heavy Rain, High Wind, Landslide, Lightning, Public Health Epidemic/Pandemic, Radon, Severe Winter Storm, Tornado, Wildfire, Civil Disturbance, Hazardous Materials Incident, Terrorism/ Cyberterrorism	Herriman City Communications	VECC, SLCo EM, UCA, Herriman City PD, Herriman City Public Works, Herriman City EM	Ensure communication lifelines remain functional during disaster.	High	Herriman general funds, SLCo EM general fund, HMGP, HMA grants	Medium-term	Medium	
8	Establish a coordinating group to address long-term communications needs and implementation strategies.	Dam Failure, Drought, Earthquake, Extreme Cold, Extreme Heat, Flooding, Heavy Rain, High Wind, Landslide, Lightning, Public Health Epidemic/Pandemic, Radon, Severe Winter Storm, Tornado, Wildfire, Civil Disturbance, Hazardous Materials Incident, Terrorism/ Cyberterrorism	Herriman City Communications	Local jurisdictions, Herriman City EM, Herriman City Public Works, NGO partners	Enhances interoperability. Early notification of impending disaster to decrease loss of life. Improved relationships with the public and stakeholders. Faster delivery of information.	Low	Herriman general funds	Short-term	Medium	
9	Pursue and implement needed mutual aid agreements.	Dam Failure, Drought, Earthquake, Extreme Cold, Extreme Heat, Flooding, Heavy Rain, High Wind, Landslide, Lightning, Public Health Epidemic/Pandemic, Radon, Severe Winter Storm, Tornado, Wildfire, Civil Disturbance, Hazardous Materials	Herriman City EM	SLCo EM, local jurisdictions, SLCo Public Works, NGO partners, NWS	Established agreements in place for disaster and incident assistance	Low	Herriman general funds	Short-term	Low	

DRAFT

#	Action	Hazard(s)	Lead Agency	Potential Partners	Benefits (Losses Avoided)	Cost Estimate	Funding Source(s)	Time-frame	Priority	Comments
		Incident, Terrorism/ Cyberterrorism								
10	Provide education regarding all natural hazards through live trainings and web-based, print, and broadcast media.	Avalanche, Dam Failure, Drought, Earthquake, Extreme Cold, Extreme Heat, Flooding, Heavy Rain, High Wind, Landslide, Lightning, Public Health Epidemic/Pandemic, Radon, Severe Winter Storm, Tornado, Wildfire	Herriman City EM	NWS, NGO partners, SLCo EM, SLCo Public Works, Herriman City Communications, Herriman City PD, Herriman City Public Works	Increased understanding of local hazards, resources improved relationships with the public and stakeholders, and improved safety. For example, share informational brochures, social media posts, or trainings on defensible space and home hardening (wildfire), water conservation (drought), and avalanche warning signs, hazardous conditions, and safety recommendations (avalanche), Reduced risk through the public implementing steps to mitigate their own risk.	Low	Herriman general funds, NWS grant, BRIC grant, HMGP grant	Short-term	Medium	
11	Incorporate information about cascading effects of hazards in education programs.	Dam Failure, Drought, Earthquake, Extreme Cold, Extreme Heat, Flooding, Heavy Rain, High Wind, Landslide, Lightning, Public Health Epidemic/Pandemic, Radon, Severe Winter Storm, Tornado, Wildfire, Civil Disturbance, Hazardous Materials Incident, Terrorism/ Cyberterrorism	Herriman City EM	SLCo EM, SLCo Public Works, Herriman City Communications, Herriman City Public Works, NWS, NGO partners, Herriman City PD, SIAC, SLCo Sheriff, UFA	Increased awareness of potential secondary effects of hazards can help residents reduce their risk.	Low	Herriman general funds, NWS, HMGP grant, BRIC grant	Short-term	Medium	
12	Develop education programs to target specific groups, including homeowners, developers, schools, and people with special needs.	Dam Failure, Drought, Earthquake, Extreme Cold, Extreme Heat, Flooding, Heavy Rain, High Wind, Landslide, Lightning, Public Health Epidemic/Pandemic, Radon, Severe Winter Storm, Tornado, Wildfire, Civil Disturbance, Hazardous Materials Incident, Terrorism/ Cyberterrorism	Herriman City EM	Herriman City Communications, Herriman City PD, Herriman City Public Works, SLCo EM, NGO partners, water districts, Jordan School District, UFA	Provides educational benefits to underserved populations to increase awareness and improve safety.	Low	Herriman general funds, NWS grant, SLCo EM general fund, BRIC grant, HMGP grant	Short-term	Medium	

DRAFT

#	Action	Hazard(s)	Lead Agency	Potential Partners	Benefits (Losses Avoided)	Cost Estimate	Funding Source(s)	Time-frame	Priority	Comments
13	Use maps and similar products on county EM website and other media to educate public on areas at risk of hazards.	Dam Failure, Drought, Earthquake, Extreme Cold, Extreme Heat, Flooding, Heavy Rain, High Wind, Landslide, Lightning, Public Health Epidemic/Pandemic, Radon, Severe Winter Storm, Tornado, Wildfire, Civil Disturbance, Hazardous Materials Incident, Terrorism/ Cyberterrorism	Herriman City EM	Herriman City GIS, SLCo EM, Herriman City Public Works, Herriman City Communications	Improved understanding of location of hazards and potential areas impacted.	Low	Herriman general funds	Short-term	Medium	
14	Coordinate with existing public education programs such as the American Red Cross, Ready, Set, Go!, Fire Adapted Communities or Firewise, Be Ready Utah, and the National Weather Service.	Avalanche, Dam Failure, Drought, Earthquake, Extreme Cold, Extreme Heat, Flooding, Heavy Rain, High Wind, Landslide, Lightning, Public Health Epidemic/Pandemic, Radon, Severe Winter Storm, Tornado, Wildfire, Civil Disturbance, Hazardous Materials Incident, Terrorism/ Cyberterrorism	Herriman City EM	SLCo EM, PIO Association, Public Safety & Outreach Groups, NGOs, NWS, UFA, Herriman City Public Works, SLCo Public Works	Partnerships help facilitate information sharing to a larger audience. Provides educational benefits to underserved populations to increase awareness and improve safety	Low	Herriman general funds, NWS grant, SLCo EM general fund	Short-term	Medium	
15	Establish and enforce appropriate planning, zoning, and building code ordinances.	Dam Failure, Drought, Earthquake, Extreme Cold, Extreme Heat, Flooding, Heavy Rain, High Wind, Landslide, Lightning, Public Health Epidemic/Pandemic, Radon, Severe Winter Storm, Tornado, Wildfire, Civil Disturbance, Hazardous Materials Incident, Terrorism/ Cyberterrorism	Herriman City Building and Planning and Zoning	Herriman City Communications, SLCo EM, Herriman City Public Works, Herriman City EM	Reduces potential damage to buildings and infrastructure and reduces risk of injury to occupants.	Low	Herriman general funds, BRIC grant, HMGP grant	Short-term	Medium	
16	Ensure current hazard ordinances are available for viewing online.	Dam Failure, Drought, Earthquake, Extreme Cold, Extreme Heat, Flooding, Heavy Rain, High Wind, Landslide, Lightning, Public Health Epidemic/Pandemic, Radon, Severe Winter Storm, Tornado, Wildfire, Civil Disturbance, Hazardous Materials Incident, Terrorism/ Cyberterrorism	Herriman City Building and Planning and Zoning	Planning Department Herriman City Communications, Herriman City EM, SLCo EM	Help inform residents and stakeholders. Improved enforcement of codes.	Low	Herriman general funds	Short-term	Low

City of Holladay Annex

To participate in this multi-jurisdictional hazard mitigation plan (MJHMP) update for Salt Lake County (SLCo), the governing body of the city of Holladay passed a formal resolution, a copy of which is maintained at the local government offices.

Planning Process Contact Information

Table 1 provides information on the point of contact during the updating of the MJHMP.

Jurisdiction Profile

Date of Incorporation

November 30, 1999

Location and Description

The city of Holladay is in central Salt Lake County. The city is approximately 8.5 square miles in area and is approximately 4,465 feet above sea level. The city of Holladay features various outdoor activities and historical sites including the Holladay Village Plaza for local shops, Big Cottonwood Regional Park for outdoor activities, and Cottonwood Paper Mill for historical charm.

Population

The 2022 American Community Survey 5-Year Estimate from the U.S. Census Bureau records the population of the city of Holladay as 31,563 people.

DRAFT

Demographics

Most of the 31,563 people are between the ages of 35 and 44, with a median age of 33.6; 15,894 are females (50.4%) and 15,669 are males (49.6%). English is the primary language in 85.9% of homes,, with 4% Spanish and 10.1% other languages.

Brief History

A group of pioneers known as the Mississippi Company and led by John Holladay entered the Salt Lake Valley in July 1847. They discovered a spring-fed stream, which they named Spring Creek. Most of the group returned to Great Salt Lake for the winter, but a few men stayed and built dugouts along the stream, establishing the first village outside Salt Lake City. The village was named Holladay's Settlement after John Holladay. Holladay's Settlement attracted businesses and residents with popular establishments like Neilson's Store and Harper-Bowthorpe Blacksmith Shop calling the settlement home. The city was incorporated on November 30, 1999, driven by the residents' desire for local control over planning and zoning. The city of Holladay expanded its boundaries in 2002 and again in 2015 to include more areas, reflecting its growth and development. Canyon Cove, also referred to as the Cove, is a well-regarded residential neighborhood in the city of Holladay known for its natural beauty, mountain views, and convenient location that offers a mix of urban living and outdoor access. It is located east of Wasatch Boulevard in the southeast corner of the city.

Climate

The city of Holladay experiences a humid continental climate (Dfa Köppen classification) characterized by hot summers and cold winters with significant temperature variations throughout the year. Average high temperatures are approximately 74.5°F in the summer and approximately 22.5°F in the winter. Rain each year is approximately 27.8 inches, and snowfall averages 52.4 inches.

Public Services

Holladay City Hall serves as the administrative hub for the city and offers a variety of municipal services. The Public Services Department maintains and operates the city's infrastructure, including roadways, parks, and buildings, while managing capital projects and engineering tasks. Fire, EMS, and HAZMAT response are contracted through the Unified Fire Authority. Law enforcement is contracted through the Unified Police Department.

Governing Body

The governing body of the city consists of the Mayor who is elected at large and five council members who are elected by districts. The city also has a City Manager who serves as the chief administrative officer under the direction of the city council as the city operates under the Council–Manager form of government.

DRAFT

Development Trends

Holladay Village Project: The city has experienced significant redevelopment in and near the Holladay Village area, including retail, office, and residential development. A significant mixed-use project that will include owned residential units and office and retail space is slated to be completed in early 2025 with some completed in late 2024, and a number of other projects are underway or proposed.

Cottonwood Mall Redevelopment Project: The Cottonwood Mall site has transferred ownership to a local developer, and plans are underway to develop the site using the 2008 site development master plan. This project, known as Holladay Hills, will add residential and commercial sites to the city landscape. Construction on a portion of the project is complete, and both residential and commercial units are expected to be occupied by early 2025.

Future Significant Projects: The City Council has been considering two large potential projects. One focuses on improvements needed at City Hall, including seismic reinforcement of the nearly 100-year-old facility. The other project is a generational opportunity to convert the closed Spring Lane elementary school into the city's largest public park, providing needed open space and recreational amenities in the community. In 2022, the city also pledged future sales tax revenues totaling $28,974,912 to pay debt service on sales tax revenue bonds issued in June 2022. Proceeds from these bonds are to be used to finance construction and maintenance on various road and stormwater projects.

Jurisdiction-Specific Hazards and Risk

The Calculated Priority Risk Index (CPRI) is a comprehensive assessment tool for evaluating and prioritizing risks in a given context. It considers various factors, such as probability, impact, and urgency, to determine the level of risk associated with events or situations. The results for each hazard, including its risk factor (RF) value, are shown in Table 5. The results are based on the criteria in Table 6 and the equation that follows it. The CPRI helps organizations and individuals make informed decisions about risk management and mitigation strategies. It provides a systematic approach to identifying and addressing potential issues, allowing for a more efficient allocation of resources and proactive risk prevention. With the CPRI, stakeholders can prioritize their focus on the most critical risks, leading to more effective risk management and, ultimately, better outcomes.

Table 5: Calculated Priority Risk Index Values for the City of Holladay

Type of Hazard Event	Probability of Future Events	Spatial Extent	Severity of Life/ Property Impact	Warning Time	Duration	Response Capacity	Risk Factor Value
Avalanche	1	1	2	4	2	2	1.8
Drought	4	4	1	1	4	1	2.5
Earthquake	1	4	4	4	4	4	3.1
Extreme Heat	4	4	1	1	4	1	2.5
Extreme Cold	4	4	1	1	4	1	2.5

DRAFT

Type of Hazard Event	Probability of Future Events	Spatial Extent	Severity of Life/ Property Impact	Warning Time	Duration	Response Capacity	Risk Factor Value
Flooding	3	2	2	1	4	2	2.4
Landslide/ Slope Failure	1	1	2	4	4	2	2.0
Radon	4	4	1	1	0	1	2.2
Heavy Rain	3	2	2	2	3	2	2.4
High Wind	3	4	2	2	3	2	2.6
Lightning	4	1	1	3	1	1	2.1
Severe Winter Weather	4	4	1	1	2	1	2.3
Tornado	1	2	3	4	3	4	2.4
Wildfire	3	2	2	4	4	2	2.7
Dam Failure	1	3	2	4	4	3	2.3
Civil Disturbance	2	1	2	4	2	3	2.2
Cyberattack	2	1	2	4	3	4	2.4
Hazardous Materials Incident (Transportation & Fixed Facility)	3	2	2	4	2	2	2.5
Public Health Epidemic/ Pandemic	3	4	1	1	4	2	2
Terrorism	2	1	2	4	2	3	2.2

Table 6: Criteria for the Calculated Priority Risk Index

Risk Index Factor	Degree of Risk Level		Criteria	Factor Weight for Degree of Risk Level
Probability of Future Events	1	Unlikely	Less than 1 percent probability of occurrence in the next year or a recurrence interval of greater than every 100 years.	30%
	2	Occasional	1 to 10 percent probability of occurrence in the next year or a recurrence interval of 11 to 100 years.	
	3	Likely	11 to 90 percent probability of occurrence in the next year or a recurrence interval of 1 to 10 years.	

DRAFT

Risk Index Factor	Degree of Risk Level		Criteria	Factor Weight for Degree of Risk Level
	4	Highly Likely	91 to 100 percent probability of occurrence in the next year or a recurrence interval of less than 1 year.	
Spatial Extent	1	Limited	Less than 10% of the planning area could be impacted.	10%
	2	Small	10%–25% of the planning area could be impacted	
	3	Significant	25%–50% of the planning area could be impacted.	
	4	Extensive	50%–100% of the planning area could be impacted.	
Severity of Life/Property Impact	1	Negligible	Less than 5% of the affected area's critical and non-critical facilities and structures are damaged/ destroyed. Only minor property damage and minimal disruption of life. Temporary shutdown of critical facilities.	30%
	2	Limited	More than 5% and less than 25% percent of property in the affected area is damaged/ destroyed. Complete shutdown of critical facilities for more than one day but less than one week.	
	3	Critical	More than 25% and less than 50% of property in the affected area is damaged/ destroyed. Complete shutdown of critical facilities for over a week but less than one month.	
	4	Catastrophic	Over 50% of critical and non-critical facilities and infrastructures in the affected area are damaged/ destroyed. Complete shutdown of critical facilities for more than one month.	
Warning Time	1	Self-defined	More than 24 hours	10%
	2	Self-defined	12 to 24 hours.	
	3	Self-defined	6 to 12 hours.	
	4	Self-defined	Less than 6 hours.	
Duration	1	Brief	Up to 6 hours.	10%
	2	Intermediate	Up to one day.	
	3	Extended	Up to one week.	
	4	Prolonged	More than one week.	
Response Capacity	1	High	Significant resources and capability to respond to this kind of event; staff are trained, experienced, and ready.	10%
	2	Medium	Some resources and capability to respond to this kind of staff; some staff may be trained,	

DRAFT

Risk Index Factor	Degree of Risk Level		Criteria	Factor Weight for Degree of Risk Level
			experienced, and ready while others may need additional support.	
	3	Low	Limited resources and capability to respond to this kind of event; additional staff or staff training needed.	
	4	None	No resources and capability to respond this kind of event; additional outside support would be required.	

RISK FACTOR (RF) EQUATION

RF Value = [(Probability x 0.30) + (Spatial Extent x 0.10) + (Severity of Life/Property Impact x 0.30) + (Warning Time x 0.10) + (Duration x 0.10) + (Response Capacity x 0.10)]

Hazards with an RF value greater than or equal to 2.5 are considered high risk. Those with RF values of 2.0 to 2.4 are considered moderate risk hazards, and those with an RF value less than 2.0 are considered low risk. The highest possible RF value is 4.

Hazard Event History

Examining hazard event histories provides valuable insights to inform decision-making and help prioritize resources for risk prevention and response efforts. Table 7 lists the hazard events impacting the city of Holladay planning area since the 2019 plan update, as recorded in the Storm Events Database from the National Centers for Environmental Information.

Table 7: History of Hazard Events in the City of Holladay

Type of Hazard Event	FEMA Disaster #	Date(s)	Damage or Impacts	Description
Avalanche		N/A	None	N/A
Drought		Ongoing	The tree canopy in the big cottonwood area is slowly drying out from drought and a lack of irrigation (which was discontinued). Trees in this area are dying as they are stressed and at the end of their expected lifespan.	The city of Holladay has a large tree canopy (riparian area) along Big Cottonwood Creek. Drought stresses the existing, aging trees.
Earthquake		03/18/ 2020	No damage or major impacts in our jurisdiction.	5.7 earthquake in Magna (West of Holladay). The quake was in the morning

DRAFT

Type of Hazard Event	FEMA Disaster #	Date(s)	Damage or Impacts	Description
				hour before regular work hours.
Extreme Heat			No known numbers on people needing/using cooling centers. Public outreach to residents for available cooling centers was completed as applicable through social media and city email blasts. Information was also put in City Newsletter.	Multiple heat warnings issued by NWS for this area. County owned buildings opened to residents who needed a place to cool down.
Extreme Cold		Unknown	None	Unknown
Flooding		N/A	The only flooding was due to a heavy rain event. See below. No spring runoff flooding in 2023, Big Cottonwood Creek is fairly well controlled by Salt Lake County Flood Control.	Unknown
Landslide/ Slope Failure		N/A	None	Unknown
Radon		Ongoing	No event, ongoing health concern for individuals in high concentration areas.	Unknown
Heavy Rain		08/18/ 2021	A poorly maintained and overwhelmed storm drain system resulted in flooding of about a dozen residential properties. One home was later purchased by the city and demolished, the lot will not be rebuilt upon.	Heavy rainfall event two evenings in a row (accumulation .91 and 1.25 inches respectively) resulted in soil saturation and an overwhelmed storm drain system.
High Wind		09/08/ 2020	Downed trees and tree limbs required a four-day cleanup effort and the assistance of some partners to clear canal areas. Some residents/neighborhoods were without power for several days.	A widespread windstorm hit Salt Lake County with wind speeds of up to 99 mph in some areas, estimated to be 50–60 mph in Holladay.
Lightning		Ongoing	Unknown	Ongoing risk at public events, specifically concerts in the park, 4th of July celebration, and Blue Moon.
Severe Winter Weather		N/A	None	
Tornado		N/A	None	

DRAFT

Type of Hazard Event	FEMA Disaster #	Date(s)	Damage or Impacts	Description
Wildfire		N/A	None	
Dam Failure		N/A	None	
Civil Disturbance		2020	Non	
Cyberattack		N/A	None	
Hazardous Materials Incident (Transporta-tion & Fixed Facility)		04/23/ 2024	Directly adjacent neighbors were evacuated for approximately 24 hours, and approximately 430 homes in a half-mile radius were evacuated overnight for five hours. Eight homes were unable to return for an additional 8–10 hours, one home was destroyed, and multiple homes had broken windows and needed major repairs. Major roads were closed for a full day requiring signage and rerouting of traffic. Two families were displaced permanently.	Unstable dynamite and a large amount of unknown hazardous chemicals were found in a private residence. The dynamite could not be relocated for disposal. A controlled detonation was carried out on location after evacuation of surrounding areas.
Public Health Epidemic/ Pandemic		2020	Pivoted to online services model–virtual city hall. Citizens were very supportive of local businesses. The city provided microgrants to help with safety measures.	
Terrorism		N/A		

National Flood Insurance Program Summary

The city of Holladay participates in the National Flood Insurance Program (NFIP). Table 8 displays statistics related to the NFIP. The city of Holladay will continue to adopt and enforce floodplain management requirements, including regulating new construction of Special Flood Hazard Areas, making substantial improvement and/or damage determinations, or determining the permits required of owners to bring a substantially improved or damaged structure back into compliance. The city of Holladay does not participate in the Community Rating System (CRS).

Table 8: National Flood Insurance Program Status

Init FHBM Identified	Init FIRM Identified	Current Effective Map Date	Adopted Date	Date Joined NFIP	Tribal
8/30/77	12/18/85	11/19/21	2021	8/24/04	No

DRAFT

Table 9: National Flood Insurance Overview for the City of Holladay

Community ID	Number of Losses	Total Net Payment	Active Policies	Total Coverage
490253	6	$20,061.95	106	$25,804,000

Table 10: Responses on Floodplain Management for the City of Holladay[1]

Question	Response
Who is the floodplain manager? Is this their primary or secondary role?	Community Development Director – NFIP is secondary role.
Does the floodplain manager have adequate training and capacity for their role? If not, what else is needed?	Floodplain training sessions are offered twice a year, as the applications and theories do not change. Training needs to be more consistent. Capacity – currently there is adequate capacity to deal with incoming permits. However, the 14-day review requirement on permitting does cause issues as the floodplain review takes longer.
How does the community enforce its floodplain rules? Does enforcement include monitoring compliance and acting to correct violations?	Through new development and redevelopment permitting – all rules are applied. Monitoring is difficult as most of that is on private property and not accessible. When issues are known, they are enforced.
When was the community's most recent Community Assistance Visit (CAV)?	Unknown
Were any violations noted on the community's most recent CAV?	N/A
Is there an upcoming CAV? If no, is one needed?	N/A
When was the most recent floodplain management ordinance adopted?	2012
Does your community participate in the Community Rating System (CRS)? If so, describe the steps the community has taken to achieve the CRS goals.	No – planning may investigate this for future.
Does the community's floodplain management ordinance include any higher standards? If so, please list.	Unknown
Who is responsible for permitting?	Floodplain manager and CED Director (one and the same)
How does the community issue development permits in the special flood hazard area?	There is a floodplain permit that is separate from the development permit.
Does the community maintain elevation certificates?	Yes

[1] Add acronyms

Question	Response
Does the community track the number of buildings in the special flood hazard area? If yes, are there any trends?	Not that is currently up to date.
How many repetitive loss (RL) structures does the community have? (List number and type of structure)	0
How many severe repetitive loss (SRL) structures does the community have? (List number and type of structure)	0
Have any RL/SRL properties been mitigated since the last plan update?	0
Who is responsible for making substantial damage/substantial improvement determinations?	City Engineers
How does the substantial damage/substantial improvement process work in your community?	Initiated by a claim, improvements determined after.
Is there sufficient staff and training to make substantial damage/substantial improvement determinations?	There could be more training. If there were a major event, there would not be adequate staffing.
How are substantial damage/substantial improvement requirements messaged to the public before and after an event?	We have never done this before, but it would likely be a notification. Before: all hazards guide After: what to look for guide on website, social media
Have any substantially damaged/substantially improved structures been mitigated since the last plan update?	0
How will the community remain in compliance with the NFIP moving forward? (Simply stating "the community will continue to comply with the NFIP" will not meet FEMA's planning requirements)	Annually notify properties in the floodplain of NFIP requirements for flood mitigation.
How does the community support map change requests? This could be requests during the Risk MAP process or through Letters of Map Amendment or Revision.	Digitally through FEMAs website portal.
When did the latest Flood Insurance Rate Map (FIRM) become effective?	2021
When was the latest FIRM adopted?	2009
Is the FIRM and Flood Insurance Study (FIS) report in an accessible location? How would the public get access to their flood map information?	Send public to FEMA's website. Could add a link on our website.
Does the community use any Risk MAP products? If so, describe.	GIS/Esri

Question	Response
Does the community collect updated floodplain data or modeling? Is this shared with partners and with FEMA?	No
Other comments?	N/A
How does the community educate the public on floodplain management and the availability of flood insurance, in and out of the floodplain?	Website links, permitting processes
How does the community engage with insurance agents on flood insurance?	The city may provide a statement on building code standards.
Does the community (or state) have flood hazard disclosure laws?	The state of Utah does.
How familiar is the public with their flood insurance options?	Most people are familiar if they live in a hazard area. There has been confusion with new flooding maps.
How many properties have flood insurance in the community?	Unknown – we do not monitor that.
Are there any areas where flood insurance is lacking?	Unknown.
Other comments?	N/A

Jurisdiction-Specific Vulnerabilities and Impacts

Table 11 provides information on the vulnerable assets in the city of Holladay, including its critical facilities, highlighting the city's vulnerability to identified hazards. It also describes the potential impacts on the community arising from those vulnerabilities. By understanding the risks associated with these assets, local authorities can develop proactive strategies to mitigate vulnerabilities and ensure the safety and functionality of these important assets during hazard events. These data are invaluable for decision-making and prioritizing resources for emergency response and preparedness efforts, ultimately contributing to more effective risk management and greater resilience in the community.

Vulnerable assets within the city include 1 fire station, 1 police station, 1 emergency operations center (EOC), and 13 schools. Primary transportation routes include I-215, 2300 East/Holladay Boulevard, Highland Drive, Van Winkle, and Big Cottonwood Rd/6200 South. Community centers and recreation assets include Holladay Lions Recreation Center, the Mt. Olympus Senior Center, Holladay City Hall Park, the Big Cottonwood Regional Park Old Mill Golf Course, Knudsen Park, and several trailheads. Big Cottonwood Creek travels from southeast to northwest across the city. There are 10 homes in Holladay listed on the National Register of Historic Places and other unregistered structures of a historic nature. "The Cove" refers to an area in southeast Holladay, near Canyon Cove Drive, that may face unique risks due to its proximity to the mountains.

DRAFT

Table 11: Jurisdiction-Specific Vulnerabilities and Impacts in the City of Holladay

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
Avalanche	People	*Vulnerability*: The cove is the only area where there could be any risk of avalanche in the jurisdiction. There is no data to support a risk of avalanches.
	Structures	N/A – No historic avalanches in the jurisdiction.
Drought	People	*Vulnerability*: All residents are vulnerable to drought conditions. *Impacts*: Residents may face restrictions on water use.
	Structures	*Vulnerability*: Drought increases the risk of wildfire. Homes along I-215, especially on the south end of the jurisdiction, are at risk from potential fires. *Impacts*: Drought may contribute to fire danger from dry grasses and sparks causing fast-moving fires that may threaten structures.
	Economic Assets	*Vulnerability*: Businesses that are reliant on water are vulnerable to drought conditions. *Impacts*: Prolonged drought may lead to water restrictions or increased costs for culinary water and irrigation water for landscaping.
	Natural, Historic, and Cultural Resources	*Vulnerability*: Trees and vegetation are vulnerable to drought impacts. *Impacts*: The Big Cottonwood tree canopy has been impacted by drought and lack of additional irrigation. Trees are stressed and aging, so more of them are dying off.
	Critical Facilities and Infrastructure	*Vulnerability*: Extended droughts can lead to reduced water availability, impacting the reliability of drinking water supplies. *Impacts*: Drought not only affects residents but also places additional stress on water utilities to meet demand. The U.S. Environmental Protection Agency has announced a $110 million loan to enhance drinking water reliability in drought-prone regions in Utah, highlighting the importance of maintaining resilient water infrastructure.
	Community Activities	*Vulnerability*: Community events are vulnerable to restrictions during drought conditions. *Impacts*: Fireworks have been limited during the drought due to dry vegetation, which poses a fire risk.
Earthquake	People	*Vulnerability*: All Holladay residents are vulnerable to earthquakes. The elderly and those with access and functional needs might have special requirements during such events. *Impacts*: People may be injured or killed by falling objects or collapsed structures. Power and water supplies are likely to be disrupted. Depending on weather and other circumstances, vulnerable populations will be affected more severely.
	Structures	*Vulnerability*: All buildings are vulnerable, particularly those with unreinforced masonry (URMs). *Impacts:* All structures could experience damage in a strong earthquake. Past damage estimates indicate greater damage to structures north of Casto Lane and Murray Holladay Road and north of 6200 South.
	Economic Assets	*Vulnerability*: All Holladay businesses are vulnerable to earthquake impacts.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		Impacts: Earthquakes are likely to cause extensive economic losses. Businesses throughout the city could experience damage to their buildings and inventory. Damage to infrastructure can also disrupt the ability of businesses to remain in operation. Roads, rail transit lines, and utilities such as power, water, and communication systems are all vulnerable to damage from earthquakes, which can disrupt economic activity.
	Natural, Historic, and Cultural Resources	*Vulnerability*: Historic homes are vulnerable to earthquake damage. *Impacts*: Older structures are more susceptible to damage during seismic events.
	Critical Facilities and Infrastructure	*Vulnerability*: Transportation networks, water systems, and all critical facilities are vulnerable to earthquakes. *Impacts*: I-215 and other major roadways, such as Wasatch Boulevard, Van Winkle, 4500 South, and 3900 South, are vulnerable to disruption. Infrastructure, such as water systems, may be affected by liquefaction. City Hall and the Unified Police Department precinct are likely to be unusable after a seismic event. St. Mark's Hospital and the Intermountain Medical Center (IMC) may be disrupted. (Neither is within the boundaries of Holladay, but St. Mark's is just outside.) Long-term healthcare centers are also at risk.
	Community Activities	*Vulnerability*: All community activities are vulnerable to disruption by earthquakes. *Impacts*: Earthquakes disrupt community routines, halting gatherings, events, and local services. Key community spaces like schools, parks, and local businesses would face closure or restricted access.
Extreme Heat	People	*Vulnerability*: Approximately 18% of the population is above the age of 64. These individuals are at higher risk during extreme heat events. Low-income populations are also impacted (5% live in poverty). *Impacts*: Those with underlying health conditions or without access to cooling systems can experience heat-related illnesses, such as dehydration, heat exhaustion, and heat stroke.
	Structures	*Vulnerability*: Older structures or those constructed with specific materials are vulnerable to damage from extreme heat. *Impacts*: Prolonged high temperature can cause roads to soften, warp, or crack, especially on older surfaces. Repeated expansion and contraction of materials like wood, metal, or concrete can cause warping, cracking, and weakening over time.
	Economic Assets	*Vulnerability*: All businesses are vulnerable to increased energy costs. *Impacts*: Increased energy costs for cooling systems can affect business operations.
	Natural, Historic, and Cultural Resources	*Vulnerability*: Extreme heat can affect the health of vegetation and trees. *Impacts*: Heat can stress vegetation and lead to poor health.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
	Critical Facilities and Infrastructure	*Vulnerability*: Long-term care facilities are vulnerable to extreme heat conditions. *Impacts*: Long-term healthcare facilities may be at risk in the event of extreme heat combined with a power outage or rolling blackouts. Holladay has eight care or rehabilitation centers, and several others are on the border of the city.
	Community Activities	*Vulnerability*: Outdoor events are vulnerable to extreme heat impacts. *Impacts*: The city of Holladay hosts an outdoor concert series during the summer and a Fourth of July celebration. Extreme heat during these events can be dangerous for attendees and staff; water and cooling areas are provided to mitigate heat risks.
Extreme Cold	People	*Vulnerability*: Approximately 18% of the population is above the age of 64. These individuals are at higher risk during extreme cold events. Low-income populations are also impacted (5% live in poverty). *Impacts*: Exposed or vulnerable populations could experience health consequences such as hypothermia or frostbite.
	Structures	*Vulnerability*: Some older structures may experience damage from burst pipes during extreme cold conditions. *Impacts*: Burst pipes can cause extensive structural and electrical damage, especially in basements and older homes. Repeated freeze–thaw cycles can cause cracks in bricks, mortar, and stucco, which may lead to long-term structural weakening.
	Economic Assets	*Vulnerability*: All businesses are vulnerable to the impacts of extreme cold. *Impacts*: Increased heating costs can affect business operations and profitability.
	Natural, Historic, and Cultural Resources	None
	Critical Facilities and Infrastructure	*Vulnerability*: Long-term care facilities, power, and transportation systems are vulnerable to extreme cold impacts. *Impacts*: Long-term healthcare facilities may be at risk in the event of extreme cold combined with a power outage. Holladay has eight elderly care or rehabilitation centers, and several are on the border of the city. Transportation routes may be impacted by ice and snow, affecting accessibility and safety.
	Community Activities	*Vulnerability*: Winter events such as the tree lighting ceremony are vulnerable to extreme cold impacts. *Impacts*: Winter events may be canceled or may be poorly attended due to adverse weather conditions.
Flooding	People	*Vulnerability*: Residents along Big Cottonwood Creek in floodplain areas (500-year and 100-year) as determined by the FEMA floodplain maps are vulnerable to flooding. *Impacts*: Fast-moving floodwaters are a safety risk; people may be swept away. If residences are damaged, people will be displaced from homes.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
	Structures	*Vulnerability*: Homes and businesses in the Knudsen Corner area and along Big Cottonwood Creek are at increased risk of flooding, especially from spring runoff. Flood control measures, such as the Jordan River Canal and structures up the canyon, help mitigate flooding risk in the jurisdiction. By code, ground-floor elevations are required to be above the flood elevation, but some older structures or accessory structures may not be. Homes along Heughs and Tolcate Creeks may be subject to bank erosion and subsequent flooding during high runoff. *Impacts*: Water damage to homes and buildings is possible, especially for those in flood-prone zones without proper elevation or floodproofing.
	Economic Asset	*Vulnerability*: Local businesses along waterways. *Impacts*: Commercial properties could experience damage to structures, contents or inventory.
	Natural, Historic, and Cultural Resources	*Vulnerability*: Knudsen Park is in a flood zone. Big Cottonwood Regional Park (Creekside Park) acts as a flood retention basin for Big Cottonwood Creek. The school to the west of the park might experience flooding. *Impacts*: Community sites might be inaccessible or damaged by flooding.
	Critical Facilities and Infrastructure	*Vulnerability*: There is potential for road flooding from Big Cottonwood Creek along Highland Circle, 6200 South, and Kings Row Drive. *Impacts*: Damaged or closed roads can limit access and cause disruptions for residents and may delay emergency response.
	Community Activities	*Vulnerability*: Recreation at Knudsen and Creekside Park is vulnerable to flooding impacts. *Impacts*: Facilities may be damaged or closed and events canceled.
Landslide/ Slope Failure	People	*Vulnerability*: Residents in the Cove are vulnerable to landslides and slope failure. *Impacts*: These residents may be at increased risk of landslides or debris flows following a wildland fire above this area and in conjunction with heavy rainfall.
	Structures	*Vulnerability*: Homes in the Cove may be at increased risk of rock falls or landslides, especially if there is a wildfire in the area. There are no historical events recorded. *Impacts*: Structures could be damaged or destroyed if a slope failure were to occur.
	Economic Assets	*Vulnerability*: There are none identified in landslide areas.
	Natural, Historic, and Cultural Resources	*Vulnerability*: Heughs Canyon, other hiking areas might have some risk. *Impacts*: Trailhead amenities could be damaged or trails inaccessible.
	Critical Facilities and Infrastructure	*Vulnerability*: Wasatch Boulevard may be subject to rock falls and landslides under the right circumstances.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		Impacts: Damaged or closed roads can limit access that causes disruptions for residents and may delay emergency response.
	Community Activities	*Vulnerability*: Hiking and other recreation activities in canyon areas. *Impacts*: Trailhead amenities could be damaged or trails inaccessible.
Radon	People	*Vulnerability*: Holladay has areas with high concentrations of radon. Utahradon.org states that 42% of homes tested in Holladay have dangerous levels of radon. Individuals may be at risk depending on the location and layout of their homes. *Impacts*: Residents exposed to radon have higher risk of developing lung cancer. Additional public awareness campaigns could benefit the community.
	Structures	N/A – Radon does not affect structures.
	Economic Assets	N/A – Radon is primarily a health risk.
	Natural, Historic, and Cultural Resources	N/A – Radon is primarily a health risk.
	Critical Facilities and Infrastructure	N/A – Radon is primarily a health risk.
	Community Activities	N/A – Radon is primarily a health risk.
Heavy Rain	People	*Vulnerability*: Residents along waterways are vulnerable to heavy rain impacts. *Impacts*: There is a safety risk for people near fast-moving water.
	Structures	*Vulnerability*: Homes and businesses along waterways, especially along Big Cottonwood Creek, and the Kings Row area, are at risk. *Impacts*: Structures and contents inside can be damaged or destroyed by flash flooding or pooling of water during or following heavy rain.
	Economic Assets	*Vulnerability*: Businesses situated along waterways or in flooding zones are vulnerable to heavy rain impacts. *Impacts*: Structures or inventory may be damaged by flooding.
	Natural, Historic, and Cultural Resources	N/A
	Critical Facilities and Infrastructure	*Vulnerability*: The storm drain system is dated in some areas and can be overwhelmed by heavy rainfall, especially when soil saturation is high or multiple events occur in succession. *Impacts*: Roadways may be impassable due to standing water. This disrupts travel for residents and may delay emergency response.
	Community Activities	*Vulnerability*: Prolonged rain can damage grass, sport fields, or playgrounds and may lead to temporary closures. *Impacts*: Community events and recreation activities may be postponed or canceled.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
High Wind	People	*Vulnerability*: Holladay has many trees, and any resident may be impacted by fallen trees, limbs, or power lines. *Impacts*: Residents may be injured by falling trees. In past windstorms, many people were without power for days before Rocky Mountain Power could reconnect lines to homes. Due to older infrastructure, connections from streets to homes were impacted.
	Structures	*Vulnerability*: Large and old trees can fall on structures; tree limbs may also damage structures. This can happen all over the city, but there is a higher risk in the Cottonwoods due to the old and dying trees there. *Impacts*: Falling trees and limbs can cause significant damage to structures.
	Economic Assets	*Vulnerability*: Businesses throughout Holladay are vulnerable to high wind impacts. *Impacts*: Businesses may be adversely affected by power outages caused by high winds.
	Natural, Historic, and Cultural Resources	*Vulnerability*: Mature trees are vulnerable to high wind impacts. *Impacts*: Trees in the cottonwood/tree canopy may be damaged or lost in high wind events. As these trees age, they are more susceptible to damage and loss.
	Critical Facilities and Infrastructure	*Vulnerability*: Power lines and communications lines are vulnerable to damage from downed trees. Debris on roads can also cause disruptions *Impacts*: Power outages can disrupt activity throughout the city. Roads may be blocked by fallen trees, tree limbs, and powerlines until cleanup can be facilitated.
	Community Activities	*Vulnerability*: Outdoor activities, marathons, outdoor concert series, the Blue Moon Festival, and Fourth of July events can be impacted by sudden gusts of high winds or incoming storms. *Impacts*: Events may be postponed or canceled. Wind has been a factor in past events, but no major damage or injuries have been reported.
Lightning	People	*Vulnerability*: Those recreating outdoors may be subject to sudden lightning storms. Holladay is an active community with many outdoor events and nearby outdoor recreation opportunities. *Impacts*: People can be injured or killed by a lightning strike.
	Structures	*Vulnerability*: Homes and businesses in the Cove and along Wasatch Boulevard are vulnerable to lightning impacts. *Impacts*: These structures are in the wildland–urban interface (WUI) and are at higher risk of fire damage from lightning strikes.
	Economic Assets	*Vulnerability*: Businesses and homeowners are vulnerable to lightning-related impacts. *Impacts*: Fires or electrical or communication system failures can increase repair costs for homeowners and businesses.
	Natural, Historic, and Cultural Resources	*Vulnerability*: Historic trees and homes are vulnerable to lightning impacts. *Impacts*: Lightning can damage trees or historic homes and can cause fires.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
	Critical Facilities and Infrastructure	*Vulnerability*: Power networks may be impacted by lightning (Rocky Mountain Power owns the power network). *Impacts*: Power outages can disrupt public services, emergency response, and other community activities.
	Community Activities	*Vulnerability*: Outdoor concerts, the Blue Moon Festival, Fourth of July celebration, and marathons are vulnerable to lightning impacts.. *Impacts*: There are safety concerns for attendees if shelter is not available. Events may be postponed or canceled.
Severe Winter Weather	People	*Vulnerability*: All residents are vulnerable to severe winter weather. The east benches tend to get higher snow accumulation. *Impacts*: Residents may be temporarily affected by heavy snow and snow squalls due to transportation impacts. Residents along the east bench may be unable to get in and out of their neighborhoods for a few hours until plows can get to their smaller, steep streets. Many residents commute outside the city. Approximately 13,000 residents leave the city for work daily. If heavy snow results in power loss, those with access and functional needs, the elderly, and lower-income individuals may be at higher risk of adverse effects from cold.
	Structures	*Vulnerability*: All structures are vulnerable; older buildings may have higher risks. *Impacts*: Ice buildup can clog and tear down gutters, leading to water pooling and foundation damage. When accompanied by extreme cold temperatures, storms can result in burst pipes, causing extensive structural and electrical damage, especially in basements and older homes. Repeated freeze–thaw cycles can cause cracks in bricks, mortar, and stucco, which can lead to long-term structural weakening.
	Economic Assets	*Vulnerability*: Employers, such as schools, may be temporarily affected by severe winter weather when roads are unsafe to travel on. *Impacts*: Employees may be unable to get to work. Some businesses may close temporarily.
	Natural, Historic, and Cultural Resources	N/A – Structures are built to withstand typical winter weather.
	Critical Facilities and Infrastructure	*Vulnerability*: Power and transportation systems are vulnerable to severe winter weather impacts. Impacts: Power may be interrupted during heavy snow or blizzard. Transportation may be temporarily disrupted in heavy snow, blizzard, icing, and snow squall conditions. Mobility may be limited, and emergency response may be delayed.
	Community Activities	*Vulnerability*: Community activities face temporary disruption due to severe winter weather if transportation is affected. *Impacts*: Events may be postponed or canceled. Attendance at events may be low.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
Tornado	People	*Vulnerability*: Any member of our population could be affected by a tornado, although those on the west end of the city would be at higher risk due to topography (though the risk remains very low). *Impacts*: Those in path of tornado could be injured or killed by blowing debris or collapsing structures.
	Structures	*Vulnerability*: Any structures in the path of a tornado are vulnerable to damage. *Impacts*: Powerful tornado winds can damage or destroy structures, particularly those that are not securely anchored to foundations, such as manufactured homes or recreational vehicles. Damage to roofs and broken windows is likely.
	Economic Assets	*Vulnerability*: Any local small businesses in the path of a tornado are vulnerable to disruption. *Impacts*: Businesses may be damaged by a tornado, or their ability to operate may be disrupted if power or communication systems fail.
	Natural, Historic, and Cultural Resources	*Vulnerability*: Historic homes, trees, and community centers/parks, including the library and Lions Rec Center, are vulnerable to tornado impacts. *Impacts*: Older structures may not be able to withstand strong winds. Community buildings may also be damaged.
	Critical Facilities and Infrastructure	*Vulnerability*: City Hall, the police precinct, the fire station, and essential infrastructure—including power and water systems—are vulnerable to tornado impacts. *Impacts*: Critical facilities may be damaged or unable to function due to power outages.
	Community Activities	*Vulnerability*: Summer outdoor activities are vulnerable to tornado impacts. *Impacts*: There are safety concerns for people outside without shelter. Events could be postponed or canceled.
Wildfire	People	*Vulnerability*: Residents in the Cove are at higher risk of being impacted by wildfire as they are situated along the WUI. *Impacts*: There is a safety risk for those near the fire if they are unable to evacuate quickly. Residents may be temporarily displaced by evacuations. Older residents and those with access or functional needs may face difficulty if evacuation is needed. Older and younger residents, as well as those with underlying pulmonary or cardiac health conditions, may face serious health consequences from poor air quality.
	Structures	*Vulnerability*: There are approximately 180 housing units in the Cove area at risk. Structures in the Cottonwood area may be at increased risk of fire due to the tree canopy and old water pipes, low water pressure, and limited access. *Impacts*: Fire is destructive to structures. Those with inadequate defensible space or made of combustible materials may be at higher risk. Wind-blown embers can start spot fires and damage structures not immediately in the WUI. Structures can also be damaged by secondary hazards, such as post-fire debris flows.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
	Economic Assets	*Vulnerability*: Assets such as the golf course, three hotels, a few corporate offices are vulnerable to wildfire impacts. *Impacts*: These are unlikely to be impacted, but under the right conditions, they may experience damage. Businesses in fire zones may suffer structural damage or closure due to poor air quality or may be affected by evacuations. Those not directly affected by fire may see a decline in customer visits and revenue during and following a wildfire.
	Natural, Historic, and Cultural Resources	*Vulnerability*: Heughs Canyon Trail and other recreational areas in the foothills are vulnerable to wildfire impacts. *Impacts*: Recreation areas may be inaccessible or damaged by fire.
	Critical Facilities and Infrastructure	*Vulnerability*: Wasatch Boulevard and I-215 could be closed temporarily during a wildfire. *Impacts*: Roads may be closed due to flames, smoke, fallen trees, or to evacuation efforts. Traffic around the valley could be affected if these major routes are closed.
	Community Activities	*Vulnerability*: Recreation and outdoor events are vulnerable to wildfire impacts. *Impacts*: Marathons and general recreation in the canyons may be interrupted in case of wildfire.
Dam Failure	People	*Vulnerability*: Residents along Big Cottonwood Creek who reside in an inundation zone for Spencer's Dam, Lake Mary-Phoebe Dam, or Twin Lakes Dam are vulnerable to dam failure impacts. *Impacts*: These residents may be subject to evacuation and flooding of their homes and businesses. Fast-moving water is a safety concern. One senior living home is in the inundation zone for Twin Lakes Dam. These are high hazard potential dams, which indicates that a failure can result in loss of life.
	Structures	*Vulnerability*: Homes and businesses in the inundation area are vulnerable to damage from dam failure. *Impacts*: Flooding following a dam failure can damage or destroy structures and their contents.
	Economic Assets	*Vulnerability*: Businesses in the Cottonwood Mall site area and Knudsen Corner are vulnerable to dam failure impacts. *Impacts*: Businesses may be damaged or may be closed following dam failure. Flooded commercial properties can lead to prolonged business interruptions, revenue losses, and costly rebuilding.
	Natural, Historic, and Cultural Resources	*Vulnerability*: Knudsen Corner is vulnerable to dam failure impacts. *Impacts*: Trees and park amenities may be damaged by flooding.
	Critical Facilities and Infrastructure	*Vulnerability*: Roadways, power lines, and water infrastructure are vulnerable to damage from dam failure. *Impacts*: I-215, Wasatch Boulevard, and other major roadways could be damaged and disrupt mobility in the community. Emergency response could be delayed. Power and water infrastructure could be damaged and lead to outages for residents and businesses.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
	Community Activities	*Vulnerability*: The Senior Center and Lions Rec Center (just outside Holladay) are in inundation zones. *Impacts*: Loss or damage to these facilities would impact community activities.
Civil Disturbance	People	Business owners (looting), those attending community events or large gatherings.
	Structures	City Hall/Police Precinct, Fire Station, The Plaza
	Economic Assets	The Plaza, shopping centers.
	Natural, Historic, and Cultural Resources	The Plaza
	Critical Facilities and Infrastructure	City Hall/Police Precinct, Fire Station, The Plaza.
	Community Activities	Any gathering with a lot of people – Blue Moon, 4th of July Celebration are our largest gatherings.
Cyberattack	People	Residents could have their private information stolen—social security numbers, banking information, medical records—from local services (schools, clinics, or city systems). Online services (like utility billing, permit applications, or emergency alerts) could be interrupted, limiting how people interact with the city.
	Structures	In homes or businesses with smart locks or security systems, hackers could gain access or disable them, increasing the risk of break-ins.
	Economic Assets	Schools, St. Marks Hospital (just outside city boundary), Utah Transit Authority public transit. Financial records, payroll systems, or transaction histories could be manipulated or stolen.
	Natural, Historic, and Cultural Resources	None
	Critical Facilities and Infrastructure	Power systems (Rocky Mountain Power), water systems (partner agencies)
	Community Activities	Online calendars, permit systems, or event registration platforms could be taken offline.
Hazardous Materials Incident (Transporta-tion & Fixed Facility)	People	Residents along the I-215 corridor may be impacted by a HAZMAT incident along the roadway which wraps around the south and eastern boarders of the city. Residents would be impacted if the I-215 corridor were shut down, traffic would be very congested. Toxic fumes, spills, or explosions can cause respiratory problems, skin burns, or other health emergencies. Vulnerable groups (children, elderly, people with asthma) are especially at risk. Residents near the incident may need to evacuate or stay indoors, possibly for hours or even days.
	Structures	Homes are situated along I-215. Homes and businesses near the site may absorb chemicals into walls, floors, or HVAC systems, requiring

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		deep cleaning or even demolition. Some HAZMAT materials are flammable or reactive. A transportation crash or leak at a facility could trigger explosions or structural fires. Buildings may be deemed unlivable until cleared by HAZMAT teams, especially if the material is long-lasting or highly toxic.
	Economic Assets	Stores, restaurants, and offices in the hazard zone may have to close during clean-up, losing days or weeks of revenue. Property owners or companies found responsible could face steep environmental clean-up costs, legal liability, and fines.
	Natural, Historic, and Cultural Resources	Knudsen Park and Olympus Hills Park are situated near I-215.
	Critical Facilities and Infrastructure	A HAZMAT spill on Holladay Blvd, Highland Drive, or nearby freeways like I-215 could shut down traffic and limit access to schools, fire stations, or clinics. Firefighters, HAZMAT crews, and medical responders might be overwhelmed or exposed during cleanup.
	Community Activities	Outdoor events near the spill may be called off due to poor air quality or safety risks. Recreation centers, churches, or schools near the incident might need to close temporarily, disrupting routines.
Public Health Epidemic/ Pandemic	People	13% of the population in Holladay is elderly and may be disproportionally affected by an epidemic or pandemic, both through isolation and ill health effects. 5% of the population is low income and might have healthcare access issues. Depending on the severity of the epidemic/pandemic, all populations may be impacted.
	Structures	None
	Economic Assets	Schools (Granite School District), local businesses, and hospitals (St. Marks just outside boundary) may be affected.
	Natural, Historic, and Cultural Resources	Lions Rec Center. county library. schools (Granite District – 5 elementary, 2 junior high, 1 high school.)
	Critical Facilities and Infrastructure	None
	Community Activities	Community gatherings may be canceled or postponed or changed.
Terrorism	People	None in particular
	Structures	City Hall, Police Precinct, Justice Court.
	Economic Assets	Shopping and commercial centers (The Plaza (Holladay Village), Cottonwood Mall Site, VanWinkle, Millrock).
	Natural, Historic, and Cultural Resources	Schools

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
	Critical Facilities and Infrastructure	I-215 (Utah Department of Transportation)
	Community Activities	4th of July, Blue Moon, marathons (private).

Jurisdiction-Specific Changes in Vulnerability

Hazard events can impact communities, infrastructures, and ecosystems. The severity of these impacts can be influenced by climate change, population patterns, and land use developments. Understanding these factors is crucial for the city of Holladay to develop a resilient community and minimize the impacts of hazards. Table 12 displays the unique changes within the community and the related effects of each hazard on the city of Holladay.

DRAFT

Table 12: Jurisdiction-Specific Changes in Vulnerability in the City of Holladay

Type of Hazard Event	Description of Potential Impacts	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
Avalanche	N/A – Avalanche is historically not a risk within our jurisdictional boundaries.	More-extreme winter storms and changes in temperature may increase the risk of avalanche in new areas or larger avalanches in expected areas. Unknown if risk is greater in the city due to climate change.	N/A – Holladay is fairly built out, no new areas of growth.	N/A – The cove has been and remains a residential area.	Stayed the same
Drought	Loss of tree canopy, dying trees and increased fire/wind damage risk.	Extreme weather may lead to worsening drought in some years.	N/A – Holladay is fairly built out, no large areas of growth.	N/A – Drought is widespread.	Stayed the same
Earthquake	Widespread loss of buildings, damage to water systems, damage to power systems, damage to transportation routes (especially bridges)	N/A – weather does not impact likelihood of earthquake	N/A – Holladay is fairly built out, no new areas of growth.	Development has not changed greatly. Earthquakes are widespread and will affect every area. Holladay Hills and the Village have added over 300 units. Overall population change is around 3000.	Stayed the same
Extreme Heat	Impacts to elderly on high-heat days. May indirectly lead to wildfire	There are more high-heat days and warnings for when temperatures do not cool overnight. The incidence and duration of heat waves have increased.	N/A – Holladay is fairly built out, no new areas of growth.	N/A – Heat is widespread.	Stayed the same

DRAFT

Type of Hazard Event	Description of Potential Impacts	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
Extreme Cold	Freezing temperatures occur annually in Holladay. They impact the elderly and low-income/transient population the most.	Extremes in weather may bring some colder days than expected, but as a general rule, heat has been a larger issue in recent years.	N/A	N/A	Stayed the same
Flooding	Areas along Big Cottonwood Creek, especially in Knudsen Corner, are in floodplain. This area is mainly residential, with a few businesses. Homes and small businesses may experience limited flooding.	Warmer weather in the spring can contribute to runoff flooding, as snow melts all at once, especially in the mid elevations. There has been increased concern about this the last few years with no direct flooding in Holladay.	N/A	Holladay Hills is no longer in a floodplain, per updates. Commercial use has declined, but residential units have increased by about 250.	Increased
Landslide/ Slope Failure	The Cove and East Bench areas of Holladay may be subject to slope instability and rockfalls, especially in wet years. Risk levels are unknown.	Wetter years and repeated rain events can increase soil saturation and the risk of landslide/slope failure, as has occurred in nearby jurisdictions over the last few years.	N/A – Cove and areas along Wasatch Blvd. are built out.	N/A –The Cove and areas along Wasatch Boulevard are built out.	Stayed the same
Radon	Effects on public health depend on area of residence and availability of mitigation systems for individuals living in those areas.	N/A	Increase of around 3000 who may be impacted by radon, depending on area and dwelling.	N/A	Increased
Heavy Rain	Heavy rain events have overwhelmed storm drain systems in the city in the last five years and caused flooding of residential areas (up to 12 homes).	Storms have become more severe in recent years. When they are frequent, soil becomes saturated, and the water has nowhere to go.	The population has remained steady; there are no areas for increased growth aside from building more high density housing. New construction has up-to-date	No large changes in land use or development. The city has identified storm drain issues and conducted mitigation.	Stayed the same

DRAFT

Type of Hazard Event	Description of Potential Impacts	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
			storm drains and fewer issues.		
High Wind	Damaged tree limbs block roads and interfere with powerlines. Some older trees may fall on structures and damage them. Widespread loss of power can take days to restore.	Stronger storms have brought more down-slope wind events and other sudden high winds.	N/A	N/A – Areas of growth not impacted more than others by high wind.	Increased
Lightning	Lightning can start fires in dry areas (in conjunction with drought) and cause injuries to people who are recreating outdoors.	More extreme weather may increase occurrences of lightning.	N/A	N/A	Stayed the same
Severe Winter Weather	Heavy snow, blizzards, snow squalls happen frequently in the winter. Holladay is situated along the bench and can get more snow and have larger transportation impacts along the east side of the city.	The last few winters have had larger, more extreme storms and widespread transportation impacts.	N/A	N/A	Stayed the same
Tornado	Tornadoes have been documented in Salt Lake County from F0–F2 strength. All areas have equal risk.	N/A	N/A	N/A	Stayed the same
Wildfire	The Cove and residential areas near Wasatch Blvd. are at risk of being evacuated or lost to wildfire as they are situated in the wildland–urban interface (WUI).	Drought conditions, high winds, and heat waves have increased over the last 5–10 years.	N/A	N/A – The Cove and WUI areas are built out	Stayed the same
Dam Failure	Widespread evacuation and flooding of areas along Big Cottonwood Creek that lie in inundation zones from Twin Lakes, Lake Mary-Phoebe, and Spencer's Dam. All three dams are high risk;	More extreme heat and cold and years of drought and then years of high snowmelt may impact the stability of dams. Unknown if that is specifically an issue with Twin	N/A	The Cottonwood Mall site is being redeveloped to include ~600 more residential units.	Stayed the same

DRAFT

Type of Hazard Event	Description of Potential Impacts	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	Spencer's is the closest with a lead time of less than 30 minutes to begin evacuating the nearest residential areas.	Lakes, Lake Mary-Phoebe, or Spencer's.			
Civil Disturbance	Civil unrest has been a nationwide issue with growing political tension. There have not been any large issues in Holladay as yet.	N/A	Population demographics have stayed the same in Holladay.	N/A	Stayed the same
Cyberattack	Cyberattack is a growing risk worldwide. Cities nearby have had security issues resulting in loss of funds.	N/A	N/A	N/A	Stayed the same
Hazardous Materials Incident (Transporta-tion & Fixed Facility)	Holladay has very few facilities with HAZMAT, However, I-215 is a major transportation corridor and tankers carrying HAZMAT can have accidents. Homes and businesses along the south and east side would be at highest risk due to proximity to the highway.	N/A	N/A	N/A	Stayed the same
Public Health Epidemic/ Pandemic	In the last 10 years, there has been an increase in public health concern, especially after COVID. The elderly continue to be impacted by COVID.	N/A	N/A	N/A	Stayed the same
Terrorism	Terrorism is a risk everywhere, especially with political tension growing nationwide. However, Holladay is not at higher risk than surrounding areas and has not had any notable incidents related to terrorism.	N/A	N/A	N/A	Stayed the same

DRAFT

Additional Public Involvement

The city of Holladay provides several opportunities for public participation. Figure 1 displays examples of outreach sharing the public survey. An announcement about the mitigation plan update and link to the survey was also included in the City Journal mailer sent to city residents.

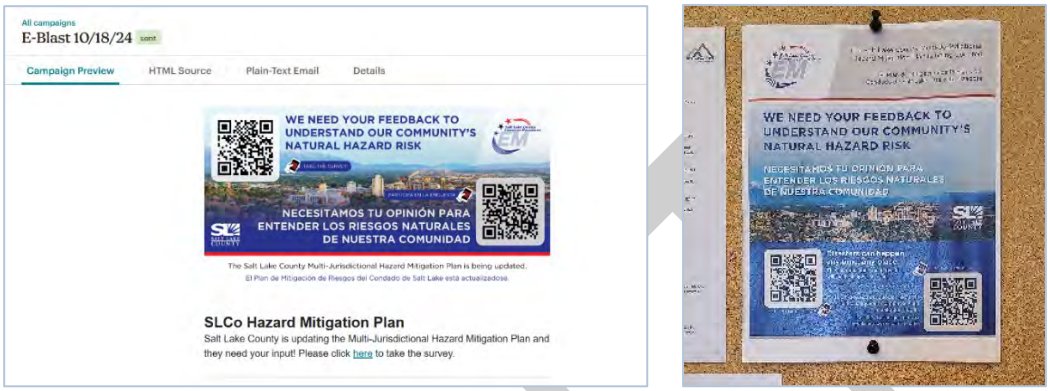

Figure 1: Email Blast Newsletter (*left*) and Flyer for the City of Holladay (*right*)

Plan Integration

Incorporating the underlying principles of the Hazard Mitigation Plan and its recommendations into other plans is a highly effective and low-cost way to expand their influence. All plan participants will use existing methods and programs to implement hazard mitigation actions where possible. As previously stated, mitigation is most successful when it is incorporated into the day-to-day functions and priorities of government and public service. This plan builds on the momentum developed through previous and related planning efforts and mitigation programs, and it recommends implementing actions where possible through these other program mechanisms. These existing mechanisms include the following:

- Regularity Capabilities
- Administrative Capabilities
- Fiscal Capabilities

Respective planning stakeholders will conduct implementation and incorporation into existing planning mechanisms and will be done through the routine actions of:

- Monitoring other planning/program agendas
- Attending other planning/program meetings
- Participating in other planning processes; and
- Monitoring community budget meetings for other community program opportunities.

The successful implementation of this plan will require constant and vigilant review of existing plans and programs for coordination and multi-objective opportunities that promote a safe, sustainable community. Regular efforts should be made to monitor the progress of mitigation actions implemented through other

DRAFT

planning mechanisms. Where appropriate, priority actions should be incorporated into planning updates. Table 9 lists existing planning mechanisms in which the Hazard Mitigation Plan has been integrated.

Table 9: Previous Plan Integration by the City of Holladay

Plan	Description
City of Holladay Comprehensive Emergency Management Plan (CEMP)	The city recently promulgated a CEMP which references the mitigation plan and incorporates mitigation actions from the previous plan update (2019).

Table 10: Future Plan Integration Opportunities for the City of Holladay

Plan	Description
General Plan	The city is currently working to update its General Plan.
Community Wildfire Protection Plan (CWPP)	The CWPP will be updated in 2026. The updated Mitigation Plan and associated mitigation actions will be referenced to inform current and future goals, capabilities, and gaps.
Evacuation Plan	An evacuation plan and map are under development. Hazard profiles and areas of concern from the Mitigation Plan will help inform areas of high risk in the evacuation plan.

Capability Assessment

Local mitigation capabilities are existing authorities, policies, programs, and resources that reduce hazard impacts or could help carry out hazard mitigation activities.

Planning and Regulatory Capabilities

Planning and regulatory capabilities are the plans, policies, codes, and ordinances that prevent and reduce the impacts of hazards.

Table 13: Assessment of the Planning Capabilities of the City of Holladay

Plan	Does it address hazards? (Y/N)	How can it be used to implement mitigation actions?	When was the last update? When is the next update?
General Plan	Y	Help identify current and future gaps in capabilities	2016. Next update 2025–2026
Capital Improvement Plan	Y	Identifies projects where mitigation actions can be implemented.	2024
Climate Change Adaptation Plan	Y	Accounts for natural constraints and hazards when considering city planning, growth, and goals.	2016. Next update 2025–2026
Community Wildfire Protection Plan	Y	Informs area of concern for wildfire and identifies gaps specific to Wildland–Urban Interface areas.	2021, Next update 2025

DRAFT

Plan	Does it address hazards? (Y/N)	How can it be used to implement mitigation actions?	When was the last update? When is the next update?
Economic Development Plan	N	Unknown	2016. Next update 2025–2026
Land Use Plan	Y	Shows areas of growth/ change, historic areas that may impact future mitigation needs	2016. Next update 2025–2026
Local Emergency Operations Plan	Y	Outlines current emergency operations procedures, may help identify areas of improvement.	Promulgated October 2024
Stormwater Management Plan	Y	Identifies high priority areas and potential hazards.	2024
Transportation Plan	N	Unknown	Unknown
Substantial Damage Plan	N/A	N/A	N/A
Other? (Describe)	N/A	N/A	N/A

Table 14: Assessment of the Regulations and Ordinances of the City of Holladay

Regulation/Ordinance	Does it effectively reduce hazard impacts?	Is it adequately administered and enforced?	When was the last update? When is the next update?
Building Code	Yes, in relation to unreinforced masonry. The city adopted the state's building code, the International Building Code (IBC 2021) with amendments. Additionally, the city adopted the 1997 edition of the Uniform Code for the Abatement of Dangerous Buildings (UCADB) and the 2003 edition of the International Property Maintenance Code.	Enforced during additions and new construction	2021
Flood Insurance Rate Maps	Y	Y	2019
Floodplain Ordinance	Y	Y	2021
Subdivision Ordinance	Yes, evaluates natural hazards	Y	2024
Zoning Ordinance	Y	Y	2024
Natural Hazard-Specific Ordinance (Stormwater, Steep Slope, Wildfire)	Yes, for some hazards. There are no specific wildfire ordinances at this time.	Y	Steep Slopes 2021 Stormwater 2020

DRAFT

Regulation/Ordinance	Does it effectively reduce hazard impacts?	Is it adequately administered and enforced?	When was the last update? When is the next update?
Acquisition of Land for Open Space and Public Recreation Use	Y	Y	2018
Prohibition of Building in At-Risk Areas	Yes, for slopes steeper than 40%	Y	1999
Other? (Describe)	Fault Study Zones and High Liquefaction Areas	Creates new engineering suggestions for construction in known fault areas.	2021

Administrative and Technical Capabilities

Administrative and technical capabilities include staff and their skills. They also include tools that can help carry out mitigation actions.

Table 15: Assessment of the Administrative Capabilities of the City of Holladay[2]

Administrative Capability	In Place? (Y/N)	Is staffing adequate?	Are staff trained on hazards and mitigation?	Is coordination between agencies and staff effective?
Chief Building Official	Y	Currently have one building inspector	Yes, more training could be useful	Yes
Civil Engineer	Y	Yes	Yes	Yes
Community Planner	Y	Yes	Yes	Yes
Emergency Manager	Y	This is currently a part time position.	Yes.	Yes
Floodplain Administrator	Y	This is a secondary position.	Yes	Yes
Geographic Information System (GIS) Coordinator	Y	Yes	Yes	Yes
Planning Commission	Y	Unknown	Unknown	Unknown
Fire Safe Council	Y	Through UFA	Unknown	Yes with UFA

[2] UFA = UFA = Unified Fire Authority.

Administrative Capability	In Place? (Y/N)	Is staffing adequate?	Are staff trained on hazards and mitigation?	Is coordination between agencies and staff effective?
CERT (Community Emergency Response Team)	Rebuilding	No, there is a need for more volunteers and participation.	Could use more training specific to the area and CERT.	Unknown
Active VOAD (Voluntary Agencies Active in Disasters)	Y	Unknown	Unknown	No. Unable to make connections with current VOAD.
Other? (Please describe.)	N/A	N/A	N/A	N/A

Table 16: Assessment of the Technical Capabilities of the City of Holladay

Technical Capability	In Place? (Y/N)	How has it been used to assess/mitigate risk in the past?	How can it be used to assess/mitigate risk in the future?
Mitigation Grant Writing	N	N/A	More grant funding would allow for more mitigation measures.
Hazard Data and Information	Y	Use Hazus and local GIS mapping available to community.	Use current mapping and information to inform future plan updates and needs.
GIS	Y	GIS has created a myriad of maps to address hazards and assist city and residents in understanding risk.	Continue to update maps, use new maps to help with emergency response strategies and understanding in the community.
Mutual Aid Agreements (MOUs)	N	N/A	MOUs to address specific hazards, needs, gaps have to be developed.
Other? (Please describe.)	N/A	N/A	N/A

Financial Capabilities

Financial capabilities are the resources to fund mitigation actions. Talking about funding and financial capabilities is important to determine what kinds of projects are feasible, given their cost. Mitigation actions like outreach programs are lower cost and often use staff time and existing budgets. Other actions, such as earthquake retrofits, could require substantial funding from local, state, and federal partners. Partnerships, including those willing to donate land, supplies, in-kind matches, and cash, can be included.

DRAFT

Table 17: Assessment of the Financial Capabilities of the City of Holladay

Funding Resource	In Place? (Y/N)	Has it been used in the past and for what types of activities?	Could it be used to fund future mitigation actions?	Can it be used as the local cost match for a federal grant?
Capital Improvement Project Funding	Y	Roadway Improvement, stormwater system enhancements, and other infrastructure upgrades.	Yes	Yes
General Funds	Y	Maintenance and operations of roadways, stormwater and infrastructure. Staff salaries, emergency management program funds.	Y	Unknown
Hazard Mitigation Grant Program (HMGP/404)	N	N	Not at this time. Possibly after an event causing significant damage.	N
Building Resilient Infrastructure & Communities (BRIC)	N	We applied and were not selected.	N	N
Flood Mitigation Assistance (FMA)	N	N	Not at this time. Possibly after an event causing significant damage.	N
Public Assistance Mitigation (PA Mitigation/406)	N	Yes, post high wind event.	Unknown	N
Community Development Block Grant (CDBG)	N	Yes, to address building accessibility at Police Department.	Possibly	N
Natural Resources Conservation Services (NRCS) Programs	N	N	Possibly	N
U.S. Army Corps (USACE) Programs	N	N	N	N
Property, Sales, Income, or Special Purpose Taxes	Y	Goes into General Fund.	Y	Y

Private Sector or Nonprofit Programs	Unknown	Unknown	Unknown	Unknown
Other?	N/A	N/A	N/A	N/A

Education and Outreach Capabilities

Education and outreach capabilities are programs and methods that could communicate about and encourage risk reduction. These programs may be run by a participant or a community-based partner. Partners, especially those who work with underserved communities, can help identify additional education and outreach capabilities.

Table 18: Assessment of the Education and Outreach Capabilities of the City of Holladay

Education and Outreach Capability	In Place? (Y/N)	Does it currently incorporate hazard mitigation?	Could it be used to support mitigation in the future?
Community Newsletter(s)	Y	Yes – as a community education and awareness tool.	Yes – as a community education and awareness tool.
Hazard Awareness Campaigns (such as Firewise, Storm Ready, Severe Weather Awareness Week, School Programs)	Y	Y	Y

Organizations that Represent, Advocate for, or Interact with Underserved and Vulnerable Communities (Please describe.)	N	N	Y
Social Media (Please describe.)	Y – use social platforms to send out monthly preparedness public outreach	Y	Y
Other? (Please describe.)	N/A		

Opportunities to Expand and/or Improve Capabilities

Actions that can expand and improve existing authorities, plans, policies, and resources for mitigation include budgeting for mitigation actions, passing policies and procedures for mitigation actions, adopting and implementing stricter mitigation regulations, approving mitigation updates, and making additions to existing plans as new needs are recognized. Table 19 lists the opportunities for the city of Holladay.

Table 19: Opportunities to Expand and/or Improve the Capabilities of the City of Holladay

Capability	Opportunity to Expand and/or Improve
Planning and Regulation	The city can develop a five-year water conservation plan. Plan integration, such as incorporating this plan into the general plan, can also help expand current capabilities.
Administrative and Technical	The city could support additional training for staff and volunteers on hazard mitigation. For example, providing hazard-specific mitigation training for the Chief Building Official and the Community Emergency Response Team (CERT) team.
Financial	The city can focus on expanding mitigation grant writing capabilities, such as by participating in state or federal Direct Technical Assistance programs, to be able to apply and win pre- and post-disaster mitigation grants like the Hazard Mitigation Grant Program (HMGP).
Education and Outreach	The city has many opportunities to expand current public education capabilities, such as public meetings, to include hazard specific information. Further, the city can implement new methods to engage the public such as developing and

DRAFT

Capability	Opportunity to Expand and/or Improve
	distributing hard copies or working with local champions to promote hazard mitigation information. In particular, the city can focus on expanding public awareness on specific hazards of concern including but not limited to earthquakes (particularly for unreinforced masonry construction), extreme heat, flooding, severe weather, radon, wildfire, and more.

Mitigation Strategy

Mitigation strategies provide proactive measures that are designed to minimize the impacts of hazards on the city of Holladay. Table 20 shows mitigation action alternatives, and Table 22 shows the status of previous mitigation activities. Table 22 is the 2025 mitigation action plan for the city of Holladay.

Table 20: Mitigation Action Alternatives for the City of Holladay

Action	Type of Action	Selected for inclusion in the plan?	If not selected, why not?
Add a link on Holladay's website to the Utah Avalanche Center to facilitate public awareness.	Education and Awareness Programs	No.	A more targeted and applicable action was included to help mitigate against Avalanche within city boundaries.
Update of the city's Stormwater Master Plan to include specific flood mitigation projects and flood-prone areas of the city.	Structure and Infrastructure Projects	No.	The current stormwater plan includes high risk areas; the plan was recently updated.
Bury powerlines along Highland Drive (previously in plan)	Structure and Infrastructure Projects	No.	Although this project may still be completed, it is very expensive, will likely be more than five years out, and does not mitigate against wind damage in wider areas of the city.
Provide information and encourage radon testing during the building permitting process.	Education and Awareness Programs	No.	This action does not reach residents not upgrading or building properties. A different approach to public education was selected as it aligns with public health goals and presents more effective ways to interface with the community.

DRAFT

Table 21: Status of Prior Mitigation Actions of the City of Holladay[3]

Action	Hazard(s)	Agency Lead	Support Agency(ies)	Status Update (if ongoing, explain)
Bury power lines.	All hazards	Holladay	Utilities	Complete • Buried powerlines through Knutzen park and the village. • Plans to bury powerlines along Highland Drive from arbor lane to VanWinkle by 2030, possibly longer – looking for funding sources to achieve this goal. – reasoning is aesthetic. • Trees are regularly trimmed. • Plan to remove from future projects.
Develop a robust cyber security program, incorporating components of the NIST Cybersecurity Framework.[4]	Cyberattack	Holladay	IT Contractor	Complete • A cyber security program has been implemented using the Utah Cyber Center recommended software and Tecserv best practices.
Increase adult influenza vaccination rates to the Healthy Salt Lake target rate. Currently the rate is 70%.	Public Health Epidemic/ Pandemic	Holladay	SLCo Public Health	Ongoing • In 2022, Influenza Vaccination rates in the city of Holladay were 62.2% (most current date I could find). Highest rates were at 73% post-covid. The COVID-19 pandemic and loss of confidence in vaccinations has impacted vaccine rates negatively.

[3] CED = Community and Economic Development, CERT = Community Emergency Response Team, SLCo = Salt Lake County, SLCo EM = Salt Lake County Emergency Management, SLCo PW = Salt Lake County Public Works, UFA = Unified Fire Authority.

DRAFT

Action	Hazard(s)	Agency Lead	Support Agency(ies)	Status Update (if ongoing, explain)
Develop an outreach program to encourage residents to strengthen structures that are built of unreinforced masonry.	Earthquake	Holladay		Ongoing • This would be a great very long-term goal but is not feasible to complete with current resources.
Road surface improvements.	All hazards	Holladay		Complete – Maintenance ongoing. • Improved all roadways at risk of failing.
Retrofit City Hall.	Earthquake	Holladay		Ongoing • Building plans have been developed, funding is forthcoming. Estimated target for beginning construction is January 2026.
Canal bank stabilization (such as, but not limited to netting and/or wire mesh).	Flooding	Holladay	Upper Canal Water Co.	Complete • Banks are stable. Improvements were made in specific places. Continue to monitor monthly.
Continue to encourage water conservation using Jordan Valley Water Conservation outreach material and information from Salt Lake City Department of Public Utilities and the State of Utah's "Slow the Flow" program.	Drought	Holladay Emergency Management		Ongoing • Materials are available, promoted on the Holladay Website – sustainability page.
Develop outreach document specific to fire resistant natural vegetation.	Drought	Holladay Emergency Management		Complete • UFA – outreach to homeowners to make homes more defensible. 2018–2020.
Assess current communications and interoperable emergency/warning systems.	Earthquake	Holladay Emergency Management	Communications	Ongoing • Plans to purchase Starlink and form a PACE program and communications annex.

DRAFT

Action	Hazard(s)	Agency Lead	Support Agency(ies)	Status Update (if ongoing, explain)
Ensure that current natural hazard ordinance(s) are online, linked to Emergency Services website, and easily accessible and can be download. Provide personal, CERT and amateur radio training for the citizens of the city.	Earthquake	Holladay Emergency Management	Planning and Zoning	Ongoing • Hazard Maps are available on Holladay website. • CERT training and outreach is ongoing. Training is offered regionally for CERT.
The city of Holladay is participating in the National Flood Insurance Program.	Flood	Holladay Emergency Management		Ongoing • Info is available on the city website: https://www.holladayut.gov/departments/community_development/planning_division/natural_hazards.php
Update & digitize floodplain maps.	Flood	GIS	Holladay Emergency Management	Complete • Flood Hazard maps have been developed and are available online for viewing or download at the city Website.
Develop protocol for working with State and Federal agencies in developing impact of post fire debris flow hazard.	Landslide	Holladay Emergency Management	Fire and Planning and Zoning	Ongoing
Create outreach materials (what to do when severe weather strikes) specific to this group and insert the information the into city-wide newspaper, and phone books specific to 55 age group developed by County Aging services.	Severe Weather	Holladay Emergency Management		Ongoing • No Specific materials produced in the last few years. Possibly pre-COVID.

DRAFT

Action	Hazard(s)	Agency Lead	Support Agency(ies)	Status Update (if ongoing, explain)
Encourage avalanche preparedness for backcountry users.	Severe Weather	Holladay Emergency Management		Deleted Do not plan to continue this goal in future mitigation.
Public awareness through "Fire Wise" programs.	Wildland Fire	Holladay Emergency Management	Fire	Ongoing through UFA and CED. • Permitting and planning processes encourage defensible homes and landscaping in vulnerable areas.
Create defensible space.	Wildland Fire	Fire	Holladay Emergency Management	Ongoing through UFA and CED. • Permitting and planning processes encourage defensible homes and landscaping in vulnerable areas.
Continue to support and take part in annual Utah Shakeout exercises to promote earthquake awareness.	Earthquake	Emergency Manager, Emergency Manage		Ongoing • The city completes a shakeout or evacuation drill annually in conjunction with the Great Utah Shakeout. We also support citizen led fairs and exercises and provide earthquake related outreach in the form of journal articles, social media, and community courses.
Continue to enforce building codes, development of new codes and zoning ordinances as needed or state codes are updated.	Earthquake	City of Holladay Community Development Department.		Ongoing
Continue to execute training and exercise programs.	Earthquake	Emergency Management Committee		Ongoing • Training is being tracked and developed for department heads and city council. Tabletop exercises, drills, and functional exercises are conducted as appropriate and in accordance with the IPP.
Educate residents and business through public information and events.	Earthquake	Emergency Management Committee and		Ongoing • We support citizens through providing emergency preparedness outreach in the form of journal

Table 22: 2025 Mitigation Action Plan for the City of Holladay[5]

#	Action	Hazard(s)	Lead Agency	Potential Partners	Benefits (Losses Avoided)	Cost Estimate	Funding Source(s)	Timeframe	Priority	Comments
1	Post a sign at the trailhead to Heughs Canyon warning of winter avalanche danger.	Avalanche	City of Holladay Parks and Recreation	SLCo, USFS	Increase public awareness, educate residents and visitors, and improve safety.	Low	City general fund	Short term	Medium	
2	Include parking offsets on the north and south sides of City Hall as part of the retrofit to prevent parking near the building.	Civil Disturbance	City of Holladay Emergency Management		Ensure safety for city staff and elected officials. Ensure continuity of government.	Medium	Federal earmark funding, City general fund	Medium term	High	New element being explored for the building upgrade and retrofit.
3	Gather pertinent information on dams up Big Cottonwood Canyon, including inundation mapping, timing, water levels, and EAPs from partners.	Dam Failure	City of Holladay Emergency Management	Salt Lake City, SLCo, UDNR	Provide information for future planning and mitigation.	Low	City general fund	Short term	High	Need more information to plan for possibilities in our jurisdiction. The city does not own or operate these dams.
4	Develop a five-year water conservation plan and include it in the General Plan update.	Drought	City of Holladay Emergency Management		Plan for long-term environmental impacts.	Low	City general fund	Medium term	Medium	
5	Produce a drought map to inform residents of the drought status.	Drought	City of Holladay CED Department/ GIS		Educate residents to conserve water resources.	Low	City general fund	Short term	Low	
6	Update and retrofit City Hall to account for life safety in an earthquake and increase security for city staff and the Police Department.	Civil Disturbance Earthquake	City of Holladay Emergency Management		Ensure the safety of city staff and elected officials and ensure continuity of government.	High	Federal earmark funding, BRIC, PDM, City general fund	Medium term	High	This is an ongoing project—the city has been working to secure funding for several years. Plans are currently underway. Construction is slated to begin in 2026.
7	Build a dedicated Emergency Communications Center (ECC) with power and communications redundancy.	Earthquake, Tornado, Extreme Weather, Hazardous Materials Incident, Wildfire	City of Holladay Emergency Management		Coordinate efficient and effective responses to reduce loss of life and property.	Medium	City general fund, EOC grant program	Medium term	High	Currently we do not have a dedicated space for an ECC, which means setting it up during an incident. Post building update, there will be a dedicated space.
8	Create a handout to include in permit packets about buildings with unreinforced masonry (URM) regarding risks and low-cost retrofits, such as strapping water tanks and flexible pipes.	Earthquake	City of Holladay CED Department		Educate residents about URMs to reduce loss of life and property damage.	Low	City general fund	Short term	Medium	Large areas of Holladay are made up of URMs. Small and large retrofit projects can protect residents in an earthquake – many are not aware of the risks.
9	Participate in Code Blue and provide information and links to Salt Lake County warming centers and resources.	Extreme Cold	City of Holladay Emergency Management	SLCo	Educate the public on actions they can take during extreme cold events.	Low	City general fund	Short term	Low	

[5] BRIC = Building Resilient Infrastructure and Communities, CED = Community and Economic Development, CERT = Community Emergency Response Team, CWPP = Community Wildfire Protection Plan, EAP = Emergency Action Plan, ECC = Emergency Communications Center, EM = Emergency Management, EOC = Emergency Operations Center, FMA = Flood Mitigation Assistance, HMGP = Hazard Mitigation Grant Program, NFIP = National Flood Insurance Program, NWS = National Weather Service, PDM = Pre-Disaster Mitigation, SIAC = Statewide Information and Analysis Center, SLCo = Salt Lake County, SLCo EM = Salt Lake County Emergency Management, UDNR = Utah Department of Natural Resources, UFA = Unified Fire Authority, UGS = Utah Geological Survey, UPD = Unified Police Department, URM = Unreinforced Masonry, USFS = United States Forest Service, WUI = Wildland–Urban Interface.

#	Action	Hazard(s)	Lead Agency	Potential Partners	Benefits (Losses Avoided)	Cost Estimate	Funding Source(s)	Timeframe	Priority	Comments
10	Gather information and begin comprehensive mapping of the tree canopy (Cottonwoods), compare every five years to determine its status.	Extreme Heat	City of Holladay CED Department		Provide information for future planning and mitigation.	Low	City general fund	Medium term	Medium	Tree canopy is a delicate balance between water conservation and conservation to reduce heat effect. More data is needed to make informed decisions.
11	Communicate heat warning information and appropriate responses to residents through social media, newsletters, and other outgoing information. (e.g., encourage staying indoors, provide symptom reminders).	Extreme Heat	City of Holladay Emergency Management	The City Journal	Provide education to residents and vulnerable populations.	Low	City general fund	Short term	Low	
12	Continue to comply with all requirements of the NFIP.	Flooding	City of Holladay CED Department		Prevent property damage and loss of life.	Low	City general fund	Short term	Medium	
13	Identify risks of earthquake and canal flooding throughout the jurisdiction.	Flooding, Earthquake	City of Holladay CED Department		Provide information for future planning and mitigation.	Low	City general fund, FMA if flood risk reducing projects identified.	Long term	Low	The city has many canals that follow along fault lines, which could present flooding issues after an earthquake. More information is needed to mitigate risks in the future.
14	Train personnel on emergency plans and establish notification procedures for emergency personnel and city officials.	Hazardous Materials Incident	City of Holladay Emergency Management	UFA, UPD, Salt Lake County	Coordinate efficient and effective responses to reduce loss of life and property.	Low	City general fund	Short term	High	A recent HAZMAT incident in the city highlighted the need to establish clear procedures and training for incident notification.
15	Evaluate undeveloped properties for possible acquisition in areas of high risk (mostly along Wasatch Blvd.).	Landslide/Slope Failure	City of Holladay CED Department	UGS	Prevent development in potentially dangerous areas.	High	City general fund	Long term	Medium	
16	Provide the public with information about radon risk, mitigation, and funding programs on the city website and at events.	Radon	City of Holladay, Happy Healthy Holladay		Educate residents and vulnerable populations about radon risks and mitigation strategies.	Low	City general fund	Short term, ongoing	Medium	
17	Promote regular tree trimming and the “Right Tree in the Right Place” program to residents. Educate the public on old trees and the risks associated with pine trees.	Severe Weather – High Wind, Tornado	City of Holladay CED Department		Educate residents about tree maintenance and the risks associated with pine trees.	Low	City general fund	Short term, ongoing	Low	There are numerous old trees in the area, and specific issues with aging pines.
18	Partner with NWS to address lightning and severe weather during outdoor city-sponsored events.	Severe Weather – Heavy Rain, High Wind Tornado, Lightning	City of Holladay Emergency Management	National Weather Service	Plan and coordinate efficient and effective responses to reduce loss of life and property.	Low	City general fund	Short term	High	
19	Continue to educate residents on appropriate stormwater practices to keep gutters and canals clear of debris.	Severe Weather – Heavy Rain, High Wind, Lightning	City of Holladay		Provide education to residents on stormwater practices to prevent blockages and reduce flooding risks.	Low	City general fund	Short term, ongoing	Low	

DRAFT

#	Action	Hazard(s)	Lead Agency	Potential Partners	Benefits (Losses Avoided)	Cost Estimate	Funding Source(s)	Timeframe	Priority	Comments
20	Create a plan to support assisted living facilities and areas of high vulnerability during severe winter weather events.	Severe Winter Weather – Heavy Snow, Blizzard	City of Holladay Emergency Management	Private partners, Health Care Coalition	Enhance future planning and response.	Low	City general fund	Short term	Low	
21	Hold a community preparedness workshop.	Severe Winter Weather – Heavy Snow, Blizzard	City of Holladay Emergency Management	Be Ready Utah	Educate residents to reduce risks, injuries, or property damage from hazards.	Low	City general fund	Short term	Low	
22	Participate in monitoring threats from the SIAC.	Terrorism (including Cyberattacks)	City of Holladay Emergency Management	SLCo EM, UPD	Coordinate efficient and effective responses to reduce loss of life and property.	Low	City general fund	Short term, Ongoing	Low	
23	Work with partner agencies to update the CWPP.	Wildfire	City of Holladay Emergency Management	UFA	Identify areas of higher wildfire risk and potential actions to reduce risk through planning and coordination.	Low	City general fund	Short term	Low	
24	Distribute defensible space information for any redevelopment in the Cottonwoods and WUI areas.	Wildfire	City of Holladay CED Department	Unified Fire Authority, Forest Service	Provide education and resources to residents.	Low	City general fund	Short term	Low	
25	Create an evacuation zone plan and annex.	Wildfire, Hazardous Materials Incident	City of Holladay Emergency Management	Unified Fire Authority, Unified Police Department, Salt Lake County Emergency Management	Improve the safety of residents by identifying potential problems and facilitating smoother evacuation through planning and coordination.	Low	City general fund	Short term	Medium	
26	Map hydrant locations and areas of low water pressure for internal purposes.	Wildfire	City of Holladay CED Department	UFA, Salt Lake City, water agencies	Enhance the safety of residents and ensure the ability to protect structures through planning and coordination.	Low	City general fund	Short term	Medium	
27	Increase adult influenza vaccination rates to the Healthy Salt Lake target rate. Currently the rate is 70%.	Epidemic/Pandemic	SLCo Public Health	City of Holladay Emergency Management	Improve community immunity to influenza, reducing illness and potential death in Holladay.	Low	City general fund	Short term	Medium	
28	Develop an outreach program to encourage residents to strengthen structures that are built of unreinforced masonry.	Earthquake	City of Holladay Emergency Management	UFA	Reduce damage to unreinforced masonry structures during earthquakes.	Low	City general fund	Short term	Low	
29	Continue to encourage water conservation using Jordan Valley Water Conservation outreach material and information from Salt Lake City Department of Public Utilities and the State of Utah's "Slow the Flow" program.	Drought	City of Holladay Emergency Management	Jordan Valley Water Conservation District, SLCo Public Utilities	Reduce water usage per household, increasing the amount of water available to the city during droughts.	Low	City general fund	Short term	Medium	
30	Assess current communications and interoperable emergency/ warning systems.	Earthquake	City of Holladay Emergency Management	SLCo EM, UFA	Improve communication and coordination among emergency response agencies during a disaster.	Low	City general fund	Short term	Medium	
31	Provide personal, CERT, and amateur radio training for the citizens of the city.	Earthquake	City of Holladay Emergency Management	SLCo EM, UFA	Enable the city to tap into citizen CERT members to support disaster response and recovery.	Low	City general fund	Short term	Medium	
32	Continue participating in the National Flood Insurance Program.	Flooding	City of Holladay Emergency Management	SLCo EM	Reduce losses from flooding through enhanced flood ordinances, building codes, and flood insurance.	Low	City general fund	Short term	High	

#	Action	Hazard(s)	Lead Agency	Potential Partners	Benefits (Losses Avoided)	Cost Estimate	Funding Source(s)	Timeframe	Priority	Comments
33	Develop protocol for working with State and Federal agencies in developing impact of post fire debris flow hazard.	Landslide	City of Holladay Emergency Management	Utah Emergency Management, FEMA	Improve efficiency in coordination to provide support for those impacted by post-fire debris flow.	Low	City general fund	Short term	Medium	
34	Create outreach materials on actions to take when severe weather strikes and include this information in citywide newspapers and phone books targeted at the 55+ age group, developed by County Aging Services.	Severe weather	City of Holladay Emergency Management	SLCo Aging Services	Ensure that the aging population knows how to remain safe during severe weather by targeting media they utilize.	Low	City general fund	Short term	Medium	
35	Facilitate public awareness through “Fire Wise” programs.	Wildland Fire	City of Holladay Emergency Management	UFA, CED	Encourage local governments to work with residents to prepare for wildfire and mitigate potential damage.	Low	City general fund	Short term	High	
36	Create defensible space.	Wildland Fire	City of Holladay Emergency Management	UFA, CED	Reduce the intensity and chances of catastrophic wildland fire.	Medium	Paid for by those developing homes	Medium term	High	
37	Continue to support and take part in annual Utah Shakeout exercises to promote earthquake awareness.	Earthquake	City of Holladay Emergency Management	Utah Division of Emergency Management	Prepare citizens to protect themselves during a disaster.	Low	City general fund	Short term	Medium	
38	Continue to enforce building codes and develop new codes and zoning ordinances as needed or when state codes are updated.	Earthquake, Flooding	City of Holladay Emergency Management	SLCo Emergency Management	Reduce the likelihood of buildings to sustain damage during an earthquake.	Low	City general fund	Short term	High	
39	Continue to execute training and exercise programs.	Earthquake, Wildfire, Severe Weather	City of Holladay Emergency Management	SLCo Emergency Management	Improve communication and coordination between emergency response partners.	Low	City general fund	Short term	Medium	
40	Educate residents and businesses through public information and events.	Earthquake	City of Holladay Emergency Management	SLCo Emergency Management	Support citizens through providing emergency preparedness outreach in the form of journal articles, social media, community courses, and other events.	Low	City general fund	Short term	Low	
41	Collaborate with partners to rehabilitate Lake Mary-Phoebe dam structure. Address spillway capacity and seepage control measures.	Dam Failure	Salt Lake City Corporation	SLCo EM, Holladay EM, Utah Division of Water Rights Dam Safety, Salt Lake City Public Utilities	Reinforce the dam structure, including addressing spalling and deterioration as indicated in dam inspection reports to reduce the risk of failure.	High	Salt Lake City General Fund, SLCo General Fund, HHPD Grant, HMGP, Utah Bureau of Water Resources revolving fund	Short term	High	

DRAFT

Mitigation Action Prioritization

The mitigation actions were evaluated based on the STAPLEE criteria.

Table 23: Mitigation Action Prioritization – STAPLEE

Action	Social	Technical	Administrative	Political	Legal	Economic	Environmental	Priority
1	3	4	4	4	3	4	4	High
2	3	2	1	3	3	2	3	Low

Jordan School District Annex

To participate in this multi-jurisdictional hazard mitigation plan (MJHMP) update for Salt Lake County (SLCo), the governing body of the Jordan School District passed a formal resolution, a copy of which is maintained at the local government offices.

Planning Process Contact Information

Table 1 provides information on the point of contact during the updating of the MJHMP.

Table 1: Contact Information for the Jordan School District

Name	Contact Information
Ian Roberts	**Phone**: 801-567-8885 **email:** ian.roberts@jordandistrict.org

The Jordan School District has a fully integrated approach to hazard mitigation planning and program implementation. During the 2024 update process, the MJHMP participation roles in Table 2 were recorded.

Table 2: Participant List for the Jordan School District

Name	Title	Jurisdiction

Dave Rostrom	Facilities Services Director	Jordan School District

Jurisdiction Profile

Date of Incorporation

1904

Location and Description

The Jordan School District, in the southwestern part of Salt Lake County, encompasses a vibrant and diverse community that includes several suburban neighborhoods and rural areas. Established in 1904, it has grown to serve a large student population, making it one of the largest school districts in the state, with 68 schools. The district prides itself on its commitment to providing a high-quality education, offering various academic programs, extracurricular activities, and support services to meet the needs of its students. With many elementary, middle, and high schools, the district is dedicated to fostering an inclusive environment that promotes student achievement and well-being, making it a vital part of the local community. Jordan School District provides educational opportunities for students living in the cities

DRAFT

of Bluffdale, Herriman, Riverton, South Jordan, West Jordan, and Copperton, and southwest portions of unincorporated Salt Lake County (see Figure 1).

Population

For the 2024–2025 school year, the Jordan School District had 57,083 students enrolled.[1] Figure 2 presents the demographics of the students in the district.

Brief History

The district was established in 1904, starting with a student population 3,354.[2] Its name and initial boundaries derived from the Jordan Stake of the LDS Church, which then stretched across the entire Salt Lake Valley, from east to west, and extended from around Midvale to the valley's southern end.[3]

Climate

Salt Lake County experiences a semi-arid climate characterized by hot, dry summers and cold, snowy winters. The region typically has four seasons, with average summer temperatures reaching the 80s to 90s°F (27–37°C). In comparison, winter temperatures can drop into the 20s to 30s°F (-6 to 4°C). Precipitation is relatively low, mostly occurring during the spring and early summer months. Snowfall is common in winter, contributing to the area's overall water supply. The surrounding mountains can influence weather patterns, leading to occasional heavy snowfall in the winter months. The climate can impact various aspects of school life, including outdoor activities and commuting conditions.[4]

Public Services

The Jordan School District provides public services to support student education and well-being. These services include comprehensive academic programs, extracurricular activities, and specialized support for students with diverse needs. The district offers counseling and mental health services; nutritional programs, such as free and reduced lunch options; and opportunities for advanced placement and career and technical education. In addition, the district emphasizes community engagement through family support services and partnerships that enhance learning environments. These services aim to ensure that students have the necessary resources to thrive academically and personally.

Demographics

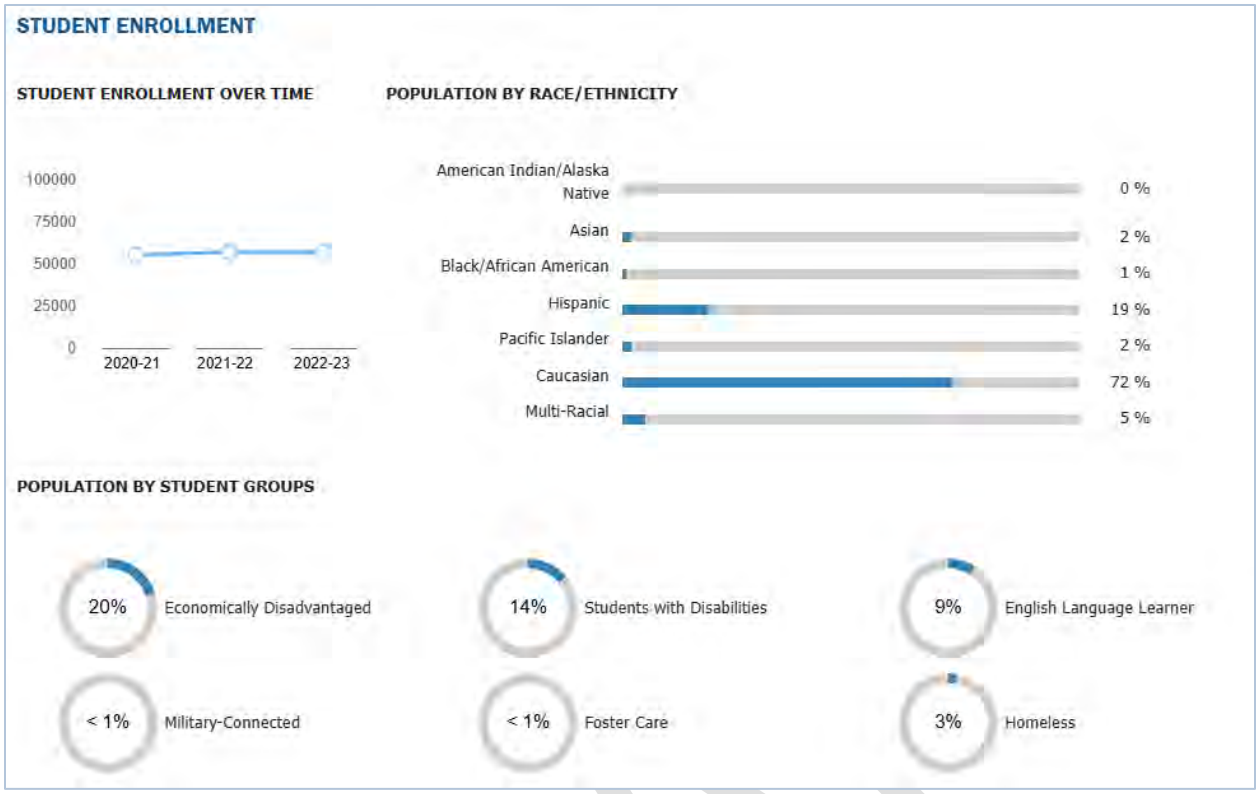

Figure 2: Demographics of Students in the Jordan School District[6]

Governing Body

The district is overseen by the seven members of the Board of Education, elected by voters from the district's five precincts. Elections for the School Board take place every two years in November alongside the general election. When new members are sworn in, they also select a president and a vice president. The Board values public involvement, providing various opportunities for community members to participate in decision-making through School Community Groups, ad hoc committees, task forces, and other organizations. The Board of Education appoints both the Superintendent of Schools and the Business Administrator, and the district operates under the general oversight of the Utah State Office of Education.[7]

Development Trends

The Jordan School District is poised for several development trends to enhance educational quality and community engagement. In May 2023, the district established a new elementary school in Herriman,

[6] Jordan School District, "Profile." https://reportcard.schools.utah.gov/District/Profile?DistrictID=653&schoolyearendyear=2023.
[7] Utah Department of Government Operations, "Division of Archives and Records Service." https://archives.utah.gov/research/entities/550/.

serving students in Herriman and Riverton.[8] One significant trend is integrating technology into the classroom, with plans to expand access to digital resources and learning platforms that cater to diverse learning styles. In addition, there is a growing focus on sustainable practices, including developing green school buildings and eco-friendly programs that promote environmental stewardship among students. The district also prioritizes mental health and wellness initiatives, recognizing the importance of supporting students' emotional well-being and academic success. As these trends unfold, the Jordan School District strives to create an inclusive and innovative learning environment that prepares students for future challenges.

Jurisdiction-Specific Hazards and Risk

The Calculated Priority Risk Index (CPRI) is a comprehensive assessment tool for evaluating and prioritizing risks in a given context. It considers various factors, such as probability, impact, and urgency, to determine the level of risk associated with events or situations. The results for each hazard, including its risk factor (RF) value, are shown in Table 3. The results are based on the criteria in Table 4 and the equation that follows it. The CPRI helps organizations and individuals make informed decisions about risk management and mitigation strategies. It provides a systematic approach to identifying and addressing potential issues, allowing for a more efficient allocation of resources and proactive risk prevention. With the CPRI, stakeholders can prioritize their focus on the most critical risks, leading to more effective risk management and, ultimately, better outcomes.

Table 3: Calculated Priority Risk Values for the Jordan School District

Type of Hazard Event	Probability of Future Events	Spatial Extent	Severity of Life/ Property Impact	Warning Time	Duration	Response Capacity	Risk Factor Value
Avalanche	1	1	1	1	1	1	1
Drought	2	2	2	1	3	1	1.9
Earthquake	2	4	4	4	4	2	3.2
Extreme Heat	2	2	1	1	3	1	1.6
Extreme Cold	2	2	1	1	3	1	1.6
Flooding	3	2	2	3	3	1	2.4
Landslide/ Slope Failure	1	1	1	4	1	2	1.4
Radon	3	1	2	1	4	2	2.3
Heavy Rain	3	2	1	2	2	1	1.9
High Wind	2	2	1	2	2	1	1.6
Lightning	2	1	1	4	1	1	1.6

[8] Jordan School District, "Students and Community Come Together to Break Ground for Brand New Elementary School in Herriman." https://jordandistrict.org/2023/05/students-and-community-come-together-to-break-ground-for-brand-new-elementary-school-in-herriman/.

Type of Hazard Event	Probability of Future Events	Spatial Extent	Severity of Life/ Property Impact	Warning Time	Duration	Response Capacity	Risk Factor Value
Severe Winter Weather	2	2	1	1	2	1	1.5
Tornado	1	1	1	4	1	2	1.4
Wildfire	2	2	2	2	3	2	2.1
Dam Failure	1	1	1	2	1	2	1.2
Civil Disturbance	1	1	1	3	1	2	1.3
Cyberattack	2	2	1	4	1	2	1.8
Hazardous Materials Incident (Transportation & Fixed Facility)	2	2	1	4	1	1	1.7
Public Health Epidemic/ Pandemic	2	2	1	1	4	1	1.7
Terrorism	1	1	1	2	1	1	1.1

Table 4: Criteria for the Calculated Priority Risk Index

Risk Index Factor	Degree of Risk Level		Criteria	Factor Weight for Degree of Risk Level
Probability of Future Events	1	Unlikely	Less than 1 percent probability of occurrence in the next year or a recurrence interval of greater than every 100 years.	30%
	2	Occasional	1 to 10 percent probability of occurrence in the next year or a recurrence interval of 11 to 100 years.	
	3	Likely	11 to 90 percent probability of occurrence in the next year or a recurrence interval of 1 to 10 years.	
	4	Highly Likely	91 to 100 percent probability of occurrence in the next year or a recurrence interval of less than 1 year.	
Spatial Extent	1	Limited	Less than 10% of the planning area could be impacted.	10%
	2	Small	10%–25% of the planning area could be impacted	
	3	Significant	25%–50% of the planning area could be impacted.	

DRAFT

Risk Index Factor	Degree of Risk Level		Criteria	Factor Weight for Degree of Risk Level
	4	Extensive	50%–100% of the planning area could be impacted.	
Severity of Life/Property Impact	1	Negligible	Less than 5% of the affected area's critical and non-critical facilities and structures are damaged/ destroyed. Only minor property damage and minimal disruption of life. Temporary shutdown of critical facilities.	30%
	2	Limited	More than 5% and less than 25% percent of property in the affected area is damaged/ destroyed. Complete shutdown of critical facilities for more than one day but less than one week.	
	3	Critical	More than 25% and less than 50% of property in the affected area was damaged/ destroyed. Complete shutdown of critical facilities for over a week but less than one month.	
	4	Catastrophic	Over 50% of critical and non-critical facilities and infrastructures in the affected area are damaged/ destroyed. Complete shutdown of critical facilities for more than one month.	
Warning Time	1	Self-defined	More than 24 hours	10%
	2	Self-defined	12 to 24 hours.	
	3	Self-defined	6 to 12 hours.	
	4	Self-defined	Less than 6 hours.	
Duration	1	Brief	Up to 6 hours.	10%
	2	Intermediate	Up to one day.	
	3	Extended	Up to one week.	
	4	Prolonged	More than one week.	
Response Capacity	1	High	Significant resources and capability to respond to this kind of event; staff are trained, experienced, and ready.	10%
	2	Medium	Some resources and capability to respond to this kind of staff; some staff may be trained, experienced, and ready while others may need additional support.	
	3	Low	Limited resources and capability to respond to this kind of event; additional staff or staff training needed.	
	4	None	No resources and capability to respond this kind of event; additional outside support would be required.	

DRAFT

RISK FACTOR (RF) EQUATION

RF Value = [(Probability x 0.30) + (Spatial Extent x 0.10) + (Severity of Life/Property Impact x 0.30) + (Warning Time x 0.10) + (Duration x 0.10) + (Response Capacity x 0.10)]

Hazards with an RF value greater than or equal to 2.5 are considered high risk. Those with RF values of 2.0 to 2.4 are considered moderate risk hazards, and those with an RF value less than 2.0 are considered low risk. The highest possible RF value is 4.

Hazard Event History

Examining hazard event histories provides valuable insights to inform decision-making and help prioritize resources for risk prevention and response efforts. Table 5 lists the hazard events impacting the Jordan School District since 2013.

Table 5: Hazard Events Specific to the Jordan School District Since 2013

Type of Hazard Event	FEMA Disaster #	Date(s)	Damage or Impacts	Description
Flooding	N/A	09/14/2013	Flooding of Herriman High School required extensive exterior cleanup, but there was minimal interior damage to finishes.	Heavy rain and large surface areas brought sheets of water into the school.
Heavy Rain	N/A	09/14/2013	Flooding of Herriman High School required extensive exterior cleanup, but there was minimal interior damage to finishes.	Heavy rain and large surface areas brought sheets of water into the school.
Public Health Epidemic/ Pandemic	DR-4525-UT, 3478	2020–2023	School closures, online schooling	COVID-19 pandemic
Earthquake	Unknown	March 18, 2020	Stress cracks from lateral shaking, loss of a portion of rock veneer to an entryway	5.7 magnitude Magna earthquake. Most schools and district facilities had no damage. One middle school needed structural connection at the main entrance and one elementary school lost a few piece of rock veneer which were replaced by EIFS.

National Flood Insurance Program Summary

The Jordan School District does not participate in the National Flood Insurance Program.

DRAFT

Jurisdiction-Specific Vulnerabilities and Impacts

Table 6 provides information on the vulnerable assets in the Jordan School District, including its critical facilities, highlighting the district's vulnerability to identified hazards. By understanding the risks associated with these assets, local authorities can develop proactive strategies to mitigate vulnerabilities and ensure the safety and functionality of these important assets during hazard events. These data are invaluable for decision-making and prioritizing resources for emergency response and preparedness efforts, ultimately contributing to more effective risk management and greater resilience in the community.

Vulnerabilities include over 57,000 children served by JSD, as well as 7,048 faculty and staff. Structures include 42 elementary schools, 13 middle schools, 10 high schools and technical schools, and 3 special schools. The district also maintains office buildings, school buses, and other vehicles that may be vulnerable to loss from hazards.

Table 6: Jurisdiction-Specific Vulnerabilities and Impacts in the Jordan School District

Hazard	Vulnerable Asset	Description of Vulnerabilities and Impacts
Avalanche	People	N/A—not relevant to Jordan School District (JSD) schools.
Drought	People	*Vulnerability:* All students and staff are vulnerable to the effects of drought, including the lack of drinking/culinary water, as well as poor air quality that may arise. *Impacts:* Droughts can reduce municipal water supplies, which are essential for everyday activities such as drinking, cooking, and cleaning. Individuals with underlying health conditions, particularly young children and other medically vulnerable individuals, may experience heightened effects due to drought-related poor air quality and dust storms.
	Structures	*Vulnerability:* District buildings, foundations, landscaping, and sports fields are vulnerable to drought conditions. *Impacts:* Drought can lead to restrictions on the irrigation of landscaping and sports fields at school facilities. In addition, severe or prolonged drought can cause soil contraction due to decreased soil moisture, potentially damaging structural foundations or building walls, necessitating repairs.
	Economic Assets	*Vulnerability:* The district may face increased costs associated with water usage during drought conditions. *Impacts:* Drought can lead to shortages in water supply for various school activities, resulting in usage restrictions or increased costs.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Schools and schoolyards are vulnerable to drought conditions. *Impacts:* Droughts can reduce municipal water supplies, which can damage vegetation on school grounds and limit recreation opportunities for students and the community.
	Critical Facilities and Infrastructure	*Vulnerability:* Water supply systems are at risk during drought conditions. *Impacts:* Utah is the second driest state in the U.S., and drought could affect water supply and delivery systems over large regions, potentially affecting all of Salt Lake County. This situation could

Hazard	Vulnerable Asset	Description of Vulnerabilities and Impacts
		limit the availability of water for irrigation and culinary purposes across the district.
	Community Activities	*Vulnerability:* JSD schools and properties, which hold many events each year for education, recreation, and performing arts, are vulnerable to drought conditions. *Impacts:* School fields and auditoriums are used daily as part of education programs and are also rented for community events. Serious drought conditions could impact or limit the community use of these facilities for education and community activities.
Earthquake	People	*Vulnerability:* All students and staff are vulnerable to the impacts of an earthquake. *Impacts:* Interruption and/or displacement of student learning. There is a risk of possible injuries from falling objects if an earthquake occurs during school hours. In addition, students may be displaced from their homes following an earthquake and may be unable to attend school.
	Structures	*Vulnerability:* All schools and district facilities are vulnerable to damage and other disruptions resulting from an earthquake. *Impacts:* There is a potential for collapse or damage to schools and district structures during a seismic event. Classes may be disrupted or canceled due to damage. Although no JSD schools were identified in the K–12 Public Schools Unreinforced Masonry Inventory, they may still require extensive repairs after an earthquake.
	Economic Assets	*Vulnerability:* District budgets are vulnerable due to the potential need for repairs or replacement of instructional materials. *Impacts:* Repairing or rebuilding damaged schools could be very costly. Reconstruction and retrofitting of old buildings is expensive. There could also be a loss of educational equipment, such as computers or lab equipment, which may get damaged. Buses and district-owned vehicles could be damaged, leading to costly replacement or repair. Temporary relocation of students to alternate facilities to provide education may require leasing costs.
	Natural, Historic, and Cultural Resources	*Vulnerability:* JSD buildings are often used as community centers to house displaced families during emergencies. *Impacts*: JSD buildings may be unavailable for sheltering or other community activities.
	Critical Facilities and Infrastructure	*Vulnerability:* Utility systems such as water, power, and communication may be damaged and inoperable. In addition, emergency response and medical care may be overwhelmed. *Impacts:* The schools may not be functional if water, power, communication or other systems are disrupted, and emergency responders may not be available to respond to schools immediately.
	Community Activities	*Vulnerability:* Education and community activities are vulnerable to earthquakes. *Impacts:* JSD buildings may be unavailable for daily school operations or for other community activities. Schools are often used

Hazard	Vulnerable Asset	Description of Vulnerabilities and Impacts
		as community centers or shelters to house displaced families but may be unsafe for use following an earthquake.
Extreme Heat	People	*Vulnerability:* Students and staff are vulnerable to health issues related to extreme heat. *Impacts:* Extreme heat can lead to potential heat-related illnesses among students and faculty if schools have inadequate cooling systems or if A/C is disrupted. Furthermore, extreme heat can contribute to illness for school staff and students, as well as attendees at outdoor events/games in the summer. Heat-related illnesses, such as dehydration, heat exhaustion, and heat stroke, may occur if temperatures continue to rise and there are not adequate resources (e.g., EMS staff, drinking water, restrooms, shade) available. These conditions can pose significant health issues.
	Structures	*Vulnerability:* School HVAC systems, power systems, blacktops, parking areas, and sidewalks are vulnerable to extreme heat. *Impacts:* Extreme heat can place a strain on power grids and lead to interruptions in service. Extreme heat may strain cooling systems and contribute to increased power costs. In addition, pavement can buckle in extreme heat and require repairs.
	Economic Assets	*Vulnerability*: The district may face increased costs or damage to HVAC systems due to extreme heat. *Impacts:* Increased energy use raises financial costs for schools, businesses, and residents. In addition, damage to roadways and sidewalks from heat-related buckling can require costly emergency repairs and may cause secondary disruptions while transportation routes are closed.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Air and water quality may be reduced due to extreme heat. *Impacts:* Extreme heat can contribute to an increase in evaporation rates, reduce water availability for agriculture, recreation, and culinary use, exacerbate the effects of drought, and increase wildfire risk. In addition, heat can contribute to increased ozone levels, which can impact respiratory health.
	Critical Facilities and Infrastructure	*Vulnerability:* Power system failures and power outages, as well as road/transportation system damage, can occur during extreme heat events.. *Impacts:* One of the most significant secondary hazards associated with excessive heat events is the failure of motorized systems, such as ventilation systems used to control temperatures inside buildings. Extreme heat can increase demand for power and water resources and may contribute to widespread power outages. Heat can cause roads to buckle and may lead to road closures for emergency repairs. In addition, increased demand for healthcare services can put a strain on providers.
	Community Activities	*Vulnerability:* Extreme heat may lead to the cancellation of sports or activities. *Impacts:* Precautions are taken to ensure student, spectator and other participants' safety during high temperature activities. There

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerabilities and Impacts
		are no current impacts or history of event cancellations, but this is a possibility if extreme heat worsens.
Extreme Cold	People	*Vulnerability:* Students, particularly those who walk to school, and staff are vulnerable to extreme cold conditions. *Impacts:* Potential exposure to cold-related health problems for students and faculty may occur, particularly if schools have inadequate heating systems or if power is disrupted. Prolonged exposure can lead to hypothermia, frostbite, and death. Windy conditions can exacerbate these risks.
	Structures	*Vulnerability:* HVAC equipment and water lines are vulnerable to increased demand during extreme cold conditions. *Impacts:* Although water lines have not frozen previously, they could be affected if heating systems are not operational and cold temperatures are severe.
	Economic Assets	*Vulnerability:* The district is vulnerable to increased costs associated with extreme cold conditions. *Impacts:* The district's budget may be impacted by increased heating costs and possible emergency repairs to HVAC systems. Schools could potentially have to close if they are unable to keep buildings warm, leading to missed school or work for students and staff.
	Natural, Historic, and Cultural Resources	Extreme cold conditions are not directly relevant to JSD schools, but they can be harmful to wildlife or other natural systems.
	Critical Facilities and Infrastructure	*Vulnerability:* Water, power, or transportation systems are vulnerable to extreme cold conditions. *Impacts:* Freezing temperatures can lead to various infrastructure disruptions. They can cause insulators to fail and conductors to break. Extreme cold can also cause water in pipes to freeze, leading to burst pipes and water damage. Schools may not be able to stay in session if power, communication, or heating system outages occur or if there is water damage. Transportation may be disrupted due to icy conditions, affecting commutes and emergency services.
	Community Activities	*Vulnerability:* Recess, sports, and school or community events are vulnerable to extreme cold conditions. *Impacts:* Student recess is held indoors if temperature, weather, or air quality conditions present a safety concern to students and staff. Sports are typically indoors during cold months and will be canceled if travel conditions are deemed unsafe or if building systems are not operational.
Flooding and Heavy Rain	People	*Vulnerability:* Students/families and staff in flood-prone areas are vulnerable to the impacts of flooding and heavy rain. *Impacts:* Heavy rain or rapid snowmelt can lead to flooding, particularly if drainage systems are overwhelmed. This could affect school accessibility, disrupt classes, damage facilities, and pose a risk to student safety. The potential for flooding could impact the occupancy of school buildings, or buildings could receive minor to significant damage. Students and families in the school district may

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerabilities and Impacts
		be forced to evacuate homes, causing disruptions to education and daily life.
	Structures	*Vulnerability:* School buildings and district vehicles are vulnerable to flooding. Although no schools were identified in flood zones, they could be affected by localized or flash flooding following heavy rain or other severe weather events. *Impacts:* Buildings or vehicles can be damaged by floodwaters. The potential for flooding could impact the occupancy of school buildings, or buildings could receive minor to significant damage. Electrical and HVAC systems could be damaged, leading to replacement costs. Computers, books, equipment, and classrooms may suffer loss of supplies and learning materials. Athletic facilities and gymnasiums could be damaged, requiring repairs.
	Economic Assets	*Vulnerability:* Costs of flood damage to school assets. *Impacts:* Water damage to walls, floors, and roofs could require costly repairs. Prolonged disruptions could delay school operations, increasing expenses.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Floodwaters can damage school grounds, parks, and playgrounds. *Impacts:* The inability to use school facilities/grounds during repairs can disrupt educational and recreational activities.
	Critical Facilities and Infrastructure	*Vulnerability:* Community lifelines, such as power, communication, and transportation systems, could be damaged or disrupted by flooding. *Impacts:* Power outages, broken water mains, and sewage system failures could make schools unsafe for operation. Flooded roads and bridges can block bus routes, making it challenging for students and staff to commute. In addition, JSD buildings are often used as community centers to house displaced families during emergencies.
	Community Activities	*Vulnerability:* Education routines and community events held at schools are vulnerable to disruption from flooding. *Impacts:* Flooding could impact the occupancy of school buildings, and day-to-day school activities or other events may be temporarily canceled due to safety concerns.
Landslide/ Slope Failure	People	*Vulnerability:* There is minimal vulnerability for the JSD school population. *Impacts:* Students and staff are not likely to be affected by a landslide at school, but their homes might be affected. Families, students, and staff may need to evacuate affected areas, leading to temporary displacement and disruption of daily life.
	Structures	*Vulnerability:* There is minimal potential to impact JSD schools, as no structures have been identified in landslide-susceptible areas. *Impacts:* Schools and district facilities are not likely to be damaged, but homes and other structures located near slopes or unstable terrain may suffer foundation cracks or damage, making these buildings unsafe to occupy.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerabilities and Impacts
	Economic Assets	N/A—not relevant to JSD schools.
	Natural, Historic, and Cultural Resources	N/A—not relevant to JSD schools.
	Critical Facilities and Infrastructure	*Vulnerability:* Transportation networks are vulnerable to landslides, and there is possible damage to utility systems. *Impacts:* School buses may be unable to reach students due to road blockages. Students and staff may be unable to travel to school due to closed roads. Landslides elsewhere in the region could affect utility systems like power, water, or communication, which may disrupt school activities.
	Community Activities	*Vulnerability:* N/A—not relevant to JSD schools. *Impacts:* Other areas in the community may be affected. Parks, hiking trails, and other community recreational areas may be closed due to instability.
Radon	People	*Vulnerability:* All students and staff are vulnerable to radon exposure. *Impacts:* Radon could be present in school facilities and all faculty and students could be exposed to radon in school facilities. Long-term radon exposure is the second leading cause of lung cancer, particularly in enclosed spaces like classrooms and offices. Young children, teachers, and school staff who spend many hours in affected buildings may face greater health risks. Radon could also potentially affect residences of staff and students.
	Structures	*Vulnerability:* The district's vulnerability is minimal, as radon is primarily a health risk. *Impacts:* Some schools could potentially have high levels of radon that might require foundation repairs or ventilation for radon mitigation.
	Economic Assets	N/A—not relevant to JSD schools.
	Natural, Historic, and Cultural Resources	N/A—not relevant, as radon is primarily a health risk.
	Critical Facilities and Infrastructure	N/A—not relevant, as radon is primarily a health risk.
	Community Activities	N/A—not relevant to JSD schools.
High Wind	People	*Vulnerability:* All students and staff are vulnerable to high winds. *Impacts:* Students or staff could be injured by blowing debris or falling tree limbs.
	Structures	*Vulnerability:* All school facilities and vehicles are vulnerable. High winds can occur over a large area and may affect the whole district. *Impacts:* High winds can damage school buildings, harm roofs, and break windows. Schools may be inoperable if damage is severe or

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerabilities and Impacts
		during power and communication outages. Classes may be canceled or moved online, impacting the academic calendar.
	Economic Assets	*Vulnerability:* There are potential costs for structure or vehicle repairs. *Impacts:* Significant budget impacts can result from physical damage to structures and building contents. Debris removal can be costly and may strain budgets.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Schoolyards, playgrounds, and outdoor/indoor recreational facilities can be damaged from high winds. *Impacts:* Activities may be canceled, or areas may be closed for use.
	Critical Facilities and Infrastructure	*Vulnerability:* Schools and district facilities, including utility systems, are vulnerable to high winds. *Impacts:* Roof damage and broken windows can make school facilities unsafe. Damaged power lines and communication equipment may interrupt in-person and online learning. School buses and other transportation may be delayed due to fallen debris or road closures. Transportation disruptions can make it difficult for students or staff to travel to class. Classes may be canceled or moved online, impacting the academic calendar.
	Community Activities	*Vulnerability:* Recreation activities are vulnerable to disruption. *Impacts:* High winds may force the cancellation or delay of school sports, fairs, or other school gatherings.
Lightning	People	*Vulnerability:* Students and staff are vulnerable to lightning strikes. A large area is at risk of lightning strikes during every thunderstorm. If thunder can be heard, lightning is close enough to strike and shelter should be sought. Because it is impossible to know where lightning will strike, all people, structures, and infrastructure are considered vulnerable to lightning. *Impacts:* Students or staff could be injured if lightning strikes, particularly during outdoor activities. The district monitors safe conditions for outdoor events.
	Structures	*Vulnerability:* Structures are vulnerable to damage or power surges caused by lightning. *Impacts:* Lightning strikes can cause fires, structural damage, or power surges that damage electrical systems and disrupt learning in schools.
	Economic Assets	*Vulnerability:* Structures, computers, and electronic tools are vulnerable to lightning damage. *Impacts:* Damage from lightning can result in expensive repairs to electrical systems, computers, and other infrastructure.
	Natural, Historic, and Cultural Resources	N/A—not relevant to JSD.
	Critical Facilities and Infrastructure	*Vulnerability:* Lightning can damage power and communication systems.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerabilities and Impacts
		Impacts: Power and communication outages can affect operations for schools, homes, businesses, emergency responders, and medical facilities.
	Community Activities	*Vulnerability:* Recreation activities are vulnerable to lightning. *Impacts:* Lightning may force the cancellation or delay of school sports, fairs, or other school gatherings.
Severe Winter Weather	People	*Vulnerability:* Students and staff are vulnerable to severe winter weather, which occurs over large areas and could affect the entire district. *Impacts:* Travel to school facilities may be difficult for students and staff during severe winter weather. Roads may be slick or impassable due to ice, snow, or traffic from collisions. Pedestrians may incur injuries from slips and falls.
	Structures	*Vulnerability:* Minimal damage to school facilities is expected. *Impacts:* There is possible damage from heavy snow loads on roofs and an increased need for facilities/maintenance staff to clear parking lots and sidewalks.
	Economic Assets	*Vulnerability:* The district is vulnerable to increased costs associated with severe winter weather. *Impacts:* Severe winter weather can lead to increased maintenance and repair costs. Schools will have an increase in operational costs to keep buildings warm. Transportation and fuel costs can also increase due to snow plowing and de-icing parking lots and sidewalks.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Trees, landscaping, playgrounds or outdoor equipment are vulnerable to severe winter weather. *Impacts:* Heavy snow can break tree limbs, causing damage to school landscaping and outdoor equipment.
	Critical Facilities and Infrastructure	*Vulnerability:* Utility networks are vulnerable to damage or outages. *Impacts:* Heavy snow can damage power lines, affecting heating, lighting, and communication systems. Heating systems can overload, leading to failures. Frozen pipes and water breaks can disrupt water access in schools. Snow-covered roads can delay emergency response times as well as make it harder for school buses to operate safely, leading to delays or snow days.
	Community Activities	*Vulnerability:* School functions are vulnerable to severe winter weather. *Impacts:* Daily school or other school gatherings may be postponed or canceled due to unsafe travel conditions, causing disruptions to learning and class schedules.
Tornado	People	*Vulnerability:* Students and staff are vulnerable to tornadoes, which are rare but could occur anywhere in the district. *Impacts:* Flying debris, collapsed structures, and vehicle/bus accidents caused by high winds can lead to injuries or fatalities. Families may be temporarily or permanently displaced due to damaged homes, and student access to education may be interrupted.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerabilities and Impacts
	Structures	*Vulnerability:* All district facilities, schools, and vehicles are vulnerable to tornado damage. *Impacts:* Tornadoes can damage or destroy school buildings. Roofs can be torn off, windows shattered, and buildings leveled.
	Economic Assets	*Vulnerability:* The district is vulnerable to significant costs to structures and equipment due to tornado damage. *Impacts:* High costs are associated with rebuilding and repairing damaged property, including vehicles and classroom materials.
	Natural, Historic, and Cultural Resources	N/A—not relevant to JSD.
	Critical Facilities and Infrastructure	*Vulnerability:* Utility network outages and transportation access are vulnerable to tornado impacts. *Impacts:* Damage can occur to electrical grids, water systems and communication systems. Debris can block roads, hindering emergency response and transportation access to school.
	Community Activities	*Vulnerability:* Parks, playgrounds, sport facilities, and fields for schools are vulnerable to tornado damage. *Impacts:* Outdoor recreation areas may be damaged or littered with debris, making them unsafe or temporarily unusable, and activities may be canceled.
Wildfire	People	*Vulnerability:* Students and staff are vulnerable to the effects of wildfires. *Impacts:* Smoke and poor air quality can cause respiratory issues, especially for children and those with pre-existing conditions like asthma. Outdoor events may be canceled, and indoor recess may be required. Families in evacuated areas may need to leave their homes, disrupting daily life and interrupting access to education.
	Structures	*Vulnerability:* No structures have been identified in high wildfire risk areas. *Impacts:* Schools are not expected to be directly impacted by wildfire. However, evacuation or damage to homes near the interface might impact students or employees and disrupt school attendance.
	Economic Assets	*Vulnerability:* There is minimal direct vulnerability, but indirect impacts may arise from the community. *Impacts:* Local businesses may be destroyed or forced to close temporarily. Reconstructing homes and infrastructure can put financial strain on residents and government resources.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Watershed and air quality are at risk due to wildfires. *Impacts:* Water sources may be contaminated and could affect the water supply. Smoke pollution can linger for weeks.
	Critical Facilities and Infrastructure	*Vulnerability:* Utility systems and emergency response capabilities are vulnerable to wildfire impacts. *Impacts:* Fires can damage power lines, leaving homes and critical facilities without electricity. Evacuations and road closures can impact travel to and from school. Resources devoted to fire

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerabilities and Impacts
		response may strain emergency response capabilities in the community.
	Community Activities	*Vulnerability:* Daily school activities and other school events are vulnerable to disruption from wildfires. *Impacts:* Smoke, evacuations, or direct fire damage may cause schools to close temporarily, affecting student learning. School events or gatherings may be postponed or canceled.
Dam Failure	People	*Vulnerability:* Students and staff, particularly at schools in potential inundation areas, are vulnerable to dam failure. *Impacts:* Dam failures can occur suddenly, but those downstream might have some warning. The failure of high-hazard dams may lead to injuries and loss of life for those caught in the resulting floodwaters. Homes may be damaged or destroyed, resulting in potential long-term displacement for residents, which may affect school enrollment.
	Structures	*Vulnerability:* Four school district facilities are in potential dam inundation areas in West Jordan, two in Riverton, and one in Bluffdale. *Impacts:* Significant structural and infrastructural losses can result from a dam failure. Homes, businesses, schools, and government service facilities can be damaged.
	Economic Assets	*Vulnerability:* The district budget is vulnerable to dam failure impacts. *Impacts:* Possible costs include school building repairs and equipment or classroom material replacement. Debris, sediment, and other material deposited following a dam failure can require extensive cleanup efforts.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Playgrounds and landscaping are vulnerable to damage from dam failure. *Impacts:* Equipment could be damaged.
	Critical Facilities and Infrastructure	*Vulnerability:* Utility networks are vulnerable to outages caused by dam failure. *Impacts:* Schools could be disrupted by power outages, communication network outages, or damage to transportation systems. If roads are damaged or blocked, transportation to or from school could be difficult for students and staff. Disruption of public water supply or wastewater treatment facilities could lead to reduced water quality, water shortages, exposure to sewage, and other health hazards. Damage or disruption to major roads, railroads, power, communications, or other public utilities could delay vital services and disrupt school functionality.
	Community Activities	*Vulnerability:* School events are vulnerable to disruption from dam failure. *Impacts:* Evacuations or direct damage may cause schools to close temporarily, affecting students' learning. School events or gatherings may be postponed or canceled.
Civil Disturbance	People	During a civil disturbance, students and staff can be impacted in several ways. They may experience disruptions to essential

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerabilities and Impacts
		services, such as transportation, healthcare, and utilities. There is also potential for personal injury, fatality and emotional distress.
	Structures	Civil disturbances can result in property damage.
	Economic Assets	Civil disturbances can lead to economic repercussions, including loss of income and damage to buildings.
	Natural, Historic, and Cultural Resources	No direct impact on JSD. Civil disturbances can have several impacts on the environment. These include increased pollution from burning vehicles, buildings, and other materials and the use of chemical agents to disperse crowds. In addition, large gatherings during civil disturbances can increase the generation of waste, including litter and potentially hazardous materials.
	Critical Facilities and Infrastructure	Schools and other essential facilities may be impacted if they are near or the target of civil disorder or riots. Civil disturbances can lead to various impacts and losses to a community's critical infrastructure. This can include damage to transportation systems, such as roadways, bridges, and public transit facilities, and disruption to communications networks, including phone lines and internet services. In addition, civil disturbances can damage power plants, electrical grids, and water supply systems, leading to power outages and water supply disruptions. These disruptions can significantly impact on the daily lives of community members and hinder the delivery of essential services.
	Community Activities	Schools may be impacted if they are near or the target of civil disorder or riots, school events or gatherings may be postponed or canceled
Cyberattack	People	Cyberattacks can expose student and employee data that can be used for identity theft, leading to financial and emotional distress for individuals and families. Teachers may be unable to access lesson plans, online resources, and student records, disrupting the learning environment.
	Structures	A cyberattack can damage public and private buildings. If private buildings or businesses utilize HVAC & Smart Building systems cybercriminals can control heating, ventilation, and security systems making them unsafe or unusable. If 911 systems are compromised, response times, medical emergencies, or crimes can be delayed leading to property damage or loss of life. If a cyberattack triggers a failure in gas, water, or electrical systems it could lead to a fire, flooding, or other property damage from a cascading effect
	Economic Assets	Financial exploitation of local government and business may occur. School operations may be disrupted, leading to loss in revenue from events, programs, and other activities.
	Natural, Historic, and Cultural Resources	Vulnerabilities are not currently known for this topic.
	Critical Facilities and Infrastructure	Cyberattacks, especially ransomware, can render critical systems (like computers, email, and school databases) inaccessible.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerabilities and Impacts
	Community Activities	A cyberattack can disrupt the student learning environment as well as can postpone, delay, or cancel student activities and gatherings.
Hazardous Materials Incident (Transportation & Fixed Facility)	People	Salt Lake County is significantly vulnerable to hazardous materials in various locations, including industrial sites, transportation routes, and waste management facilities. The proximity of residential areas and schools to these sites increases the risk of exposure to toxic substances in the event of accidental releases or spills. Unknown exposure to toxic chemicals, flammable substances, or other hazardous materials can cause respiratory issues, burns, poisoning, or long-term health complications whether caused by a transportation accident or a fixed facility release. A spill or gas leak may require evacuations resulting in the relocation of students and staff.
	Structures	Hazardous substances could result in the infiltration of homes, businesses, and public buildings such as schools making them unsafe to occupy. Certain chemicals are also highly flammable and could cause structural damage if ignited.
	Economic Assets	Buildings and/or infrastructure exposed to toxic materials may require extensive cleanup. Businesses or transportation companies responsible for the incident may face lawsuits, fines, or compensation claims from the affected parties.
	Natural, Historic, and Cultural Resources	No direct impact on JSD. Hazmat spills can severely damage the environment by contaminating the air, soil, and water. Cleanup can take weeks, months, or even years to complete, depending on the extent of the spill.
	Critical Facilities and Infrastructure	Schools may need to be evacuated or closed due to chemical spills, gas leaks, or other toxic exposures. A Hazmat incident on highways or local roads could block access to schools. A chemical spill could contaminate local water supplies, air systems, or power infrastructure which can affect school operations.
	Community Activities	Evacuations, or direct damage may cause schools to close temporarily, affecting student's learning. School events or gatherings may be postponed or canceled.
Public Health Epidemic/ Pandemic	People	In-person student learning/activities might not be available at this event. Students, teachers, and staff may contract illnesses leading to hospitalizations or fatalities, especially among vulnerable populations.
	Structures	Schools may need physical changes such as ventilation upgrades, sanitation stations, and modified classroom layouts. Schools, buses, and public spaces may require frequent deep cleaning and new health protocols
	Economic Assets	The district may have to spend more money on technology for remote learning, personal protective equipment (PPE), and sanitation supplies.
	Natural, Historic, and Cultural Resources	School performances and activities may be postponed or canceled.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerabilities and Impacts
	Critical Facilities and Infrastructure	In-person student learning/activities might not be available at this event. Reduced or modified school bus services may occur due to social distancing requirements. Delays in supply chain might occur affecting school meal programs, shortage in cleaning supplies, PPE, etc.
	Community Activities	In-person student learning/activities might not be available at this event.
Terrorism	People	Educational facilities could be targets for terrorist activities or active shooter scenarios which can result in the loss of life and injuries.
	Structures	Attacks involving explosives, arson, or sabotage could destroy or severely damage school buildings and administrative offices.
	Economic Assets	Implementing enhanced security measures (security, screening, emergency drills) requires significant funding
	Natural, Historic, and Cultural Resources	Educational facilities could be targets for terrorist activities or active shooter scenarios.
	Critical Facilities and Infrastructure	Physical attacks on power grids, communication infrastructure, and water supplies could impact school operations and the public's health.
	Community Activities	Threats or actual attacks could lead to the suspension of sports events or other school activities.

Hazards Not Profiled

Avalanche has been omitted from further discussion of hazard impacts and from mitigation actions. As shown in the description in Volume 1, avalanche risk is primarily in the Wasatch Mountains in Salt Lake County. No JSD schools or facilities are located within known avalanche paths or near slopes where avalanche is likely to occur. Additionally, there have been no previous occurrences of avalanches impacting JSD facilities or assets.

Jurisdiction-Specific Changes in Vulnerability

Hazard events can impact communities, infrastructures, and ecosystems. The severity of these impacts can be influenced by climate change, population patterns, and land use developments. Understanding these factors is crucial for the Jordan School District to develop a resilient community and minimize the impacts of hazards. Table 7 displays the unique changes each identified hazard has had on the Jordan School District.

DRAFT

Table 7: Jurisdiction-Specific Changes in Vulnerability in the Jordan School District

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
Avalanche	N/A	N/A	N/A	N/A
Drought	Climate change affects drought incidents by altering precipitation patterns and increasing temperatures. Warmer weather can lead to longer dry periods and more severe droughts.	Drought can influence population patterns. Increased water costs can affect the cost of living. Sustainable development efforts and improved water management may attract newcomers.	Local governments to adjust zoning laws and promote sustainable practices in new projects. As a result, prolonged drought conditions can reshape the area's landscape and influence future development trends.	Same
Earthquake	Rising temperatures can lead to glacial melting, which affects pressure on tectonic plates and may trigger seismic activity through isostatic rebound. In addition, increased rainfall and flooding can erode soils, weakening structural integrity and heightening earthquake vulnerability. Although the direct links between climate change and earthquakes are still under investigation, the environmental effects may impact the region's seismic risk.	Population growth may contribute to the potential for more residents displaced from shelter when a disaster occurs.	The Jordan School District (JSD) may implement land use and development changes to enhance safety and resilience. Key impacts could include assessing existing buildings to ensure that they meet updated safety standards, leading to renovations, or constructing new earthquake-resistant structures. In addition, land use planning may restrict development in high-risk areas and designate open spaces for emergency evacuation. The district might also develop facilities for emergency preparedness, such as shelters and resource centers, while expanding green spaces for emergency gatherings. Increased collaboration with local government and emergency services would promote community engagement through joint response strategies and educational programs on earthquake preparedness.	Increased
Extreme Heat	Climate change significantly impacts extreme heat by increasing the	Some may move to areas perceived as safer or seek	Rising temperatures may lead government planners to adopt heat	Increase

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	frequency and intensity of heat waves. Rising global temperatures lead to longer and hotter summers, affecting residents and local infrastructure while heightening health risks, especially for vulnerable populations. Urban heat islands from reduced vegetation and extensive pavement further amplify these effects.	better job opportunities elsewhere. The economic impact and infrastructure damage can also make certain neighborhoods less desirable, leading to shifts in demographics and the socioeconomic landscape as new residents with different backgrounds move in.	mitigation strategies, such as increasing green spaces and using reflective materials. Zoning regulations might shift to promote mixed-use developments that enhance walkability and reduce vehicle reliance during peak heat. As concerns about heat-related health risks grow, there may be greater demand for improvements like shaded sidewalks and cooling centers, influencing future development toward resilience and sustainability.	
Extreme Cold	Higher atmospheric temperatures allow for more moisture, resulting in heavier snowfall and potentially lower temperatures during these events.	By driving some residents to relocate to warmer areas. Harsh winters can hinder economic activities and deter new residents and businesses, influencing housing demand and the attractiveness of certain neighborhoods. This may disproportionately affect lower-income families, leading to changes in demographics and socioeconomic stratification in the community.	Extreme cold can impact land use and development by shifting priorities toward indoor facilities like shopping centers and community spaces, as outdoor activities are curtailed. Developers may focus on energy-efficient designs to cope with harsh winter conditions, which can lead to increased construction costs and adjusted project timelines.	Same
Flooding and Heavy Rain	Higher temperatures increase the frequency and intensity of extreme weather events and alter precipitation patterns. They lead to more-intense rainstorms and accelerated snowmelt from nearby mountains, raising water levels in rivers and streams. This combination	Population growth may contribute to the potential for more residents displaced from shelter when a disaster occurs.	Flooding can impact land use at JSD schools by necessitating zoning changes and limiting construction in flood-prone areas. Existing buildings may need retrofitting, while new facilities might be built on higher ground. Effective drainage and	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	increases the risk of flooding, especially in areas with inadequate drainage and urban development in flood-prone zones, heightening the potential for damage to homes and infrastructure.		resilience planning will be crucial in addressing these challenges.	
Landslide/ Slope Failure	Climate change increases the risk of landslides through heavier rainfall and temperature fluctuations. Intense rain saturates soil, destabilizing slopes, while freeze–thaw cycles weaken the ground. Changes in vegetation can also reduce stability, leading to a higher potential for landslides.	Landslides and slope failures can impact population patterns by making some areas unsafe, leading to displacement and lower property values. This prompts residents to move to safer regions, thereby increasing density in more stable areas. Concerns about future landslides may also deter newcomers from high-risk zones, shaping long-term demographic trends.	Landslides and slope failures can impact land use and development by rendering certain areas unsafe for construction. This often results in stricter zoning laws, pushing developers to focus on more stable regions. Consequently, property values may decline in affected areas, and infrastructure investments shift to increase safety, ultimately guiding growth toward safer locations.	Same
Radon	Climate change can affect radon levels by altering soil temperatures and moisture conditions. Higher temperatures may increase radon emissions from the ground, while heavy rainfall can change groundwater and soil saturation, impacting radon migration into buildings.	Radon exposure can influence population patterns as increased health awareness may drive families to move away from areas with high radon levels. This shift could particularly affect vulnerable groups, changing demographics in the JSD.	Radon can impact land use and development by necessitating site assessments and mitigation, which can increase costs. Developers might prioritize areas with lower radon risks and adopt designs that reduce gas infiltration. This awareness may prompt stricter building codes and zoning regulations, influencing where new projects are located and shaping community planning.	Same
High Wind	Climate change affects high winds by altering atmospheric patterns and increasing extreme weather events.	Population growth may contribute to the potential for more residents displaced	High winds could change land use and development in JSD classes by requiring windbreaks, such as trees,	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	Rising temperatures may lead to more substantial, unpredictable winds and more frequent thunderstorms, posing risks to infrastructure and air quality.	from shelter when a disaster occurs.	to protect buildings and reduce erosion. Outdoor spaces may be redesigned for safety, incorporating sheltered areas. New construction could also focus on better anchoring and resilience against wind, leading to a reevaluation of class planning with an emphasis on sustainability.	
Lightning	Climate change may alter atmospheric patterns and contribute to more extreme events. Climate change increases temperatures and alters precipitation, leading to more intense thunderstorms and frequent lightning strikes. Urbanization can enhance this effect, posing risks to public safety and infrastructure.	Minimal	As climate change causes more intense storms, urban planners may adapt zoning and building codes to enhance resilience, thereby influencing the town's growth.	Same
Severe Winter Weather	Climate change impacts heavy snow and blizzards by altering precipitation patterns. Higher temperatures can lead to more rain than snow, affecting snowpack levels. In addition, increased storm intensity results in heavier, more unpredictable snowfall.	Population growth may contribute to the potential for more residents displaced from shelter when a disaster occurs.	Heavy snow or blizzard conditions may prompt land use and development changes at JSD to enhance safety and accessibility. The district could invest in better snow removal systems and features like heated sidewalks to prevent snow buildup. Parking areas might be redesigned for easier access during winter weather, and outdoor spaces could be adapted for winter activities. In addition, building layouts may be modified to minimize the impact of snow on entrances and walkways, ensuring that the class remains functional during severe conditions.	Increased
Tornado	Climate change may increase the frequency or intensity of tornadoes.	Not expected to affect the school population.	Tornadoes can significantly alter land use and development by	Same

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
			leading to stricter construction codes and zoning laws for resilience. Communities may invest in tornado shelters, relocate critical facilities away from high-risk areas, and create open spaces for emergency response, all while promoting economic development through sustainable practices.	
Wildfire	Climate change contributes to raising temperatures and creating drier conditions, prolonged droughts lead to more dry vegetation, which serves as fuel for fires.	Not expected to affect the school population.	Recovery efforts often focus on resilient infrastructure and green spaces, leading to stricter building codes and encouraging development in safer areas. As wildfires increase with climate change, adapting land use is vital for community resilience.	Increased
Dam Failure	Climate change raises the risk of dam failure by causing heavier rainfall and rapid snowmelt. These changes can overwhelm dams and compromise their integrity, highlighting the need for urgent safety assessments and upgrades to protect communities downstream.	Dam failure can impact population patterns by displacing residents and altering demographics. Evacuations can lead to an influx in safer areas, while destruction may deter new residents and contribute to population decline. Fear of future disasters may also prompt remaining individuals to relocate, changing the community's composition and affecting population density.	Dam failure can reshape land use and development by making areas prone to flooding unsuitable for growth. This may lead planners to focus on safer regions and implement stricter zoning laws to enhance resilience. The emphasis on sustainable practices and flood mitigation can ultimately transform the urban landscape, prioritizing disaster preparedness in future developments.	Same

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
Civil Disturbance	Climate change can increase civil disturbances by intensifying environmental stresses and social tensions. Rising temperatures may lead to droughts, wildfires, and poor air quality, particularly affecting vulnerable communities. Resource scarcity, especially water, can spark conflicts and protests. In addition, an influx of migrants from harder-hit areas may strain local resources, further escalating tensions.	By encouraging residents to move for safety, leading to outflows and new arrivals. These events can reveal social issues, impacting community dynamics, employment, and property values, ultimately reshaping demographics, and social cohesion.	By shifting community priorities toward safety and stability. Developers may hesitate to invest in troubled areas, leading to a focus on public spaces and community centers. Residents might also push for zoning changes favoring low-density housing and community-oriented efforts, prompting a reevaluation of land use strategies.	Same
Cyberattack	Possible attack on the industry, which is seen as producing large amounts of greenhouse gases and burning fossil fuels. Climate change can heighten cyberattack risk by increasing vulnerabilities during extreme weather. Disruptions like power outages offer cybercriminals opportunities, but focusing on emergency responses can weaken cybersecurity measures.	Cyberattacks can change population patterns by eroding trust in essential services. Compromised systems may cause residents to leave due to safety concerns, while high-profile incidents can deter businesses, leading to job losses. This perception of vulnerability may also make the city less appealing to newcomers, resulting in demographic shifts and affecting local development.	Cyberattacks can impact land use and development by undermining confidence in public infrastructure. If essential systems are compromised, investors may be discouraged, slowing economic activity. Local governments might also redirect funds to increase cybersecurity rather than new infrastructure, altering development timelines and urban planning priorities. This can significantly reshape the city's growth and land use.	Same
Hazardous Materials Incident (Transportation & Fixed Facility)	Climate change elevates the risk of hazardous materials incidents by increasing extreme weather events like heavy rain and wildfires. These events can breach storage tanks and heighten material volatility. Vulnerable infrastructure can lead to more spills or accidents, while climate shifts may also introduce new challenges for managing	By causing evacuations and temporary declines in density. In the long run, unsafe areas may deter new residents, affecting growth and diversity. In addition, negative perceptions can lower property values and economic prospects, leading	Contaminated areas may be designated as hazardous sites, limiting their residential or commercial use and decreasing property values. This can drive developers to seek safer locations, altering growth patterns. Over time, such incidents may lead to new zoning regulations focused on public safety and environmental protection.	Same

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	hazardous substances and public health.	families to relocate, which impacts local demographics.		
Public Health Epidemic/ Pandemic	Worsening air quality can also exacerbate respiratory conditions like asthma, especially in vulnerable populations, by increasing the spread of vector-borne diseases and raising the risk of waterborne illnesses due to flooding or drought.	Public health crises, like the COVID-19 pandemic, have notably affected JSD enrollment. There may be declines as prospective students delay education due to health concerns, while some existing students might drop out or take leaves of absence. Conversely, there could be an increase in enrollment in healthcare-related programs in response to public health needs, resulting in a fluctuating enrollment landscape.	Public health considerations may lead to significant changes at JSD, focusing on land use and infrastructure. To enhance well-being, outdoor spaces like gardens and recreational areas could be prioritized. In addition, buildings may be upgraded for better air quality, and new wellness centers could be established, promoting a culture of health among students.	Increased
Terrorism	Terroristic activity is sometimes centered around climate change. Climate change impacts terrorism incidents by creating resource scarcity and social unrest. Increased competition for essential resources like water can fuel tensions, making communities more vulnerable to extremist ideologies. Extreme weather events may disrupt social order and infrastructure, offering terrorist groups opportunities to exploit crises. In addition, climate-driven population displacement can heighten tensions in receiving areas, raising the risk of domestic terrorism. Law enforcement's focus on climate-	Terrorism could lead to a decline in enrollment at JSD due to safety concerns. Potential students might defer their education or choose other institutions perceived as safer. Following any incidents, increased security measures may lead to a temporary drop in enrollment.	Changes in land use at JSD due to terrorism could involve enhanced security measures, such as increased surveillance and emergency response facilities. Access points may be redesigned to restrict vehicle entry, and outdoor spaces could be modified to improve safety, limiting gatherings and reshaping the class environment to prioritize security over open communal areas.	Increased

	related challenges can also limit its capacity to address terrorism threats.			

DRAFT

Additional Public Involvement

The Jordan School District proactively informs students and families about potential hazards and safety issues. The district uses a multi-faceted approach to public outreach, which includes regular communication through newsletters, social media updates, and community meetings. It also provides essential resources on its official website, offering guidelines on preparing for and responding to various emergencies, such as natural disasters and health concerns. In addition, the school district collaborates with local emergency services to hold safety drills and workshops, ensuring that families are well-informed and equipped to handle potential threats. This commitment to transparency and education helps to foster a safe and informed community for all students and their families. Figure 3 and Figure 4 show examples of public outreach.

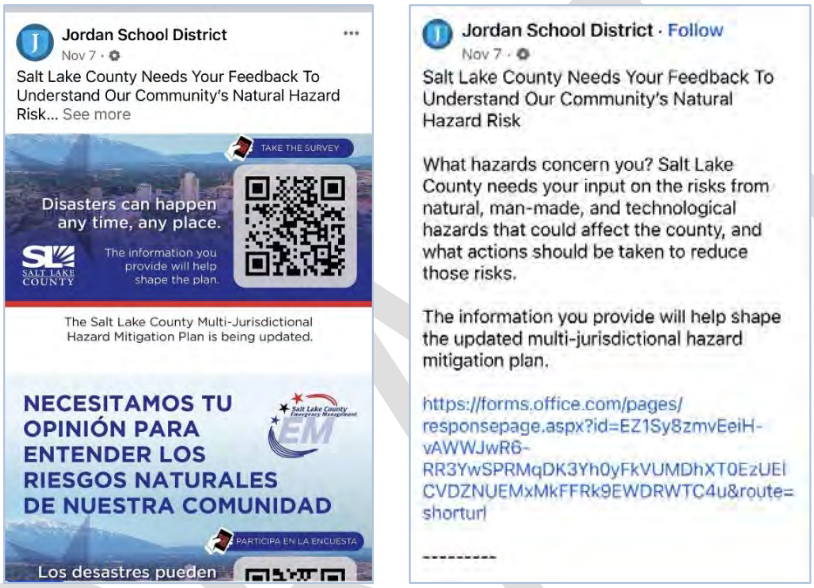

Figure 3: Facebook (*left*) and X (*right*) Posts for the Hazard Mitigation Survey

Figure 4: Website Posting of Public Survey

Plan Integration

Incorporating the underlying principles of the Hazard Mitigation Plan and its recommendations into other plans is a highly effective and low-cost way to expand their influence. All plan participants will use existing methods and programs to implement hazard mitigation actions where possible. As previously stated, mitigation is most successful when it is incorporated into the day-to-day functions and priorities of government and public service. This plan builds on the momentum developed through previous and related planning efforts and mitigation programs, and it recommends implementing actions where possible through these other program mechanisms. These existing mechanisms include the following:

- Regularity Capabilities
- Administrative Capabilities
- Fiscal Capabilities

Respective planning stakeholders will conduct implementation and incorporation into existing planning mechanisms and will be done through the routine actions of:

- Monitoring other planning/program agendas
- Attending other planning/program meetings
- Participating in other planning processes; and
- Monitoring community budget meetings for other community program opportunities.

The successful implementation of this plan will require constant and vigilant review of existing plans and programs for coordination and multi-objective opportunities that promote a safe, sustainable community.

DRAFT

Regular efforts should be made to monitor the progress of mitigation actions implemented through other planning mechanisms. Where appropriate, priority actions should be incorporated into planning updates. Table 8 lists existing planning mechanisms into which the Hazard Mitigation Plan has been integrated. Table 9 lists the opportunities for integrating elements of this plan into other plans.

Table 8: Integration of Previous Plans by Jordan School District

Plan	Description
None	N/A

Table 9: Opportunities for Integration with Future Plans of the Jordan School District

Plan	Description
Annual District-wide Facilities Assessment Plan	These facility assessments identify items at each building in the Jordan School District and prioritize the mitigation of the identified risk or need.
District Policy AA435 – Community Emergency Management Programs	Because the school district does not have the same long-term planning mechanisms as a municipality, this policy outlines how the district can coordinate with local and county agencies for education and training programs and community organizations to develop preparedness and response procedures. This could also integrate mitigation planning.
City Building Codes	The school district will work with city planning departments to ensure that new school construction aligns with building codes and can withstand local hazards.
Capital Projects Plans	Capital projects planning addresses the remodel and renovation of existing facilities in support of educational needs. It also provides inspections for life safety needs and preservation of existing facilities.

Capability Assessment

Local mitigation capabilities are existing authorities, policies, programs, and resources that reduce hazard impacts or could help carry out hazard mitigation activities.

Planning and Regulatory Capabilities

Planning and regulatory capabilities are the plans, policies, codes, and ordinances that prevent and reduce the impacts of hazards.

Table 10: Assessment of the Planning Capabilities of the Jordan School District

Mutual Aid Agreements	N/A	N/A	N/A
Other? (Please describe.)			

Financial Capabilities

Financial capabilities are the resources to fund mitigation actions. Talking about funding and financial capabilities is important to determine what kinds of projects are feasible, given their cost. Mitigation actions like outreach programs are lower cost and often use staff time and existing budgets. Other actions, such as earthquake retrofits, could require substantial funding from local, state, and federal partners. Partnerships, including those willing to donate land, supplies, in-kind matches, and cash, can be included.

DRAFT

Table 14: Assessment of the Financial Capabilities of the Jordan School District

Funding Resource	In Place? (Y/N)	Has it been used in the past and for what types of activities?	Could it be used to fund future mitigation actions?	Can it be used as the local cost match for a federal grant?

Education and Outreach Capabilities

Education and outreach capabilities are programs and methods that could communicate about and encourage risk reduction. These programs may be run by a participant or a community-based partner. Partners, especially those who work with underserved communities, can help identify additional education and outreach capabilities.

Table 15: Assessment of the Education and Outreach Capabilities of the Jordan School District

Education and Outreach Capability	In Place? (Y/N)	Does it currently incorporate hazard mitigation?	Could it be used to support mitigation in the future?
Community Newsletter(s)	Yes	Unknown	Unknown
Hazard Awareness Campaigns (such as Firewise, Storm Ready, Severe Weather Awareness Week, School Programs)	No	N/A	N/A

DRAFT

Opportunities to Expand and/or Improve Capabilities

Actions that can expand and improve existing authorities, plans, policies, and resources for mitigation include budgeting for mitigation actions, passing policies and procedures for mitigation actions, adopting and implementing stricter mitigation regulations, approving mitigation updates, and making additions to existing plans as new needs are recognized. Table 16 lists the opportunities for the Jordan School District.

Table 16: Opportunities to Expand and/or Improve the Capabilities of the Jordan School District

Capability	Opportunity to Expand and/or Improve
Planning and Regulation	The district does not develop or participate in many plans that relate to mitigation, but these plans can still impact the district's planning for its own assets. The district can review the current building codes, including seismic standards, and identify which schools can be upgraded in alignment with current codes.
Administrative and Technical	The district can identify partners to help fill in gaps in capabilities, such as GIS, hazard data collection, and experience with mitigation grants. SLCo is one example of a partner that could help expand this type of capability, in addition to the communities where the school district operates.
Financial	The district can pursue new funding sources like the Hazard Mitigation Grant Program. Additionally, the district can consider if and when BRIC is replaced to assess whether the new grant is a viable opportunity for further mitigation financing.
Education and Outreach	The district can share additional information with students, staff and faculty on hazards and how to reduce their risk. For example, the district's current ability to offer handouts and host public meetings could incorporate additional hazard information like regular earthquake or seasonal flood notices. Partners, such as SLCo, could help identify and provide relevant information to share.

Mitigation Strategy

Mitigation strategies provide proactive measures that are designed to minimize the impacts of hazards on the Jordan School District. The Jordan School district did not participate in the previous plan; therefore, no previous mitigation actions were available. Table 17 is the 2025 mitigation action plan for the Jordan School District.

DRAFT

THIS PAGE INTENTIONALLY LEFT BLANK

DRAFT

Table 17: 2025 Mitigation Action Plan for the Jordan School District[9]

#	Action	Hazard(s)	Lead Agency	Potential Partners	Benefits (Losses Avoided)	Cost Estimate	Funding Source(s)	Timeframe	Priority	Comments
1	Conduct seismic evaluations of district facilities and pursue mitigation/retrofitting where needed.	Earthquake	Jordan School District	Cities within district boundaries	Reduce structural losses to buildings, furnishings, and equipment while minimizing interruption of education activities. Reduce the risk of injury to students and staff.	High	BRIC/FEMA, district budget	Long-term	High	
2	Grade all sites for proper drainage and evaluate storm drain capacity to reduce flood risk.	Heavy Rain/Flooding	Jordan School District	Cities within district boundaries	Reduce structural losses to buildings, furnishings, and equipment while minimizing interruption of education activities. Reduce the risk of injury to students and staff.	High	Currently unknown, could use local or federal grants such as FMA	Long-term	Medium	Sites are typically graded to address drainage issues during early construction.
3	Assess the vulnerability of all properties and mitigate deficiencies. Include school site and building security updates.	Terrorism	Jordan School District	Cities within district boundaries	Reduce risk of injury to students, staff, and faculty.	High	Currently unknown, might have potential funding with HB84, local and federal grants, district budget	Long-term	High	
4	Update equipment and landscaping to promote water conservation.	Drought	Jordan School District	Cities within district boundaries	Conserve water supply and ensure the landscape is resilient to drought.	Medium	District budget	Ongoing	Low	
5	Establish and/or expand policies and public education opportunities for district-wide emergency notifications and provide information on hazards and mitigation.	Drought, Earthquake, Extreme Heat, Extreme Cold, Flooding, High Wind, Heavy Rain, Landslide/Slope Failure, Lightning, Radon, Tornado Severe Winter Weather, Wildfire, Dam Failure, Cyberattack, Hazardous Materials Incident, Public Health Epidemic/Pandemic, Terrorism	Jordan School District	Cities within district boundaries	Increased awareness of potential impacts of hazards among student community and staff may help reduce interruptions to district operations. Can also contribute to reducing the risk of structural damage and injuries from hazards. Sharing information via the website or take-home notices to parents can increase awareness of hazard mitigation measures such as water conservation (drought), home retrofitting (earthquake), flood maps, inundation areas, and elevation projects for utilities (flood, dam failure, heavy rain), home weatherization (extreme heat, extreme cold, severe winter weather), tree pruning and wind-rated building materials (high wind, tornado), recognizing warning signs and methods to stabilize slopes (landslides), and	Low	District budget	Ongoing	Medium

Jurisdiction Profile

Date of Incorporation

Kearns became a metro township in January 2017, then converted to a city on May 1, 2024.

Location and Description

The city of Kearns is located southwest of Salt Lake City. The city is approximately 4.6 square miles in area and is approximately 4,500 feet above sea level. The city offers a blend of residential neighborhoods and recreational facilities that is home to the Utah Olympic Oval, an indoor speed skating rink built for the 2002 Winter Olympics.

DRAFT

Population

The 2022 American Community Survey 5-Year Estimate from the U.S. Census Bureau records the population of the city of Kearns as 37,058 people.

Demographics

Most of the 37,058 people are between the ages of 35 and 44, with a median age of 32.3; 18,666 are females (50.4%) and 18,392 are males (49.6%). English is the primary language in 62.7% of homes,, with 32.3% Spanish, and 5% other languages.

Brief History

During World War II, the area was initially developed as the Kearns Army Air Base to serve as a critical training facility for aircrew members. The base was decommissioned after the war, and the land was gradually converted to a residential community. Named after Senator Thomas Kearns, the area saw significant growth and development and became a prominent suburb of Salt Lake City. Today, Kearns is known for its diverse population, community spirit, and notable landmarks.

Climate

The city of Kearns experiences a humid continental climate (Dfb Köppen classification) characterized by warm summers and cold winters. Average high temperatures are approximately 85°F in the summer and approximately 36°F in the winter. Rain each year is approximately 15.4 inches, and snowfall averages 60 inches annually.

Public Services

The city of Kearns offers a wide range of public services through the Greater Salt Lake Municipal Services District (MSD). The MSD oversees services like planning and zoning, business licenses, inspections, emergency planning, and other municipal services.

Governing Body

The city of Kearns governing body comprises the Mayor, Deputy Mayor, and a three-member council.

Development Trends

The Kearns General Plan, adopted in 2020 and amended in 2021 and 2022, outlines a community-driven vision for land use, transportation, economic development, and housing, including elements on resilience, infrastructure, and moderate-income housing. Kearns is also experiencing population growth, making it one of the younger and more diverse municipalities in Salt Lake County. This is driving the need for more housing and community services. Efforts are underway to boost the local economy through job creation

DRAFT

and support for local businesses. These trends reflect Kearns' commitment to fostering a vibrant and sustainable community.

Jurisdiction-Specific Hazards and Risk

The Calculated Priority Risk Index (CPRI) is a comprehensive assessment tool for evaluating and prioritizing risks in a given context. It considers various factors, such as probability, impact, and urgency, to determine the level of risk associated with events or situations. The results for each hazard, including its risk factor (RF) value, are shown in Table 5. The results are based on the criteria in Table 6 and the equation that follows it. The CPRI helps organizations and individuals make informed decisions about risk management and mitigation strategies. It provides a systematic approach to identifying and addressing potential issues, allowing for a more efficient allocation of resources and proactive risk prevention. With the CPRI, stakeholders can prioritize their focus on the most critical risks, leading to more effective risk management and, ultimately, better outcomes.

Table 5: Calculated Priority Risk Index Values for the City of Kearns

Type of Hazard Event	Probability of Future Events	Spatial Extent	Severity of Life/ Property Impact	Warning Time	Duration	Response Capacity	Risk Factor Value
Avalanche	0	0	0	0	0	0	0
Drought	2	1	1	1	1	1	1.3
Earthquake	2	4	4	4	4	2	3.2
Extreme Heat	2	2	1	1	1	1	1.4
Extreme Cold	2	2	1	1	1	1	1.4
Flooding	1	2	1	1	1	1	1.1
Landslide/ Slope Failure	1	1	1	1	1	2	1.1
Radon	2	1	1	1	1	2	1.4
Heavy Rain	2	2	1	2	1	1	1.5
High Wind	2	2	1	2	1	1	1.5
Lightning	2	2	1	2	1	1	1.5
Severe Winter Weather	2	2	1	1	1	1	1.4
Tornado	1	1	1	1	1	2	1.1
Wildfire	1	1	1	1	1	1	1
Dam Failure	1	1	1	1	1	3	1.2
Civil Disturbance	1	2	1	2	1	2	1.3
Cyberattack	2	2	1	2	1	2	1.6
Hazardous Materials Incident	2	2	1	2	1	1	1.5

DRAFT

Type of Hazard Event	Probability of Future Events	Spatial Extent	Severity of Life/ Property Impact	Warning Time	Duration	Response Capacity	Risk Factor Value
(Transportation & Fixed Facility)							
Public Health Epidemic/ Pandemic	2	2	1	1	1	1	1.4
Terrorism	1	1	1	2	1	1	1.1

Table 6: Criteria for the Calculated Priority Risk Index

Risk Index Factor	Degree of Risk Level		Criteria	Factor Weight for Degree of Risk Level
Probability of Future Events	1	Unlikely	Less than 1 percent probability of occurrence in the next year or a recurrence interval of greater than every 100 years.	30%
	2	Occasional	1 to 10 percent probability of occurrence in the next year or a recurrence interval of 11 to 100 years.	
	3	Likely	11 to 90 percent probability of occurrence in the next year or a recurrence interval of 1 to 10 years.	
	4	Highly Likely	91 to 100 percent probability of occurrence in the next year or a recurrence interval of less than 1 year.	
Spatial Extent	1	Limited	Less than 10% of the planning area could be impacted.	10%
	2	Small	10%–25% of the planning area could be impacted	
	3	Significant	25%–50% of the planning area could be impacted.	
	4	Extensive	50%–100% of the planning area could be impacted.	
Severity of Life/Property Impact	1	Negligible	Less than 5% of the affected area's critical and non-critical facilities and structures are damaged/destroyed. Only minor property damage and minimal disruption of life. Temporary shutdown of critical facilities.	30%
	2	Limited	More than 5% but less than 25% percent of property in the affected area is damaged/ destroyed. Complete shutdown of critical facilities for more than one day but less than one week.	

DRAFT

Risk Index Factor	Degree of Risk Level		Criteria	Factor Weight for Degree of Risk Level
	3	Critical	More than 25% and less than 50% of property in the affected area was damaged/destroyed. Complete shutdown of critical facilities for over a week but less than one month.	
	4	Catastrophic	Over 50% of critical and non-critical facilities and infrastructures in the affected area are damaged/ destroyed. Complete shutdown of critical facilities for more than one month.	
Warning Time	1	Self-defined	More than 24 hours	10%
	2	Self-defined	12 to 24 hours.	
	3	Self-defined	6 to 12 hours.	
	4	Self-defined	Less than 6 hours.	
Duration	1	Brief	Up to 6 hours.	10%
	2	Intermediate	Up to one day.	
	3	Extended	Up to one week.	
	4	Prolonged	More than one week.	
Response Capacity	1	High	Significant resources and capability to respond to this kind of event; staff are trained, experienced, and ready.	10%
	2	Medium	Some resources and capability to respond to this kind of staff; some staff may be trained, experienced, and ready while others may need additional support.	
	3	Low	Limited resources and capability to respond to this kind of event; additional staff or staff training needed.	
	4	None	No resources and capability to respond this kind of event; additional outside support would be required.	

RISK FACTOR (RF) EQUATION

RF Value = [(Probability x 0.30) + (Spatial Extent x 0.10) + (Severity of Life/Property Impact x 0.30) + (Warning Time x 0.10) + (Duration x 0.10) + (Response Capacity x 0.10)]

Hazards with an RF value greater than or equal to 2.5 are considered high risk. Those with RF values of 2.0 to 2.4 are considered moderate risk hazards, and those with an RF value less than 2.0 are considered low risk. The highest possible RF value is 4.

DRAFT

Hazard Event History

Examining hazard event histories provides valuable insights to inform decision making and help prioritize resources for risk prevention and response efforts. Table 7 lists the hazard events impacting the city of Kearns since the 2019 plan update, as recorded in the Storm Events Database from the National Centers for Environmental Information.

Table 7: History of Hazard Events in the City of Kearns

Type of Hazard Event	FEMA Disaster #	Date(s)	Damage or Impacts	Description
Avalanche		N/A	N/A	N/A
Drought		1930s 1950s–1960s: 2020: 2021:	Air quality issues, potential for greater ecosystem collapse, decreased precipitation.	1930s: The Great Salt Lake and streams experienced low water levels 1950s–1960s: The Great Salt Lake experienced even lower water levels than in the 1930s. 2020: Utah experienced its driest year on record, with record dry soils and low snowpack. 2021: The Great Salt Lake reached an all-time record low due to a drought.
Earthquake	DR-4548-UT	03/18/20	M 5.7 earthquake was felt March 2020. 1962 Magna M 5.2 earthquake and the 1992 Western Traverse Mountains M 4.2 earthquake	M 5.7 earthquake at 7:09 a.m., centered 3.7 miles northeast of Kearns in Magna. The Wasatch Fault is considered overdue for a major earthquake, with a 57% chance of an M 6.0 or greater in the next 50 years.
Extreme Heat	N/A	Summers of 2020, 2021, 2022, 2023, 2024	Reported 9 deaths in Northern Utah, an upward trend in heat exposure and heat-related deaths since 2015. Excessive heat can also affect infrastructure.	Kearns along with Salt Lake County had one of the hottest summers on record, with several days over 105°F.
Extreme Cold	N/A	Winter of 2022 & 2023	2022: 5 people experiencing homelessness died from cold-related exposure. These deaths were in Salt Lake City, but this threat could impact neighboring jurisdictions.	N/A

DRAFT

Type of Hazard Event	FEMA Disaster #	Date(s)	Damage or Impacts	Description
Flooding	N/A	2008, 2011 flooding	Water was 9–12" on some roads, making them impassable & accumulated in low lying areas.	N/A
Landslide/ Slope Failure	N/A	N/A	N/A	N/A
Radon	N/A	Ongoing	N/A	It is believed that 31% of the homes in Kearns have radon in them.
Heavy Rain	N/A	N/A	N/A	Kearns will see local flooding around storm drains through the year when they become clogged with debris or with sudden summer downpours. No damage has been reported from these.
High Wind	N/A	2018 and 2021	Minor structural damage	Salt Lake County and surrounding areas experienced a severe windstorm with winds exceeding 100 mph in some areas.
Lightning	N/A	N/A	N/A	N/A
Severe Winter Weather	N/A	03/06/22, 02/06/2023		Kearns has seen snow totals of up to 30 inches in a 24 hour period. This impacts the ability of residents to get around, causes power outages and has caused structures to collapse due to the heavy snow weight on roofs.
Tornado	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A

National Flood Insurance Program Summary

The city of Kearns participates in the National Flood Insurance Program (NFIP). Table 8 displays statistics related to the NFIP. The city of Kearns does not participate in the Community Rating System (CRS).

Table 8: National Flood Insurance Program Status for the City of Kearns[2]

Initial FHBM Identified	Initial FIRM Identified	Current Effective Map Date	Adopted Date	Date Joined NFIP	Tribal
12/18/85	12/18/85	09/25/09	2009	05/26/20	No

Table 9: National Flood Insurance Program Overview for the City of Kearns

Community ID	Number of Losses	Total Net Payment	Active Policies	Total Coverage
490265	0	$0	1	$350,000

The city of Kearns has designated the Director of Planning and Development Services as the Floodplain Administrator. The duties of the Floodplain Administrator are supported by the Greater Salt Lake Municipal Services District (MSD). The current Flood Damage Prevention and Control Ordinance was adopted on 8/9/2021. The current Flood Insurance Rate Map (FIRM) became effective on9/25/2009. The MSD is responsible for issuing floodplain permits in MSD Member Communities, including Kearns. The permits include a description of all work, including the kind and type of construction, proposed intent, and location. Substantial damage/substantial improvement structures are identified through the permitting process. Structures that are determined to be substantially damaged or substantial improvements are required to come into compliance with current codes. The MSD Building Department provides guidance on how to build in accordance with existing building codes.

Jurisdiction-Specific Vulnerabilities and Impacts

Table 10 provides information on the vulnerable assets in the city of Kearns, including its critical facilities, highlighting the city's vulnerability to identified hazards. It also describes the potential impacts to the community arising from those vulnerabilities. By understanding the risks associated with these assets, local authorities can develop proactive strategies to mitigate vulnerabilities and ensure that the safety and functionality of these important assets during hazard events. These data are invaluable for decision-

[2] FIRM = Flood Insurance Rate Map, FHBM = Flood Hazard Boundary Map

making and prioritizing resources for emergency response and preparedness efforts, ultimately contributing to more effective risk management and greater resilience in the community.

Community assets that may be vulnerable to hazards include 1 fire station, 1 police station, 11 schools, the Kearns Senior Center, Kearns Library, and Kearns Oquirrh Park Fitness Center. The city also has multiple parks including Oquirrh Park, Loader Park, and David Gourley Park. The city sits between Mountain View Corridor and Bangerter Highway, but neither directly intersect the city. Other primary routes include 4700 South, 5400 South, 6200 South, and 5600 West. Element Event Center and the Utah Olympic Oval are other notable facilities in the community.

Table 10: Jurisdiction-Specific Vulnerabilities and Impacts in the City of Kearns

Hazard	Vulnerable Asset	Description of Vulnerabilities and Impacts
Avalanche	People	N/A – Avalanche is not a concern for the City of Kearns.
Drought	People	*Vulnerability:* All Kearns residents are vulnerable to drought. Prolonged drought could disproportionately affect seniors, children, low-income households, and individuals without stable housing. *Impacts:* These populations may face challenges in paying higher water bills or investing in water-saving appliances. Air quality deterioration caused by dust and pollutants during drought can increase respiratory illnesses and strain public health.
	Structures	*Vulnerability:* Older homes are vulnerable to drought due to outdated plumbing or inefficient irrigation systems, making them less adaptable to drought restrictions. *Impacts:* A lack of water-wise landscaping may raise fire risk in residential areas.
	Economic Assets	*Vulnerability:* Businesses such as car washes, food services, and those that rely on water-intensive operations are vulnerable to drought. *Impacts:* Vulnerable businesses could face reduced capacity or higher costs during drought conditions. Prolonged dry spells may reduce demand for outdoor-based services or events.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Parks, wildlife, and vegetation are vulnerable to drought. *Impacts:* Parks and public landscapes may see stressed vegetation and reduced wildlife. Native flora may be lost if water conservation measures limit irrigation, thus reducing aesthetic and ecological value.
	Critical Facilities and Infrastructure	*Vulnerability:* Water systems and public buildings are vulnerable to drought. *Impacts:* Drought can reduce reservoir levels and water pressure, affecting public buildings and firefighting capabilities. Compacted soils may increase flash flood risk when rain returns.
	Community Activities	*Vulnerability:* Outdoor recreation *Impacts:* Outdoor public spaces may become less usable due to poor turf conditions or increased heat. Community programming may need to focus on drought education, heat safety, and water conservation.
Earthquake	People	*Vulnerability:* All residents of Kearns are vulnerable to earthquakes. *Impacts:* Earthquakes can lead to severe injury or death from falling objects or collapsed structures. A major earthquake could severely affect vulnerable populations in Kearns, especially those in mobile

Hazard	Vulnerable Asset	Description of Vulnerabilities and Impacts
		homes or unreinforced dwellings. Limited mobility and access to medical care could increase risk.
	Structures	*Vulnerability:* Kearns has a significant number of unreinforced masonry buildings, many of which are vulnerable to structural failure. *Impacts:* The 2020 earthquake highlighted how older construction types are not built to current seismic standards. Structural damage may result in residents being displaced from homes. Businesses and other facilities may also be damaged, contributing to disruption throughout the community. Recovery could be costly and take months or years depending on the magnitude.
	Economic Assets	*Vulnerability:* All businesses in Kearns are vulnerable to earthquakes. *Impacts:* Businesses can face losses from structural damage or loss of contents or inventory. An earthquake could disrupt commerce and emergency access, especially if transportation networks or utility lines fail. Businesses lacking insurance may not recover.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Trees and historic buildings are vulnerable to earthquakes. *Impacts:* Earthquakes could damage mature trees, disrupt soil integrity, and harm wildlife. Historical buildings with poor structural integrity may collapse or require extensive repairs.
	Critical Facilities and Infrastructure	*Vulnerability:* All critical facilities and infrastructure are vulnerable to earthquakes. *Impacts:* Damage to utilities, roadways, and health centers could delay emergency response and reduce public safety. Police and fire departments may be unable to reach affected areas quickly.
	Community Activities	*Vulnerability:* Large community gatherings are vulnerable to earthquakes. *Impacts:* Large events or community gatherings, especially at high-occupancy buildings like the Olympic Oval, could become hazardous during an earthquake. Emergency plans must address evacuation and shelter-in-place procedures.
Extreme Heat	People	*Vulnerability:* Kearns residents without access to air conditioning face elevated risk during extreme heat events. *Impacts:* Prolonged exposure may lead to heat exhaustion, dehydration, and heat stroke. Vulnerable populations, such as the elderly, young children, low-income individuals, and unsheltered persons, may be disproportionally affected by heat, especially those who work outdoors and/or do not have access to air conditioning. Extreme heat could lead to an increase in hospitalizations and reduced outdoor recreation, especially in the middle of the day when temperatures are the warmest.
	Structures	*Vulnerability:* Older structures are vulnerable to extreme heat. *Impacts:* Older residential buildings or public spaces without updated cooling systems may struggle to maintain safe indoor temperatures. Rising temperatures also increase energy demand and strain HVAC systems. Heat can strain infrastructure and increase cooling costs.
	Economic Assets	*Vulnerability:* Outdoor businesses are vulnerable to extreme heat.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerabilities and Impacts
		Impacts: Businesses that rely on outdoor activity, such as recreation or construction, may see reduced productivity or schedule delays. High cooling costs may strain household and commercial budgets. Employers might have to limit work hours, impacting their profit margins. Construction work done outdoors would be impacted, especially if frequent breaks and shaded areas are required.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Parks, natural ecosystems, and historic sites are vulnerable to extreme heat. *Impacts:* Extended heat can dry out vegetation in parks and open areas, stressing local ecosystems. Historic buildings may experience accelerated deterioration from thermal expansion and contraction.
	Critical Facilities and Infrastructure	*Vulnerability:* Community centers, healthcare facilities, and power infrastructure are vulnerable to extreme heat. *Impacts:* Healthcare facilities may experience an uptick in heat-related emergencies. Cooling centers, shelters, and power infrastructure may become strained during long heatwaves.
	Community Activities	*Vulnerability:* Community events are vulnerable to extreme heat. *Impacts:* Community events may be canceled or rescheduled due to safety concerns. Shade structures, water stations, and medical support will be essential for maintaining safe public gatherings.
Extreme Cold	People	*Vulnerability:* Residents who lack adequate shelter or are part of vulnerable populations are at risk from extreme cold. *Impacts:* Kearns residents who lack adequate heating or live in older homes may face serious risks during winter storms. Elderly residents, children, and those experiencing homelessness are particularly at risk for hypothermia and frostbite.
	Structures	*Vulnerability:* Older structures are vulnerable to extreme cold. *Impacts:* Freezing temperatures can lead to burst pipes, roof damage, and structural degradation—especially in homes without modern insulation. Temperature fluctuations increase building stress.
	Economic Assets	*Vulnerability:* All Kearns businesses are vulnerable to extreme cold. *Impacts:* Cold weather can interrupt daily operations, damage storefronts, and raise heating costs. Unmaintained roads may prevent employees from getting to work or delivering goods.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Vegetation, wildlife, and historical sites are vulnerable to extreme cold. *Impacts:* Severe frost and ice accumulation can damage ornamental trees, wildlife habitats, and historic landmarks, particularly those older structures vulnerable to moisture infiltration.
	Critical Facilities and Infrastructure	*Vulnerability:* Emergency response systems, roads, power systems, and water systems are vulnerable to extreme cold. *Impacts:* Cold weather may impair fire, police, and emergency service response if vehicles or equipment are impacted. Ice and snow accumulation can disrupt road access and power delivery. Burst pipes could impact essential services like electricity and clean, running water.
	Community Activities	*Vulnerability:* Community events are vulnerable to extreme cold.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerabilities and Impacts
		Impacts: Cold snaps may limit participation in community events or public access to outdoor amenities. The Olympic Oval and similar venues may need heating contingency plans and enhanced visitor protocols. Some events may be postponed or canceled. Access to activities, whether indoor or outdoor, could be impacted by the ability to travel there. If cars cannot start, access to both community activities as well as essential services and work may be impacted.
Flooding (and Heavy Rain)	People	*Vulnerability:* Flooding in Kearns is typically low-risk but may result from regional overflow or localized, extreme rain events. No significant waterways or flood hazard zones are in Kearns. *Impacts:* Residents in low-lying areas or near drainage channels may face water intrusion and access issues.
	Structures	*Vulnerability:* The risk to structures from flooding and heavy rain is low. *Impacts:* Buildings exposed to runoff may suffer water damage to foundations and basements. Aging stormwater infrastructure may not handle high rainfall volumes effectively.
	Economic Assets	*Vulnerability:* Business supply chains and transportation are vulnerable to flooding. *Impacts:* Kearns could have indirect impacts from flooding in neighboring jurisdictions that contributes to business losses. Flooding may interrupt supply chains, delay commuting, or result in temporary business closures. Cleanup costs can burden uninsured property owners.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Parks, trails, and historic sites are vulnerable to flooding. *Impacts:* Saturated soils and runoff may erode parks, damage trails, or harm wildlife habitats. Historic structures could deteriorate from moisture exposure.
	Critical Facilities and Infrastructure	*Vulnerability:* Risk to Kearns from flooding is low. However, indirect impacts from road or other infrastructure damage outside Kearns is possible. *Impacts:* Road closures and infrastructure stress may delay emergency services. Overflowing systems may release contaminants into public areas. Damage to major routes like Bangerter Hwy or Mountainview Corridor outside of Kearns due to flooding could impede access to Kearns residents.
	Community Activities	*Vulnerability:* The risk of flooding is low. *Impacts:* Water accumulation may temporarily close recreational areas or community venues like the Olympic Oval, affecting scheduled programming.
Landslide/ Slope Failure	People	*Vulnerability:* The risk of landslide in Kearns is very low. The terrain does not have the variability and slope to generate a landslide.
	Structures	*Vulnerability:* There is little landslide susceptibility, and the risk to structures in Kearns is very low.
	Economic Assets	None
	Natural, Historic, and	None

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerabilities and Impacts
	Cultural Resources	
	Critical Facilities and Infrastructure	None
	Community Activities	None
Radon	People	*Vulnerability:* Radon exposure is a public health concern in Kearns due to naturally occurring uranium in local soils. According to utahradon.org, 13% of homes tested in Kearns had dangerous radon levels. *Impacts:* Long-term exposure increases lung cancer risk, particularly for residents unaware of indoor air quality.
	Structures	*Vulnerability:* Homes with basements or structural weaknesses are vulnerable to radon. *Impacts:* Homes with basements or poor ventilation are more susceptible to high radon accumulation. Testing and mitigation may be limited by cost.
	Economic Assets	*Vulnerability:* Property values are vulnerable to high radon levels. *Impacts:* High radon levels can affect property values and delay real estate transactions. Lack of widespread mitigation may discourage investment.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Water supply and historic buildings are vulnerable to radon exposure. *Impacts:* Elevated radon may seep into natural aquifers or poorly ventilated historic buildings, compromising health and preservation efforts.
	Critical Facilities and Infrastructure	*Vulnerability:* Public buildings such as schools or city buildings are vulnerable to radon exposure. *Impacts:* Radon can collect in any structure that is exposed through the soil and does not have adequate ventilation. Schools, clinics, and municipal buildings must monitor and mitigate radon to maintain safety, especially in below-grade areas.
	Community Activities	*Vulnerability:* The risk of radon affecting community activities is low. *Impacts:* Radon doesn't typically affect activities because it is primarily a long-term exposure risk. Indoor activities may see lower attendance if health concerns about radon persist, particularly among immunocompromised residents or young families.
High Wind	People	*Vulnerability:* High wind can occur across the city, and all residents are potentially vulnerable. *Impacts:* Individuals outdoors or without adequate shelter during wind events are at risk of injury or death from flying debris or falling objects. Vulnerable populations may face increased risk due to limited mobility or lack of warning systems.
	Structures	*Vulnerability:* All structures are vulnerable to high wind, particularly those in Shadow Ridge Estates mobile home park.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerabilities and Impacts
		Impacts: Residential homes with large, flat roofs or lightweight materials may struggle to withstand strong winds. Wind can damage roofs, windows, and utility lines. Trees and debris may fall on buildings, especially in areas with aging infrastructure. Mobile homes or other structures that lack secure foundations are highly vulnerable to damage.
	Economic Assets	*Vulnerability:* All businesses are vulnerable to high wind. *Impacts:* High winds can disrupt travel, close businesses, and require costly debris removal. Extended power outages and structural repairs may lead to operational downtime and lost revenue. Businesses might have large signs and awnings that can be damaged, leading to business interruptions. Businesses without insurance may face long-term recovery challenges.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Trees, parks, and historical sites are vulnerable to high wind. *Impacts:* Strong gusts may damage vegetation and compromise historical landmarks, particularly if not structurally reinforced.
	Critical Facilities and Infrastructure	*Vulnerability:* Critical facilities and infrastructure are vulnerable to high wind. *Impacts:* High wind can damage fire and police facilities. Power lines can be knocked down and lead to power outages. Debris can block roads and disrupt emergency response. Power and communication outages can disrupt emergency response and medical care. Infrastructure such as poles, pipes, and service lines may be compromised.
	Community Activities	*Vulnerability:* Community events and recreation are vulnerable to high wind. *Impacts:* Events and gatherings, especially at outdoor venues like parks and sports fields or other recreation sites like the Olympic Oval, may be canceled due to safety concerns. Outdoor events like festivals and sporting activities may involve injury from falling debris and damaged structures.
Lightning	People	*Vulnerability:* Lightning can occur anywhere in Kearns, and all residents are potentially vulnerable. *Impacts:* Lightning can cause serious injury or death to those near a strike. Individuals caught outside during thunderstorms may be injured by lightning strikes or indirectly via fires or electrical surges. Those participating in outdoor sports and recreation activities, outdoor workers, or unhoused individuals are at higher risk.
	Structures	*Vulnerability:* All structures are vulnerable to lightning impacts. *Impacts:* Lightning can cause fires or internal damage to electrical systems in homes and public buildings.
	Economic Assets	*Vulnerability:* All Kearns businesses are vulnerable to lightning-related incidents. *Impacts:* Businesses may suffer from downtime or structural repair costs following a lightning-related incident, impacting economic stability. Lightning can damage electronic systems due to power surge.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerabilities and Impacts
	Natural, Historic, and Cultural Resources	*Vulnerability:* Parks and open spaces are vulnerable to lightning impacts. *Impacts:* Fires or surges can damage parklands and historical sites. Restoration may be expensive if funding is not available.
	Critical Facilities and Infrastructure	*Vulnerability:* Critical facilities, power infrastructure, and communication systems are vulnerable to lightning strikes. *Impacts:* Power surges or fires may interrupt critical services and lead to an increase in medical calls for injuries or burns. Communications towers attract lightning due to their height and metal structure.
	Community Activities	*Vulnerability:* Outdoor events, recreation, and sports to lightning threats. *Impacts:* Outdoor activities may be suspended or canceled during thunderstorms. Community confidence in safety protocols may influence event attendance. Events at Kearns parks and sports fields could be affected.
Severe Winter Weather	People	*Vulnerability:* Severe winter storms are common in the region and can affect the entire community. All residents are vulnerable. Snow accumulation in the Kearns area is often lower compared to areas on the East Bench of the Wasatch. *Impacts:* Severe snowstorms impact those without reliable heating or transportation. Vulnerable populations (elderly, young children, low income, unsheltered persons) may be disproportionally affected by cold, especially those who work outdoors and/or do not have access to reliable heating or if they are unable to perform snow removal. Commuting to work or essential services could be challenging if snow has not been cleared. Heavy snow can increase the risk of injuries due to slips and falls, along with illnesses and other health consequences from exposure to cold. People can be injured in car accidents while driving in severe winter weather conditions. Poor road conditions may prevent people from getting to and from work.
	Structures	*Vulnerability:* All buildings are potentially vulnerable to severe winter weather. Older or weakened structures may be more at risk. *Impacts:* Snow and ice accumulation can lead to roof collapse, frozen pipes, and weakened building materials. Older homes may have weakened roofs or inadequate insulation.
	Economic Assets	*Vulnerability:* All Kearns businesses are vulnerable to severe winter weather. *Impacts:* Cold weather can halt commerce, increase utility costs, and delay services. Local businesses may struggle with decreased vehicle movement and customer traffic.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Parks and historic structures are vulnerable to severe winter weather. *Impacts:* Snow and ice may damage vegetation and place stress on older buildings and historic structures.
	Critical Facilities and Infrastructure	*Vulnerability:* Emergency response facilities and road networks are vulnerable to severe winter weather. *Impacts:* Transportation networks such as Bangerter Highway or I-215 may become impassable during heavy snow or blizzard conditions.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerabilities and Impacts
		Utilities, such as power and water supply, may be disrupted. Delays in road clearance and increased demand on utilities can hinder emergency operations and access.
	Community Activities	*Vulnerability:* Community events *Impacts:* Activities and services may be delayed or canceled due to poor road conditions. This may affect events at the Olympic Oval or Element Event Center. Ensuring heating and shelter provisions becomes a priority.
Tornado	People	*Vulnerability:* Although tornadoes are not common, they can occur in Kearns. All residents are at risk if a tornado were to occur. *Impacts:* Tornadoes can cause serious injury or death from blowing debris, uprooted trees, and structural collapse. Individuals in mobile homes, such as Shadow Ridge Estates, or older structures that cannot withstand the strong winds of a tornado are at higher risk of injury. Evacuation may be difficult during short-notice events.
	Structures	*Vulnerability:* All homes and other structures in Kearns are vulnerable to tornado. Shadow Ridge Estates mobile homes are at high risk. *Impacts:* Tornadoes can cause complete destruction of homes, businesses, and community landmarks.
	Economic Assets	*Vulnerability*: All businesses in the path of a tornado are vulnerable. *Impacts:* Property loss and business interruptions may take months to recover from, especially for uninsured owners. A tornado can affect roads, power, and communication infrastructure, and these disruptions can also impact a business's ability to operate. Closures may lead to lost wages or layoffs, lost revenue, and interruption of supply chains.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Parks, playgrounds, and vegetation to tornado damage. *Impacts:* High winds may devastate vegetation and damage cultural assets beyond repair.
	Critical Facilities and Infrastructure	*Vulnerability:* Critical facilities and infrastructure are all vulnerable effects. *Impacts:* Emergency response facilities can be damaged by tornado winds and debris, which may affect their operations. Tornadoes can damage power lines or substations, or damage communication towers, which may further disrupt emergency response operations. Roads may be blocked by debris. Essential services and utilities may be overwhelmed by debris or outages. Road access for emergency responders may be blocked. Schools or recreational facilities with large glass windows or weak roofs are at risk.
	Community Activities	*Vulnerability:* All community events, particularly outdoor recreation, are vulnerable to tornadoes. *Impacts:* Community events and services may be postponed indefinitely if venues are damaged or perceived as unsafe.
Wildfire	People	*Vulnerability:* Kearns is not located near the undeveloped foothills. It is mostly urban, so wildfire risk is relatively low. Small brush fires may be possible in open spaces. *Impacts:* Risk to residents in Kearns is relatively low. Wildfire smoke can cause poor air quality throughout the region, and Kearns

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerabilities and Impacts
		residents, particularly those with respiratory conditions, may be affected by wildfires occurring elsewhere.
	Structures	*Vulnerability:* Risk to structures in Kearns from wildfire is low. *Impacts:* A few buildings could be affected if a wildfire were to break out in an undeveloped open lot or park.
	Economic Assets	*Vulnerability:* Direct risk to businesses in Kearns from wildfire is low. *Impacts:* Although Kearns does not have businesses near a wildland urban interface, businesses may experience indirect disruptions if a large fire occurs elsewhere in the county. It could impact transportation routes, power supply, or supply chains. Fires may disrupt commerce, damage service sectors, and result in costly insurance claims or uninsured losses.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Vegetation and parks are vulnerable to wildfire. *Impacts:* Fires may destroy vegetation, wildlife habitats, and historic landmarks. Recovery may take years.
	Critical Facilities and Infrastructure	*Vulnerability:* Power lines and water delivery systems may be threatened by wildfire. *Impacts:* Power or water facilities outside Kearns could be affected by wildfire, disrupting services to the city. Emergency responders from Kearns may be needed for support and may become overloaded.
	Community Activities	*Vulnerability:* Outdoor events are vulnerable to wildfire impacts. *Impacts:* Outdoor gatherings may be restricted or have limited visitation due to wildfire smoke. Seasonal programming may shift or be canceled due to increased wildfire risk.
Dam Failure	People	N/A – Dam failure is not a concern in the City of Kearns.
Civil Disturbance	People	Public unrest can strain emergency services and expose residents to injury or disruption in services.
	Structures	Businesses and public buildings may suffer damage or vandalism.
	Economic Assets	Perception of unrest may reduce investment and deter visitors. Cleanup and security measures may be costly.
	Natural, Historic, and Cultural Resources	Historic districts may be targeted or unintentionally damaged. Recovery may be delayed if funding is limited.
	Critical Facilities and Infrastructure	Emergency access and communications may be compromised during a large-scale disturbance.
	Community Activities	Public events may be canceled due to safety concerns. Community morale and participation may decline.
Cyberattack	People	Vulnerable populations may be disproportionately affected by loss of digital services, especially in medical or financial systems.
	Structures	Security systems and building automation may be compromised, risking physical safety or infrastructure failure.
	Economic Assets	Digital disruptions can delay payroll, billing, and commercial transactions, affecting local economic stability.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerabilities and Impacts
	Natural, Historic, and Cultural Resources	Data loss or infrastructure manipulation may lead to unintentional environmental impacts or failure in preservation systems.
	Critical Facilities and Infrastructure	Water, power, and emergency systems may be disabled or delayed by ransomware or data breaches.
	Community Activities	Community trust may erode if systems managing public events, utilities, or emergency communications are breached.
Hazardous Materials Incident (Transporta-tion & Fixed Facility)	People	With freight rail lines nearby, Kearns residents face risk of exposure in the event of a spill or derailment.
	Structures	Hazmat incidents may require shelter-in-place or evacuation orders. Exposure could damage structural integrity.
	Economic Assets	Local businesses may close temporarily due to contamination risk or cleanup operations.
	Natural, Historic, and Cultural Resources	Flora, fauna, and water quality may suffer. Cultural landmarks may require remediation if affected.
	Critical Facilities and Infrastructure	Emergency access and utilities may be restricted. Hospitals and response teams may face surge capacity.
	Community Activities	The Olympic Oval or nearby public facilities may close or require sanitization, delaying events.
Public Health Epidemic/ Pandemic	People	Contagious disease outbreaks impact all residents, but elderly, immunocompromised, and low-income individuals face the greatest risks.
	Structures	Temporary medical or quarantine structures may be needed if healthcare facilities are overwhelmed.
	Economic Assets	Illness outbreaks disrupt the workforce, commerce, and supply chains, impacting local business operations.
	Natural, Historic, and Cultural Resources	Outdoor spaces may be used more frequently, while access to indoor sites may decline.
	Critical Facilities and Infrastructure	Medical centers may reach capacity, and staffing shortfalls may affect essential services.
	Community Activities	Events may be canceled or modified for distancing and health protocols. Public participation may drop due to fear or illness.
Terrorism	People	An intentional attack can lead to significant casualties, fear, and disruption of daily life. Residents may avoid public places post-incident.
	Structures	Explosive or targeted attacks can cause major structural damage and long-term closures.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerabilities and Impacts
	Economic Assets	The perception of risk may deter investment and tourism. Recovery costs can be substantial, especially for uninsured entities.
	Natural, Historic, and Cultural Resources	Cultural landmarks and historic buildings may be targets or suffer collateral damage.
	Critical Facilities and Infrastructure	Water, power, or emergency systems may be direct targets. Response coordination may be strained.
	Community Activities	Community events may be canceled or permanently relocated due to perceived risk. The Olympic Oval and future Olympic events are high-profile vulnerabilities.

Hazards Not Profiled

Avalanche and dam failure are not profiled for the City of Kearns. The terrain in Kearns is relatively level and not conducive to avalanche, and no previous avalanches have occurred there. No high or significant hazard dams are located in Kearns and no dam inundation boundaries intersect the city.

Jurisdiction-Specific Changes in Vulnerability

Hazard events can impact communities, infrastructures, and ecosystems. The severity of these impacts can be influenced by climate change, population patterns, and land use developments. Understanding these factors is crucial for the city of Kearns to develop a resilient community and minimize the impacts of hazards.

Table 11 displays the unique changes within the community and the related effects on each identified hazard affecting the city of Kearns.

Table 11: Jurisdiction-Specific Changes in Vulnerability in the City of Kearns

Type of Hazard Event	Description of Potential Impacts	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
Avalanche	N/A	N/A	N/A	N/A	N/A
Drought	Public health due to water rationing, loss/damage to green/natural spaces	Extreme/ unusual weather, air/water/soil quality issues, increased snowpack melt	Local restaurants or grocery stores may need to get their groceries from areas that are farther away.	Growth in subdivisions and commercial facilities has put increased strain on water supply. In 2023, a new water line, called Zone E Loop 6600 South, was	Increased due to climate change

Type of Hazard Event	Description of Potential Impacts	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
				built to provide Kearns more access to water sources.	
Earthquake	Residencial building collapse, given age and unreinforced masonry. Lack of proper maintenance to some structures	Extreme or unusual weather patterns, increased greenhouse gas emissions, and rising sea levels can trigger seismic activity on fault lines.	The population may not feel safe and could choose to live in other areas.	New buildings and infrastructure are built to current building codes providing increased protection from earthquake damage.	Same
Extreme Heat	Public health, water rationing, medical surge, reduction in outdoor activities	Extreme/unusual weather, increased snowpack melt, drought conditions, air/water/soil quality issues	Outdoor workers may need more frequent breaks and adequate shade. Outdoor activities may be reduced, and community events would be canceled, unless restrooms, shade, first aid, and water are guaranteed.	Increased density from new buildings increases extreme heat due to the urban heat island effect.	Increased due to climate change
Extreme Cold	Public health, sheltering needs, transportation issues, access to essential services, warming costs	Extreme/unusual weather	People may struggle to pay heating bills or access essential services, especially if they cannot start their cars or get to public transportation.	During extreme cold events, more buildings running heat mean more stress on the electrical grid.	Increased due to climate change
Flooding	Transportation interruptions, road closures, medical surges, access to essential services	Extreme/unusual weather, ecosystem disruptions, water/soil/air quality	Flooding would significantly impact those with access and functional needs.	More impervious surfaces from residences and commercial facilities increase pluvial flooding across Kearns.	Increased due to climate change

DRAFT

Type of Hazard Event	Description of Potential Impacts	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
				To counteract this, Kearns has instituted conservation landscaping across the city. These include Paul F. Walker 9-11 Memorial Park and KID Office Tank Landscaping.	
Landslide/ Slope Failure	Access to essential services, road closures, debris management, medical surges	Air, water and soil quality issues from the debris	Local businesses or homes may not be able to recover if they don't have funds or an insurance policy.	New development in Kearns has not increased risk of landslides.	Increased due to climate change
Radon	Public health	Air, water, and soil quality issues	People may choose to live in other areas if there are high radon levels in Kearns.	New development in Kearns has not increased risk of radon.	Same
Heavy Rain	Public safety and infrastructure, medical surge, access to essential services	Extreme/unusual weather, flooding, increased snowpack melt, ecosystem damage	Heavy rain could delay essential services like police and fire response.	More impervious surfaces from residences and commercial facilities increase pluvial flooding across Kearns. To counteract this, Kearns has instituted conservation landscaping across the city. These include Paul F. Walker 9-11 Memorial Park and KID Office Tank Landscaping.	Increased due to climate change
High Wind	Public safety and infrastructure,	Extreme/unusual weather, increased	People can get injured, or their homes can have	New development in Kearns has not	Increased due to

DRAFT

Type of Hazard Event	Description of Potential Impacts	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	debris management, medical surge, access to essential services	precipitation, soil/water/air quality issues	extensive damage in a high wind event.	increased the risk of high winds.	climate change
Lightning	Public safety and infrastructure, medical surge	Extreme/unusual weather, increased wildfire risk	If there are a lot of lightning events in the same area, it can lead to a medical surge. People may choose to move to a different part of the county.	New development in Kearns has not increased the risk of radon.	Increased due to climate change
Severe Winter Weather	Public health and transportation interruptions, access to essential services, road closures	Extreme/unusual weather	People commuting to and from work might have transportation challenges. It can lead to a medical surge if there are a lot of traffic fatalities or falls.	Increased development requires the city of Kearns to plow and provide evacuation during heavy snow.	Increased due to climate change
Tornado	Medical surge, debris management, access to essential services	Air, water, and soil quality issues	Potential injuries and fatalities from a tornado event	Increased development means that more structures are at risk of damage from hurricanes.	Same
Wildfire	Public safety and infrastructure, access to essential services, medical surge, sheltering needs	Extreme/unusual weather, air/water/soil quality issues	Those with access and functional needs will have to seek shelter or know how to get assistance.	New development has not increased the risk of wildfire.	Increased due to climate change
Dam Failure	N/A	N/A	N/A	N/A	N/A

DRAFT

Type of Hazard Event	Description of Potential Impacts	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
Civil Disturbance	Public safety and infrastructure, medical surge	N/A	Social media can impact the likelihood of civil disturbances, potentially inciting violence.	New development has not increased the risk of civil disturbance.	Same
Cyberattack	Public safety and infrastructure (digital), access to essential services, traffic jams or accidents	N/A	Physical security access is a concern if hackers can get into security systems and let themselves in.	New development has not increased the risk of cyberattacks.	Same
Hazardous Materials Incident (Transporta-tion & Fixed Facility)	Train derailment or other transportation accident with hazardous chemicals, public safety and infrastructure	Soil, water, and air quality issues	Local businesses could suffer if customers cannot access them. Those with access and functional needs could compromise their health, depending on the hazardous materials.	New development has not increased the risk of a hazardous materials incident.	Same
Public Health Epidemic/ Pandemic	Public health and economic damage, social distancing measures	Air, water, and soil quality issues	Socially vulnerable groups are most at risk, especially if certain businesses or residents don't abide by recommended health protocols.	New development has not increased the risk of pandemics or epidemics.	Same
Terrorism	Public safety and infrastructure, medical surge, access to essential services	N/A	There is potential for a medical surge, which would overwhelm local resources.	New development has not increased the risk of terrorism.	Same

DRAFT

Additional Public Involvement

The city of Kearns provided several opportunities for public participation. Figure 1 and Figure 2 are examples of public outreach efforts.

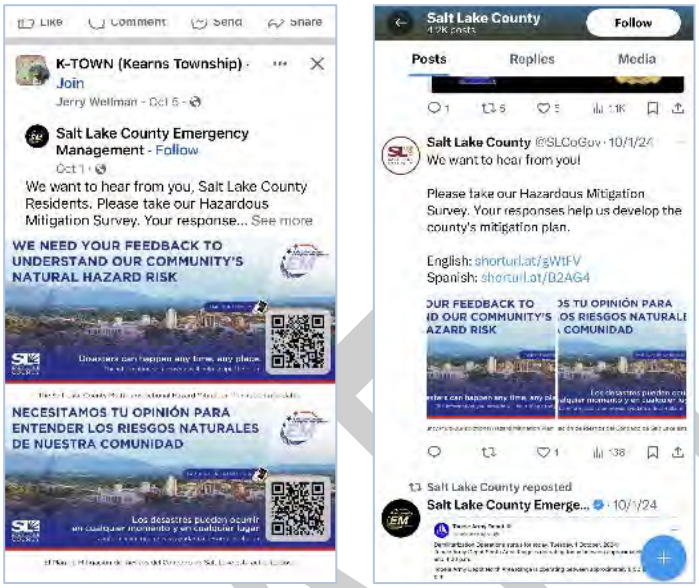

Figure 1: Social Media Posts for the Hazard Mitigation Survey

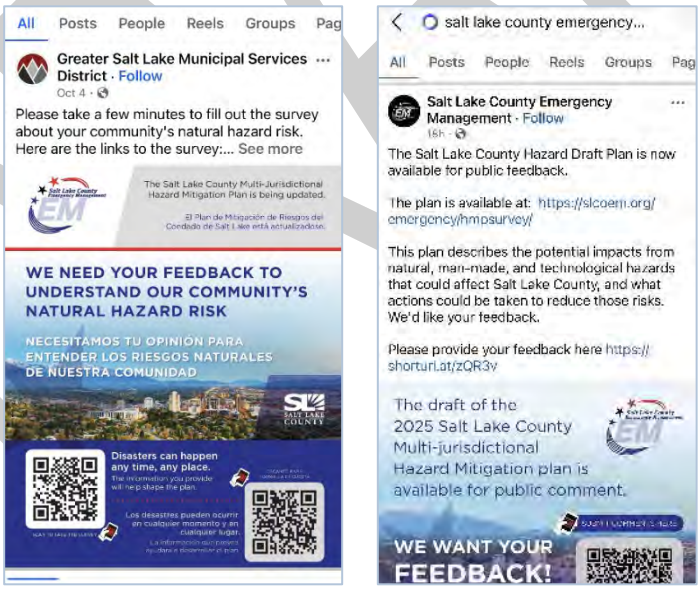

Figure 2: Social Media Posts for the Hazard Mitigation Survey (*left*) and Hazard Draft Plan Review (*right*)

Plan Integration

Incorporating the underlying principles of the Hazard Mitigation Plan and its recommendations into other plans is a highly effective and low-cost way to expand their influence. All plan participants will use existing

methods and programs to implement hazard mitigation actions where possible. As previously stated, mitigation is most successful when it is incorporated into the day-to-day functions and priorities of government and public service. This plan builds on the momentum developed through previous and related planning efforts and mitigation programs, and it recommends implementing actions where possible through these other program mechanisms. These existing mechanisms include the following:

- Regularity Capabilities
- Administrative Capabilities
- Fiscal Capabilities

Respective planning stakeholders will conduct implementation and incorporation into existing planning mechanisms and will be done through the routine actions of:

- Monitoring other planning/program agendas
- Attending other planning/program meetings
- Participating in other planning processes; and
- Monitoring community budget meetings for other community program opportunities.

The successful implementation of this plan will require constant and vigilant review of existing plans and programs for coordination and multi-objective opportunities that promote a safe, sustainable community. Regular efforts should be made to monitor the progress of mitigation actions implemented through other planning mechanisms. Where appropriate, priority actions should be incorporated into planning updates. Table 12 lists existing planning mechanisms in which the Hazard Mitigation Plan has been integrated. Table 13 lists the opportunities for integrating elements of this plan into other plans

Table 12: Integration of Previous Plans by the City of Kearns

Plan	Description
Stormwater Management Plan	Overview of stormwater management efforts for Kearns
General Plan	Overview of strategies and goals for Kearns

Table 13: Opportunities for Integration with Future Plans of the City of Kearns

Plan	Description
Master Transportation Plan	Findings from population growth and transportation needs
Active Transportation Plan	Community feedback on alternative travel methods like biking and walking
Moderate Income Housing Plan	Overview of community demographics and housing needs for Kearns

Capability Assessment

Local mitigation capabilities are existing authorities, policies, programs, and resources that reduce hazard impacts or could help carry out hazard mitigation activities.

Planning and Regulatory Capabilities

Planning and regulatory capabilities are the plans, policies, codes, and ordinances that prevent and reduce the impacts of hazards.

Table 14: Assessment of the Planning Capabilities of the City of Kearns[3]

Plan	Does it address hazards? (Y/N)	How can it be used to implement mitigation actions?	When was the last update? When is the next update?
General Plan	Y	General plan can inform the future of Kearns, which can be incorporated into mitigation actions.	2020
Capital Improvement Plan	Y – in General Plan	Can inform mitigation actions as far as funding sources and the department overseeing the work.	2020
Climate Change Adaptation Plan	N	N/A	N/A
Community Wildfire Protection Plan	Y	CWPP references wildfire mitigation.	2021
Economic Development Plan	Y – Referenced in General Plan	Can inform funding sources for mitigation actions	202
Land Use Plan	Y – Referenced in General Plan	Can inform mitigation actions.	2020.
Local Emergency Operations Plan	Y	Kearns adopted the MSD's plan in 2020. MSD converted its EOP to a CEMP, which was adopted in February 2025.	2025
Stormwater Management Plan	Y	Adopted the MSD's plan and could be incorporated into mitigation actions for flooding.	2020
Transportation Plan	Y	Active Transportation Plan can inform mitigation actions.	2023
Substantial Damage Plan	N	N/A	N/A
Other? (Describe)

DRAFT

Table 15: Assessment of the Regulations and Ordinances of the City of Kearns

Regulation/Ordinance	Does it effectively reduce hazard impacts?	Is it adequately administered and enforced?	When was the last update? When is the next update?
Building Code	Building codes inform how structures are built to standard and brought up to code when remodeling occurs. Kearns has several commercial buildings. Kearns has adopted the state versions of the International Building Code (IBC 2021) and International Residential Code (IRC 2021) with amendments.	Y	2001
Flood Insurance Rate Maps	Y – Kearns does not have flood hazard areas, but it is still vulnerable to flooding from surrounding jurisdictions.	Y	2023
Floodplain Ordinance	Y – This is part of the zoning ordinance updated in 2023	Y	2023
Subdivision Ordinance	Y	Y	2024
Zoning Ordinance	Y	Y	2023
Natural Hazard-Specific Ordinance (Stormwater, Steep Slope, Wildfire)	No steep slope concern in Kearns. Ordinances concerning the obstruction of stormwater along with permit applications not interfering with the safe disposal of natural stormwaters/ floodwaters. A Storm Water Pollution Prevention Plan is required for land disturbance permits. Kearns has floodplain hazard regulations and geological hazard regulations.	Y	2023
Acquisition of Land for Open Space and Public Recreation Use	Kearns is built out to its boundaries in all directions. New growth occurs only when land is rezoned or repurposed.	Y	2023
Prohibition of Building in At-Risk Areas	Y	Y	2023
Other? (Describe)			

Administrative and Technical Capabilities

Administrative and technical capabilities include staff and their skills. They also include tools that can help carry out mitigation actions.

Table 16: Assessment of the Administrative Capabilities of the City of Kearns

Administrative Capability	In Place? (Y/N)	Is staffing adequate?	Are staff trained on hazards and mitigation?	Is coordination between agencies and staff effective?
Chief Building Official	Y – MSD	Need more building inspectors.	Yes, but more training is always good.	Yes
Civil Engineer	Y – MSD	Yes	Yes, but more training is always good.	Yes
Community Planner	Y – MSD	Yes	Yes, but more training is always good.	Yes
Emergency Manager (EM)	Y	No, need designated full-time EM.	Yes, but more training is always good.	Yes
Floodplain Administrator	Y – MSD	Yes	Yes, but more training is always good.	Yes
Geographic Information System (GIS) Coordinator	Y – MSD	Yes	Yes, but more training is always good.	Yes
Planning Commission	Y	Yes	Yes, but more training is always good.	Yes
Fire Safe Council	N – The Unified Fire Authority (UFA) controls fire service.	N/A	N/A	Yes
CERT (Community Emergency Response Team)	N	N/A	N/A	N/A
Active VOAD (Voluntary Agencies Active in Disasters)	Y	Yes	Yes, but more training is always good.	Yes
Other? (Please describe.)				

DRAFT

Table 17: Assessment of the Technical Capabilities of the City of Kearns[4]

Technical Capability	In Place? (Y/N)	How has it been used to assess/mitigate risk in the past?	How can it be used to assess/mitigate risk in the future?
Mitigation Grant Writing	Yes – MSD	Not used yet. Kearns is part of the MSD, Kearns just became a city on May 1, 2024. All services are currently contracted out through UFA, UPD, the MSD, or Salt Lake County.	Can be used to apply for grant funding to complete mitigation work.
Hazard Data and Information	Yes – MSD	Was used to identify known risks and areas of concern.	Can help with project tracking and identifying areas to prioritize for mitigation actions.
GIS	Yes – MSD	Was used to map out known hazards and identify areas of concern. GIS was also used to collect damage assessment information after the 2020 earthquake.	Can help with project tracking and identifying areas to prioritize for mitigation actions.
Mutual Aid Agreements	Yes – MSD & Salt Lake County	Mutual aid agreements for sheltering, damage assessments, public works (debris removal, snow removal)	Mutual aid can be used to prioritize mitigation efforts.
Other? (Please describe.)			

Financial Capabilities

Financial capabilities are the resources to fund mitigation actions. Talking about funding and financial capabilities is important to determine what kinds of projects are feasible, given their cost. Mitigation actions like outreach programs are lower cost and often use staff time and existing budgets. Other actions, such as earthquake retrofits, could require substantial funding from local, state, and federal partners. Partnerships, including those willing to donate land, supplies, in-kind matches, and cash, can be included.

Table 18: Assessment of the Financial Capabilities of the City of Kearns

Funding Resource	In Place? (Y/N)	Has this funding resource been used in the past and for what types of activities?	Could this resource be used to fund future mitigation actions?	Can this be used as the local cost match for a federal grant?
Capital Improvement Project Funding	Y	Yes, storm drain and water management	Yes	Yes
General Funds	Y	Yes	Yes	Yes

[4] UFA = Unified Fire Authority, UPD = Unified Police Department, MSD = Municipal Services District

Funding Resource	In Place? (Y/N)	Has this funding resource been used in the past and for what types of activities?	Could this resource be used to fund future mitigation actions?	Can this be used as the local cost match for a federal grant?
Hazard Mitigation Grant Program (HMGP/404)	N	No, could be used.	No	No
Building Resilient Infrastructure & Communities (BRIC)	N	No, could be used.	No	No
Flood Mitigation Assistance (FMA)	N	No, could be used.	No	No
Public Assistance Mitigation (PA Mitigation/406)	N	No, could be used.	No	No
Community Development Block Grant (CDBG)	Y	Developed interlocal agreement with CDBG and Emergency Solutions Grant Program.	No	No
Natural Resources Conservation Services (NRCS) Programs	N	No, could be used.	No	No
U.S. Army Corps (USACE) Programs	N	No, could be used.	No	No
Property, Sales, Income, or Special Purpose Taxes	Y	Yes, capital improvement projects	No	No
Stormwater Utility Fee	Y	Yes, Stormwater management	Yes	Yes
Fees for Water, Sewer, Gas, or Electric Services	Y	Yes, stormwater maintenance	Yes	Yes
Impact Fees from New Development and Redevelopment	Y	Code enforcement	Yes	Yes
General Obligation or Special Purpose Bonds	Y	Stormwater management	Yes	Yes
Federal-funded Programs (Please describe)	Y	No, could be used	No	No
Private Sector or Nonprofit Programs	N	No, could be used	Yes	Yes
Other?	Y	Small Business Impact Grant for COVID-19 business owners.	Yes	No

DRAFT

Education and Outreach Capabilities

Education and outreach capabilities are programs and methods that could communicate about and encourage risk reduction. These programs may be run by a participant or a community-based partner. Partners, especially those who work with underserved communities, can help identify additional education and outreach capabilities.

Table 19: Assessment of the Education and Outreach Capabilities of the City of Kearns[5]

Education and Outreach Capability	In Place? (Y/N)	Does it currently incorporate hazard mitigation?	Could it be used to support mitigation in the future?
Community Newsletter(s)	Y	Y	Y
Hazard Awareness Campaigns (such as Firewise, Storm Ready, Severe Weather Awareness Week, School Programs)	Y – through UFA and SLCo EM	Y	Y
Public Meetings/Events (Please describe.)	Y – City council meetings are open to the public at the library.	Y	Y
Emergency Management Listserv	Y	Y	Y
Local News	Y	Y	Y
Distributing Hard Copies of Notices (e.g., public libraries, door-to-door outreach)	Y	Y	Y

Organizations that Represent, Advocate for, or Interact with Underserved and Vulnerable Communities (Please describe.)	Y	Y	Y
Social Media (Please describe.)	Y	Y	Y
Other? (Please describe.)			

Opportunities to Expand and/or Improve Capabilities

Actions that can expand and improve existing authorities, plans, policies, and resources for mitigation include budgeting for mitigation actions, passing policies and procedures for mitigation actions, adopting and implementing stricter mitigation regulations, approving mitigation updates, and making additions to existing plans as new needs are recognized. Table 20 lists the opportunities for the city of Kearns.

[5] UFA = Unified Fire Authority, MSD = Municipal Services District

Table 20: Opportunities to Expand and/or Improve the Capabilities of the City of Kearns[6]

Capability	Opportunity to Expand and/or Improve
Planning and Regulation	Kearns is part of the MSD, and it just became a city on May 3, 2024, so it is now building out a city leadership team. All services are currently contracted out to UPD, UFA, the MSD, or Salt Lake County. As it moves forward, the city must decide if it wants to continue those contracts or start its own. For example, Kearns can evaluate the MSD CEMP and Stormwater Management Plan and determine if all risk is effectively incorporated or if additional local input should be integrated.
Administrative and Technical	Kearns is part of the MSD, and it just became a city on May 3, 2024, so it is now building out a city leadership team. All services are currently contracted out to UPD, UFA, the MSD, or Salt Lake County. As it moves forward, the city must decide if it wants to continue those contracts or start its own. For example, Kearns could acquire additional mitigation grant writing support. The city could seek additional support such as through federal or state direct technical assistance programs for mitigation grants to expand these grant writing capabilities.
Financial	As of this writing, the city's budget is still in development. Adding mitigation actions to the budget would increase the likelihood of their implementation. Additionally, the city could apply for new Hazard Mitigation Assistance (HMA) grants.
Education and Outreach	Kearns is part of the MSD, and it just became a city on May 3, 2024, so it is now building out a city leadership team. All services are currently contracted out to UPD, UFA, the MSD, or Salt Lake County. As it moves forward, the city must decide if it wants to continue those contracts or start its own. UPD, UFA, and Salt Lake County have community outreach programs. Kearns can explore what kinds of programs would be best handled at the County level, versus what kind of educational activities for hazard mitigation such as public meetings or social media posts, could be handled at the local level. Kearns can continue to engage in preparedness activities and incident response training to improve overall readiness and community resilience.

Mitigation Strategy

Mitigation strategies provide proactive measures that are designed to minimize the impacts of hazards on the city of Kearns. Table 21 shows mitigation action alternatives, and Table 22 shows the status of previous mitigation activities. Table 23 is the 2025 mitigation action plan for the city of Kearns.

Table 21: Mitigation Action Alternatives for the City of Kearns

Action	Type of Action	Selected for inclusion in the plan?	If not selected, why not?
Continue social media engagement.	Education and Awareness Programs	Y	
Adopt new building codes as they are approved to bring some existing structures up to current codes.	Structure and Infrastructure Projects	N	Refined this to address code enforcement for specific hazards.

[6] CEMP = Comprehensive Emergency Management Plan, HMA = Hazard Mitigation Assistance, MSD = Municipal Services District UFA = Unified Fire Authority, UPD = Unified Police Department.

DRAFT

Table 22: Status of Prior Mitigation Actions of the City of Kearns[7]

Action	Hazard(s)	Agency Lead	Support Agency(ies)	Status Update
Asbestos removal	Public Health, Hazardous Materials Release	UDEQ	Kearns	Ongoing – Community health programming to abate asbestos in homes
Seismic retrofitting.	Earthquake	Kearns	MSD	Ongoing.
Fireline along the railroad tracks to mitigate wildfires from occurring and affecting nearby neighborhoods.	Wildfire	Union Pacific Railroad	Kearns	Ongoing discussion – land maintenance.
Procure and install an emergency notification system.	All hazards	Kearns	SLCo EM	Complete.
Create an Emergency Operations Plan.	All hazards	Kearns	MSD	Complete.
The bridge at 4015 W lacks load capacity for emergency services vehicles and needs to be replaced or retrofitted. This is an important roadway that connects many communities in the county.	All hazards; Flooding, Winter Storms, Severe Thunderstorms	Kearns	Taylorsville	Incomplete – 4015 W Bridge is being replaced by Kearns in 2024/2025.

Magna City Annex

To participate in this multi-jurisdictional hazard mitigation plan (MJHMP) update for Salt Lake County (SLCo), the governing body of Magna City passed a formal resolution, a copy of which is maintained at the local government offices.

Planning Process Contact Information

Table 1 provides information on the point of contact during the updating of the MJHMP.

Table 1: Contact Information for Magna City

Name	Contact Information
Madison Warner	**Phone:** 801-971-4977; **email:** mwarner@unifiedfire.org

Magna City has a fully integrated approach to hazard mitigation planning and program implementation. During the 2024 update process, the MJHMP participation roles in Table 2 were recorded.

Table 2: Participant List for the Magna City

Name	Title	Jurisdiction
Madison Warner	Municipal Emergency Planner	Unified Fire Authority/Salt Lake County Emergency Management
Audrey Pierce	Mayor Pro Tem	Magna City

Jurisdiction Profile

Date of Incorporation

Magna became a metro township in January 2017 then converted to a city on May 1, 2024.

Location and Description

Magna City is located southwest of Salt Lake City. The city is approximately 37.4 square miles in area and is approximately 4,250 feet above sea level. The city's development has been significantly influenced by its historical connection to the copper mining industry. The city maintains a small town appeal with notable landmarks, such as the Empress Theatre and Please Green Cemetery, that reflect Magna's rich history.

Population

The 2022 American Community Survey 5-Year Estimate from the U.S. Census Bureau records the population of Magna City as 29,488 people.

DRAFT

Demographics

Most of the 1,465 people are between the ages of 35 and 34, with a median age of 32.5; 15,239 are males (51.7%) and 14,249 are females (48.3%). English is the primary language in 71.3% of homes,, with 23.7% Spanish, and 5% other languages.

Brief History

Magna City has a rich history rooted in the mining industry. Founded in the early 1900s, Magna quickly became known for its copper mining and processing as it became a community for workers of the Utah Copper Company. The city's name is derived from the Latin word meaning "great" or "large," reflecting the significant copper deposits found in the area. As mining operations expanded, Magna City attracted a diverse population seeking employment opportunities. The city has preserved its historical heritage, and today Magna City offers a blend of historical charm and modern amenities.

Climate

Magna City experiences a cold semi-arid climate (Bsk Köppen classification) characterized by hot, dry summers and cold winters with moderate precipitation. Average high temperatures are approximately 92°F in the summer and approximately 23°F in the winter. Rain each year is approximately 15.4 inches, and snowfall averaged 52 inches.

Public Services

Magna City offers a wide range of public services through the Greater Salt Lake Municipal Services District (MSD). The MSD provides staffing and administrative support and other services and handles planning and zoning, business licensing, code enforcement, inspections, emergency planning, and related municipal services. Public works services are contracted with SLCo Public Works, which encompasses the construction and maintenance of roads, snow removal, and street lighting.

Governing Body

The Magna City governing body consists of a Mayor and City Council, and it has an appointed City Manager.

Development Trends

The city recently approved its first General Plan since incorporating as a metro township in 2017. This plan guides the future of planning and development in Magna, focusing on key elements, such as land use, transportation, housing, economic development, parks, trails, recreation, open space, natural hazards, community facilities, and sustainability. Magna converted from a metro township to a city on May 1, 2024.

DRAFT

Jurisdiction-Specific Hazards and Risk

The Calculated Priority Risk Index (CPRI) is a comprehensive assessment tool for evaluating and prioritizing risks in a given context. It considers various factors, such as probability, impact, and urgency, to determine the level of risk associated with events or situations. The results for each hazard, including its risk factor (RF) value, are shown in Table 3. The results are based on the criteria in

Table 4 and the equation that follows it. The CPRI helps organizations and individuals make informed decisions about risk management and mitigation strategies. It provides a systematic approach to identifying and addressing potential issues, allowing for a more efficient allocation of resources and proactive risk prevention. With the CPRI, stakeholders can prioritize their focus on the most critical risks, leading to more effective risk management and, ultimately, better outcomes.

Table 3: Calculated Priority Risk Index Values for Magna City

Type of Hazard Event	Probability of Future Events	Spatial Extent	Severity of Life/ Property Impact	Warning Time	Duration	Response Capacity	Risk Factor Value
Avalanche	2	2	1	4	1	1	1.7
Drought	3	4	2	1	4	2	2.6
Earthquake	3	4	4	4	4	3	3.6
Extreme Heat	3	4	3	1	4	2	2.9
Extreme Cold	2	4	2	1	3	1	2.1
Flooding	2	1	2	2	3	3	2.1
Landslide/ Slope Failure	2	1	1	0	4	1	1.5
Radon	4	3	3	1	4	1	3
Heavy Rain	3	3	2	3	1	1	2.3
High Wind	2	3	2	1	1	2	1.9
Lightning	3	1	1	1	1	3	1.8
Severe Winter Weather	3	4	2	1	3	2	2.5
Tornado	1	1	3	4	1	1	1.9
Wildfire	2	1	1	4	4	1	1.9
Dam Failure	2	2	2	3	3	3	2.3
Civil Disturbance	3	1	2	3	4	1	2.4
Cyberattack	3	3	2	4	4	3	2.9
Hazardous Materials Incident (Transportation & Fixed Facility)	4	2	2	4	4	3	3.1

DRAFT

Type of Hazard Event	Probability of Future Events	Spatial Extent	Severity of Life/ Property Impact	Warning Time	Duration	Response Capacity	Risk Factor Value
Public Health Epidemic-Pandemic	2	4	3	1	4	2	2.6
Terrorism	1	3	4	4	3	4	2.9

Table 4: Criteria for the Calculated Priority Risk Index

Risk Index Factor	Degree of Risk Level		Criteria	Factor Weight for Degree of Risk Level
Probability of Future Events	1	Unlikely	Less than 1 percent probability of occurrence in the next year or a recurrence interval of greater than every 100 years.	30%
	2	Occasional	1 to 10 percent probability of occurrence in the next year or a recurrence interval of 11 to 100 years.	
	3	Likely	11 to 90 percent probability of occurrence in the next year or a recurrence interval of 1 to 10 years.	
	4	Highly Likely	91 to 100 percent probability of occurrence in the next year or a recurrence interval of less than 1 year.	
Spatial Extent	1	Limited	Less than 10% of the planning area could be impacted.	10%
	2	Small	10%–25% of the planning area could be impacted	
	3	Significant	25%–50% of the planning area could be impacted.	
	4	Extensive	50%–100% of the planning area could be impacted.	
Severity of Life/Property Impact	1	Negligible	Less than 5% of the affected area's critical and non-critical facilities and structures are damaged/ destroyed. Only minor property damage and minimal disruption of life. Temporary shutdown of critical facilities.	30%
	2	Limited	More than 5% and less than 25% percent of property in the affected area is damaged/ destroyed. Complete shutdown of critical facilities for more than one day but less than one week.	
	3	Critical	More than 25% and less than 50% of property in the affected area was damaged/ destroyed. Complete shutdown of critical facilities for over a week but less than one month.	
	4	Catastrophic	Over 50% of critical and non-critical facilities and infrastructures in the affected area are damaged/	

DRAFT

Risk Index Factor	Degree of Risk Level		Criteria	Factor Weight for Degree of Risk Level
			destroyed. Complete shutdown of critical facilities for more than one month.	
Warning Time	1	Self-defined	More than 24 hours	10%
	2	Self-defined	12 to 24 hours.	
	3	Self-defined	6 to 12 hours.	
	4	Self-defined	Less than 6 hours.	
Duration	1	Brief	Up to 6 hours.	10%
	2	Intermediate	Up to one day.	
	3	Extended	Up to one week.	
	4	Prolonged	More than one week.	
Response Capacity	1	High	Significant resources and capability to respond to this kind of event; staff are trained, experienced, and ready.	10%
	2	Medium	Some resources and capability to respond to this kind of staff; some staff may be trained, experienced, and ready while others may need additional support.	
	3	Low	Limited resources and capability to respond to this kind of event; additional staff or staff training needed.	
	4	None	No resources and capability to respond this kind of event; additional outside support would be required.	

RISK FACTOR (RF) EQUATION

RF Value = [(Probability x 0.30) + (Spatial Extent x 0.10) + (Severity of Life/Property Impact x 0.30) + (Warning Time x 0.10) + (Duration x 0.10) + (Response Capacity x 0.10)]

Hazards with an RF value greater than or equal to 2.5 are considered high risk. Those with RF values of 2.0 to 2.4 are considered moderate risk hazards, and those with an RF value less than 2.0 are considered low risk. The highest possible RF value is 4.

Hazard Event History

Examining hazard event histories provides valuable insights to inform decision-making and help prioritize resources for risk prevention and response efforts. Table 5 lists the hazard events impacting the city of Magna since the 2019 plan update, as recorded in the Storm Events Database from the National Centers for Environmental Information.

DRAFT

Table 5: History of Hazard Events in Magna City

Type of Hazard Event	FEMA Disaster #	Date(s)	Damage or Impacts	Description
Avalanche	N/A	N/A	N/A	N/A
Drought	N/A	1930s: The Great Salt Lake and streams experienced low water levels 1950s–1960s: The Great Salt Lake experienced even lower water levels than the 1930s. 2020: Utah experienced its driest year on record, with record dry soils and low snowpack. 2021: The Great Salt Lake reached an all-time record low due to a drought.	Air quality issues, potential for greater ecosystem collapse (local vegetation/ birds), decreased precipitation, decreased brine fly and shrimp populations	The entire county has had a historic drought risk.
Earthquake	DR-4548-UT	5.7 Earthquake was felt March 2020 1962 Magna M 5.2 earthquake and the 1992 Western Traverse Mountains M 4.2 earthquake (Christensen, 1992; University of Utah Seismograph Stations, 2010a; figure 3).	Some structural damage was reported. Walls were cracked, plaster was knocked off, and lead paint dust was released. Some buildings suffered wall failure. The Greater Salt Lake Municipal Services District, which includes Magna, received 219 damage reports online.	The Wasatch Fault is considered overdue for a major earthquake, with a 57% chance of a 6.0 M or greater earthquake occurring in the next 50 years. There is still concern about the stability of Rio Tinto's tailings pond.
Extreme Heat	N/A	Summers of 2020, 2021, 2022, 2023, 2024	Reported 9 deaths in Northern Utah, an upward trend in heat exposure and heat-related deaths since 2015. Excessive heat can also affect infrastructure.	
Extreme Cold	N/A	Winter of 2022 & 2023	Code Blue alerts impacted the city, with vulnerable groups needing shelter from the cold.	Eastbound traffic was restricted.

DRAFT

Type of Hazard Event	FEMA Disaster #	Date(s)	Damage or Impacts	Description
Flooding	N/A	April 27, 2024	Flooding on State Route 201	Rated Minor residential and Minimal commercial
Landslide/ Slope Failure	N/A	N/A	N/A	N/A
Radon	N/A	N/A	N/A	Radon is a concern in Magna due to its proximity to Bingham Canyon Mine & high levels in other nearby areas.
Heavy Rain	N/A	N/A	N/A	There have been some significant rains, but no major damage associated.
High Wind	DR-4578-UT	September 7, 2020	Significant windstorm impacted utilities, residential and commercial properties, and transportation.	Salt Lake County and surrounding areas experienced a severe windstorm with winds exceeding 100 mph in some areas.
Lightning	N/A	N/A	N/A	N/A
Severe Winter Weather	N/A	N/A	N/A	There have been some significant winter storms, but no major damage from them.
Tornado	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Dam Failure	N/A	N/A	A few significant hazard-rated dams near Magna would impact locals.	Maintenance is behind.
Civil Disturbance	N/A	N/A	N/A	N/A
Cyberattack	N/A	N/A	N/A	N/A

Terrorism	N/A	N/A	N/A	N/A

National Flood Insurance Program Summary

Magna City participates in the National Flood Insurance Program (NFIP). Table 6 displays statistics related to the NFIP. Magna City does not participate in the Community Rating System (CRS).

Table 6: National Flood Insurance Program Status for the Magna City[1]

Initial FHBM Identified	Initial FIRM Identified	Current Effective Map Date	Adopted Date	Date Joined NFIP	Tribal
12/18/85	12/18/85	9/25/2009	1985	6/3/20	No

Table 7: National Flood Insurance Policies for Magna City

Community ID	Number of Losses	Total Net Payment	Active Policies	Total Coverage
490266	0	$0	1	$350,000

Magna City has designated the Director of Planning and Development Services as the Floodplain Administrator. The duties of the Floodplain Administrator are supported by the Greater Salt Lake Municipal Services District (MSD). The current Floodplain Hazard Regulations were adopted on 6/16/2023. The current Flood Insurance Rate Map (FIRM) is dated 9/25/2009. The MSD is responsible for issuing floodplain development permits in MSD Member Communities, including Magna City. The permits include a description of all work, including the type of construction, proposed intent, and location. Substantial damage/substantial improvement structures are identified through the permitting process and through utilizing FEMA's Substantial Improvement/Substantial Damage Desk Reference. Structures that are determined to be substantially damaged or substantially improved are required to come into compliance with current codes. The MSD Building Department provides guidance on how to build in accordance with existing building codes.

[1] FIRM = Flood Insurance Rate Map, FHBM = Flood Hazard Boundary Map

DRAFT

Jurisdiction-Specific Vulnerabilities and Impacts

Table 8 provides information on the vulnerable assets in Magna City, including its critical facilities, highlighting the city's vulnerability to identified hazards. It also describes the potential impacts to the community arising from those vulnerabilities. By understanding the risks associated with these assets, local authorities can develop proactive strategies to mitigate vulnerabilities and ensure the safety and functionality of these important assets during hazard events. This data is invaluable for decision-making and prioritizing resources for emergency response and preparedness efforts, ultimately contributing to more effective risk management and greater resilience in the community.

Critical facilities in Magna include two fire stations, one police station, and seven schools. Other community facilities include the Magna Library, Magna Senior Center, Magna Fitness & Recreation Center, and Kennecott-Magna Pool. Parks include Great Salt Lake State Park, Magna Copper Park, Magna Regional Park, Pleasant Green Park, Copper Club Golf Course, and several other neighborhood parks. Primary transportation routes include Highway 201, I-80, Highway 111/8400 West, and 3500 South. The Empress Theater, Magna Community Baptist Church, Great Saltair, and Magna Commercial Downtown Historic District are notable historic sites in the city.

Table 8: Jurisdiction-Specific Vulnerabilities and Impacts in Magna City

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
Avalanche	People	*Vulnerability:* While avalanches are rare in much of Magna due to its valley location, residents living or working in the southwestern foothill areas near the Oquirrh Mountains, especially near canyon roads or trailheads, are vulnerable to avalanches. *Impacts:* Residents could face disruption if a slope failure or snow slide occurs during winter storms. Such events may cut off commuting routes, interrupt access to schools or medical facilities, and limit emergency response during critical timeframes.
	Structures	*Vulnerability:* Buildings located near steep, snow-prone slopes, such as residential properties near mining roads or the base of the Oquirrhs, are at risk from avalanches. *Impacts:* Buildings may be threatened by avalanche debris, including heavy snow and falling trees. Roof structures not designed to withstand large snow loads could suffer damage or collapse if impacted.
	Economic Assets	*Vulnerability:* Local businesses are vulnerable to avalanches. *Impacts:* If an avalanche damages property or disrupts key roadways, recovery costs may be substantial, particularly for homeowners or business owners without insurance or financial capacity for immediate repairs. Local businesses dependent on transportation or regular customer access could experience temporary shutdowns or revenue loss.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Vegetation, wildlife, and historic sites are vulnerable to avalanches. *Impacts:* An avalanche in the foothills could damage local ecosystems, flattening vegetation and altering runoff patterns critical to wildlife. Historical mining remnants, older homesteads, or cultural

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		sites located in or near affected slopes could be buried or destabilized, complicating future preservation efforts.
	Critical Facilities and Infrastructure	*Vulnerability:* Road networks, utility lines, and emergency response are vulnerable to avalanches. *Impacts:* Debris from an avalanche may block access to emergency routes or isolate neighborhoods near the base of the Oquirrh range. If roads are obstructed, fire, law enforcement, or Emergency Medical Services (EMS) response times may be delayed. Utility lines, including power and telecommunications, may also be damaged by heavy snow loads or falling debris.
	Community Activities	*Vulnerability:* Recreation and outdoor activities are vulnerable to avalanches. *Impacts:* Recreational use of the surrounding foothills could be reduced due to avalanche risk, particularly after snowstorms. Public concern about slope stability may deter both residents and visitors from engaging in outdoor activities or attending events near affected areas.
Drought	People	*Vulnerability:* All residents are vulnerable to drought. *Impacts:* Magna's residents may struggle with the impacts of prolonged drought. Rising water rates can make it difficult for some families to afford basic utility costs. The heat and dryness associated with drought also increase the likelihood of respiratory illness, dehydration, and wildfire-related evacuations.
	Structures	*Vulnerability:* All structures are vulnerable; older homes may have higher risks. *Impacts:* Many older homes in Magna may be equipped with outdated plumbing and inefficient fixtures, leading to higher water consumption and utility bills during drought restrictions. Landscape damage and foundation settling caused by dry soil can also contribute to structural wear and reduce home value over time.
	Economic Assets	*Vulnerability:* Small businesses that rely heavily on water, such as nurseries, auto washes, or food production, are vulnerable to drought. *Impacts:* Water-dependent businesses may be economically strained by water restrictions or supply reductions. Costs related to maintaining cooling systems, landscaping, and irrigation infrastructure may increase, reducing profit margins and potentially leading to layoffs or closures.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Parks and open spaces in Magna, such as Magna Regional Park, are vulnerable to drought. Ecosystems and cultural sites are also vulnerable. *Impacts:* Open spaces and parks may experience significant vegetation loss as a result of water shortages. Prolonged drought can degrade soil quality, contribute to invasive species spread, and impact wildlife habitat. Older cultural sites that depend on irrigation for preservation may also deteriorate more rapidly without proper moisture regulation.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
	Critical Facilities and Infrastructure	*Vulnerability:* Water supply and emergency response facilities are vulnerable to drought. *Impacts:* Drought conditions may force the rationing of culinary water for public buildings, placing stress on services like hospitals and fire departments. A lack of water can hinder firefighting capabilities, while healthcare centers may see more cases of heat-related illness.
	Community Activities	*Vulnerability:* Public events and recreation activities are vulnerable to drought. *Impacts:* Water use restrictions could impact public events, limit irrigation of sports fields, and reduce participation in outdoor gatherings. Heat advisories during drought periods may prompt the cancellation of festivals or recreational programs.
Earthquake	People	*Vulnerability:* All residents in Magna are vulnerable to earthquakes. *Impacts:* People can be injured or killed by falling objects or collapsing structures. Residents may be displaced from their homes. Vulnerable populations (elderly, young children, low income, unsheltered persons) may be more affected by an earthquake. Health impacts could be severe.
	Structures	*Vulnerability:* All structures in Magna are vulnerable to earthquakes, particularly older homes and unreinforced masonry (URM) buildings. *Impacts:* The 2020 Earthquake highlighted risks and the brick houses that are predominant in Magna City, historically known to fail during an earthquake.
	Economic Assets	*Vulnerability:* All businesses in Magna are vulnerable to earthquakes. *Impacts:* Economic impacts could be great due to structural damage and failure of transportation and public health systems. Recovery for community and businesses could be lengthy.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Ecosystems and historic and cultural sites are vulnerable to earthquakes. *Impacts:* Local vegetation and wildlife could be impacted by an earthquake, changing migration patterns or plant die-off. Historical and cultural resources could be severely damaged by an earthquake.
	Critical Facilities and Infrastructure	*Vulnerability:* All city infrastructure is vulnerable to earthquakes and could be negatively affected due to physical damage, utility failure, and medical surges. *Impacts:* Access to emergency services could be compromised.
	Community Activities	*Vulnerability:* All gatherings and events are vulnerable to earthquakes. *Impacts:* Community gatherings could lead to increased risk to public safety if an earthquake were to occur in the middle of an event. Many events may be postponed or canceled during recovery.
Extreme Heat	People	*Vulnerability:* Magna's residents, particularly seniors, children, low-income households, and individuals experiencing homelessness, are highly susceptible to extreme heat conditions. *Impacts:* Extreme heat can lead to dehydration, heat exhaustion, or heat stroke, particularly in vulnerable groups like seniors. Outdoor

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		workers in construction, landscaping, or delivery services face heightened exposure during summer months when temperatures regularly exceed safe thresholds. Limited access to air conditioning or cooling shelters can contribute to increased emergency room visits, dehydration, and heatstroke, especially during prolonged heatwaves.
	Structures	*Vulnerability:* Extended periods of heat put significant strain on buildings, especially older homes and facilities with outdated heating, ventilation, and air conditioning (HVAC) systems or limited insulation. *Impacts:* Schools, municipal buildings, and community centers without modern cooling infrastructure may become unsafe or unusable during peak heat events. Prolonged exposure to extreme temperatures can also deteriorate roofing materials and compromise indoor air quality.
	Economic Assets	*Vulnerability:* Local businesses are vulnerable to extreme heat. *Impacts:* Local employers may need to alter work hours or increase operational costs to ensure employee safety during high-heat periods. Outdoor-based industries, including construction and utility maintenance, often experience project delays or reduced productivity due to mandatory rest breaks and hydration protocols. Small businesses may also face increased utility costs from air conditioning demands, affecting their profit margins.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Parks and open spaces in Magna, such as Copper Park and Pleasant Green are vulnerable to extreme heat. *Impacts:* Parks may suffer from vegetation loss due to heat stress and water scarcity. Prolonged heat can degrade turf, damage shade trees, and impact local wildlife patterns. Historic buildings constructed with traditional materials may deteriorate faster under extreme temperature fluctuations, especially without adequate climate control.
	Critical Facilities and Infrastructure	*Vulnerability:* Healthcare and power infrastructure are vulnerable to extreme heat. *Impacts:* Health clinics and emergency medical services in Magna may experience an uptick in patients presenting with heat-related symptoms, putting strain on healthcare capacity. Prolonged high temperatures can also lead to power surges and brownouts, threatening the stability of air conditioning systems in critical facilities such as senior centers, fire stations, and water treatment plants.
	Community Activities	*Vulnerability:* Outdoor events and recreation are vulnerable to extreme heat. *Impacts:* Outdoor events during the summer are at risk of cancellation or lower turnout due to excessive heat. Ensuring public safety at these events requires additional investments in shade, hydration stations, and emergency medical support. Heat risk may also affect participation in summer road races and community sports leagues, with potential financial impacts on local programming and tourism.
	People	*Vulnerability:* Cold weather events in Magna pose serious risks for vulnerable populations, including the elderly, young children,

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
Extreme Cold		individuals experiencing homelessness, and low-income residents living in poorly insulated homes. *Impacts:* Outdoor workers and transit-dependent individuals face elevated exposure, particularly during early morning hours when temperatures can drop sharply. Health complications, including hypothermia and frostbite, become more likely during extended cold snaps.
	Structures	*Vulnerability:* Homes and other structures, particularly older buildings, are vulnerable to extreme cold. *Impacts:* Extreme cold can cause pipes in homes and businesses to freeze and burst, particularly in older buildings without adequate insulation or heating. Fluctuations between freezing and thawing can lead to foundation cracking, roof damage, and deterioration of concrete or masonry structures. Heating systems may also become overburdened, resulting in potential breakdowns during critical weather conditions.
	Economic Assets	*Vulnerability:* All Magna businesses are vulnerable to extreme cold. *Impacts:* Cold-related damage, such as water leaks and structural cracking, can disrupt business operations and incur significant repair costs. Power outages during severe cold spells may force temporary closures of retail and service establishments. Delays in goods transport, snow removal costs, and reduced foot traffic during cold snaps can further impact Magna's small business economy.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Plants, wildlife, and historic sites are vulnerable to extreme cold. *Impacts:* Persistent low temperatures may harm local vegetation and threaten wildlife habitats in Magna's parks and open lands. Frost damage can kill ornamental plants and young trees, reducing canopy cover and green space aesthetics. Historic properties—especially those using original plumbing or outdated insulation—are at increased risk of water damage from burst pipes or ice accumulation.
	Critical Facilities and Infrastructure	*Vulnerability:* Public utilities, particularly water and wastewater systems, roads, and power infrastructure, are at high risk during freezing temperatures. *Impacts:* Frozen or burst pipes can disrupt services and increase repair workloads for local agencies. Snow and ice buildup may also hamper road access to critical sites, delaying emergency services. Energy demand spikes can stress local power supply systems.
	Community Activities	*Vulnerability:* Community events and recreation are vulnerable to extreme cold. *Impacts:* Cold conditions significantly reduce outdoor community engagement, especially when accompanied by wind or snowfall. Events such as winter markets, parades, or outdoor recreational programming may be canceled or require added infrastructure. Nearby winter tourism, including ski trips to the Wasatch Front, may be indirectly affected if roads are icy or public interest declines due to extreme cold warnings.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
Flooding (and Heavy Rain)	People	*Vulnerability:* Residents near Coon Canyon Creek, Lee Creek, and other waterways, near Kennecott Tailings Pond and the shore of the Great Salt Lake, are vulnerable to flooding. *Impacts:* Individuals may need rescuing from high waters. Water carrying hazardous materials from Rio Tinto's tailings ponds could pose an additional risk. Injuries or fatalities from floodwaters could cause a medical surge.
	Structures	*Vulnerability:* Structures near flood hazard zones, waterways, or low-lying areas are vulnerable to flooding. *Impacts:* Structures may be affected if exposed to flood waters. Recovery efforts could be impacted if there is no insurance or sufficient funds to make repairs.
	Economic Assets	*Vulnerability:* Businesses near waterways are vulnerable to flooding. *Impacts:* Flooding may interrupt commerce and transportation. The local economy could suffer if businesses or community services were unavailable for a significant period.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Historic sites, vegetation, wildlife, and stream ecosystems are vulnerable to flooding *Impacts:* Historic and cultural buildings would be impacted by flooding, potentially leading to extended closures during repairs. Local vegetation could be affected, leading to soil erosion or a change in wildlife patterns.
	Critical Facilities and Infrastructure	*Vulnerability:* No critical facilities in Magna were identified in flood hazard zones. Roads and utilities may be vulnerable to flooding. *Impacts:* Floodwater could damage roads, affect utilities, and carry hazardous materials.
	Community Activities	*Vulnerability:* Community events and recreation are vulnerable to flooding. *Impacts:* Community activities could be postponed or canceled if there is extensive flooding. Flooding can impact local parks, preventing outdoor recreation for residents.
Landslide/ Slope Failure	People	*Vulnerability:* Residents in areas near the western slopes of the Oquirrh Mountains or steeply graded hillsides within Magna's boundary are vulnerable to landslide or slope failure events. The Tailings Pond is a human-made feature but could experience slope failure. *Impacts:* Individuals with access and functional needs may face greater challenges during evacuation or post-event recovery. Blocked or damaged roadways could limit access to healthcare facilities, schools, or emergency shelters, placing further strain on vulnerable populations.
	Structures	*Vulnerability:* Homes and commercial buildings located near steep or unstable terrain are vulnerable to landslide or slope failure. *Impacts:* Structures near slope failure may suffer structural damage from soil displacement or debris flows. Damage to HVAC systems or foundations could make buildings uninhabitable or unsafe. Emergency response capabilities may also be hindered if access routes for police, fire, or EMS are blocked by fallen debris or roadway damage.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
	Economic Assets	*Vulnerability:* The local economy and outdoor recreation are vulnerable to landslides. *Impacts:* A major landslide event could negatively impact Magna's local economy, particularly if parks, trailheads, or outdoor recreational areas are closed for extended periods. Prolonged cleanup efforts or repeated hazards may discourage investment or tourism. Additionally, if response and recovery efforts are perceived as slow or ineffective, they may affect public confidence and the city's long-term reputation.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Habitats and historic buildings are vulnerable to landslides and slope failure. *Impacts:* Natural areas near slopes, such as slopes west of Magna, could see habitat disruption, tree loss, and long-term erosion due to earth movement. Cultural and historic structures, including any pioneer-era buildings or older infrastructure, may be at risk of collapse if located in affected zones. Inadequate insurance coverage or limited restoration funding could delay or prevent proper repairs, placing these resources at permanent risk. The destabilization of slopes could also increase susceptibility to future landslides in the same area.
	Critical Facilities and Infrastructure	*Vulnerability:* Power, communication, and transportation infrastructure are vulnerable to landslides. *Impacts:* Landslides may bring down utility poles, resulting in power outages that disrupt basic services including water, internet, and emergency communications. Emergency response times may be slowed if major roads are impassable. Facilities such as fire stations, police departments, or public works yards located near vulnerable slopes could also be directly affected or isolated by the event.
	Community Activities	*Vulnerability:* Community events and recreation are vulnerable to landslides and slope failure. *Impacts:* Community gatherings and outdoor recreation in Magna could be curtailed if public spaces are damaged or deemed unsafe. Debris from a slope failure could impact air quality through dust or particulates, while runoff might affect soil and water quality, posing potential public health risks. These impacts could reduce public engagement in community events and place additional burdens on local resources during recovery efforts.
Radon	People	*Vulnerability:* Residents in 31% of homes tested in Magna are exposed to dangerous levels of radon. *Impacts:* Radon exposure causes an increased risk of lung cancer for those exposed.
	Structures	*Vulnerability:* A significant portion of homes in Magna (31%) have tested above the radon mitigation threshold. *Impacts:* Radon enters buildings and homes through cracks in foundations, basements, and crawl spaces, posing health risks to occupants.
	Economic Assets	*Vulnerability:* Real-estate business and property values are vulnerable to high radon levels.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		Impacts: The local economy could be impacted by the health concerns of high radon levels. People may purchase homes in other areas.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Natural habitats, water, and historical buildings are vulnerable to radon exposure. *Impacts:* Local vegetation could be impacted by radon. Soil erosion and water quality issues are possible. Ventilation in historical or cultural buildings is important to decrease radon risk.
	Critical Facilities and Infrastructure	*Vulnerability:* Drinking and irrigation water are vulnerable to high radon levels. *Impacts:* High radon levels in water could impact local vegetation and resident health.
	Community Activities	*Vulnerability:* Water resources and recreation are vulnerable to radon exposure. *Impacts:* Irrigation water might have to be limited if radon levels are very high, impacting landscaping and outdoor recreation. People might not want to engage in recreational activities in Magna if there are high radon levels.
High Wind	People	*Vulnerability:* Residents and visitors in Magna may be at risk during high wind events, especially those engaged in outdoor work or recreation. *Impacts:* Windborne debris can cause injury. People inside homes or public facilities may also be endangered if structural damage occurs or windows shatter during intense gusts.
	Structures	*Vulnerability:* All buildings in Magna are vulnerable to high wind events; the Sunset Vista Manufactured Home Community is particularly vulnerable. *Impacts:* Strong winds can damage buildings by lifting roofing materials, shattering windows, and causing exterior siding to detach. Trees and utility poles falling onto homes, vehicles, or commercial buildings are common hazards. Structures that lack wind-resistant design, particularly older homes or outbuildings and mobile/ manufactured homes, are more susceptible to damage.
	Economic Assets	*Vulnerability:* All businesses are vulnerable to high wind events. *Impacts:* High wind events can interrupt commercial activity by damaging storefronts, disrupting power, or impeding transportation routes. Cleanup and repair costs may burden businesses, especially those without insurance coverage for wind damage. Service providers may experience delays or cancellations.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Natural habitats, parks, and open spaces are vulnerable to high wind events. Historical structures are also vulnerable. *Impacts:* Parks, trail systems, and natural landscapes in Magna may see uprooted trees, damaged vegetation, and soil erosion from intense winds. Historical buildings may face structural harm if not built to current wind-resistance standards. Repairs may be difficult if preservation funds are limited or insurance coverage is insufficient.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
	Critical Facilities and Infrastructure	*Vulnerability:* Power infrastructure, communication towers, and road networks are vulnerable to high wind events. *Impacts:* Utilities may be impacted by high winds. Downed lines and poles can lead to prolonged outages and communication delays. Access to essential services may be hindered if debris blocks roadways or entrances to fire stations, clinics, or other critical facilities.
	Community Activities	*Vulnerability:* Outdoor events and recreation are vulnerable to high wind events. *Impacts:* Outdoor events, such as farmers' markets, concerts, and youth sports, may be canceled or disrupted during wind advisories. Damage to tents, signs, or recreational infrastructure may limit safe gathering. Public confidence in event safety may decline if shelters and safety protocols are not visible or well-communicated.
Lightning	People	*Vulnerability:* Lightning can happen anywhere in Magna, and all residents are vulnerable. People outdoors are most vulnerable. *Impacts:* Lightning can cause injury or death to those in close proximity to a strike. Individuals caught outside during thunderstorms in Magna face a heightened risk of lightning strikes. Additionally, indirect hazards such as fires caused by lightning or contact with electrified surfaces (e.g., water or metal objects) can endanger public health and safety. Those without access to shelter during fast-moving storms are particularly vulnerable.
	Structures	*Vulnerability:* All structures are vulnerable to lightning strikes. *Impacts:* Lightning can directly strike buildings, causing fires, structural damage, or power surges that destroy electrical systems and appliances. Structures with inadequate grounding or lightning protection systems are especially at risk, including barns, tall buildings, and open-frame facilities.
	Economic Assets	*Vulnerability:* All businesses are vulnerable to lightning impacts. *Impacts:* Businesses may face repair costs following lightning-related fires or electrical damage. Downtime caused by structural or electrical failure can delay services and result in revenue loss. Repeated lightning incidents can affect the perception of area safety, potentially discouraging future investment or residential development.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Undeveloped areas on the western and northern sides of Magna and historical buildings are vulnerable to lightning. *Impacts:* Wildland areas and parks in Magna may be ignited by lightning, especially during dry periods, creating fire risk for surrounding neighborhoods. Historical buildings and cultural sites are particularly vulnerable if they lack fire suppression systems or structural protections against electrical surges. Restoration of these properties may be delayed due to limited funds or insurance.
	Critical Facilities and Infrastructure	*Vulnerability:* Power, communication, and healthcare systems are vulnerable to lightning strikes. *Impacts:* Lightning strikes may lead to power outages, damaged transformers, or disrupted communication systems. Hospitals, emergency dispatch centers, and utilities must maintain surge protection and backup power. Emergency calls may spike following

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		a severe storm, requiring hospitals and public safety personnel to respond rapidly to injuries or fire-related incidents.
	Community Activities	*Vulnerability:* Outdoor events and sports are vulnerable to lightning. *Impacts:* Lightning risk often results in the cancellation of outdoor community events, from sports tournaments to local festivals. Residents may be less inclined to participate in open-air gatherings if there is limited shelter or if prior lightning-related incidents have occurred. Event planners must consider early warning systems and shelter availability.
Severe Winter Weather	People	*Vulnerability:* Cold snaps and winter storms in Magna pose elevated risks to vulnerable populations, including the elderly, low-income households, young children, and individuals experiencing homelessness. *Impacts:* Vulnerable populations and outdoor workers, such as utility or construction personnel, may be exposed to frostbite or hypothermia if safety protocols are not followed. Snow accumulation may also limit access to healthcare or essential services for those without reliable transportation or physical mobility.
	Structures	*Vulnerability:* Homes and commercial buildings in Magna are vulnerable to severe winter weather. *Impacts:* Structures may be damaged by accumulated snow and ice. Roofs may collapse under heavy snow loads, especially if poorly maintained or flat-roofed. Ice dams can cause interior water damage, while frozen pipes in uninsulated structures may burst, requiring costly repairs.
	Economic Assets	*Vulnerability:* Businesses throughout Magna are vulnerable to severe winter weather. *Impacts:* Storm-related power outages, damaged infrastructure, and hazardous road conditions can delay deliveries and affect business continuity. Snow removal and maintenance costs rise significantly during prolonged cold periods, impacting city and business budgets. Service sectors dependent on foot traffic may experience revenue drops during severe storms.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Trees, vegetation, and historic buildings are vulnerable to severe winter weather. *Impacts:* Winter storms may damage trees and other vegetation in public spaces like Magna Regional Park. Persistent ice buildup on historical buildings may deteriorate masonry and woodwork, especially if meltwater seeps into cracks and refreezes. Restoration efforts may be delayed if damage is widespread and resources are limited.
	Critical Facilities and Infrastructure	*Vulnerability:* Roads, power, and public facilities are vulnerable to severe winter weather. *Impacts:* Utilities are highly susceptible to winter storm disruptions. Roads may become impassable if snowplows cannot keep up with accumulation, limiting the ability of police, fire, and EMS to respond. Emergency shelters and warming centers may see increased demand, particularly during extended cold spells.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
	Community Activities	*Vulnerability:* Community centers and events are vulnerable to severe winter weather. *Impacts:* Outdoor events and sports programs may be suspended or canceled due to snow, ice, or dangerous wind chills. Community centers and local venues must provide heated shelter options to accommodate residents. The city may also need to deploy additional resources for clearing sidewalks and emergency routes.
Tornado	People	*Vulnerability:* Although tornadoes are infrequent in the Salt Lake Valley, Magna is at risk during severe wind events. *Impacts:* Individuals in mobile homes or light-frame housing, such as those Sunset Vista, face the highest danger. Residents may experience injuries from flying debris or collapsing structures, and emergency medical services may face temporary surges in demand following a direct hit.
	Structures	*Vulnerability:* All structures near a tornado part are vulnerable. *Impacts:* Tornadoes can cause substantial destruction to homes, businesses, and public buildings, particularly those not designed to withstand high winds. Roofs may be torn off, walls collapsed, and windows shattered. Mobile homes and temporary structures face near-total loss if struck directly.
	Economic Assets	*Vulnerability:* All local businesses are vulnerable to tornado impacts *Impacts:* Local businesses may suffer long-term setbacks due to property damage, service disruption, and cleanup costs. Facilities lacking insurance for tornado-related losses may struggle to reopen. Prolonged recovery timelines could lead to job losses or displacement of workers and customers.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Trees, parks, and historic buildings are vulnerable to tornado impacts. *Impacts:* High winds associated with tornadoes may flatten trees, rip up landscaping, and destroy vegetation across parks and open spaces. Historic landmarks may sustain irreparable damage, especially if built prior to modern wind-resistant building codes. The loss of such resources could affect community identity and heritage preservation.
	Critical Facilities and Infrastructure	*Vulnerability:* Emergency response, roads, and power are vulnerable to tornado impacts. *Impacts:* Essential services may be damaged or temporarily disabled following a tornado. Roads blocked by debris may delay emergency response times. Continued service delivery depends on the structural integrity and resilience of these facilities. Power and water could be disrupted if there is extensive damage.
	Community Activities	*Vulnerability:* Outdoor events, recreation, and community centers are vulnerable to tornado impacts. *Impacts:* Tornado-related damage to schools, parks, and recreation centers can significantly disrupt community programming. Outdoor activities are especially vulnerable during tornado season, and safe shelter must be readily available. Public confidence may decrease if emergency plans and warning systems are not widely known or visible.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
Wildfire	People	*Vulnerability:* Residents along the western border and those within the northern less-developed area of Magna are vulnerable to wildfires. *Impacts:* Urban interface wildfire areas can pose a health/safety hazard due to unpredictable or fast moving fires. There are health concerns about hazardous materials exposure if the fire starts on Rio Tinto land and moves into Magna.
	Structures	*Vulnerability:* Structures near the wildland-urban interface (WUI) in western and northern Magna are vulnerable to wildfires. *Impacts:* Wildfire can damage structures and affect emergency services. If people do not have insurance, they might not be able to afford repairs.
	Economic Assets	*Vulnerability:* Businesses near the WUI are vulnerable to wildfires. *Impacts:* Local businesses could suffer if they do not have the funds to repair damage. If the area is prone to burning, the city's reputation could be impacted. People might not visit if it is not safe or there is high risk.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Vegetation, habitat, and historic buildings are vulnerable to wildfires. *Impacts:* Loss of natural spaces. Historic buildings would have to be rebuilt. There is a lot of open space on the southwest side of Magna, which is concerning for small brush fires that could grow. Rio Tinto land is nearby and any sort of fire or chemical leak could impact Magna's vegetation and wildlife.
	Critical Facilities and Infrastructure	*Vulnerability:* Utilities and transportation are vulnerable to interruption due to wildfires. *Impacts:* Power could be turned off if it is deemed unsafe by Rocky Mountain Power. Road access and communications service are concerns if emergency services cannot reach residents. Medical services would be impacted if they must run on a generator or other limited power source.
	Community Activities	*Vulnerability:* Community events are vulnerable to wildfire impacts. *Impacts:* Community activities would be impacted, especially in outdoor areas like parks if there is high wildfire risk. Areas with a lot of brush or natural vegetation present a high risk as well, which may deter people from recreating in those areas.
Dam Failure	People	*Vulnerability:* A breach or failure involving the Kennecott tailings ponds above Magna poses a serious hazard to public health and safety. The potential inundation area of the tailings pond is unmapped, and to do so would be difficult due to its size and shape and unknown points of failure. *Impacts:* The rapid release of water and potentially toxic mining byproducts could threaten residents in low-lying areas, particularly those with limited mobility or lacking access to timely emergency alerts. Immediate evacuation could be difficult for vulnerable populations, including seniors and individuals with disabilities.
	Structures	*Vulnerability:* Homes, schools, and commercial properties located downslope of the tailings impoundments are vulnerable to dam failure.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		Impacts: Structures downslope from a failure at the tailings pond could be inundated or contaminated by debris-laden water. Structures exposed to hazardous materials may suffer lasting damage, especially if cleanup is delayed. Contaminated buildings may require extensive remediation or reconstruction before they are safe to occupy.
	Economic Assets	*Vulnerability:* Local businesses are vulnerable to dam failure, particularly those close to the tailings pond. *Impacts:* A significant flood event involving contaminated water could severely disrupt local commerce. Businesses in the affected area may face prolonged closures due to cleanup, structural damage, or loss of customer access. Magna's reputation could be impacted regionally if recovery efforts are slow or if the area is perceived as environmentally unsafe, which could discourage investment or residential growth.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Wildlife, plants, and stream ecosystems are vulnerable to dam failure. *Impacts:* A dam failure involving tailings ponds could release toxic materials into nearby creeks, wetlands, and open spaces, causing widespread damage to ecosystems. Sensitive vegetation and wildlife in the area may be harmed, and restoration could take years. Historic properties and cultural landmarks in Magna may also be at risk if located within the path of the flood or exposed to contamination.
	Critical Facilities and Infrastructure	*Vulnerability:* Critical facilities and utilities are vulnerable to dam failure. *Impacts:* Floodwaters containing industrial waste could disrupt operations at critical facilities such as fire stations, police departments, water utilities, and public health clinics. Utility infrastructure, including water lines, power substations, and stormwater systems, may be damaged or overwhelmed, delaying emergency response and recovery. Long-term environmental testing and infrastructure replacement may be required.
	Community Activities	*Vulnerability:* Outdoor events, recreation and community centers are vulnerable to dam failure. *Impacts:* Local parks, recreation centers, and outdoor event spaces would be significantly affected in the aftermath of a tailings dam failure. Events may be canceled or relocated, and public spaces may remain closed for extended cleanup. Additionally, lingering concerns about environmental safety could reduce participation in outdoor recreation and community programming.
Civil Disturbance	People	Possible risk to health or safety. A civil disturbance could overwhelm local resources and impact access to emergency services if people are injured.
	Structures	Looting or damage to buildings are possible.
	Economic Assets	Theft or interruption of services/transportation. It can affect Magna's reputation if people are afraid to visit or live in the area after a civil disturbance. They also may be concerned about crime.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
	Natural, Historic, and Cultural Resources	Local business owners may be affected if they cannot afford repairs to their property.
	Critical Facilities and Infrastructure	Service/transportation interruption. Power and water service could be affected if they are struck or shut down. Police and fire could be impacted if roads are inaccessible.
	Community Activities	Outdoor community activities would be impacted if it is not safe or vandalism is likely.
Cyberattack	People	Disruption of power and communications is a concern for vulnerable populations.
	Structures	A cyberattack could impact the physical security of buildings or homes if the security system can be hacked into. In addition, a cyberattack could affect fire suppression systems or evacuation methods, which would exacerbate the issue.
	Economic Assets	Flow of commerce could be interrupted. This could impact payroll or other virtual systems for emergency services, local businesses, and homes (like paying a mortgage or utility bill). If people cannot use the internet or are locked out of a specific account, it is challenging to pay bills, complete projects, and access information.
	Natural, Historic, and Cultural Resources	Natural, historic, and cultural resources could be impacted if the cyberattack accesses critical infrastructure like water or power. This could disrupt the energy grid by manipulating data or overriding emergency systems. It could flood areas, redirect emergency services, or shut off power.
	Critical Facilities and Infrastructure	Delivery of utilities, such as power and water service, could be affected and critical infrastructure could be compromised if the hacker is asking for a ransom or the cyberattack cannot be resolved in a reasonable time. Shelters would need to provide essential services.
	Community Activities	Community activities can be impacted from a reputation perspective if there is not public trust. The public might not want to go to certain areas or visit businesses in Magna if it was affected by a cyberattack.
Hazardous Materials Incident (Transporta-tion & Fixed Facility)	People	High risk of exposure due to proximity of industrial mining operation tailing ponds and railroads that traverse the city. Several key transportation routes also go through Magna which could carry hazardous materials.
	Structures	Could create the need to evacuate or shelter in place. Structures would need to clean up the hazardous materials.
	Economic Assets	Could affect businesses in the area, including financial recovery.
	Natural, Historic, and Cultural Resources	Could severely damage local flora and fauna. Remediation may be needed.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
	Critical Facilities and Infrastructure	Possible interruption of essential services and access to emergency services.
	Community Activities	Community activities could be canceled until it is safe to recreate outdoors, especially if hazardous materials seeped into water or soil.
Public Health Epidemic/ Pandemic	People	Direct risk of contagious/severe illnesses. Vulnerable populations are especially at risk if they are exposed, which could overwhelm medical facilities or create a medical surge.
	Structures	If medical facilities are overwhelmed, additional local facilities or temporary structures may be needed to accommodate patients.
	Economic Assets	Interruptions of normal business operations, potential reduction in the workforce, and social distancing restrictions that can impact local businesses
	Natural, Historic, and Cultural Resources	Increased use of outdoor spaces as seen with the COVID-19 pandemic. Restricted access to outdoor areas or historical buildings if social distancing is required. This can also impact the visitation to those areas if people do not want to socially distance or are afraid of the potential exposure.
	Critical Facilities and Infrastructure	Increased use of public health resources, leading to a medical surge. Illness for public safety or healthcare professionals if they are working with or exposed to patients experiencing symptoms.
	Community Activities	Indoor community events could be canceled, especially if the number of people in an area at a time is restricted or social distancing is required. Outdoor events might have less attendance or require certain protective health measures, like hand washing and masks.
Terrorism	People	People could be scared to recreate outside after a terrorism event or could sustain injuries from a terrorism event.
	Structures	Structures could sustain damage from a terrorism event and the owner's financial situation could affect their ability to make repairs. Businesses might be concerned about future terrorism events and choose to relocate.
	Economic Assets	The reputation of the area post-terrorism event could affect the local businesses, both existing and new. A new business might not want to move into the area if the land or building had been affected by a terrorism event. In addition, the terrorism event could be costly for a resident or local business to make needed repairs.
	Natural, Historic, and Cultural Resources	Historic buildings or cultural resources could be impacted if there is lower visitation by locals and tourists. Local wildlife may migrate to a different area if there is significant activity where they typically go.
	Critical Facilities and Infrastructure	Critical facilities and infrastructure would be affected by a targeted terrorism event. Essential employees might not be able to perform their jobs, and water/power infrastructure could be shut down or damaged.
	Community Activities	Community activities could be affected by a terrorism event if the reputation of the area declines. If it is deemed unsafe or if there are

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		multiple incidents in the same area, people won't want to recreate or attend events.

Jurisdiction-Specific Changes in Vulnerability

Hazard events can impact communities, infrastructures, and ecosystems. The severity of these impacts can be influenced by climate change, population patterns, and land use developments. Understanding these factors is crucial for Magna City to develop a resilient community and minimize the impacts of hazards. Table 9 displays the changes within the city and the related effects of each hazard on Magna City.

Table 9: Jurisdiction-Specific Changes in Vulnerability in Magna City

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
Avalanche	Higher temperatures could melt snow faster in the spring. This can also carry hazardous materials into water and soil downstream into Magna City.	Population growth in the city increases the number of people who might be affected by an avalanche.	New subdivisions being developed in Magna City near the neighboring Rio Tinto mine are threatened by avalanches.	Same
Drought	Extreme/unusual weather, higher temperatures, reduced local vegetation	Population growth places more people at risk of drought conditions.	Increased commercial and residential buildings add to water demands, increasing the risk of drought.	Increased due to climate change
Earthquake	Extreme or unusual weather patterns, increased greenhouse gas emissions, and rising sea levels can trigger seismic activity.	The 2020 Magna earthquake demonstrated local vulnerabilities to an earthquake, including building and home collapses, debris in roadways, and restricted access to essential services.	As more subdivisions have been built in Magna, more structures are at risk of damage from earthquakes. This risk is partially mitigated by constructing new structures to higher building codes.	Same

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
Extreme Heat	Higher temperatures, reduced vegetation, changes in wildlife	Outdoor workers may need more frequent breaks or adequate shade. Outdoor community activities will need more restrooms, first aid stations, water, and shaded areas.	Slightly increased density due to development can exacerbate extreme heat in certain neighborhoods.	Increased due to climate change
Extreme Cold	Extreme/ unusual weather, reduced vegetation, freezing pipes	People may not recreate outside as much and there may be a decline in outdoor events due to the cold weather.	Increased subdivision and commercial development in Magna increases energy demand during extreme cold events, stressing the electrical grid.	Increased due to climate change
Flooding	Extreme/ unusual weather, increased precipitation, higher temperatures that melt the snowpack	Population growth places more people at risk of flooding.	Development in Magna has not been in the 1% or 0.2% annual chance flood zone, but may increase the likelihood of pluvial flooding.	Increased due to climate change
Landslide/ Slope Failure	Soil erosion, increased precipitation, snowpack melt, increased risk of future landslides or slope failures	Residents near Rio Tinto land would be significantly impacted by a landslide or slope failure. Hazardous materials could move into waterways or soil, impacting vegetation and wildlife.	Development in north and northwest Magna is at higher risk of landslides due to its proximity to the Rio Tinto mine.	Increased due to climate change
Radon	Soil erosion, increased precipitation, water quality issues	Population health is a significant concern as far as air and water quality. Outdoor recreation would be impacted in areas with high radon levels.	Development in Magna has not changed the risk of radon.	Same
Heavy Rain	Extreme/ unusual weather, flooding, soil erosion, water quality issues	Residences and businesses could flood. Recovery efforts would be	Increased impervious surfaces due to development increase	Increased due to climate change

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
		impacted if there is no insurance or enough funds to make repairs.	the risk of pluvial flooding.	
High Wind	Extreme/ unusual weather including thunderstorms, water, air, and soil quality issues	High winds impact homes and businesses. Recovery efforts would be impacted if there is no insurance or enough funds to make repairs.	Development in Magna has not increased the risk from high winds.	Increased due to climate change
Lightning	Extreme/ unusual weather, increased temperatures, increased wildfire risk, damage to local vegetation and wildlife habitats	Medical surges are possible for lightning events, especially if they occur at an outdoor event. Outdoor community events may be less frequent.	Development in Magna has not increased the risk from lightning.	Increased due to climate change
Severe Winter Weather	Extreme/unusual weather	People may stick to indoor activities, which affects the local economy. Roads may be inaccessible, preventing outdoor events from occurring. Sheltering may be necessary for an extended period.	New subdivisions increase the responsibility of Magna to provide plowing and evacuations during extreme winter weather.	Increased due to climate change
Tornado	Soil, water, and air quality issues	Outdoor community events would be challenging in tornado conditions.	With more structures in Magna, there is a slightly higher risk of tornado damage.	Same
Wildfire	Extreme/ unusual weather, higher temperatures, drought, reduced vegetation, air/water/soil quality issues	Those with access and functional needs would be most at risk, especially if evacuations are necessary.	New developments in western Magna are at higher risk of wildfire damage.	Increased due to climate change
Dam Failure	Increased temperatures, increased precipitation, soil erosion, water and	Population growth places more people at risk of flooding due to dam failure. Water and soil	Development in Magna has not increased the risk of dam failure.	Same

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	air quality changes	quality are a concern.		
Civil Disturbance	Conversations concerning climate change could lead to hostility or violence.	Social media continue to have a great impact on society, which may lead to an increase in civil disturbances.	Development in Magna has not increased the risk of civil disturbance.	Same
Cyberattack	N/A	The increasingly digital world poses greater risk of cyber incidents, including hacks of physical security systems of buildings, payroll systems, and communications systems.	Development in Magna has not increased the risk of cyberattacks.	Same
Hazardous Materials Incident (Transporta-tion & Fixed Facility)	More chemicals released into the atmosphere from melting permafrost, leading to potential health concerns when mixed with a hazardous materials spill	A hazardous materials incident could significantly impact travel and commerce for local residents.	Development in Magna has not increased the risk of hazardous materials incidents.	Same
Public Health Epidemic/ Pandemic	Higher temperatures, reduced vegetation, species migrating to other areas (different diseases moving into an area)	Socially vulnerable groups are most at risk in a public health epidemic or pandemic.	Development in Magna has not increased the risk of pandemics/epidemics.	Same
Terrorism	N/A	Sheltering is a concern for a terrorism event, especially if there are road closures.	Development in Magna has not increased the risk of terrorism.	Same

DRAFT

Additional Public Involvement

Magna City provided several opportunities for public participation. Figure 1 displays examples of public outreach.

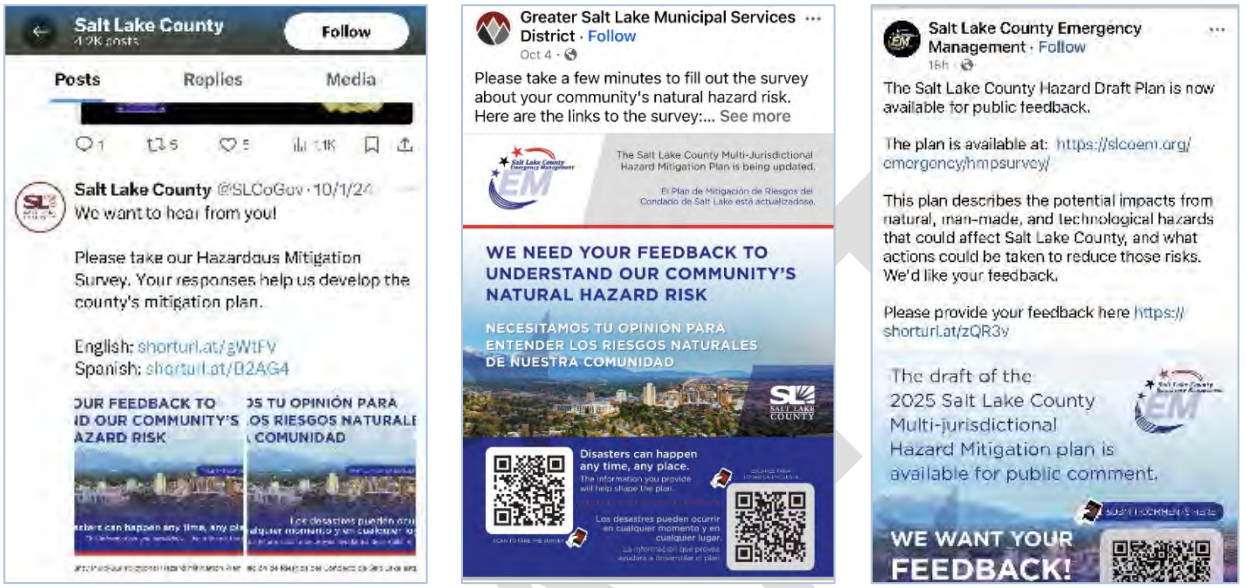

Figure 1: Social Media Posts for the Hazard Mitigation Survey (*left* and *center*) and Draft Plan Review (*right*)

Plan Integration

Incorporating the underlying principles of the Hazard Mitigation Plan and its recommendations into other plans is a highly effective and low-cost way to expand their influence. All plan participants will use existing methods and programs to implement hazard mitigation actions where possible. As previously stated, mitigation is most successful when it is incorporated into the day-to-day functions and priorities of government and public service. This plan builds on the momentum developed through previous and related planning efforts and mitigation programs, and it recommends implementing actions where possible through these other program mechanisms. These existing mechanisms include the following:

- Regularity Capabilities
- Administrative Capabilities
- Fiscal Capabilities

Respective planning stakeholders will conduct implementation and incorporation into existing planning mechanisms and will be done through the routine actions of:

- Monitoring other planning/program agendas
- Attending other planning/program meetings
- Participating in other planning processes; and
- Monitoring community budget meetings for other community program opportunities.

DRAFT

The successful implementation of this plan will require constant and vigilant review of existing plans and programs for coordination and multi-objective opportunities that promote a safe, sustainable community. Regular efforts should be made to monitor the progress of mitigation actions implemented through other planning mechanisms. Where appropriate, priority actions should be incorporated into planning updates. Table 10 lists existing planning mechanisms in which the Hazard Mitigation Plan has been integrated.

Table 11 lists the opportunities for integrating elements of this plan into other plans.

Table 10: Previous Plan Integration by Magna City

Plan	Description
None	N/A

Table 11: Opportunities for Integration with Future Plans of Magna City

Plan	Description
2021 Magna General Plan	The General Plan guides the future of planning and development in Magna. Elements include land use; transportation; housing; economic development; parks, trails, recreation and open space; natural hazards; community facilities; and sustainability.

Capability Assessment

Local mitigation capabilities are existing authorities, policies, programs, and resources that reduce hazard impacts or could help carry out hazard mitigation activities.

Planning and Regulatory Capabilities

Planning and regulatory capabilities are the plans, policies, codes, and ordinances that prevent and reduce the impacts of hazards.

Table 12: Assessment of the Planning Capabilities of Magna City

Plan	Does it address hazards? (Y/N)	How can it be used to implement mitigation actions?	When was the last update? When is the next update?
General Plan	Y	Magna's future goals in general plan can inform mitigation actions.	2021
Capital Improvement Plan	Y – referenced in General Plan.	As Magna becomes a city, a plan would help it start planning out projects and priorities for leadership.	2021
Climate Change Adaptation Plan	N	N/A	N/A

DRAFT

Plan	Does it address hazards? (Y/N)	How can it be used to implement mitigation actions?	When was the last update? When is the next update?
Community Wildfire Protection Plan	Y	CWPP highlights wildfire mitigation activities.	2021
Economic Development Plan	Y – Referenced in General Plan	Goals and strategies that can be incorporated into mitigation actions.	2021
Land Use Plan	Y – Referenced in General Plan and in Future Land Use document	Highlights land use goals over a period, which can feed into mitigation actions.	2021
Local Emergency Operations Plan	Y	Magna adopted the MSD's plan, which was then converted to the CEMP in 2025.	2025
Stormwater Management Plan	Y – MSD plan	Can inform mitigation actions related to flooding and other severe weather hazards.	2020
Transportation Plan	Y	Informs various hazards as far as mitigation actions.	2020
Substantial Damage Plan	N	N/A	N/A
Other? (Describe)			

Table 13: Assessment of the Regulations and Ordinances of Magna City

Regulation/ Ordinance	Does it effectively reduce hazard impacts?	Is it adequately administered and enforced?	When was the last update? When is the next update?
Building Code	Building codes ensure that structures are built to national standard and brought up to code when remodeling occurs. Magna City has several commercial buildings. Magna has adopted the state's building codes, the International Building Code (IBC 2021) and International Residential Code (IRC 2021) with amendments, as its building code.	Y	2017
Flood Insurance Rate Maps	Y	Y	2023
Floodplain Ordinance	Y	Y	2023
Subdivision Ordinance	Y	Y	2023
Zoning Ordinance	Y	Y	2023
Natural Hazard-Specific Ordinance	Y	Y	2023

Administrative and Technical Capabilities

Administrative and technical capabilities include staff and their skills. They also include tools that can help carry out mitigation actions.

Table 14: Assessment of the Administrative Capabilities of Magna City[2]

Administrative Capability	In Place? (Y/N)	Is staffing adequate?	Are staff trained on hazards and mitigation?	Is coordination between agencies and staff effective?
Chief Building Official	Y , MSD	Yes	Yes, more training is always good.	Room for improvement.
Civil Engineer	Y, MSD	Yes	Yes, more training is always good.	Room for improvement.
Community Planner	Y, MSD	Yes	Yes, more training is always good.	Room for improvement.
Emergency Manager	Y	Yes	Yes, more training is always good.	Room for improvement.
Floodplain Administrator	Y, MSD	Yes	Yes, more training is always good.	Room for improvement.
Geographic Information System (GIS) Coordinator	Y, MSD	Yes	Yes, more training is always good.	Room for improvement.
Planning Commission	Y	Yes	Yes, more training is always good.	Room for improvement.
Fire Safe Council	N – UFA is the contracted fire department.	Yes	Yes, more training is always good.	Room for improvement.
CERT (Community Emergency Response Team)	N	N/A	N/A	N/A

[2] MSD = Municipal Services District, UFA = Unified Fire Authority.

Administrative Capability	In Place? (Y/N)	Is staffing adequate?	Are staff trained on hazards and mitigation?	Is coordination between agencies and staff effective?
Active VOAD (Voluntary Agencies Active in Disasters)	Y	Yes. American Red Cross, LDS Church, Salvation Army	Yes, more training is always good.	Room for improvement.
Other? (Please describe.)				

Table 15: Assessment of the Technical Capabilities of Magna City[3]

Technical Capability	In Place? (Y/N)	How has it been used to assess/mitigate risk in the past?	How can it be used to assess/mitigate risk in the future?
Mitigation Grant Writing	Y, MSD and the county	Magna is a part of the MSD, which supports the city in technical capabilities. Magna became a city on May 1, 2024.	Can be used to fund mitigation actions
Hazard Data and Information	Y, MSD	Yes	Hazard data and information were used to determine what areas to prioritize in the city.
GIS	Y, MSD	Yes	Identified areas prone to natural and manmade hazards to reduce risk.
Mutual Aid Agreements	Y, MSD and the county	Mutual aid agreements for sheltering, damage assessments, public works (debris removal, snow removal)	Can be used to complete mitigation actions.
Other? (Please describe.)			

Financial Capabilities

Financial capabilities are the resources to fund mitigation actions. Talking about funding and financial capabilities is important to determine what kinds of projects are feasible, given their cost. Mitigation actions like outreach programs are lower cost and often use staff time and existing budgets. Other actions, such as earthquake retrofits, could require substantial funding from local, state, and federal partners. Partnerships, including those willing to donate land, supplies, in-kind matches, and cash, can be included.

[3] MSD = Municipal Services District.

DRAFT

Table 16: Assessment of the Financial Capabilities of Magna City

Funding Resource	In Place? (Y/N)	Has it been used in the past and for what types of activities?	Could it be used to fund future mitigation actions?	Can it be used as the local cost match for a federal grant?
Capital Improvement Project Funding	Y	Yes, storm drain and water management	Y	Yes
General Funds	Y	Yes	Y	Yes
Hazard Mitigation Grant Program (HMGP/404)	N	No, could be used.	Y	No
Building Resilient Infrastructure & Communities (BRIC)	N	No, could be used.	Y	No
Flood Mitigation Assistance (FMA)	N	No, could be used.	Y	No
Public Assistance Mitigation (PA Mitigation/406)	N	No, could be used.	Y	No
Community Development Block Grant (CDBG)	Y	Developed interlocal agreement with CDBG and Emergency Solutions Grant Program.	Y	No
Natural Resources Conservation Services (NRCS) Programs	N	No, could be used.	Y	No
U.S. Army Corps (USACE) Programs	N	No, could be used.	Y	No
Property, Sales, Income, or Special Purpose Taxes	Y	Yes, capital improvement projects	Y	No
Stormwater Utility Fee	Y	Yes, Stormwater management	Y	Yes
Fees for Water, Sewer, Gas, or Electric Services	Y	Yes, stormwater maintenance	Y	Yes
Impact Fees from New Development and Redevelopment	Y	Code enforcement	Y	Yes
General Obligation or Special Purpose Bonds	Y	Stormwater management	Y	Yes
Federal-funded Programs (Please describe)	Y	Grant from EPA for Magna Water District to replace lead services. Also received funds in 2023 to replace Haynes Well Field well.	Y	No

DRAFT

Funding Resource	In Place? (Y/N)	Has it been used in the past and for what types of activities?	Could it be used to fund future mitigation actions?	Can it be used as the local cost match for a federal grant?
Private Sector or Nonprofit Programs	N	No, could be used	Y	Yes
Other?	Y	Small Business Impact Grant for COVID-19 business owners.	Y	No

Education and Outreach Capabilities

Education and outreach capabilities are programs and methods that could communicate about and encourage risk reduction. These programs may be run by a participant or a community-based partner. Partners, especially those who work with underserved communities, can help identify additional education and outreach capabilities.

Table 17: Assessment of the Education and Outreach Capabilities of Magna City[4]

Education and Outreach Capability	In Place? (Y/N)	Does it currently incorporate hazard mitigation?	Could it be used to support mitigation in the future?
Community Newsletter(s)	Y	Y	Y
Hazard Awareness Campaigns (such as Firewise, Storm Ready, Severe Weather Awareness Week, School Programs)	Y, between SLCo, MSD, and UFA	Y	Y
Public Meetings/Events (Please describe.)	Y – City council meetings are open to the public at the Webster Community Center	Y	Y
Emergency Management Listserv	Yes	Yes, SLCo EM provides.	Y
Local News	Y	Y	Y
Distributing Hard Copies of Notices (e.g., public libraries, door-to-door outreach)	Y	Y	Y
Insurance Disclosures/ Outreach	N	N	Y
Organizations that Represent, Advocate for, or Interact with Underserved and Vulnerable Communities (Please describe.)	Y	Y	Y

[4] MSD = Municipal Services District, SLCo = Salt Lake County, SLCo EM = Salt Lake County Emergency Management, UFA = Unified Fire Authority.

Education and Outreach Capability	In Place? (Y/N)	Does it currently incorporate hazard mitigation?	Could it be used to support mitigation in the future?
Social Media (Please describe.)	Y	Y	Y
Other? (Please describe.)			

Opportunities to Expand and/or Improve Capabilities

Actions that can expand and improve existing authorities, plans, policies, and resources for mitigation include budgeting for mitigation actions, passing policies and procedures for mitigation actions, adopting and implementing stricter mitigation regulations, approving mitigation updates, and making additions to existing plans as new needs are recognized. Table 18 lists the opportunities for Magna City.

Table 18: Opportunities to Expand and/or Improve the Capabilities of Magna City[5]

Capability	Opportunity to Expand and/or Improve
Planning and Regulation	Magna became a city on May 1, 2024, and must now build out a city leadership team. All services are currently contracted out to UPD, UFA, or the MSD/Salt Lake County. As it moves forward, it must decide whether it wants to continue those contracts or start its own. For example, the city can review the MSD's CEMP and Stormwater Management Plan to ensure they include all local data and procedures, updating them as needed.
Administrative and Technical	Staff could receive additional training on hazards and mitigation, including building officials, engineers, planners, emergency management, floodplain management, and GIS personnel. Additionally, coordination between the MSD and Magna can be expanded to ensure thorough understanding and implementation of mitigation measures and related plans, policies, and programs.
Financial	Magna could apply for new grant programs, including HMA grants and NRCS programs.
Education and Outreach	Current education and outreach programs are typically conducted by SLCo, MSD, and the UFA. Developing and implementing hazard-specific public education programs on disaster awareness and mitigation at the local level would expand Magna City's education and outreach capabilities.

Mitigation Strategy

Mitigation strategies provide proactive measures that are designed to minimize the impacts of hazards on the city of Magna. Table 19 shows mitigation action alternatives, and

Table 20 shows the status of previous mitigation activities. Table 21 is the 2025 mitigation action plan for Magna City.

[5] CEMP = Comprehensive Emergency Management Plan, GIS = Geographic Information System, HMA = Hazard Mitigation Assistance, MSD = Municipal Services District, NRCS = Natural Resources Conservation Service, SLCo = Salt Lake County, UFA = Unified Fire Authority, UPD = Unified Police Department,

Table 19: Mitigation Action Alternatives for Magna City

Action	Type of Action	Selected for inclusion in the plan?	If not selected, why not?
Continue social media engagement.	Education and Awareness Programs	N	Incorporated into a new mitigation action as far as outreach efforts and public awareness of local hazards.
Adopt new building codes as they are approved to bring some existing structures up to current codes.	Structure and Infrastructure Projects	Y	

Table 20: Status of Prior Mitigation Actions of Magna City[6]

Action	Hazard(s)	Agency Lead	Support Agency(ies)	Status Update
Conduct wildland urban interface mitigation.	Wildfire	Magna City	UFA, SLCo EM, FFSL	Ongoing
Conduct seismic upgrades.	Earthquake	Magna City	GSL MSD, Granite School District	Ongoing
Storm drain system overhaul.	Flooding, Public Health (Pandemic/ Epidemic)	Magna City	GSL MSD, SLCo PW & Municipal Services	Ongoing.
Slope stabilization at locations like but not limited to: Copper Bend Drive.	Landslide	Magna City	GSL MSD	Ongoing – Rio Tinto did some work nearby.
Radon testing and remediation.	Radon	Magna City	SLCo Health Department, SLCo EM	Ongoing.
Conduct hazardous materials flow study.	Hazardous Materials	Magna City	GSL MSD, LEPC, UFA	Not completed.

[6] FFSL = Division of Forestry, Fire, and State Lands, GSL = Greater Salt Lake, LEPC = Local Emergency Planning Committee, MSD = Municipal Services District, SLCo = Salt Lake County, SLCo EM = Salt Lake County Emergency Management, SLCo PW = Salt Lake County Public Works, UFA = Unified Fire Authority.

Table 21: 2025 Mitigation Action Plan for Magna City[7]

#	Action	Hazard(s)	Lead Agency	Potential Partners	Benefits (Losses Avoided)	Cost Estimate	Funding Source(s)	Timeframe	Priority	Comments
1	Enhance security at critical infrastructure locations to prevent potential for terrorist acts.	Terrorism	Magna City	UPD, UFA, MSD, SLCo IT, SLCo Public Works, SLCo Clerk's Office, SLCo Sheriff's Office	Increased security protocols (both in technology and policy) for staff/first responders, with clear expectations/understanding for Magna City employees and the public.	Medium	SLCo EM general funds, Magna City general funds, UPD general funds, SLCo Sheriff's Office general funds, UFA general funds, MSD general funds, HSGP grant	Short term	Medium	
2	Develop and implement public education programs on disaster awareness and mitigation.	Avalanche, Civil Disturbance, Dam Failure, Drought, Wildfire, Earthquake, Extreme Heat, Extreme Cold, Flooding, Hazardous Materials Incident, Heavy Rain, High Wind, Landslide/ Slope Failure, Lightning, Public Health Pandemic/Epidemic, Radon, Severe Winter Weather, Terrorism, Tornado, Wildfire	SLCo EM	UFA, UPD, Sheriff's Office, SLCo Public Works & Municipal Services, Magna City UDEM, local utilities, NGO partners	Increased understanding of local resources and improved relationships with the public and stakeholders. Outlined plans/SOPs for programs. For example, increased avalanche awareness and recognition of hazardous conditions due to avalanche safety and awareness activities could enable the public particularly people who live and work in the foothills to report and avoid problem areas. Additional public outreach activities that strengthen the public's ability to mitigate their risk include programs on defensible space and home hardening (wildfire), utility elevation and floodproof materials (flooding, heavy rain), and non-structural seismic retrofits (earthquake).	Low	Magna City general funds, MSD general funds, SLCo EM general funds, HSGP grant, SHSP grant	Short term	Medium	
3	Integrate WebEOC, Crisis Track, GIS, and other technological enhancements throughout Magna City.	Avalanche, Civil Disturbance, Dam Failure, Drought, Wildfire, Earthquake, Extreme Heat, Extreme Cold, Flooding, Hazardous Materials Incident, Heavy Rain, High Wind, Landslide/ Slope Failure, Lightning, Public Health Epidemic/Pandemic,	Magna City	UFA, UPD, SLCo Public Works & Municipal Services, SLCo Health Department, SLCo EM, MSD, UDOT, local utilities	Common operating platform for stakeholders, with increased situational awareness, and improved response time.	Low	SLCo EM general funds, UFA general funds, Magna City general funds, MSD general funds, HSGP grant, Emergency	Medium term	Medium	Existing software that we just need to improve documentation/training on.

[7] ATF = Bureau of Alcohol, Tobacco, Firearms and Explosives, BRIC = Building Resilient Infrastructure and Communities, CERT = Community Emergency Response Team, CWDG = Community Wildfire Defense Grant, CWPP = Community Wildfire Protection Plan, DHS = Department of Homeland Security, ESGP = Enhanced Security Grant Program, FBI = Federal Bureau of Investigation, FFSL = Division of Forestry, Fire, and State Lands, FMA = Flood Mitigation Assistance, HHPD = High Hazard Potential Dam, HMA = Hazard Mitigation Assistance, HMGP = Hazard Mitigation Grant Program, HSGP = Homeland Security Grants Program, IPAWS = Integrated Public Alert and Warning System, LEPC = Local Emergency Planning Committee, MSD = Municipal Services District, NGO = nongovernmental organization, NRCS = Natural Resources Conservation Service, NWS = National Weather Service, PDM = Pre-Disaster Mitigation, SAFE = Schools Aid Families in Emergencies, SHSP = State Homeland Security Program, SIAC = Statewide Information and Analysis Center, SLCo = Salt Lake County, SLCo EM = Salt Lake County Emergency Management, SLCo IT = Salt Lake County Information Technology, SLCo PW = Salt Lake County Public Works, SOP = Standard Operating Procedure, UDEM = Utah Division of Emergency Management, UDEQ = Utah Department of Environmental Quality, UDOT = Utah Department of Transportation, UFA = Unified Fire Authority, UPD = Unified Police Department.

DRAFT

#	Action	Hazard(s)	Lead Agency	Potential Partners	Benefits (Losses Avoided)	Cost Estimate	Funding Source(s)	Timeframe	Priority	Comments
		Radon, Severe Winter Weather, Terrorism, Tornado, Wildfire					Operations Center grant			
4	Enhance and continue to promote the implementation of CERT and SAFE Hubs.	Avalanche, Civil Disturbance, Dam Failure, Drought, Wildfire, Earthquake, Extreme Heat, Extreme Cold, Flooding, Hazardous Materials Incident, Heavy Rain, High Wind, Landslide/ Slope Failure, Lightning, Public Health Epidemic/Pandemic, Radon, Severe Winter Weather, Terrorism, Tornado, Wildfire	Magna City	SLCo EM, MSD, NGO partners	Increased awareness of local resources.	Low	SLCo EM general funds, Magna City general funds, UDEM general funds, MSD general funds	Short term	Medium	SAFE Hubs (previously S.A.F.E. Neighborhoods) is rebranding, with a new public awareness campaign and information for all partners.
5	Establish access and functional needs registry and ensure that those with access and functional needs are included in plans.	Avalanche, Civil Disturbance, Dam Failure, Drought, Wildfire, Earthquake, Extreme Heat, Extreme Cold, Flooding, Hazardous Materials Incident, Heavy Rain, High Wind, Landslide/ Slope Failure, Lightning, Public Health Epidemic, Radon, Severe Winter Weather, Terrorism, Tornado, Wildfire	SLCo EM	Magna City, MSD, UFA, UPD, SLCo Sheriff's Office, SLCo Aging and Adult Services, SLCo Health Department	Increased situational awareness for the public and stakeholders, and greater understanding of resources available for those with access and functional needs.	Low	SLCo EM general funds, Magna City general funds, MSD general funds, HSGP grant	Short term	High	The state of Utah's Access and Functional Needs Registry is dissolving in 2025. Salt Lake County needs a way to account for those with access and functional needs, including incorporation into plans and SOPs.
6	Bring deficient high hazard dams up to current industry standards.	Dam Failure	SLCo Flood Control Engineering	SLCo EM, Magna City, water districts, dam owners, water companies, MSD Planning and Development	Increased safety (personal injuries, safety of first responders) and reduced damage to critical infrastructure.	High	SLCo Flood Control Engineering capital improvement funds, dam owners, water districts, Utah Division of Water Resources capital improvement funds, HHPD grant, Magna City general funds, MSD general funds	Long term	High	
7	Procure generators and transfer switches for schools, public facilities, and critical facilities.	Extreme Heat, Extreme Cold	MSD	Magna City, SLCo EM, Granite School District, NGO partners, water districts, UFA, UPD, SLCo Health Department, SLCo Sheriff's Office	Backup generators available at cooling centers and Code Blue centers. Accurate inventory of what the county can provide to other agencies or jurisdictions as needed.	Medium	HMA grant, Magna City general funds, MSD general funds, SLCo Health Department general funds, Granite School District general funds	Long term	Medium	

DRAFT

#	Action	Hazard(s)	Lead Agency	Potential Partners	Benefits (Losses Avoided)	Cost Estimate	Funding Source(s)	Timeframe	Priority	Comments
8	Increase the size of culverts and bridges in areas Magna City has identified as past or potential flooding concerns.	Flooding, Heavy Rain	MSD Planning and Development	SLCo EM, Magna City, water districts, local utilities, SLCo Flood Control Engineering	Allows for larger runoff during spring melt season, and reduces the amount of debris buildup.	High	SLCo PW capital improvement funds, UDOT capital improvement funds, MSD general funds, Magna City capital improvement projects, PDM, HMGP grant, FMA, NRCS	Long term	Medium	
9	Procure FMA grants.	Flooding, Heavy Rain	MSD	Magna City, SLCo Public Works, SLCo EM	Improved understanding of available grants and how money can be used for mitigation efforts.	Low	SLCo EM general funds, Magna City general funds, MSD general funds, FMA	Medium term	Medium	
10	Develop an enhanced emergency notification communications system for Magna City.	Avalanche, Civil Disturbance, Dam Failure, Drought, Earthquake, Extreme Heat, Extreme Cold, Flooding, Hazardous Materials Incident, Heavy Rain, High Wind, Landslide/ Slope Failure, Lightning, Public Health Epidemic/Pandemic, Radon, Severe Winter Weather, Terrorism, Tornado, Wildfire	Magna City	MSD, UFA, UPD, SLCo EM, UDOT, SLCo Sheriff's Office, SLCo Health Department, local utilities	Early notification of impending wildfire to decrease loss of life. Improved relationships with the public and stakeholders. Faster delivery of information with templates/plans ready to go.	Medium	SLCo EM general funds, MSD general funds, Magna City general funds, HSGP grant, BRIC grant	Short term	Medium	Estimation of $1 million, with costs shared by local jurisdictions/agencies and the county. SLCo EM has been working on developing IPAWS templates and identifying streamlined communication.
11	Promote the Firewise initiative and regularly review/update the Community Wildfire Protection Plan (CWPP).	Wildfire	UFA	SLCo EM, Magna City, SLCo Fire Warden, FFSL	Increased awareness of plans (for the public and stakeholders), improved eligibility for grants and other funding sources, and regular review of CWPP.	Low	SLCo EM general funds, MSD general funds, Magna City general funds, CWDG, Fire Prevention and Safety grant	Short term	Medium	
12	Conduct public awareness campaign on Tier 2 reporting software for chemical reporting.	Hazardous Materials Incident	UFA	SLCo EM, UPD, Magna City, Sheriff's Office, Rio Tinto, SLCo Health Department, UDEQ, water districts, local utilities, LEPC	Improved understanding of Tier 2 reporting and how local agencies/jurisdictions can find and submit information. A common operating platform for hazardous materials reporting.	Low	SLCo EM general funds, LEPC, Magna City general funds, MSD general funds	Long term	Medium	
13	Enact citywide regulations and codes for development to reduce landslide and slope failure damage to critical	Landslide, Slope Failure	MSD	SLCo EM, UFA, Magna City, SLCo Office of Regional Development, local utilities, Granite School District	Reduced likelihood of landslides and damage to critical infrastructure/buildings. Future development that is up to code and follows policy to avoid repetitive loss properties.	Medium	SLCo EM general funds, MSD general funds, Magna City general funds	Long term	Medium	

DRAFT

#	Action	Hazard(s)	Lead Agency	Potential Partners	Benefits (Losses Avoided)	Cost Estimate	Funding Source(s)	Timeframe	Priority	Comments
	infrastructure and buildings.									
14	Leverage WebEOC and GIS to track the spread of contagious diseases.	Public Health Epidemic/Pandemic	SLCo Health Department	SLCo EM, UFA, MSD, UPD, SLCo Sheriff's Office, Magna City	Use of GIS and WebEOC software to maintain situational awareness and track illnesses in Magna City.	Low	SLCo EM general funds, SLCo Health Department general funds, UDEQ general funds	Short term	Medium	Existing software that Magna City already has, so just need improved training/ documentation.
15	Create public awareness campaigns and public education programs on radon risks and provide home testing for radon.	Radon	SLCo EM	SLCo Aging and Adult Services, Magna City, MSD, SLCo Health Department	Fewer radon-caused cancer deaths. Increased engagement/ understanding with the public on what SLCo and the city can do or help with.	Low	SLCo EM general funds, Magna City general funds, UDEQ general funds, SLCo Health Department general funds	Short term	Low	
16	Develop road resurfacing project, including permeable pavement for areas with rain-based flooding.	Heavy Rain, Flooding	SLCo Flood Control Engineering	Magna City, UDOT, MSD Planning and Development	Reduced discharge of pollutants in runoff, reduced maintenance time/costs on roads, and improved traction on roads.	High	SLCo Flood Control Engineering capital improvement funds, MSD capital improvement projects, UDOT, HMGP grant, FMA, Magna City general funds	Long term	Low	
17	Create a public education program to inform property owners about tree maintenance and high strength windows.	High Winds	Magna City	SLCo Aging and Adult Services, SLCo Public Works & Municipal Services, UFA, SLCo EM, MSD	Reduced damage during high wind events to critical infrastructure. Fewer personal injuries (people driving on roads or walking in neighborhoods). Improved relationships with stakeholders and the public.	Low	SLCo Public Works & Municipal Services general funds, SLCo EM general funds, UFA general funds	Short term	Low	
18	Develop a severe winter weather mitigation program to ensure that access to primary roadways and evacuation routes.	Severe Winter Weather – Heavy Snow, Blizzard	SLCo Public Works & Municipal Services	SLCo EM, MSD, UDOT, Magna City	Ability of emergency services like police, fire, and paramedics to use roads to provide their services.	Medium	MSD general funds, SLCo Public Works & Municipal Services general funds, Magna City general funds	Short term	High	A severe winter storm with heavy snowfall requires our operators and equipment to be used to clear roads and streets for the public and emergency vehicles to use. The primary efforts will focus on keeping the roads open by clearing snow.
19	Conduct public awareness campaign about lightning safety.	Severe Weather – Lightning	SLCo EM	SLCo Parks and Recreation, UFA, SLCo Public Works &	Lightning strike awareness for the public.	Low	SLCo EM general funds, MSD general	Short term	Low

City of Midvale Annex

To participate in this multi-jurisdictional hazard mitigation plan (MJHMP) update for Salt Lake County (SLCo), the governing body of the city of Midvale passed a formal resolution, a copy of which is maintained at the local government offices.

Planning Process Contact Information

Table 1 provides information on the point of contact during the updating of the MJHMP.

Table 1: Contact Information for the City of Midvale

Name	Contact Information
Matt Dahl	**Phone:** 801-567-7262; **email:** mdahl@midvaleut.gov

The city of Midvale has a fully integrated approach to hazard mitigation planning and program implementation. During the 2024 update process, the MJHMP participation roles in Table 2 were recorded.

Name	Title	Jurisdiction
Matt Dahl	City Manager	City of Midvale
Brad Jewett	Municipal Emergency Planner	Unified Fire Authority
Brian Buckhout	Municipal Emergency Planner	Unified Fire Authority

Jurisdiction Profile

Date of Incorporation

1909.

Location and Description

The city of Midvale is located south of Salt Lake City in the middle of the Salt Lake Urbanized Metropolitan Area, comprising the Wasatch Front. It is just 12 miles south of downtown Salt Lake City and some 20 miles from four mountain resorts. The city is approximately 5.9 square miles in area and has an elevation of 4,383 feet. The city of Midvale is known for its historical significance, especially its role in the Mormon migration of the 19th century.

DRAFT

Population

The 2020 U.S. Census records the population of the city of Midvale as 36,028 people.

Demographics

According to the U.S. Census Bureau, 48.8% of the population is female. Individuals under the age of 18 make up 21.8% of the population, while 9.4% are 65 years or older. The population is composed of 70.2% White and 17.5% Hispanic residents.

Brief History

In the early 1870s and 1900s, the establishment of smelters at Bingham Junction marked a significant development in Midvale's history, driven by the burgeoning mining activities in nearby canyons. These smelters processed ores from Bingham Canyon and other mines, transforming the area into an industrial hub. The influx of industry spurred the growth of hotels, boarding houses, saloons, schools, and other establishments, making the city's Old Town a vibrant community center.

The smelting operations continued until 1958, when the last facility ceased operations. This closure led to a period of economic contraction for Midvale. However, since the early 2000s, the city has experienced remarkable growth, in part due to the redevelopment of the former smelting sites. These areas have been transformed into thriving commercial and residential zones, contributing to Midvale's revitalization and economic resurgence.

Today, Midvale stands as a testament to resilience and adaptability, evolving from its industrial roots into a dynamic city with a rich heritage and a promising future.

Climate

According to data from Weather Spark, average high temperatures for the summer range from 78°F to 86°F and the winter average low temperatures are around 27°F. Rain each year is approximately 13.7 inches, and snowfall averages 12.5 inches.

Public Services

Midvale participates in several strategic partnerships for community services. The Unified Fire Authority (UFA) provides fire, EMS, and emergency management services. The Unified Police Department (UPD) provides law enforcement, and Salt Lake County Animal Services addresses concerns for animal welfare and safety. The city's Public Works Department provides many other essential functions.

Midvale City launched the Community Building Community Initiative in 1998 to address critical health and social challenges, growing from a small dental chair in City Hall to a 3,000-square-foot facility near the 7200 South transit stop. Since becoming a 501(c)(3) nonprofit in 2014, dedicated volunteers and supporters have helped expand its impact, particularly within the Hispanic/Latino community across the Salt Lake Valley and Summit County.

DRAFT

Governing Body

The city of Midvale's governing body consists of a mayor and five-member City Council, and it has the power to create and enforce laws including the authority to levy taxes.

Development Trends

Midvale City is over 100 years old but has experienced hundreds of millions of dollars in new investment in the past few years. In the 5.9 square miles of Midvale, there is a lot of activity. It is home to a growing population of approximately 36,028 residents and some 1,300 businesses. There are many retailers who take advantage of the city's strategic location with its unparalleled access to the regional transportation system and established trade areas. It is home to many top-performing locations, mom and pop shops, and one-of-a-kind locations.

Jurisdiction-Specific Hazards and Risk

The Calculated Priority Risk Index (CPRI) is a comprehensive assessment tool for evaluating and prioritizing risks in a given context. It considers various factors, such as probability, impact, and urgency, to determine the level of risk associated with events or situations. The results for each hazard, including its risk factor (RF) value, are shown in Table 3. The results are based on the criteria in Table 4 and the equation that follows it. The CPRI helps organizations and individuals make informed decisions about risk management and mitigation strategies. It provides a systematic approach to identifying and addressing potential issues, allowing for a more efficient allocation of resources and proactive risk prevention. With the CPRI, stakeholders can prioritize their focus on the most critical risks, leading to more effective risk management and, ultimately, better outcomes.

Table 3: Calculated Priority Risk Index Values for the City of Midvale

Type of Hazard Event	Probability of Future Events	Spatial Extent	Severity of Life/ Property Impact	Warning Time	Duration	Response Capacity	Risk Factor Value
Avalanche	1	1	1	4	1	3	1.4
Drought	2	4	1	1	4	4	2.2
Earthquake	2	4	2	4	4	1	2.5
Extreme Heat	2	4	1	1	2	3	1.9
Extreme Cold	2	4	1	1	3	3	2
Flooding	2	2	1	3	3	2	1.9
Landslide/ Slope Failure	1	1	1	1	1	3	1.2
Radon	3	2	2	1	1	1	2.0
Heavy Rain	2	4	1	1	1	4	1.9
High Wind	2	4	1	1	1	4	1.9
Lightning	1	1	1	2	1	4	1.4

Type of Hazard Event	Probability of Future Events	Spatial Extent	Severity of Life/ Property Impact	Warning Time	Duration	Response Capacity	Risk Factor Value
Severe Winter Weather	3	4	1	1	3	2	2.2
Tornado	2	2	1	4	1	1	1.7
Wildfire	2	2	1	2	4	1	1.8
Dam Failure	1	1	1	2	2	3	1.4
Civil Disturbance	2	2	1	4	1	1	1.7
Cyberattack	2	2	1	4	4	4	1.9
Hazardous Materials Incident (Transportation & Fixed Facility)	2	2	1	4	3	1	1.9
Public Health Epidemic/ Pandemic	2	4	1	1	4	3	2.1
Terrorism	1	1	1	1	2	1	1.1

Table 4: Criteria for the Calculated Priority Risk Index

Risk Index Factor	Degree of Risk Level		Criteria	Factor Weight for Degree of Risk Level
Probability of Future Events	1	Unlikely	Less than 1 percent probability of occurrence in the next year or a recurrence interval of greater than every 100 years.	30%
	2	Occasional	1 to 10 percent probability of occurrence in the next year or a recurrence interval of 11 to 100 years.	
	3	Likely	11 to 90 percent probability of occurrence in the next year or a recurrence interval of 1 to 10 years.	
	4	Highly Likely	91 to 100 percent probability of occurrence in the next year or a recurrence interval of less than 1 year.	
Spatial Extent	1	Limited	Less than 10% of the planning area could be impacted.	10%
	2	Small	10%–25% of the planning area could be impacted	
	3	Significant	25%–50% of the planning area could be impacted.	

DRAFT

Risk Index Factor	Degree of Risk Level		Criteria	Factor Weight for Degree of Risk Level
	4	Extensive	50%–100% of the planning area could be impacted.	
Severity of Life/Property Impact	1	Negligible	Less than 5% of the affected area's critical and non-critical facilities and structures are damaged/ destroyed. Only minor property damage and minimal disruption of life. Temporary shutdown of critical facilities.	30%
	2	Limited	More than 5% and less than 25% percent of property in the affected area is damaged/ destroyed. Complete shutdown of critical facilities for more than one day but less than one week.	
	3	Critical	More than 25% and less than 50% of property in the affected area was damaged/ destroyed. Complete shutdown of critical facilities for over a week but less than one month.	
	4	Catastrophic	Over 50% of critical and non-critical facilities and infrastructures in the affected area are damaged/ destroyed. Complete shutdown of critical facilities for more than one month.	
Warning Time	1	Self-defined	More than 24 hours	10%
	2	Self-defined	12 to 24 hours.	
	3	Self-defined	6 to 12 hours.	
	4	Self-defined	Less than 6 hours.	
Duration	1	Brief	Up to 6 hours.	10%
	2	Intermediate	Up to one day.	
	3	Extended	Up to one week.	
	4	Prolonged	More than one week.	
Response Capacity	1	High	Significant resources and capability to respond to this kind of event; staff are trained, experienced, and ready.	10%
	2	Medium	Some resources and capability to respond to this kind of staff; some staff may be trained, experienced, and ready while others may need additional support.	
	3	Low	Limited resources and capability to respond to this kind of event; additional staff or staff training needed.	
	4	None	No resources and capability to respond this kind of event; additional outside support would be required.	

DRAFT

RISK FACTOR (RF) EQUATION

RF Value = [(Probability x 0.30) + (Spatial Extent x 0.10) + (Severity of Life/Property Impact x 0.30) + (Warning Time x 0.10) + (Duration x 0.10) + (Response Capacity x 0.10)]

Hazards with an RF value greater than or equal to 2.5 are considered high risk. Those with RF values of 2.0 to 2.4 are considered moderate risk hazards, and those with an RF value less than 2.0 are considered low risk. The highest possible RF value is 4.

Hazard Event History

Examining hazard event histories provides valuable insights to inform decision-making and help prioritize resources for risk prevention and response efforts. Table 5 lists the hazard events impacting the city of Midvale since the 2019 plan update, as recorded in the Storm Events Database from the National Centers for Environmental Information.

Table 5: History of Hazard Events in the City of Midvale[1]

Type of Hazard Event	FEMA Disaster #	Date(s)	Damage or Impacts	Description
Avalanche		N/A	No historical risk but there could be traffic impacts if an avalanche occurs in the surrounding area	Midvale borders Cottonwood Heights and is close to the mountains in unincorporated SLCo.
Drought		2020–present	Minimal risk, minimal response. The state has been in a drought over the last few years.	The state has been in a drought over the last few years.
Earthquake		March 18, 2020	Earthquake in Magna caused power outages and extensive damage throughout the county. It caused road and infrastructure damage.	The USGS database shows that there is a 48.65% chance of a major earthquake within 50km of the city of Midvale in the next 50 years.
Extreme Heat		Summers of 2020-present	Extreme heat is becoming more of a concern in the summers, especially with global warming.	The county opens cooling shelters in the summer that residents can use.
Extreme Cold		N/A	There have been Code Blue days each winter.	Shelters expand their capacity to assist those who need shelter from the cold during Code Blue days.

[1] SLCo = Salt Lake County, USGS = United States Geological Survey, WHO = World Health Organization.

DRAFT

Type of Hazard Event	FEMA Disaster #	Date(s)	Damage or Impacts	Description
Flooding		N/A	There is flood risk near the Jordan River.	People experiencing homelessness have been setting up camps near the Jordan River. This has been a safety and public health concern, especially if debris clogs up the waterway.
Landslide/ Slope Failure		N/A	No historical risk but there is concern about structure collapse and injuries/fatalities	
Radon		N/A	Concerns about public health, especially those who have access and functional needs.	52% of households in Midvale are at or above WHO's mitigation threshold for radon.
Heavy Rain		June 13, 2016	Heavy rain caused flooding in homes.	Around 70 people were displaced, and there were a few traffic accidents.
High Wind		Sept 2020	Impacted travel with debris in roads.	High winds recorded up to 90 mph.
Lightning		N/A	Potential injuries or fatalities at outdoor community events	
Severe Winter Weather		Winters in 2022 and 2023	Traffic accidents and power outages.	Heavy snow could have risk over a short duration
Tornado		N/A	Minimal risk with rare historical risk	1999 Salt Lake City tornado caused extensive damage, which could happen in Midvale.
Wildfire		July 2, 2022	Brush fire spread to a carport and two sheds	Brush fires are a concern in Midvale especially being close to the mountains in unincorporated SLCo. Wildfires coming in from other areas is a concern with the population density of Midvale.
Dam Failure		N/A	No Historical Risk but there is concern of future occurrence, dam inundation boundaries show potential in Midvale.	Midvale is in the dam inundation zone for Flat Iron Mesa and Red Pine dams. There are high and significant hazard dams surrounding Midvale.
Civil Disturbance		N/A	No historical risk but there have been protests throughout the county.	There were violent protests in Salt Lake City in 2020 that had local impacts as far as crime and infrastructure damage.

DRAFT

Type of Hazard Event	FEMA Disaster #	Date(s)	Damage or Impacts	Description
Cyberattack		N/A	No historical risk. Potential of risk to increase as events are on the rise	A cyberattack could impact government operations and essential functions.
Hazardous Materials Incident (Transportation & Fixed Facility)		July 17, 2017 and June 4, 2015	Hazmat teams responded to a synthetic opioid operation.	Midvale has an industrial train transit system that runs straight through the city and runs the risk of a derailment of a train carrying hazardous materials. An acid spill blocked road access until cleanup was completed.
Public Health Epidemic/ Pandemic	COVID 2020–2021 DR-4525-UT	January 20, 2020	Historical risk from COVID-19 as far as the local economy, public health, and societal unrest.	School and business closures, strain on public health resources for testing, long-term economic impacts. Unknown how many residents experienced the illness.
Terrorism		N/A	No historical risk but concern about the rise in social media and potential propaganda.	

National Flood Insurance Program Summary

The city of Midvale participates in the National Flood Insurance Program (NFIP). Table 6 displays statistics related to the NFIP. The city of Midvale does not participate in the Community Rating System (CRS).

Table 6: National Flood Insurance Program Status for the City of Midvale[2]

Initial FHBM Identified	Initial FIRM Identified	Current Effective Map Date	Adopted Date	Date Joined NFIP	Tribal
12/18/85	12/18/1985	09/25/2009	2009	06/03/2020	No

Table 7: National Flood Insurance Overview for the City of Midvale

Community ID	Number of Losses	Total Net Payment	Active Policies	Total Coverage
490211	0	$0	27	$5,756,000

The city of Midvale has designated the city manager or designee as the Floodplain Administrator. The Building & Safety Department supports the duties of the floodplain administrator. The current Flood Damage Prevention Ordinance was adopted 9/22/2009. The current effective FIRMs are dated

[2] FIRM = Flood Insurance Rate Map, FHBM = Flood Hazard Boundary Map.

9/25/2009. The city requires development permits for structures in the SFHA. The Building & Safety Department is responsible for reviewing building permits. Substantial damage/substantial improvement determinations would be made through the permitting and pre-construction building inspection requirements which are accomplished by the Building & Safety Department.

Jurisdiction-Specific Vulnerabilities and Impacts

Table 8 provides information on the vulnerable assets in the city of Midvale, including its critical facilities, highlighting the city's vulnerability to identified hazards. It also describes the potential impacts to the community arising from those vulnerabilities. By understanding the risks associated with these assets, local authorities can develop proactive strategies to mitigate vulnerabilities and ensure the safety and functionality of these important assets during hazard events. This data is invaluable for decision-making and prioritizing resources for emergency response and preparedness efforts, ultimately contributing to more effective risk management and greater resilience in the community.

Community assets at risk include critical facilities such as two fire stations, one police station, one emergency operations center, and nine schools. The Midvale Senior Center, Ruth Vine Tyler Library, and Copperview Community Center are other important facilities in the community. The Salt Lake County Public Works Complex, Sanitation Building & Shop, and Fleet, Sanitation, and Operations facilities are located in Midvale. Midvale City Park, Union Park, Bingham Junction Park, Midvale Museum and the Jordan River Parkway Trail are among the recreation assets in the city. Major transportation routes include I-15, I-215, 7200 South/Fort Union Boulevard, State Street/US 89, Bingham Junction Boulevard, 900 East, and Union Park Avenue. The city is served by Utah Transit Authority Trax Red and Blue lines. The city has invested in revitalizing historic Main Street as Midvale Main Arts and Culture District to increase pedestrian traffic, support businesses, and improve aesthetic appeal with murals. The Connie Crosby Family Resource Center, operated by the Road Home, serves families experiencing homelessness in Salt Lake County.

Table 8: Jurisdiction-Specific Vulnerabilities and Impacts in the City of Midvale

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
Avalanche	People	*Vulnerability:* While Midvale is not typically located in a high-risk avalanche zone, individuals who engage in recreational activities in nearby mountainous areas, such as the Wasatch foothills to the east, could face avalanche dangers. *Impacts:* Hikers, backcountry skiers, and snowmobilers unfamiliar with avalanche forecasting or safety practices are particularly at risk. Residents who frequently travel to nearby canyons during winter months may also be indirectly impacted by access closures or transportation hazards.
	Structures	*Vulnerability:* Structures within Midvale itself are unlikely to be directly affected by avalanches due to the city's flat terrain. *Impacts:* Buildings in the foothill interface or along major travel corridors leading into mountainous areas could experience secondary impacts from snow slides that block access or utility service.

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
	Economic Assets	*Vulnerability:* While Midvale does not rely directly on mountain tourism, winter road closures due to avalanche control in neighboring areas can affect commuter patterns and commercial deliveries. *Impacts:* Businesses dependent on regional recreation traffic may see disruptions. Additionally, utility disruptions caused by avalanches outside the city could have cascading effects on local commerce and services.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Vegetation and historic sites are vulnerable to avalanches. *Impacts:* Nearby avalanche events can lead to deforestation, erosion, and ecosystem disruption in adjacent recreational lands used by Midvale residents. Historic trails or landmarks in the canyons may be threatened by slides, especially if not protected or maintained seasonally.
	Critical Facilities and Infrastructure	*Vulnerability:* Roads and utilities are vulnerable to avalanches. *Impacts:* Avalanche-related road closures or power line damage near canyons may hinder access to healthcare or disrupt emergency response routes for those commuting into Midvale. Though infrastructure in Midvale is not located in avalanche zones, its connectivity to affected regions can pose indirect risks.
	Community Activities	*Vulnerability:* Outdoor recreation activities are vulnerable to avalanche conditions. *Impacts:* Outdoor winter recreation, including hiking, sledding, and backcountry activities by Midvale residents, may be impacted by avalanche conditions in adjacent areas. Community safety campaigns should emphasize avalanche awareness for residents traveling to higher elevations.
Drought	People	*Vulnerability:* All Midvale residents are vulnerable to drought. *Impacts:* Prolonged drought conditions in Midvale can disproportionately affect individuals with limited financial means, especially when utility costs rise due to water scarcity. Seniors, young children, and people experiencing homelessness may face additional health challenges related to water access and heat exposure. Residents with disabilities may struggle with compliance with water restrictions without adequate support.
	Structures	*Vulnerability:* Landscaping around structures is vulnerable to drought. *Impacts:* Drought does not typically damage buildings directly, but may increase maintenance costs due to landscaping restrictions. Older homes with inefficient plumbing and irrigation systems may see increased utility bills. Fire risk in dry conditions also threatens homes near dry vegetation.
	Economic Assets	*Vulnerability:* All businesses, particularly those dependent on water, are vulnerable to drought. *Impacts:* Businesses reliant on water may experience cost increases and operational limits. Drought can impact economic growth, particularly in sectors related to landscaping, recreation, and hospitality, which may face watering restrictions and customer service constraints.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
	Natural, Historic, and Cultural Resources	*Vulnerability:* Parks and historic and cultural sites are vulnerable to drought. *Impacts:* Local parks and green spaces may suffer from reduced irrigation, leading to dying vegetation and loss of recreational value. Drought-induced dust and poor air quality may harm sensitive historic buildings, while cultural centers may see decreased attendance due to outdoor discomfort.
	Critical Facilities and Infrastructure	*Vulnerability:* Water systems and emergency response services are vulnerable to drought. *Impacts:* Drought can strain Midvale's water distribution and fire suppression systems. Emergency services may face challenges related to wildfire management, and prolonged dry conditions can degrade soil structure around underground infrastructure.
	Community Activities	Drought: Parks and recreation activities are vulnerable to drought. *Impacts:* Water conservation mandates may limit public park use, community gardening, or water-intensive sports like swimming. Events scheduled during extreme heat or poor air quality days may require cancellation or relocation to indoor, climate-controlled venues.
Earthquake	People	*Vulnerability:* Midvale lies within the Wasatch Front, a known seismically active region. Residents in older, non-retrofitted buildings are at significant risk during a seismic event. *Impacts:* People can be injured by falling objects or trapped under collapsed structures. Residents may be displaced from homes. Vulnerable populations may face difficulty evacuating or accessing emergency services post-event. Households without preparedness kits or emergency communication plans are more likely to be adversely affected.
	Structures	*Vulnerability:* All Midvale structures are vulnerable. The entire city has a moderate to high liquefaction potential, which increases the risk of structural damage. *Impacts:* Many buildings in Midvale predate modern seismic safety codes. Unreinforced masonry buildings and homes with shallow foundations are particularly vulnerable to damage. Commercial properties and multi-family residences that have not been seismically upgraded may suffer major structural damage or collapse during a strong earthquake.
	Economic Assets	*Vulnerability:* All Midvale businesses are vulnerable to earthquakes. *Impacts:* Retail centers, small businesses, and industrial facilities are vital to Midvale's economy and may face prolonged closure or loss if significantly damaged. Disruption of utility services and transportation corridors could limit business operations and recovery timelines. Lack of insurance or retrofitting further increases economic vulnerability.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Historic and cultural sites, as well as Jordan River vegetation, are vulnerable to earthquakes. *Impacts:* Earthquakes may damage historic buildings such as schools, religious sites, or older civic structures. Additionally, ground movement may alter landscapes, affect soil stability, and impact urban tree cover or wetlands near the Jordan River corridor.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
	Critical Facilities and Infrastructure	*Vulnerability:* All critical facilities and infrastructure are vulnerable to earthquakes. *Impacts:* All city facilities are vulnerable to damage and disruption of services from an earthquake. Key infrastructure are vulnerable if not retrofitted to modern seismic standards. Damage to roads and bridges can impede travel through the city. Water and sewer lines may rupture, and utility poles or substations could be compromised. Communication systems may go down, affecting public information flow during a crisis.
	Community Activities	*Vulnerability:* Community events are vulnerable to earthquakes. *Impacts:* Large gatherings in Midvale could be hazardous during a seismic event if structural protections are lacking. Emergency plans must prioritize evacuation routes, sheltering locations, and continuity of community operations.
Extreme Heat	People	*Vulnerability:* All residents are exposed to extreme heat. Some populations may have higher risks due to socioeconomic or health conditions. *Impacts:* Extreme heat can cause illness such as dehydration, heat exhaustion, and heat stroke. Vulnerable populations during extreme heat include adults over 65, individuals with pre-existing health conditions, and young children, as they may struggle to regulate body temperature. Socioeconomically disadvantaged individuals may lack access to cooling resources, while outdoor workers are at higher risk of heat-related illnesses due to physical labor without adequate hydration and rest. Extreme heat can hinder students' learning.
	Structures	*Vulnerability:* Structures with inadequate cooling or insulation are vulnerable to extreme heat. *Impacts:* Residential buildings with inadequate insulation and ventilation and commercial buildings lacking reflective roofing and proper shading may be vulnerable to extreme heat. Materials like metal and glass can amplify heat retention, while areas with limited green space typically experience higher temperatures.
	Economic Assets	*Vulnerability:* All businesses in Midvale are vulnerable to extreme heat. *Impacts:* All businesses face increased energy costs for cooling systems. Agricultural operations can have reduced yields and higher water demand due to heat stress. The outdoor recreation industry may see decreased participation during heat waves, affecting local businesses that rely on visitors. In addition, the energy infrastructure could face strain from increased cooling demands, leading to outages.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Plants, wildlife, parks, and historic structures are vulnerable to extreme heat. *Impacts:* Local plant species and wildlife habitats can suffer from extreme heat, leading to reduced biodiversity. Historic buildings may degrade due to high temperatures, causing materials to deteriorate and paint to peel. In addition, parks and recreational areas may experience overuse and risk their preservation, as residents seek relief from the heat.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
	Critical Facilities and Infrastructure	*Vulnerability:* Emergency response and healthcare, transportation, and power infrastructure are vulnerable to extreme heat. *Impacts:* Healthcare facilities may experience increased demand because of heat-related medical issues, while schools can suffer from the strain on cooling resources. Transportation systems are at risk of damage, such as buckling roads and warped train tracks. Power grids may be strained by higher demands for electricity for cooling, leading to potential outages.
	Community Activities	*Vulnerability:* Outdoor events and recreation are vulnerable to extreme heat. *Impacts:* Activities like outdoor sports, fairs, and agricultural practices are vulnerable to extreme heat. These events can pose risks, particularly for participants such as youth athletes and elderly residents, who may suffer from heat-related illnesses. In addition, high temperatures can stress crops, which impacts local farming.
Extreme Cold	People	*Vulnerability:* All Midvale residents are exposed to extreme cold. Residents who are elderly, living with chronic health conditions, or experiencing housing insecurity face heightened risks during periods of severe cold. Children may also be vulnerable if they lack adequate winter clothing or live in underheated homes. *Impacts:* Low-income households may struggle to afford increased heating costs, putting their health and safety at risk. Exposure to freezing temperatures can lead to hypothermia, frostbite, and the exacerbation of existing medical conditions.
	Structures	*Vulnerability:* Older homes and other structures are vulnerable to extreme cold. *Impacts:* Buildings in Midvale constructed prior to modern energy-efficiency standards may experience significant heat loss during cold snaps, particularly if insulation is inadequate or windows and doors are poorly sealed. Frozen pipes can burst, leading to water damage and costly repairs. Detached or unheated structures such as garages and storage sheds are especially vulnerable. Prolonged cold can also damage road surfaces and bridge decks through freeze-thaw cycles.
	Economic Assets	*Vulnerability:* All Midvale businesses are vulnerable to extreme cold. *Impacts:* Cold weather can disrupt supply chains and business operations, particularly for sectors that rely on transportation or energy. Delivery delays, increased heating costs, and utility outages may reduce profitability for local businesses. Small-scale agriculture or garden centers may experience crop losses if frost protection systems are overwhelmed. Energy-dependent operations, including manufacturing and healthcare facilities, may face higher operational costs during extreme cold events.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Plants, ecosystems, parks, and historic and cultural sites are vulnerable to extreme cold. *Impacts:* Extended cold periods can damage native plant species, reduce food availability for wildlife, and disrupt ecosystems in local parks or along the Jordan River corridor. Historic buildings and older community landmarks in Midvale may suffer from weathering or internal damage due to poor insulation and moisture intrusion from

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		melting ice. Public art installations and monuments are also at risk of degradation during freeze-thaw conditions.
	Critical Facilities and Infrastructure	*Vulnerability:* Water, power, and transportation infrastructure, as well as emergency response services, are vulnerable to extreme cold. *Impacts:* Cold temperatures may affect the performance of critical infrastructure such as water treatment facilities, which are susceptible to frozen lines or equipment malfunctions. Power lines and substations may be burdened by increased demand or ice buildup, raising the potential for outages. Emergency services may face access issues due to icy roads, while public buildings may struggle to maintain safe indoor temperatures if heating systems fail. Public facilities may see an increased demand for warming centers and other services.
	Community Activities	*Vulnerability:* Community activities are vulnerable to extreme cold. *Impacts:* Outdoor programming can be canceled or poorly attended during extreme cold, reducing community engagement. Vulnerable populations may avoid public events if adequate heating or indoor shelter is unavailable. Community centers and gathering spaces without reliable heating infrastructure may become uncomfortable or unsafe for group activities.
Flooding (and Heavy Rain)	People	*Vulnerability:* Flooding primarily affects residents in low-lying areas near rivers and streams, especially during heavy rainfall or snowmelt. In Midvale, there is a known 1% annual chance of flood along the Jordan River and a small area in eastern Midvale where Big Cottonwood Creek passes through the city. *Impacts:* Individuals without reliable transportation may struggle to evacuate quickly, while low-income families often lack resources for flood-prevention measures. The elderly and those with disabilities may face mobility challenges, increasing their risk during emergencies. Overall, factors such as geographic location, economic status, and physical ability contribute to the community's varying levels of vulnerability to flooding.
	Structures	*Vulnerability:* Structures vulnerable to flooding primarily include those in low-lying areas, in dam inundation areas, or near the Jordan River. *Impacts:* Residential properties in flood plains and commercial buildings without proper drainage systems or flood-resistant designs face significant risks during heavy rain or snowmelt. Older structures may be more susceptible due to outdated construction standards. Overall, a combination of location and construction features contributes to their vulnerability to flooding.
	Economic Assets	*Vulnerability:* Commercial properties, especially retail centers and warehouses near rivers or low-lying areas, are at high risk during heavy rainfall or high runoff. *Impacts:* Commercial and residential developments in flood-prone zones can suffer damage, impacting property values. Public infrastructure, such as roads and utilities, may experience disruptions, leading to costly repairs. Agricultural land can be affected by excess water, reducing crop yields.
	Natural, Historic, and	*Vulnerability:* Habitat near the Jordan River, as well as historic and cultural sites, are vulnerable to flooding.

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
	Cultural Resources	*Impacts:* Natural areas like wetlands and streams are at risk of habitat destruction, while historic sites and landmarks may sustain structural damage. Cultural resources, such as parks and public spaces, can become unusable, affecting community events. Factors contributing to their vulnerability include inadequate flood management, urban development that alters water flow, and the increasing frequency of extreme weather events due to climate change.
	Critical Facilities and Infrastructure	*Vulnerability:* No critical facilities were identified within the 1% annual chance of flood zone, but utilities and roads are vulnerable. *Impacts:* Healthcare facilities, schools, and transportation networks may be vulnerable to localized flooding due to their proximity to rivers and low-lying areas, which can overflow during heavy rain or snowmelt. Flooding can disrupt emergency services, require schools to evacuate, block transportation routes, and isolate communities. In addition, inadequate drainage systems and urban development encroaching on floodplains increase these risks.
	Community Activities	*Vulnerability:* Outdoor events and parks are vulnerable to flooding. *Impacts:* Due to the area's geography and infrastructure, outdoor events, sports, and farmers' markets are vulnerable to flooding. Parks and open spaces can quickly become inundated during heavy rainfall or rapid snowmelt. Residential neighborhoods near rivers, roads, and bridges are at risk of flash floods, which can disrupt transportation and emergency services.
Landslide/ Slope Failure	People	*Vulnerability:* Residents in Midvale's eastern neighborhoods, particularly those near the Wasatch foothills, are at increased risk of landslides and slope failures. *Impacts:* Heavy rainfall or rapid snowmelt can saturate soils, leading to instability. Individuals living in areas with inadequate drainage or older infrastructure may face heightened vulnerability. Limited awareness of landslide warning signs and insufficient emergency preparedness further exacerbate risks. Residents could be displaced if homes are damaged.
	Structures	*Vulnerability:* Homes and commercial buildings situated on or near steep slopes are susceptible to damage from ground movement. *Impacts:* Homes and other structures could be damaged by landslide or other slope movement. Poor construction practices, lack of erosion control measures, and inadequate drainage systems can contribute to structural vulnerabilities. Infrastructure such as roads and bridges may also be compromised during slope failures.
	Economic Assets	*Vulnerability:* Businesses have indirect vulnerability to landslides. *Impacts:* Landslides can disrupt transportation networks, affecting commerce and daily commutes. Damage to utility lines and pipelines can lead to service interruptions, impacting businesses and residents alike. Repair and mitigation efforts can impose significant financial burdens on the community.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Soil and water, as well as historic sites, are vulnerable to slope failures. *Impacts:* Slope failures can lead to soil erosion, negatively affecting local ecosystems and water quality. Historic sites and cultural

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		landmarks located near vulnerable slopes may suffer structural damage or loss, diminishing Midvale's cultural heritage.
	Critical Facilities and Infrastructure	*Vulnerability:* Essential services such as water supply lines, power grids, and emergency response routes are at risk from landslides. *Impacts:* Landslide can damage distribution lines for power and water. Roads can be damaged and may be impassable. Disruptions to these services can impede emergency response efforts and daily operations.
	Community Activities	*Vulnerability:* Recreation and community events are vulnerable to slope failures. Impacts; Recreational areas and trails on or near slopes may become hazardous during periods of instability, limiting community engagement and outdoor activities. Public events may face cancellations or relocations due to safety concerns.
Radon	People	*Vulnerability:* Fifty-two percent of homes tested in Midvale have dangerous levels of radon. *Impacts:* Radon is the second leading cause of lung cancer after smoking. There is a higher risk for certain populations such as children, the elderly, and those with respiratory conditions.
	Structures	*Vulnerability:* All structures in Midvale are vulnerable to radon exposure. *Impacts:* Radon enters buildings and homes through cracks in foundations, basements, and crawl spaces, which exposes occupants to health risks.
	Economic Assets	*Vulnerability:* Healthcare costs are vulnerable to radon exposure. *Impacts:* Long-term exposure can lead to increased medical expenses for lung cancer treatment and respiratory issues.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Historic sites and older homes are vulnerable to radon exposure. *Impacts:* Older structures may lack modern radon-resistant designs, making mitigation more difficult and expensive.
	Critical Facilities and Infrastructure	*Vulnerability:* Water sources are vulnerable to radon exposure. *Impacts:* Radon can dissolve into groundwater, potentially affecting well water sources.
	Community Activities	None
High Wind	People	*Vulnerability:* High wind can affect the entire city, and all Midvale residents are potentially vulnerable. *Impacts:* People can be injured or killed by blowing debris or falling trees. High wind events in Midvale can pose dangers to residents, particularly the elderly, children, and individuals with mobility challenges. Outdoor workers and those without access to sturdy shelter are at increased risk of injury from flying debris.
	Structures	*Vulnerability:* Structures throughout Midvale are exposed to high winds. *Impacts:* Buildings with flat roofs, large windows, or lightweight construction materials are susceptible to wind damage. Structures can also be damaged by trees uprooted by high wind. Mobile homes and

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		temporary structures may be particularly vulnerable. Proper anchoring and reinforcement can mitigate risks.
	Economic Assets	*Vulnerability:* All businesses are vulnerable to high winds. *Impacts:* Commercial properties may suffer damage to signage, awnings, and inventory during windstorms. Agricultural operations can experience crop losses and infrastructure damage. Power outages resulting from downed lines can disrupt business activities.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Trees, parks, historic buildings, and murals are vulnerable to high winds. *Impacts:* High winds can uproot trees, damage landscaping, and harm outdoor art installations. Historic buildings may experience structural stress, leading to deterioration over time.
	Critical Facilities and Infrastructure	*Vulnerability:* Utility lines, communication towers, transportation networks, critical facilities, and public buildings are at risk during high wind events. *Impacts:* Damage to these systems can impede emergency response and daily operations. Critical facilities and other public buildings may experience structural damage.
	Community Activities	*Vulnerability:* Outdoor events, markets, and recreational activities are vulnerable to high winds. *Impacts:* Outdoor events may be canceled or pose safety risks during high wind conditions. Ensuring access to shelter and timely weather information is essential for public safety.
Lightning	People	*Vulnerability:* Residents participating in outdoor activities during thunderstorms are at risk of lightning strikes. *Impacts:* Lightning can cause injury or death to those in close proximity to a strike. Children, athletes, and outdoor workers may be particularly vulnerable. Awareness of and adherence to lightning safety protocols is crucial to prevent injuries.
	Structures	*Vulnerability:* Tall buildings, communication towers, and structures with inadequate grounding systems are susceptible to lightning damage. *Impacts:* Fires and electrical surges resulting from strikes can cause significant property damage.
	Economic Assets	*Vulnerability:* All Midvale businesses are vulnerable to lightning-induced damage. *Impacts:* Businesses may experience equipment damage and data loss due to lightning-induced power surges. Outdoor venues and recreational facilities face operational disruptions during thunderstorms.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Trees, vegetation, and historic sites are susceptible to lightning-related damage. *Impacts:* Lightning can ignite wildfires, threatening natural habitats and historic sites. Trees and vegetation struck by lightning may pose additional hazards due to falling limbs or fire spread.
	Critical Facilities and Infrastructure	*Vulnerability:* Power grids, water treatment plants, and emergency services facilities are vulnerable to lightning strikes and require protection systems to maintain functionality during storms.

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		Impacts: Failure to safeguard these infrastructures can lead to service interruptions.
	Community Activities	*Vulnerability:* Outdoor recreation and events are at risk during lightning storms. *Impacts:* Outdoor community events and sports activities may need to be postponed or canceled during lightning storms to ensure public safety. Access to real-time weather alerts and designated shelter areas is essential.
Severe Winter Weather	People	*Vulnerability:* All Midvale residents are vulnerable to severe winter weather. *Impacts:* Heavy snow can increase the risk of injuries due to slips and falls, along with illnesses and other health consequences from exposure to cold. People can be injured in car accidents while driving in severe winter weather conditions. Severe winter conditions in Midvale can pose risks to the elderly, young children, and individuals with health conditions. Limited mobility and inadequate heating can lead to hypothermia and other cold-related illnesses.
	Structures	*Vulnerability:* All structures are vulnerable to severe winter weather. *Impacts:* Heavy snow accumulation can strain roofs, leading to potential collapses, especially in older buildings. Frozen pipes and ice dams can cause water damage and structural issues.
	Economic Assets	*Vulnerability:* All businesses are vulnerable to disruptions caused by severe winter weather. *Impacts:* Retail businesses may experience decreased foot traffic during snowstorms. Transportation delays can disrupt supply chains, affecting local commerce. Increased heating demands can strain energy resources and budgets.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Trees and historic buildings are vulnerable to damage from severe winter weather. *Impacts:* Prolonged snow cover can damage vegetation and disrupt local ecosystems. Historic buildings may suffer from moisture intrusion and freeze-thaw cycles, leading to deterioration.
	Critical Facilities and Infrastructure	*Vulnerability:* Transportation networks and utility networks are vulnerable to disruptions caused by severe winter weather. *Impacts:* Transportation networks like roads and bridges can become impassable, hindering emergency responses. Snow and ice can impede access to emergency services, schools, and healthcare facilities. Power outages resulting from winter storms can disrupt essential services.
	Community Activities	*Vulnerability:* Community events and outdoor facilities are at risk during severe winter weather. *Impacts:* Community events and outdoor activities may be canceled or limited during severe winter weather. Ensuring accessible warming centers and clear communication about weather conditions is vital for public safety.
Tornado	People	*Vulnerability:* While tornadoes are less common in Midvale, residents should remain vigilant. If a tornado were to occur in the city, all residents would be at risk.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		Impacts: Residents are vulnerable to serious injury from blowing debris, uprooted trees, and structural collapse. Individuals in mobile homes or temporary structures are at higher risk. Timely access to weather alerts and designated shelters is crucial for safety.
	Structures	*Vulnerability:* All structures are vulnerable to tornado damage. *Impacts:* Buildings not constructed to withstand high winds may suffer significant damage during tornado events. Proper anchoring and reinforcement can mitigate structural vulnerabilities.
	Economic Assets	*Vulnerability:* All Midvale businesses are susceptible to tornado-related disruptions. *Impacts:* Tornadoes can cause extensive damage to commercial properties, leading to business interruptions and financial losses. Infrastructure repairs can impose additional economic burdens on the community.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Midvale parks, mature trees, and historic buildings are vulnerable to tornado-related damage. *Impacts:* High winds can uproot trees and damage natural landscapes. Historic sites and cultural landmarks may suffer structural damage, affecting their preservation.
	Critical Facilities and Infrastructure	*Vulnerability:* Power lines, water supply systems, and roads are vulnerable to tornado impacts. *Impacts:* Essential services such as power lines, water supply, and emergency response routes are vulnerable to tornado damage. Ensuring these infrastructures are resilient is key to maintaining community functions.
	Community Activities	*Vulnerability:* Outdoor events and recreation are at risk during tornadoes. *Impacts:* Outdoor festivals, sports events, and markets are vulnerable to tornadoes in Midvale due to their open spaces and limited options to provide shelter. Temporary structures, such as tents, can be easily damaged by high winds. Schools and recreational facilities with large glass windows or weak roofs also face significant risks.
Wildfire	People	*Vulnerability:* In Midvale, residents who live near the city's interface along the Jordan River may be more exposed to wildfire risks. *Impacts:* Individuals with limited mobility, such as seniors or those with health conditions, could have difficulty evacuating in a timely manner during a fast-moving fire. Households with limited financial resources may also lack the ability to implement fire safety improvements or emergency preparedness measures. These vulnerabilities are intensified during dry months when fire danger increases.
	Structures	*Vulnerability:* Homes constructed with combustible materials and those located near dense vegetation or undeveloped land are more susceptible to fire damage. *Impacts:* Midvale neighborhoods lacking sufficient defensible space face increased risk. Inadequate roofing materials and homes not built with fire-resistant features may struggle to withstand ember storms or direct flame contact during wildfire incidents.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
	Economic Assets	*Vulnerability:* Businesses near open spaces along Jordan River are at risk from wildfires. *Impacts:* Wildfires near Midvale could result in substantial economic disruption. Residences in fire-prone zones could lose value or require expensive retrofitting to meet fire resilience standards. Retail and commercial districts may suffer smoke or heat damage, especially if evacuation disrupts business operations. Additionally, power outages or damaged utility systems could interrupt daily services. While Midvale is not a major agricultural center, community gardens, landscaping businesses, and utilities may still experience losses due to wildfire impacts.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Vegetated open spaces and river ecosystems on the west side of Midvale are vulnerable to fire, especially in dry seasons or drought years. *Impacts:* Wildfires can significantly damage wildlife habitats, trees, and soil health. Cultural and historic buildings may also face elevated risks if not adequately protected. As Midvale expands toward previously undeveloped areas, the encroachment into fire-prone zones increases the exposure of important community assets.
	Critical Facilities and Infrastructure	*Vulnerability:* Power infrastructure, roads, and emergency response services are vulnerable to wildfire impacts. *Impacts:* Essential services such as fire stations and healthcare clinics, near the WUI (wildland–urban interface) may experience higher demand for services.. Power infrastructure—including overhead lines—can both spark and be damaged by fires, disrupting electricity for homes and emergency response operations. Road closures due to fire conditions may impede evacuation routes or delay emergency services.
	Community Activities	*Vulnerability:* Outdoor events and recreational activities are at risk during periods of high fire danger. *Impacts:* Community gatherings such as outdoor concerts, farmers markets, and sports events can be disrupted or canceled during periods of high fire risk. Activities like hiking and biking in the foothills also carry additional danger during dry and windy conditions. Moreover, landscaping choices using flammable vegetation increase the exposure of public facilities such as schools, libraries, and recreation centers to wildfire-related damage during the fire season.
Dam Failure	People	*Vulnerability:* Residents of Midvale who live near flood-prone zones along the Jordan River and Big Cottonwood Creek, or within proximity to upstream water infrastructure like the Red Pine, White Pine, Willow Creek, and Flat Iron Mesa dams, may face increased risks if a dam breach occurs. *Impacts:* Dam failure can cause flooding and property damage. People can be injured by fast-moving floodwaters or may be displaced from their homes. Vulnerable populations may encounter challenges evacuating quickly. Delayed warning systems or unfamiliarity with emergency plans could further hinder response and increase risk to life and safety.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
	Structures	*Vulnerability:* Structures near the Jordan River corridor, Big Cottonwood Creek, or in low-lying areas of the city are at risk of flooding should a dam fail upstream. *Impacts:* Dam failure may cause damage to residential homes, bridges, roadways, and essential community facilities such as schools, fire stations, and healthcare clinics. The age and resilience of these structures can impact their ability to withstand inundation and debris flows.
	Economic Assets	*Vulnerability:* Businesses in dam inundation zones *Impacts:* Key infrastructure and business assets in Midvale, including retail centers, utilities, and service-based industries, could be disrupted by floodwaters resulting from dam failure. Roads like State Street or I-15 may become impassable, disrupting commerce and daily activities. Water-dependent businesses could face prolonged downtime, and any agricultural zones or community gardens could experience loss of crops or irrigation capabilities. These disruptions could have a ripple effect across the local economy.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Riparian zones and historic buildings are vulnerable to flooding from a dam breach. *Impacts:* A dam breach could harm natural areas such as wetlands or riparian zones along the Jordan River, which serve as important ecological buffers. Floodwaters could erode habitats, impact water quality, and disrupt wildlife corridors. Historic or cultural landmarks, including older public buildings or park installations, may be damaged if situated in flood pathways, especially if they were not designed for high water resilience.
	Critical Facilities and Infrastructure	*Vulnerability:* Although no critical facilities were identified within dam inundation zones, they may be indirectly affected by flooding. Power, communication, and road infrastructure are vulnerable to damage in the event of a dam failure. *Impacts:* Vital services in Midvale, such as water treatment facilities, emergency operations centers, and schools, may be compromised in the event of a dam failure. Utilities like power lines, water mains, and telecommunications networks could suffer damage or go offline. Inundation may overwhelm emergency response systems, reducing the city's capacity to provide aid during and after a flood event. Infrastructure lacking redundancy or floodproofing is particularly at risk.
	Community Activities	*Vulnerability:* Community events and recreational activities are at risk from flooding caused by a dam breach. *Impacts:* Community life in Midvale could be disrupted significantly if floodwaters reach public parks, trails, or recreational venues. Events hosted at locations like Midvale City Park or the Jordan River Trail could be canceled or postponed due to damage or accessibility issues. Public confidence in infrastructure safety may also decline, affecting attendance at outdoor gatherings or activities in areas perceived to be vulnerable.
Civil Disturbance	People	Low-income individuals may lack the resources for safety, while the elderly or disabled may struggle to navigate emergencies. Young people, particularly teenagers, may be drawn into unrest, influenced

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		by social dynamics. In addition, marginalized individuals may feel targeted or compelled to participate. A lack of community cohesion and trust in authorities can further heighten tensions.
	Structures	Government buildings, commercial properties, and infrastructure, such as bridges and transportation hubs may be vulnerable. Government buildings may be targeted for their symbolic authority, while retail stores can attract crowds during protests. Residential neighborhoods also can be affected, especially in areas with heightened tensions. The vulnerability of these structures stems from their visibility and importance to the community, combined with factors such as location and ongoing social issues.
	Economic Assets	Retail establishments, especially shopping centers, are at risk as they often become focal points for protests. Transportation systems can be disrupted by blockades, hindering access to services. Financial institutions may face vandalism or theft, while critical service providers, such as healthcare facilities, could experience strain during unrest. Several economic assets are vulnerable to civil disturbances, primarily due to their visibility and reliance on foot traffic.
	Natural, Historic, and Cultural Resources	Parks and open spaces may suffer from vandalism or destruction during uncontrolled events. Historic sites can become targets, as they symbolize authority or cultural significance. Cultural resources, such as community centers and places of worship, also may be affected, as they play a vital role in community identity. Their vulnerability lies in the potential for damage during protests.
	Critical Facilities and Infrastructure	Governmental buildings, schools, and healthcare facilities may be at risk, since they often symbolize authority and serve as community hubs, making them targets during unrest. Utility infrastructure, such as water and power facilities, is also at risk of disruption. Its visibility and essential services contribute to its vulnerability during civil disturbances.
	Community Activities	Public demonstrations, parades, and local government meetings are particularly vulnerable to civil disturbances. These events often attract large crowds and can become tense, especially around contentious social or political issues. Factors such as the local demographic, economic conditions, and recent events can heighten these vulnerabilities, making it easier for conflicts to arise during passionate public gatherings.
Cyberattack	People	Older adults often lack familiarity with technology and online security, making them easy targets for phishing scams. Individuals engaging in online banking or shopping without strong security measures also face heightened risks. Families with children may be less vigilant about internet safety, allowing cybercriminals to exploit personal information. In addition, small business owners without robust cybersecurity practices are prime targets for attacks that can disrupt operations.
	Structures	Critical infrastructure, such as power plants, water treatment facilities, and transportation systems, often lack robust cybersecurity measures. Commercial businesses, especially financial institutions and healthcare providers, also are at risk due to weaker data protection and employee training. Educational institutions may be vulnerable because of limited funding for cybersecurity and outdated software.

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		Obsolete technology and insufficient training enhance the susceptibility of these structures to cyber threats.
	Economic Assets	Financial institutions, such as banks and credit unions, are at risk of data theft and service disruption. Small and medium-sized businesses often lack robust cybersecurity measures, making them attractive targets. In addition, local government agencies and critical infrastructure, such as water treatment facilities, might have outdated security protocols, posing threats to public safety. The rise of remote work further exacerbates vulnerabilities, as employees accessing networks from home can unintentionally expose systems to risks. Overall, the combination of outdated technology and insufficient cybersecurity practices increases the vulnerability of an area's economic assets.
	Natural, Historic, and Cultural Resources	Natural resources like water management systems and wildlife databases can be compromised, disrupting ecosystems. Historic sites and museums that digitize collections are at risk of losing valuable artifacts and data. In addition, cultural organizations managing events may face threats if their systems lack adequate security. The limited resources of smaller organizations further increase this vulnerability
	Critical Facilities and Infrastructure	Energy and utility services, such as electricity and water systems, which often rely on outdated technology, may be vulnerable. Transportation infrastructure, such as traffic management and public transit, is also at risk due to networked systems. Healthcare facilities that use electronic records and connected medical devices face vulnerabilities that can compromise patient safety.
	Community Activities	Online registration for events, local government services, and educational programs that rely on digital tools may be targeted due to inadequate security measures, outdated software, and insufficient staff training.
Hazardous Materials Incident (Transporta-tion & Fixed Facility)	People	Individuals with pre-existing health conditions, such as respiratory issues, and the elderly are at higher risk due to their compromised health. Children also are more susceptible. Those living near industrial areas or transport routes for hazardous materials face increased exposure risk, while low-income families may lack resources and information to effectively prepare for incidents.
	Structures	Industrial facilities, such as manufacturing plants and warehouses, often store hazardous chemicals which may leak. Residential buildings, schools, and healthcare facilities also are at risk, particularly if located along transportation routes for hazardous materials. Older buildings may lack modern safety features, increasing their vulnerability.
	Economic Assets	Industrial facilities, transportation infrastructure, and nearby commercial properties may be affected. Industrial facilities handling chemicals are at risk of spills or leaks, while roads and railways used for transporting hazardous materials can lead to accidents and contamination. In addition, nearby commercial, and residential areas face potential health risks and economic losses.
	Natural, Historic, and	Waterways and habitats are vulnerable to hazardous materials incidents, which can disrupt ecosystems. Historic sites and structures may suffer damage from toxic exposure, leading to degradation over

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
	Cultural Resources	time. In addition, cultural landmarks risk losing their significance due to contamination events. The proximity of these resources to industrial areas or transport routes exacerbates their risk.
	Critical Facilities and Infrastructure	Chemical manufacturing plants, waste treatment facilities, and transportation networks, such as highways and railroads may be at risk. Their vulnerability stems from factors such as proximity to residential areas, aging infrastructure, and inadequate safety measures. Natural hazards, such as flooding and earthquakes, can further increase risks by damaging containment systems.
	Community Activities	Local markets, school events, and outdoor gatherings are vulnerable to hazardous materials incidents if they are near industrial zones and transport corridors. This risk is heightened by inadequate emergency preparedness, lack of public awareness, and the potential for spills during transport. Large crowds at events can complicate evacuation efforts, increasing the risks for participants and nearby residents.
Public Health Epidemic/ Pandemic	People	Individuals with pre-existing health conditions like asthma and heart disease and adults over 65 may be vulnerable. Low-income families may struggle to access healthcare and vaccinations, increasing their risk. Marginalized communities with limited access to information and those living in high-density conditions also are at greater risk due to the rapid spread of diseases and the challenges in implementing preventive measures.
	Structures	Several structures are vulnerable to public health epidemics or pandemics, particularly due to their ability to facilitate the spread of disease. High-density residential areas, such as apartment complexes, are at risk, as close living quarters can lead to faster transmission. Public gathering spaces, such as schools and community centers, also pose significant threats because large groups are in confined spaces. Healthcare facilities can become hotspots for infections if infection control measures are insufficient. In addition, workplaces with high foot traffic, such as retail stores, contribute to vulnerability.
	Economic Assets	Small businesses in retail, hospitality, and food service are particularly vulnerable to public health epidemics or pandemics. These sectors face risks from fluctuating consumer demand and potential operational restrictions. The tourism industry also is affected, as travelers may avoid high-risk areas. Healthcare facilities can become overwhelmed, straining resources and impacting operations. In addition, local supply chains may experience disruptions, leading to shortages and inflation. Overall, the direct effects of illness, along with prolonged shutdowns and consumer hesitance, leave these economic assets exposed to significant downturns.
	Natural, Historic, and Cultural Resources	Natural resources like wildlife and ecosystems can be disrupted by increased human activity, raising the risk of zoonotic diseases. Historic sites may deteriorate due to reduced visitor access and funding, while cultural resources, such as community events, face cancelations, impacting social connections.
	Critical Facilities and Infrastructure	Public health epidemic or pandemic incidents can affect healthcare facilities, nursing homes, public transportation systems, schools, and food supply chains. healthcare facilities and clinics may become overwhelmed with patients, while vulnerable populations in nursing

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		homes are at higher risk. Public transportation can facilitate the spread of disease, and schools gather large groups, thereby increasing transmission potential. These facilities often lack adequate resources, including medical supplies and testing capabilities, making them more susceptible to the impacts of a health crisis.
	Community Activities	Large gatherings like festivals and sporting events can facilitate the rapid spread of diseases due to close contact. Public transportation also is at risk, as it serves many people in confined spaces. Schools and childcare facilities are particularly susceptible, given that children can easily transmit infections. In addition, food-related events, such as farmers' markets, can pose risks if hygiene practices are not followed. The interconnectedness of community members and varying adherence to health guidelines further exacerbate these vulnerabilities.
Terrorism	People	Young children and newcomers may lack awareness of potential threats, while the elderly and individuals with disabilities may struggle to respond quickly in emergencies. Marginalized communities often face bias, making them more susceptible to targeting. In addition, those with lower socioeconomic status may lack access to security measures and emergency preparedness resources.
	Structures	Government buildings, transportation hubs, commercial centers, and public spaces are particularly vulnerable to terrorism incidents. Government buildings are symbolic targets, while transportation hubs and commercial centers are attractive due to their potential for high casualties and crowd presence. Public spaces also are at risk due to their open nature and lack of security. Their vulnerability is heightened by inadequate security measures, high occupancy rates, and their locations in densely populated areas, which can amplify the impact of incidents.
	Economic Assets	Infrastructure, commercial establishments, and community facilities may be vulnerable. Critical infrastructure, such as transportation networks and power grids, could disrupt the economy if targeted. Commercial establishments, especially those with high foot traffic, and community facilities like schools and healthcare facilities also are at risk, as they can provoke widespread concern and disruption. Their accessibility and interconnectivity increase vulnerability, meaning that damage to one asset can have a broader economic impact and hinder recovery efforts.
	Natural, Historic, and Cultural Resources	Natural resources like water supplies and parks could be targeted for their significance to the community. Historic sites and cultural resources, such as museums or community centers, also are at risk due to their accessibility and importance to local identity. Their vulnerability is often heightened by inadequate security measures.
	Critical Facilities and Infrastructure	Public transportation systems, healthcare facilities, schools, and utility services like water and power plants may be affected. Their vulnerability arises from high accessibility and the potential impact of an attack, as crowded transportation and public spaces can lead to mass casualties and panic. Attacking utility services could disrupt the town's essential functions, creating chaos.

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
	Community Activities	Festivals, parades, and sporting events are particularly vulnerable to terrorism incidents. These events attract large crowds, making it easier for perpetrators to inflict harm and instill fear. In addition, community centers and places of worship serve as social hubs, increasing their risk. Factors such as limited security measures and open access to public spaces, contribute to this vulnerability.

Jurisdiction-Specific Changes in Vulnerability

Hazard events can impact communities, infrastructures, and ecosystems. The severity of these impacts can be influenced by climate change, population patterns, and land use development. Understanding these factors is crucial for the city of Midvale to develop a resilient community and minimize the impacts of hazards. Table 9 displays the unique changes within the community and the related effects on each identified hazard affecting the city of Midvale.

DRAFT

Table 9: Jurisdiction-Specific Changes in Vulnerability in the City of Midvale

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
Avalanche	Higher temperatures can lead to more rain, destabilizing snowpack and increasing the risk of wet avalanches. In addition, changes in snowfall can cause denser snow layering on slopes, making them more prone to sliding.	Avalanches can influence population patterns by deterring people from moving to or remaining in high-risk areas, leading to decreased density in these locations. The threat of avalanches prompts many to seek safer environments in urban or lower-risk regions. In addition, when avalanches occur, they can disrupt infrastructure, causing residents to relocate.	Development in Midvale has not increased the risk of avalanches.	Same
Drought	Climate change affects drought incidents by altering precipitation patterns and increasing temperatures. Warmer weather can lead to longer dry periods and more severe droughts, while changes in rainfall can reduce snowpack in nearby mountains, crucial for summer water supply. Higher temperatures also increase evaporation rates, further straining local water resources.	Drought can significantly influence population patterns by impacting economic opportunities and the quality of life. Water scarcity often leads to reduced agricultural productivity, prompting residents to migrate to areas with more stable job prospects. Increased water costs can make living less affordable, driving some residents away. Conversely, efforts to address drought, such as sustainable development or improved water management, may attract newcomers, resulting in changes in the community's demographic composition over time.	Increasing population and development will continue to put a strain on Midvale's water sources.	Increased
Earthquake	Rising temperatures can lead to glacial melting, which affects pressure on tectonic plates and may trigger seismic activity through isostatic	Earthquakes can significantly alter population patterns by prompting residents to leave for safer areas after a seismic event. This migration can lead to	Developments in transportation across the city, particularly around TRAX stations, might be vulnerable to damage during an earthquake.	Stayed the same

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	rebound. In addition, increased rainfall and flooding can erode soils, weakening structural integrity and heightening vulnerability during earthquakes. Although the direct links between climate change and earthquakes are still under investigation, environmental effects may impact the region's seismic risk.	changes in population density and attract new residents and businesses during the rebuilding process. The perception of the area as a safe place to live may shift, impacting long-term demographics, as some residents return to rebuild while others relocate permanently.		
Extreme Heat	Climate change significantly impacts extreme heat by increasing the frequency and intensity of heat waves. Rising global temperatures lead to longer and hotter summers, affecting residents and local infrastructure while heightening health risks, especially for vulnerable populations. Urban heat islands from reduced vegetation and extensive pavement further amplify these effects.	By causing residents to relocate due to damaged homes or safety concerns. Some may move to areas perceived as safer or seek better job opportunities elsewhere. The economic impact and infrastructure damage can also make certain neighborhoods less desirable, leading to shifts in demographics and the socioeconomic landscape as new residents with different backgrounds move in.	Increased density, particularly in Downtown Midvale and around TRAX stations, can lead to increased temperatures during extreme heat events.	Increased
Extreme Cold	By increasing the intensity of winter storms. Higher atmospheric temperatures allow for more moisture, resulting in heavier snowfall and potentially lower temperatures during these events. In addition, fluctuations in weather patterns may disrupt seasonal	By driving some residents to relocate to warmer areas. Harsh winters can hinder economic activities and deter new residents and businesses, influencing housing demand and the attractiveness of certain neighborhoods. This may disproportionately affect lower-income families, leading to	Increased growth of commercial and residential developments in Midvale increases energy demand during extreme cold events, stressing the electrical grid.	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	cycles, leading to unpredictable periods of extreme cold mixed with warmer spells.	changes in demographics and socioeconomic stratification in the community.		
Flooding	Higher temperatures increase the frequency and intensity of extreme weather events and alter precipitation patterns. They lead to more intense rainstorms and accelerated snowmelt from nearby mountains, raising water levels in rivers and streams. This combination raises the risk of flooding, especially in areas with inadequate drainage and urban development in flood-prone zones, heightening the potential for damage to homes and infrastructure.	Flooding can significantly alter population patterns by displacing residents from affected areas, leading them to seek shelter elsewhere. This may cause a population decline where flooding occurs, as individuals might hesitate to return due to ongoing risks or property damage. As neighborhoods become less desirable, people may migrate to safer areas, changing demographic trends and putting pressure on housing in those regions. Over time, these shifts can influence urban planning and development, as local governments address flooding risks and changing population needs.	Development in Bingham Junction abuts the 0.2% annual chance flood zone. Increased impervious surfaces due to development across Midvale could contribute to ponding and other pluvial flooding.	Decreased
Landslide/ Slope Failure	Climate change increases the risk of landslides through heavier rainfall and temperature fluctuations. Intense rain saturates soil, destabilizing slopes, while freeze–thaw cycles weaken the ground. Changes in vegetation can also reduce stability, leading to a higher potential for landslides.	Landslides and slope failures can impact population patterns by making some areas unsafe, leading to displacement and lower property values. This prompts residents to move to safer regions, thereby increasing density in more stable areas. Concerns about future landslides may also deter newcomers from high-risk zones, shaping long-term demographic trends.	Development in Midvale has not increased the risk of landslides.	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
Radon	Climate change can affect radon levels by altering soil temperatures and moisture conditions. Higher temperatures may increase radon emissions from the ground, while heavy rainfall can change groundwater and soil saturation, impacting radon migration into buildings.	Radon exposure can influence population patterns as increased health awareness may drive families to move away from areas with high radon levels. This shift could particularly affect vulnerable groups, changing demographics and demand in the housing market. Homes with lower radon levels may become more sought after, and public health campaigns can encourage community action, making previously undesirable areas more attractive once mitigation measures are implemented.	Development in Midvale has not increased the risk of radon impacts.	Decreased
Heavy Rain	Climate change increases the frequency and intensity of heavy rain, as higher temperatures allow the atmosphere to hold more moisture. This leads to stronger storms, flash flooding, and overwhelmed drainage systems.	Heavy rain can shift population patterns by pushing residents out of flood-prone areas and attracting them to safer neighborhoods. Frequent flooding may lead to evacuations and economic disruptions, prompting relocations. Over time, ongoing heavy rains can affect housing demand and community stability, altering the town's population distribution.	Increased impervious surfaces due to development across Midvale could contribute to ponding and other pluvial flooding.	Increased
High Wind	Climate change affects high winds by altering atmospheric patterns and increasing extreme weather events. Rising temperatures may lead to more substantial, unpredictable winds and more frequent thunderstorms,	High winds can alter population patterns by making certain areas less desirable. Frequent damage may drive residents to safer neighborhoods, deter newcomers, and slow growth in affected regions.	Development in Midvale has not increased the risk of high wind events.	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	posing risks to infrastructure and air quality.			
Lightning	Climate change increases temperatures and alters precipitation, leading to more intense thunderstorms and frequent lightning strikes. Urbanization can enhance this effect, posing risks to public safety and infrastructure.	Lightning can influence population patterns by causing property damage and wildfires, leading some residents to relocate. Areas with higher lightning activity may deter new residents, while safer locations could increase migration as people seek protection from severe weather.	Increased development, including multistory buildings, slightly increases the risk of lightning damage in Midvale.	Increased
Severe Winter Weather	Climate change impacts heavy snow and blizzards by altering precipitation patterns. Higher temperatures can lead to more rain than snow, affecting snowpack levels. In addition, increased storm intensity results in heavier, more unpredictable snowfall.	Increased population equals an increased number of people needing to get to work and quicker snow removal. Heavy snow or blizzards can impact population patterns by influencing where people live and work. Transportation disruptions may lead residents to seek housing closer to jobs, increasing density in some areas while depopulating others. Families might also avoid regions with frequent heavy snowfall, shifting demand to milder areas. Over time, these trends can alter community demographics and economic activity, prompting adjustments in town planning and resource allocation.	As new developments and transportation infrastructure (bike lanes, walking paths, roads) have been constructed, there are new risks to the city during extreme winter weather. The city takes on more responsibility for clearing these developments and infrastructure, as well as rescues and evacuations during heavy snow events.	Increased
Tornado	Climate change may increase the frequency and intensity of tornadoes. Higher temperatures lead to more	Tornadoes can influence population patterns by prompting residents to move to safer areas after damage occurs. This can	Increased development slightly increases the risk of tornado damage in Midvale.	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	moisture in the air, creating conditions for severe thunderstorms. Changes in wind patterns and precipitation can also heighten tornado risks, resulting in more destructive storms and greater threats to infrastructure and communities.	decrease density in affected neighborhoods while increasing the demand for housing in safer regions. New residents may also move in for recovery opportunities, altering demographics. Over time, repeated tornado threats might push long-term residents to areas with better disaster preparedness, reshaping the town's population distribution.		
Wildfire	By raising temperatures and creating drier conditions, prolonged droughts lead to more dry vegetation, which serves as fuel for fires. Erratic seasons extend the growing period, while more lightning strikes can ignite wildfires. These factors heighten the threat to ecosystems and community safety.	Displaced individuals often seek safer areas, shifting demographics, while declining property values might deter newcomers. Conversely, some may be drawn to rebuilding efforts, impacting long-term growth and community dynamics.	Development in Midvale does not clearly increase or decrease wildfire risk.	Increased
Dam Failure	Climate change raises the risk of dam failure by causing heavier rainfall and rapid snowmelt. These changes can overwhelm dams and compromise their integrity, highlighting the need for urgent safety assessments and upgrades to protect communities downstream.	Dam failure can impact population patterns by displacing residents and altering demographics. Evacuations can lead to an influx in safer areas, while destruction may deter new residents and contribute to population decline. Fear of future disasters may also prompt remaining individuals to relocate, changing the community's composition and affecting population density and economic activity.	Development in Midvale has not increased the risk of dam failure.	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
Civil Disturbance	Climate change can increase civil disturbances by intensifying environmental stresses and social tensions. Rising temperatures may lead to droughts, wildfires, and poor air quality, particularly affecting vulnerable communities. Resource scarcity, especially water, can spark conflicts and protests. In addition, an influx of migrants from harder-hit areas may strain local resources, further escalating tensions. This cycle of unrest is driven by the impacts of climate change on the environment and community dynamics.	By encouraging residents to move for safety, leading to outflows and new arrivals. These events can reveal social issues, impacting community dynamics, employment, and property values, ultimately reshaping demographics, and social cohesion.	Development in Midvale has not increased the risk of civil disturbances.	Increased
Cyberattack	Possible attack on the industry, which is seen as producing large amounts of greenhouse gases and burning fossil fuels. Climate change can heighten cyberattack risk by increasing vulnerabilities during extreme weather. Disruptions like power outages offer cybercriminals opportunities, but focusing on emergency responses can weaken cybersecurity measures. As organizations adopt new technologies to cope with climate impacts, they may	Cyberattacks can change population patterns by eroding trust in essential services. Compromised systems may cause residents to leave due to safety concerns, while high-profile incidents can deter businesses, leading to job losses. This perception of vulnerability may also make the town less appealing to newcomers, resulting in demographic shifts and affecting local development.	Development in Midvale has not increased the risk cyberattacks.	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	unintentionally introduce additional vulnerabilities.			
Hazardous Materials Incident (Transportation & Fixed Facility)	Climate change elevates the risk of hazardous materials incidents by increasing extreme weather events like heavy rain and wildfires. These events can breach storage tanks and heighten material volatility. Vulnerable infrastructure can lead to more spills or accidents, while climate shifts may also introduce new challenges for managing hazardous substances and public health.	By causing evacuations and temporary declines in density. In the long run, unsafe areas may deter new residents, affecting growth and diversity. In addition, negative perceptions can lower property values and economic prospects, leading families to relocate, which impacts local demographics.	Development in Midvale has not increased the risk of a hazardous materials incident.	Increased
Public Health Epidemic/ Pandemic	By increasing the spread of vector-borne diseases and raising the risk of waterborne illnesses due to flooding or drought. Worsening air quality can also exacerbate respiratory conditions like asthma, especially in vulnerable populations.	By prompting migration for safety and better healthcare. Vulnerable groups may move to areas with improved services, while economic instability can drive people to seek new employment opportunities. In addition, restrictions like quarantine measures can limit movement and social interactions, reshaping the community's demographics and impacting local economies.	Development in Midvale has not increased the risk of an epidemic/pandemic event.	Increased
Terrorism	Terroristic activity is sometimes centered around climate change. Climate change impacts terrorism incidents by creating conditions of resource scarcity and social unrest. Increased competition for essential	Terrorism incidents can alter population patterns by instilling fear and prompting residents to relocate to perceived safer areas, resulting in demographic shifts and potential declines in property values. Some neighborhoods may see an outflow of residents,	Development in Midvale has not increased the risk of terrorism.	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	resources, such as water, can fuel tensions, making communities more vulnerable to extremist ideologies. Extreme weather events may disrupt social order and infrastructure, offering terrorist groups opportunities to exploit crises. In addition, climate-driven population displacement can heighten tensions in receiving areas, raising the risk of domestic terrorism. Law enforcement's focus on climate-related challenges can also limit its capacity to address terrorism threats. Ultimately, while climate change may not directly cause terrorism, its effects can create an environment conducive to extremist activities.	while others could experience an influx of people seeking refuge from violence. In addition, increased security measures may deter businesses and residents from certain locations, leading to long-term changes in population density and urban development patterns.		

DRAFT

Additional Public Involvement

The city of Midvale provided several opportunities for public participation. Figure 1 and Figure 2 are examples of public outreach.

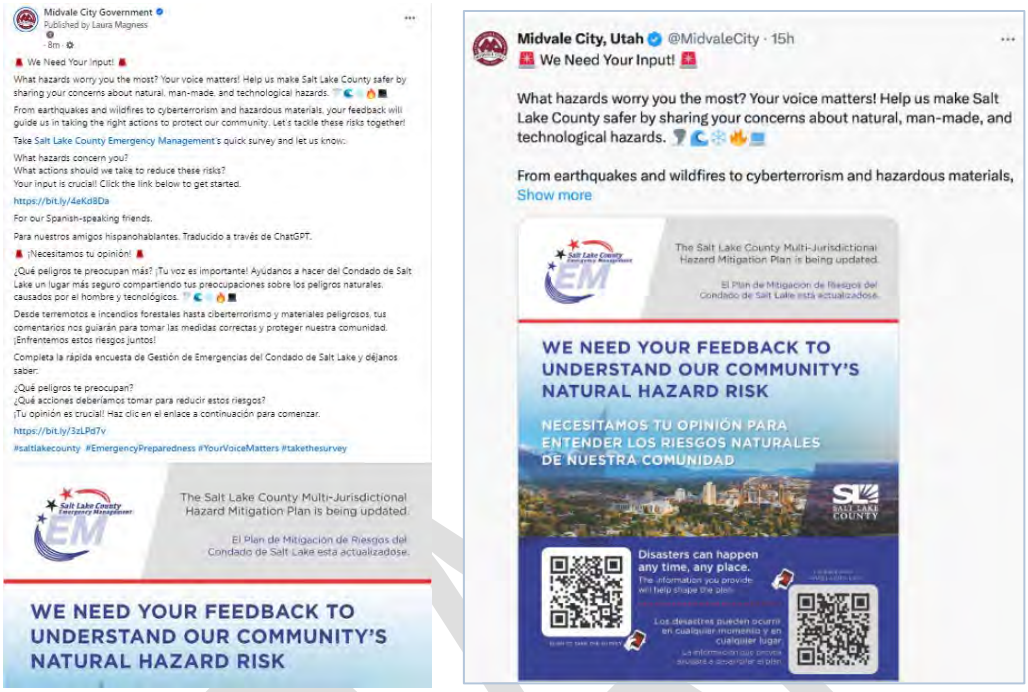

Figure 1: Social Media Post for Public Participant (*left*) and Plan Participant (*right*)

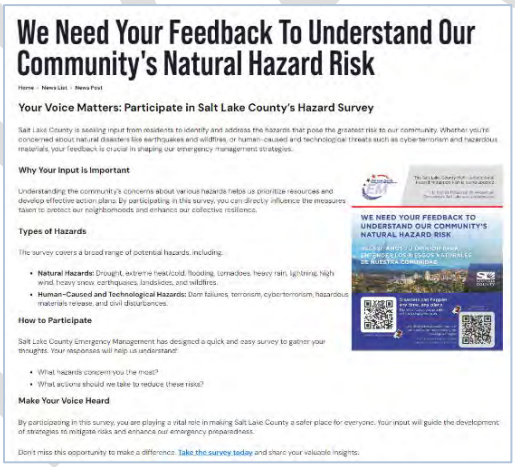

Figure 2: City Website Announcement for Plan Participations

Plan Integration

Incorporating the underlying principles of the Hazard Mitigation Plan and its recommendations into other plans is a highly effective and low-cost way to expand their influence. All plan participants will use existing methods and programs to implement hazard mitigation actions where possible. As previously stated,

mitigation is most successful when it is incorporated into the day-to-day functions and priorities of government and public service. This plan builds on the momentum developed through previous and related planning efforts and mitigation programs, and it recommends implementing actions where possible through these other program mechanisms. These existing mechanisms include the following:

- Regularity Capabilities
- Administrative Capabilities
- Fiscal Capabilities

Respective planning stakeholders will conduct implementation and incorporation into existing planning mechanisms and will be done through the routine actions of:

- Monitoring other planning/program agendas
- Attending other planning/program meetings
- Participating in other planning processes; and
- Monitoring community budget meetings for other community program opportunities.

The successful implementation of this plan will require constant and vigilant review of existing plans and programs for coordination and multi-objective opportunities that promote a safe, sustainable community. Regular efforts should be made to monitor the progress of mitigation actions implemented through other planning mechanisms. Where appropriate, priority actions should be incorporated into planning updates. Table 10 lists existing planning mechanisms in which the Hazard Mitigation Plan has been integrated. Table 11 lists the opportunities for integrating elements of this plan into other plans

Table 10: Integration of Previous Plans by the City of Midvale

Plan	Description

Table 11: Opportunities for Integration with Future Plans of the City of Midvale

Plan	Description
General Plan	Overview of long-term goals and strategies for Midvale
Stormwater Management Plan	Addresses stormwater runoff and limits discharge of pollutants in storm drain system
Water Conservation Plan	Sets goals to conserve water to maintain water supply in the region
Transportation Master Plan	Focused on guiding future transportation investments and ensuring a coordinated approach to managing the city's transportation network
Midvale Center and Fort Union Station Plan	Provides focused direction for improvements to urban design, land use, economic development, and walking and biking facilities within a half-mile from the Midvale Center and Fort Union TRAX stations
Main Street Small Area Plan	Addresses challenges in historic area of Midvale.

Plan	Description
Midvale/West Jordan Station Area Plan	Transportation planning partnership between West Jordan, Midvale City, Wasatch Front Regional Council and Utah Transit Authority

Capability Assessment

Local mitigation capabilities are existing authorities, policies, programs, and resources that reduce hazard impacts or could help carry out hazard mitigation activities.

Planning and Regulatory Capabilities

Planning and regulatory capabilities are the plans, policies, codes, and ordinances that prevent and reduce the impacts of hazards.

Table 12: Assessment of the Planning Capabilities of the City of Midvale[3]

Plan	Does it address hazards? (Y/N)	How can it be used to implement mitigation actions?	When was the last update? When is the next update?
General Plan	Yes	Yes	2024
Capital Improvement Plan	N/A	Can be used to identify funding sources for mitigation actions	Capital improvement projects are reviewed regularly.
Climate Change Adaptation Plan	N – have Water Conservation Plan	Can be used to incorporate sustainability measures into mitigation actions, provide funding sources	2025
Community Wildfire Protection Plan	Y	Can be used to identify wildfire mitigation actions	2021
Economic Development Plan	Y – in General Plan	Improve public transportation to facilitate moving people and supplies in an emergency	2016
Land Use Plan	Y – in General Plan	Provide information on wildfire or flooding mitigation actions	2016
Local Emergency Operations Plan	Y	The city plans to have annexes with actions to mitigate loss of life and property damage. The CEMP can be used to identify responsible departments for mitigation actions.	2024 but a CEMP was promulgated in 2025.
Stormwater Management Plan	Y	Can be used to identify flood mitigation actions	July 2021
Transportation Plan	Y	Can be used to map or identify traffic areas of concern, which	December 2024

[3] CEMP = Comprehensive Emergency Management Plan.

DRAFT

Technical Capability	In Place? (Y/N)	How has it been used to assess/mitigate risk in the past?	How can it be used to assess/mitigate risk in the future?
Mutual Aid Agreements	Y	Coordination with SLCo Public Works, UFA, and UPD	Additional formal MOUs required
Other? (Please describe.)			

Financial Capabilities

Financial capabilities are the resources to fund mitigation actions. Talking about funding and financial capabilities is important to determine what kinds of projects are feasible, given their cost. Mitigation actions like outreach programs are lower cost and often use staff time and existing budgets. Other actions, such as earthquake retrofits, could require substantial funding from local, state, and federal partners. Partnerships, including those willing to donate land, supplies, in-kind matches, and cash, can be included.

Table 16: Assessment of the Financial Capabilities of the City of Midvale

Education and Outreach Capabilities

Education and outreach capabilities are programs and methods that could communicate about and encourage risk reduction. These programs may be run by a participant or a community-based partner. Partners, especially those who work with underserved communities, can help identify additional education and outreach capabilities.

Table 17: Assessment of the Education and Outreach Capabilities of the City of Midvale[5]

Opportunities to Expand and/or Improve Capabilities

Actions that can expand and improve existing authorities, plans, policies, and resources for mitigation include budgeting for mitigation actions, passing policies and procedures for mitigation actions, adopting and implementing stricter mitigation regulations, approving mitigation updates, and making additions to existing plans as new needs are recognized. Table 18 lists the opportunities for the city of Midvale.

Table 18: Opportunities to Expand and/or Improve the Capabilities of the City of Midvale

Capability	Opportunity to Expand and/or Improve
Planning and Regulations	Midvale can more thoroughly document how substantial damage determinations (including data sources, tools, resources, and staffing) will be made by developing a Substantial Damage Plan or procedure. The procedure could be incorporated into the Flood Damage Prevention Ordinance.
Administrative and Technical	The Planning Commission could receive additional information on hazard risks and mitigation measures, such as through presentations on hazard mitigation, plan maintenance, and mitigation projects.
Financial	The city has grant writing capabilities but has not been awarded any Hazard Mitigation Assistance grants yet. Successfully applying for the Hazard Mitigation Grant Program (HMGP), Flood Mitigation Assistance (FMA), or other pre-disaster mitigation funding could expand the city's funding capabilities.
Education and Outreach	The city can consider connecting with stakeholders such as real estate professionals and developers to promote disclosure of flood risk and understanding of hazard risk reduction development requirements.

DRAFT

Mitigation Strategy

Mitigation strategies provide proactive measures that are designed to minimize the impacts of hazards on the city of Midvale. Table 19 shows mitigation action alternatives, and

Table 20 shows the status of previous mitigation activities. Actions that are not complete or ongoing are being carried forward in the new plan. Those that are not carried forward due to changes in priority or lack of feasibility have been identified as deleted. Table 21 is the 2025 mitigation action plan for the city of Midvale.

Table 19: Mitigation Action Alternatives for the City of Midvale

Action	Type of Action	Selected for inclusion in the plan?	If not selected, why not?
Public education	Education and awareness programs	Y – refined this mitigation action to be more specific.	
Severe weather that shuts down roads/access for residents	Natural systems protection	Y – refined this mitigation action to be more specific.	
Security	Structure and infrastructure projects	Y – refined this mitigation action to be more specific.	

Table 20: Status of Prior Mitigation Actions of the City of Midvale[6]

Action	Hazard(s)	Agency Lead	Support Agency(ies)	Status Update
Ensure that city emergency communication systems (radios, signal boosters, etc.) are functioning and ready for use.	All hazards	Midvale IT	Public Works, UPD, UFA	Ongoing – Midvale has ordered new radios and the supporting equipment. Anticipate full implementation by the end of FY25.
Gather and update GIS data on city infrastructure to ensure smooth operations during emergency operations.	All hazards	Engineering/ GIS	Midvale Public Works and Community Development	Ongoing – Progress has been made in collecting infrastructure data. Data gathering is ongoing and will focus on data required to complete upcoming utility master plans.
Update and ensure that mutual aid agreements and contacts are in place for emergency response operations. This includes other government agencies, private	All hazards	City Manager	City Attorney	Ongoing – Private contracts for pallets of water have been made. Bilateral mutual aid agreements and agreements for other

businesses, etc. so that resources are available and ready when needed.				resources, are still needed.
SCADA system for water and sewer system readings and backup generator systems for sewer lift stations.	All hazards	Midvale Public Works Department	Midvale IT	Complete – SCADA system has been implemented, tested, and is operational.
Separate stormwater from irrigation ditches.	Flooding, Hazardous Materials	City Engineer	Public Works	Ongoing – Several areas where stormwater and irrigation systems were connected have been separated. Additional separation is required. Midvale is currently working on a stormwater master plan, which will include plans for future stormwater improvements.
Develop a robust cyber security program, incorporating components of the NIST Cybersecurity Framework	Cyberattack	Midvale IT		Complete and Ongoing – Midvale IT has implemented robust cybersecurity. IT is also intent on constantly improving the program as new threats and opportunities present themselves.
Increase adult influenza vaccination rates to the Healthy Salt Lake target rate. Currently the rate is 70%	Cyberattack Public Health Epidemic/ Pandemic	Midvale EM	SLCo Public Health	Deleted – The city does not manage flu vaccinations for the community.
Establish redundancy for dispatch centers and other critical communications	All hazards	Midvale EM	VECC	Ongoing – covered by UPD and UFA
Provide education regarding all natural hazards through live trainings and web-based, print, and broadcast media	All hazards	Midvale EM	FEMA	Ongoing – Midvale periodically provides education on natural hazards. In the last year Midvale hosted an Emergency Planning Open House and has information online for residents. In addition, Midvale staff have provided training for community groups upon request.

DRAFT

Action	Hazard(s)	Agency Lead	Support Agency(ies)	Status Update
Incorporate information about cascading effects of hazards in education programs	All hazards	Midvale EM		Completed – The county makes hazard-specific public information available at City Hall.
Develop education programs to target specific groups including homeowners, developers, schools and people with special needs	All hazards	Midvale EM	Local School Districts	Ongoing – Educational opportunities have targeted the community broadly and neighborhood groups.
Utilize maps and similar products on County EM website and other media to educate public on areas at risk of hazards	All hazards	Midvale EM, GIS, and Engineering	County EM GIS	Ongoing – Maps have been used to provide information to the public regarding flooding during the spring runoff.
Coordinate with existing public education programs, such as the American Red Cross, Utah Living with Fire, be Ready Utah, the National Weather Service, etc.	All hazards	Midvale EM	American Red Cross	Incomplete
Establish and enforce appropriate planning, zoning, and building code ordinances	All hazards	Midvale EM and Zoning/ Code		Complete and Ongoing – Zoning code is constantly updated to reflect legislative changes and local land use planning.
Utilize inundation maps to identify potential evacuation areas and routes	Dam Failure	Midvale EM and GIS	SLCo EM GIS	Incomplete
Continue to encourage water conservation, using outreach material from all water districts in the county	Drought	Midvale EM and Water Department		Complete – Midvale has adopted a water conservation plan and ordinance that is in line with policies established by JVWCD. As these changes have been made, they have been promoted on social media.
Emergency Managers will coordinate with local water districts/ public utilities to support ongoing conservation efforts	Drought	Midvale EM and Public Works	Midvale City Engineer sits on the Drought Committee of the JVWCD	Ongoing

DRAFT

Action	Hazard(s)	Agency Lead	Support Agency(ies)	Status Update
Investigate feasibility of implementing an incentive program to encourage the use of low-flow appliances and fixtures in homes and businesses	Drought	Midvale EM and Water Department		Deleted – Midvale has adopted Water Conservation Standards developed by the JVWCC.
Implement water-saving devices and practices in public facilities	Drought	Midvale EM, Public Works – Parks and Facilities Divisions		Ongoing – Changes have been made to irrigation and internal appliances to conserve water. Additional changes will be made as opportunities present themselves.
Repair, maintain and improve water distribution infrastructure to prevent loss from leakage, breaks, etc.	Drought	Midvale EM and Water Department		Ongoing – Midvale has bonded to fund the repairs to significant portions of the water distribution system. Improvements are currently in the design phase, with construction to occur in 2025. Improvements will continue as part of an ongoing maintenance plan.
Coordinate public safety water use, such as hydrant testing	Drought	Midvale EM and Water Department		Ongoing
Provide information on landscaping alternatives for persons subject to green area requirements	Drought	Midvale EM		Complete – Midvale has partnered with the JVECC to provide the public with landscaping ideas and programs. Midvale recently adopted the district's water conservation guidelines by ordinance.
Provide educational materials to unreinforced masonry home and business owners	Earthquake	Midvale EM and Building Department		Incomplete
Procure Engineering Consultant to perform the nonstructural design and geotechnical assessment and review.	Earthquake	Engineering		Deleted
Assist Cities with NFIP application	Flooding	Engineering/ State	FEMA	Incomplete

DRAFT

Action	Hazard(s)	Agency Lead	Support Agency(ies)	Status Update
Encourage Communities to actively participate in NFIP	Flooding	Engineering/ State	FEMA	Incomplete
Identify and assess structures for deficiencies	Flooding	Engineering		Ongoing – Currently happening for new structures.
Modify structures as needed to address deficiencies	Flooding	Building Department.		Incomplete
Maintain Hazardous Weather Operations Plan according to StormReady requirements	Severe Weather	Midvale EM		Incomplete – Midvale is updating its plans to address different emergency that might impact the city.
Maintain Contact with NWS before reapplication	Severe Weather	Midvale EM	NWS	Deleted
Meet with NWS representative on an annual basis to receive information on new services and alerts available	Severe Weather	Midvale EM	NWS	Incomplete
Assist NWS in making other agencies and departments aware of available resources	Severe Weather	Engineering, Water, and City EM	NWS	Incomplete
Work with NWS to develop large event venue weather safety and evacuation procedures	Severe Weather	Engineering, Water, and City EM	NWS	Incomplete
Midvale will implement the "Firewise" program in con-junction with the UFA.	Wildland Fire	EM and Fire	UFA	Ongoing
Midvale has a large number of unreinforced brick residences that poses a large problem in the event of a major earthquake.	Earthquake	Midvale EM		Deleted as this does not identify a specific action.
Canal Mapping will be discussed at the yearly Emergency Managers Meeting and a subcommittee will be formed on earthquake impacts.	Flooding	Midvale EM		Ongoing – GIS has maps of the canals and irrigation lines in Midvale. A committee to discuss earthquake impacts has not been formed.

DRAFT

Action	Hazard(s)	Agency Lead	Support Agency(ies)	Status Update
Our jurisdiction will implement the "Fire is everyone's Fight" program through community outreach.	Severe Weather	Midvale EM		Incomplete
Midvale Emergency Management will work with the County Health Department to assist them in designing their mitigation programs for dealing with pandemics.	Pandemic	Midvale EM	County and UDPH	Incomplete
Emergency Management will conduct a special presentation on "Slow the Flow" to encourage residents to take advantage of the free "Water Check" program.	Drought	Midvale EM	JVWCD	Ongoing – Midvale has taken several steps to implement water conservation policies and programming. However, Midvale has not provided these specific presentations and programs.
Midvale Emergency Management will educate citizens in procuring radon testing kits. A presentation from the Health department will be made. **EM will provide Public Info on home radon test**	Radon	Midvale EM		Incomplete
Midvale Emergency Management will participate in a half-day seminar with the authors of the book *Geologic Hazards of the Magna Quadrangle, Utah,* Jessica J. Castleton, Ashley Elliott, and Greg N. McDonald, to determine testing and mitigation techniques that can be implemented.	Earthquake	Midvale EM	UDNR, Geological Survey Division	Deleted

	unreinforced masonry (URM) from an earthquake.			local jurisdictions, SLCo EM, UDEM						effects of a large-scale earthquake by minimizing post-earthquake personal injury and the need for outside assistance.
27	Discuss canal mapping at the yearly Emergency Managers meeting and form a subcommittee on earthquake impacts.	Flooding	Midvale EM	Water districts, SLCo EM, Midvale Public Works, Midvale Community Development, SLCo Flood Control, UFA	Reduce the potential for canal failures and subsequent flooding and damage to structures and infrastructure.	Low	Midvale general funds	Short term	High	Midvale Emergency Management will apply for grants for flood mitigation assistance. As each jurisdiction has already identified its flood-prone areas through Hazus and Risk MAP, Midvale EM will use existing reports to help prepare plans for mitigation and application for funding.
28	Implement the “Fire Is Everyone’s Fight” program through community outreach.	Severe Weather, Wildfire	Midvale EM	UFA, FFSL, SLCo EM, Midvale Communications	Inform residents of the actions they can take to reduce the risk of wildfire.	Low	Midvale general funds, WUIPPM fund, CWDG grant	Short term	High	Severe weather is inevitable. The best mitigation practice is timely communication of the event and actions that can be taken to minimize the effects. The biggest threat of severe weather is winter storms, which usually cause power outages that can last up to several days. Home heating has become a major problem. Each year, Midvale has several devastating fires from homeowners using unsafe heating units.
29	Midvale Emergency Management will work with the county health department in designing its mitigation programs for dealing with pandemics.	Public Health Epidemic/Pandemic	Midvale EM	Utah DHHS, SLCo EM, SLCo Health Department, Midvale Communications	Maintain awareness of potential health consequences from an epidemic/pandemic.	Low	Midvale general funds	Short term	High	“The Salt Lake County Health Department (SLCo HD) continues to improve its emergency response capacity by planning, training, exercising and working with partners and municipalities throughout the county. The SLCo HD Emergency Management Bureau takes the lead in the department and involves all health department staff through planning, training, drills, and exercises. The health department follows the principles of emergency management: to plan for, respond to, recover from, and mitigate natural and man-made emergencies and disasters. Our goal is to do the most good for the most people in the shortest amount of time.“
30	Emergency Management will provide educational materials such as “Slow the Flow” to encourage residents to take advantage of the free “Water Check” program.	Drought	Midvale EM	JVWCD, UDWR, Midvale Public Works, Midvale Community Development	Conserves water supply and reduces costs.	Low	Midvale general funds	Short term	High	Midvale is prone to cyclical droughts, which have been severe enough to require water rationing.

DRAFT

#	Action	Hazard(s)	Lead Agency	Potential Partners	Benefits (Losses Avoided)	Cost Estimate	Funding Source(s)	Time-frame	Priority	Comments
31	Midvale Emergency Management will provide information to educate citizens in procuring radon testing kits.	Radon	Midvale EM	UDEQ, SLCo Health Department, Midvale Communications, SLCo EM, SLCo Aging and Adult Services	Fewer radon-caused cancer deaths. Increased engagement/understanding with the public on what the city can do or help with.	Low	Midvale general funds, UDEQ grant, SLCo Health Dept general fund, SLCo EM general fund	Short term	High	When radon becomes trapped in buildings and homes, people breathe the radon into their lungs and the gas becomes trapped. The Environmental Protection Agency (EPA) has determined that a 4.0 pCi/L action level of radon is dangerous for human health. Utah radon levels are at or above this level, on average.
32	Ensure that city emergency communication systems (radios, signal boosters, etc.) are functioning and ready for use.	Flooding, Severe Winter Weather, Wildfire, Earthquake, High Wind, Heavy Rain	Midvale EM	Public Works, UPD, UFA	Enhanced communication and coordination during a disaster.	Low	Midvale general funds	Short term	High	
33	Gather and update GIS data on city infrastructure to ensure smooth operations during emergency operations.	Flooding, Severe Winter Weather, Wildfire, Earthquake, High Wind, Heavy Rain, Drought, Extreme Temperatures	Midvale EM	Midvale Engineering/GIS	A better understanding of these hazards allows for enhanced planning and quicker reaction time when a disaster occurs.	Medium	Midvale general funds	Medium term	Medium	
34	Update and ensure that mutual aid agreements and contacts are in place for emergency response operations. This includes other government agencies, private businesses, etc. so that resources are available and ready when needed. Jurisdiction Profile

Date of Incorporation

December 28, 2016

Location and Description

The City of Millcreek is a residential community adjacent to Salt Lake City. The city is 12.7 square miles in area and is approximately 4,285 feet above sea level. Situated along the Mill Creek Canyon in the Uinta–Wasatch–Cache National Forest, Millcreek offers an abundance of outdoor recreational activities including miles of hiking trails.

Population

The 2022 American Community Survey 5-Year Estimate from the U.S. Census Bureau records the population of the city of Millcreek as 63,380 people.

Demographics

Most of the 63,520 people are between the ages of 25-34, with a median age of 37.1; 32,003 are females (50.4%) and 31,517 are males (49.6%). English is the primary language in 78.6% of homes,, with 9.7% Spanish, and 11.7% other languages.

DRAFT

Brief History

Pioneers began settling the Canyon Rim and East Mill Creek areas in the Salt Lake Valley in the mid-1800s. By the 20th century, residential and commercial development began in Millcreek. Manufacturing operations and summer homes of the affluent from Salt Lake City also emerged along Mill Creek, particularly what is now known as Evergreen Avenue. Millcreek underwent a wave of growth and transformation during this time. Between the 1930s and 1960s, suburban expansion accelerated, exacerbated by Millcreek's proximity to Salt Lake City, the Wasatch Mountains, and key transportation routes. Millcreek became an attractive location for new starter home subdivisions with many veterans taking advantage of the location after World War II and the Korean War. Development continued throughout the 20th century and into the 21st with a focus on infill projects and smaller subdivisions. The area near I-15 became an industrial and commercial hub that benefited from its access to major highways and railroads. Salt Lake County experienced rapid growth from 2010 onward, prompting Millcreek residents to push for incorporation to better manage the expansion. In 2015, voters approved the creation of a municipal government and Millcreek was incorporated.

Climate

The City of Millcreek experiences a semi-arid climate with hot, dry summers and snowy winters. Millcreek's climate is impacted by the surrounding terrain, which affects both the temperature of the city and the precipitation patterns due to the proximity to the Wasatch Mountains. Summer temperatures can surpass 90°F, and winter temperatures range from 30°F to 40°F. The city of Millcreek experiences significant precipitation, with snowfall ranging from 40 to 50 inches and rainfall ranging from 20 to 30 inches each year.

Public Services

The city of Millcreek offers a variety of public services to enhance the quality of life for its residents. These services include essential utility services, such as power (Rocky Mountain Power), gas (Dominion Energy), water (Salt Lake City Public Utilities and the Jordan Valley Water Conservancy District), sewer (Mt. Olympus Improvement District), and solid waste management (Wasatch Front Waste & Recycling). The Public Works Department focuses on improving infrastructure, such as roads, sidewalks, and stormwater systems; handling snow removal; issuing permits, and ensuring that construction sites comply with city codes. The city of Millcreek also provides various community services, including parks, trails, recreation, and open space maintenance, along with resources for residents to report concerns and request inspections.

Governing Body

The governing body for the City of Millcreek consists of a Mayor and a four-member city council. The city council serves as the city government performing executive functions of different natures. Members of this governing body are elected by the people.

DRAFT

Development Trends

The City of Millcreek adopted its first General Plan as of 2019, a major step forward in guiding the development of the city. Through conversations with the Millcreek community, seven vision themes for future development were identified: unique neighborhoods, vibrant gathering places, a thriving economy, great connections, health and environment, the outdoor lifestyle, and enhanced culture.

Jurisdiction-Specific Hazards and Risk

The Calculated Priority Risk Index (CPRI) is a comprehensive assessment tool for evaluating and prioritizing risks in a given context. It considers various factors, such as probability, impact, and urgency, to determine the level of risk associated with events or situations. The results for each hazard, including its risk factor (RF) value, are shown in Table 5. The results are based on the criteria in Table 6 and the equation that follows it. The CPRI helps organizations and individuals make informed decisions about risk management and mitigation strategies. It provides a systematic approach to identifying and addressing potential issues, allowing for a more efficient allocation of resources and proactive risk prevention. With the CPRI, stakeholders can prioritize their focus on the most critical risks, leading to more effective risk management and, ultimately, better outcomes.

Table 5: Calculated Priority Risk Index Values for the City of Millcreek

Type of Hazard Event	Probability of Future Events	Spatial Extent	Severity of Life/ Property Impact	Warning Time	Duration	Response Capacity	Risk Factor Value
Avalanche	4	1	2	4	2	1	2.6
Drought	4	4	2	1	4	1	2.8
Earthquake	3	4	4	4	3	2	3.4
Extreme Heat	4	4	3	1	3	1	3
Extreme Cold	3	4	2	1	3	1	2.4
Flooding	4	3	3	3	3	1	3.1
Landslide/ Slope Failure	2	1	2	4	1	2	2
Radon	4	4	2	1	4	2	2.9
Heavy Rain	4	3	2	3	1	1	2.6
High Wind	4	3	3	3	2	1	3
Lightning	4	2	2	4	1	1	2.6
Severe Winter Weather	4	3	2	2	2	1	2.6
Tornado	2	2	3	4	1	2	2.4
Wildfire	4	3	3	4	3	1	3.2
Dam Failure	2	2	3	2	2	3	2.4
Civil Disturbance	2	1	2	4	2	2	2.1

DRAFT

Type of Hazard Event	Probability of Future Events	Spatial Extent	Severity of Life/ Property Impact	Warning Time	Duration	Response Capacity	Risk Factor Value
Cyberattack	2	3	3	4	3	2	2.7
Hazardous Materials Incident (Transportation & Fixed Facility)	3	1	2	4	1	1	2.2
Public Health Epidemic/ Pandemic	3	4	3	1	4	1	2.8
Terrorism	2	1	3	4	2	1	2.3

Table 6: Criteria for the Calculated Priority Risk Index

Risk Index Factor	Degree of Risk Level		Criteria	Factor Weight for Degree of Risk Level
Probability of Future Events	1	Unlikely	Less than 1 percent probability of occurrence in the next year or a recurrence interval of greater than every 100 years.	30%
	2	Occasional	1 to 10 percent probability of occurrence in the next year or a recurrence interval of 11 to 100 years.	
	3	Likely	11 to 90 percent probability of occurrence in the next year or a recurrence interval of 1 to 10 years.	
	4	Highly Likely	91 to 100 percent probability of occurrence in the next year or a recurrence interval of less than 1 year.	
Spatial Extent	1	Limited	Less than 10% of the planning area could be impacted.	10%
	2	Small	10%–25% of the planning area could be impacted	
	3	Significant	25%–50% of the planning area could be impacted.	
	4	Extensive	50%–100% of the planning area could be impacted.	
Severity of Life/Property Impact	1	Negligible	Less than 5% of the affected area's critical and non-critical facilities and structures are damaged/destroyed. Only minor property damage and minimal disruption of life. Temporary shutdown of critical facilities.	30%
	2	Limited	More than 5% and less than 25% percent of property in the affected area is damaged/ destroyed. Complete shutdown of critical facilities for more than one day but less than one week.	

DRAFT

Risk Index Factor	Degree of Risk Level		Criteria	Factor Weight for Degree of Risk Level
	3	Critical	More than 25% and less than 50% of property in the affected area was damaged/destroyed. Complete shutdown of critical facilities for over a week but less than one month.	
	4	Catastrophic	Over 50% of critical and non-critical facilities and infrastructures in the affected area are damaged/destroyed. Complete shutdown of critical facilities for more than one month.	
Warning Time	1	Self-defined	More than 24 hours	10%
	2	Self-defined	12 to 24 hours.	
	3	Self-defined	6 to 12 hours.	
	4	Self-defined	Less than 6 hours.	
Duration	1	Brief	Up to 6 hours.	10%
	2	Intermediate	Up to one day.	
	3	Extended	Up to one week.	
	4	Prolonged	More than one week.	
Response Capacity	1	High	Significant resources and capability to respond to this kind of event; staff are trained, experienced, and ready.	10%
	2	Medium	Some resources and capability to respond to this kind of staff; some staff may be trained, experienced, and ready while others may need additional support.	
	3	Low	Limited resources and capability to respond to this kind of event; additional staff or staff training needed.	
	4	None	No resources and capability to respond this kind of event; additional outside support would be required.	

RISK FACTOR (RF) EQUATION

RF Value = [(Probability x 0.30) + (Spatial Extent x 0.10) + (Severity of Life/Property Impact x 0.30) + (Warning Time x 0.10) + (Duration x 0.10) + (Response Capacity x 0.10)]

Hazards with an RF value greater than or equal to 2.5 are considered high risk. Those with RF values of 2.0 to 2.4 are considered moderate risk hazards, and those with an RF value less than 2.0 are considered low risk. The highest possible RF value is 4.

DRAFT

Hazard Event History

Examining hazard event histories provides valuable insights to inform decision-making and help prioritize resources for risk prevention and response efforts. Table 7 lists the hazard events impacting the city of Millcreek since the 2019 plan update, as recorded in the Storm Events Database from the National Centers for Environmental Information.

Table 7: History of Hazard Events in the City of Millcreek

Type of Hazard Event	FEMA Disaster #	Date(s)	Damage or Impacts	Description
Avalanche		N/A	N/A	N/A
Drought		N/A	N/A	N/A
Earthquake		03/18/2020	Minor property damage and temporary power outages.	A 5.7 magnitude earthquake struck near the city of Magna on March 18, 2020. Millcreek, along with the rest of the Salt Lake Valley, experienced strong shaking, which caused property damage and temporary power outages.
Extreme Heat		N/A	N/A	N/A
Extreme Cold		N/A	N/A	N/A
Flooding				Floods have periodically impacted Millcreek, particularly during heavy spring runoff seasons. Although not causing extensive destruction, these events have stressed infrastructure and prompted local emergency responses in Millcreek and Neffs Canyon.
Landslide/ Slope Failure		N/A	N/A	N/A
Radon		N/A	N/A	N/A
Heavy Rain		N/A	N/A	N/A
High Wind		09/07/2020	Widespread damage to trees, power lines, and homes. Power outages, some lasting several days, affected hundreds of thousands of residents.	A severe windstorm hit Millcreek, on September 7–8, 2020. The storm brought hurricane-force winds exceeding 100 mph.
Lightning		N/A	N/A	N/A

DRAFT

Type of Hazard Event	FEMA Disaster #	Date(s)	Damage or Impacts	Description
Severe Winter Weather		N/A	N/A	N/A
Tornado		N/A	N/A	N/A
Wildfire		October 14, 2020	Neffs Canyon Fire burned 80 acres close to Millcreek.	Millcreek's proximity to the Wasatch Mountains places it at risk of wildfires, which have become increasingly frequent in Utah due to rising temperatures and dry conditions. Although there have been no reports of major wildfires in Millcreek itself in the past decade, nearby fires like the one in Neffs Canyon have posed risks to air quality and required readiness for potential evacuations.
Dam Failure		N/A	N/A	N/A
Civil Disturbance		N/A	N/A	N/A
Cyberattack		N/A	N/A	N/A
Hazardous Materials Incident (Transporta-tion & Fixed Facility)		June 18, 2024	HazMat spill in Millcreek caused road/TRAX line shutdowns and an evacuation.	The United Fire Authority responded when a 55-gallon barrel behind a building was producing white smoke.
Public Health Epidemic/ Pandemic	DR-4525	2020-2023	The local economy was affected by the lack of patrons in local businesses and social distancing measures that were needed to stop the spread of the virus.	The global pandemic of COVID-19 heavily impacted Millcreek, with public health measures, emergency planning, and community services being tested and strained during this period. Public health advisories, lockdowns, and social distancing measures were enacted to mitigate the virus's spread.
Terrorism		N/A	N/A	N/A

National Flood Insurance Program Summary

The city of Millcreek participates in the National Flood Insurance Program (NFIP). Table 8 displays statistics related to the NFIP. The city of Millcreek does not participate in the Community Rating System (CRS).

DRAFT

Table 8: National Flood Insurance Program Status for the City of Millcreek[2]

Initial FHBM Identified	Initial FIRM Identified	Current Effective Map Date	Adopted Date	Date Joined NFIP	Tribal
08/30/1977	12/18/1985	11/19/2021	2021	02/16/18	No

Table 9: National Flood Insurance Policies for the City of Millcreek

Community ID	Number of Losses	Total Net Payment	Active Policies	Total Coverage
490231	3	$20,627.98	131	$39,395,000

The city of Millcreek has designated the City Engineer as the Floodplain Administrator. The current Flood Damage Prevention Ordinance was adopted on 11/8/2021. The ordinance includes a freeboard requirement of 1 foot, meaning that the lowest flood floor must be built 1 foot above the base flood elevation. The current effective Flood Insurance Rate Map (FIRM) date is 11/19/2021. In addition to the current effective FIRM, Millcreek provides information on the new maps that are being developed for the Neff's Creek area. Millcreek also requires building permits, which are issued by the Building Department. Both the Building Permit application and the Engineering Review Checklist for projects include multiple opportunities to evaluate flood risk. Substantial damage/substantial improvement determinations are made through the permitting process. Structures that meet this requirement will be required to come into compliance with current codes, including the freeboard requirement.

Jurisdiction-Specific Vulnerabilities and Impacts

Table 10 provides information on the vulnerable assets in the city of Millcreek, including its critical facilities, highlighting the city's vulnerability to identified hazards. It also describes the potential impacts on the community arising from those vulnerabilities. Impacts are the consequences or effects of each hazard on the assets. By understanding the risks associated with these assets, local authorities can develop proactive strategies to mitigate vulnerabilities and ensure the safety and functionality of these important assets during hazard events. These data are invaluable for decision-making and prioritizing resources for emergency response and preparedness efforts, ultimately contributing to more effective risk management and greater resilience in the community.

Table 10: Jurisdiction-Specific Vulnerabilities and Impacts in the City of Millcreek

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
Avalanche	People	*Vulnerability:* Risk to Millcreek residents due to avalanche is low. Avalanche risk is primarily in the canyons. Slope and other conditions that generate avalanche are not typically present in Millcreek. *Impacts:* Residents who recreate in the canyons could be affected by an avalanche if conditions shift unexpectedly or if they do not heed avalanche warnings.

[2] FIRM = Flood Insurance Rate Map, FHBM = Flood Hazard Boundary Map

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
	Structures	*Vulnerability:* Risk to structures from avalanches is low but may affect residents of Millcreek if an avalanche were to occur in Millcreek Canyon, Neffs Canyon, or Big Cottonwood Canyon. *Impacts:* Residential neighborhoods in the eastern area of the city are not typically affected by avalanches but may be exposed to avalanche under unique conditions. Residences with poor design or with inadequate setback from natural chutes may be vulnerable to snow movement and heavy snow loading.
	Economic Assets	*Vulnerability:* Businesses in eastern Millcreek face a low risk from avalanches. *Impacts:* The probability of an avalanche impacting businesses is low. Avalanche can lead to temporary road closures which may disrupt commuting and recreation-based economic activity. If homeowners or business owners do not have an insurance policy to cover damage, it would significantly affect their ability to make repairs or rebuild.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Vegetation and wildlife on the slopes near Millcreek are vulnerable to damage from avalanches. *Impacts:* An avalanche could strip forested slopes and damage. habitats. There are historic buildings in Millcreek, but they are not located in areas where there would likely be damage from avalanche impact.
	Critical Facilities and Infrastructure	*Vulnerability:* No critical facilities were identified in areas of known avalanche risk, but transportation routes are potentially vulnerable. *Impacts:* Transportation routes could be affected by road closures following an avalanche, such as Millcreek Canyon Road and I-215. An avalanche could hinder access to Millcreek by emergency services.
	Community Activities	*Vulnerability:* Outdoor activities, especially recreation in the nearby canyons, would be impacted. *Impacts:* If access is cut off or if it is dangerous to reach them, there may be less visitation, which would impact the local economy.
Drought	People	*Vulnerability:* Drought could affect all residents of Millcreek. *Impacts:* Drought can limit the water supply for culinary water and landscape irrigation. Drought can affect outdoor recreation, especially in the canyons surrounding Millcreek. People who work or recreate outside may need to take frequent breaks if they are exposed to the sun and have limited water access.
	Structures	*Vulnerability:* All structures in Millcreek are vulnerable to drought. *Impacts:* Depending on the building material, it may be more difficult to cool structures if water is limited or during the warm summer months.
	Economic Assets	*Vulnerability:* All businesses are vulnerable to drought. *Impacts:* Local business owners may face restrictions or higher costs for water they need for cleaning, irrigation, growing food, etc. This could cause businesses to close or reduce their hours in the middle of the day when it is the warmest.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Vegetation, wildlife, and parks are vulnerable to drought. *Impacts:* Drought can cause soil erosion and alter wildlife patterns. In addition, local vegetation might not be able to grow. Any public parks

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		may be at reduced watering levels to conserve resources. Drought increases wildfire risk in the foothills.
	Critical Facilities and Infrastructure	*Vulnerability:* Critical facilities, including hospitals, fire, or police stations, schools, and city facilities, are vulnerable to drought. *Impacts:* Critical infrastructure that requires a significant amount of water to run or cool is vulnerable, especially if water is rationed. There could be increased costs for watering landscaping. It may be challenging for St. Mark's Hospital or other healthcare facilities to provide service to patients.
	Community Activities	*Vulnerability:* Outdoor recreation is vulnerable to drought. *Impacts:* Outdoor recreation in the canyons, at parks, or at golf courses would face significant challenges if there were a lack of water. They would not be able to irrigate those recreation areas, especially if there are restrictions placed on the amount of water used.
Earthquake	People	*Vulnerability:* All of the more than 63,000 residents in Millcreek are potentially vulnerable to earthquakes. The Salt Lake City segment of the Wasatch Fault traverses Millcreek City, and a moderate to large-scale earthquake could cause very strong or severe ground shaking. *Impacts:* People could be injured or killed from objects falling or being trapped in collapsed structures. The most vulnerable populations include the elderly, people with disabilities, and low-income residents who may lack resources to adequately prepare for or respond during an emergency.
	Structures	*Vulnerability:* All structures in Millcreek are vulnerable to earthquakes. Older buildings and homes built before modern seismic codes are particularly vulnerable. *Impacts:* Structures not built to withstand seismic events, such as unreinforced masonry buildings, are at risk of significant damage or collapse during an earthquake. Moderate to high liquefaction potential in the western area of the city may increase the vulnerability to structural damage following an earthquake.
	Economic Assets	*Vulnerability:* All businesses in Millcreek are vulnerable to earthquakes. *Impacts:* Earthquakes are likely to cause extensive economic losses. Businesses throughout the city could experience damage to their buildings and inventory. Damage to infrastructure can also disrupt the ability of businesses to remain in operation. Roads, rail transit lines, and utilities such as power, water, and communication systems are all vulnerable to damage from earthquakes, which disrupts economic activity. Earthquakes can disrupt businesses, damage commercial properties, and cause a loss of revenue for the city. Damage to infrastructure, such as roads and utility lines, could hinder economic recovery by delaying repairs and disrupting daily operations. Repair and recovery could be costly and may take months or years.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Historic buildings, 10 homes, and one district in Millcreek are listed on the National Register of Historic Places. *Impacts:* Historic buildings and landmarks often cannot withstand strong ground shaking and are at risk of damage or destruction, threatening the loss of heritage and cultural identity. These structures

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		often require specialized efforts for preservation and restoration following a disaster.
	Critical Facilities and Infrastructure	*Vulnerability:* Many critical facilities in the city could be affected, including City Hall, fire stations, the police station, hospitals, and schools. Vital services—including power, water, communication, and transportation networks—are vulnerable to earthquake damage. *Impacts:* A major earthquake could disrupt government operations and services, hindering emergency response efforts and recovery operations. I-215 is a critical transportation route through the city. Damage to bridges or other segments of the freeway may not only hinder travel on the freeway itself but also limit movement between the east and west areas of the city.
	Community Activities	*Vulnerability:* All community activities are vulnerable to earthquakes. *Impacts:* Earthquakes disrupt community routines, halting gatherings, events, and local services. Key community spaces like schools, parks, and local businesses would face closure or restricted access, which could disrupt social cohesion and recovery efforts.
Extreme Heat	People	*Vulnerability:* Extreme heat poses significant health risks to residents, particularly vulnerable groups like the elderly, young children, individuals with chronic illnesses, and those without access to cooling resources. *Impacts:* High temperatures can cause heat-related illnesses, such as heat exhaustion and heatstroke, which can be fatal if not properly managed. Figure 10 in Volume 1 indicates that Millcreek has a comparatively high percentage of individuals over age 65, which may indicate a higher vulnerability to heat-related illnesses. Residents will also be affected by increased energy costs due to demand for air conditioning or other cooling systems. In addition, extreme temperatures worsen air quality by raising ozone levels, which poses respiratory risks.
	Structures	*Vulnerability:* All structures are vulnerable to extreme heat. *Impacts:* Buildings, especially older ones, may lack modern insulation and air-conditioning systems, making them vulnerable to internal heat buildup. Prolonged exposure to extreme heat can also cause wear and tear on roofs and damage materials like asphalt.
	Economic Assets	*Vulnerability:* All businesses, particularly those with outdoor workers, are vulnerable to extreme heat. *Impacts:* Outdoor workers are vulnerable to heat-related illness. Businesses that depend on outdoor operations may be vulnerable to reduced productivity. Businesses may be affected by higher energy costs from cooling. High temperatures can impact outdoor workers, reducing productivity and increasing the risk of heat-related injuries. Prolonged heat waves can strain businesses, particularly those dependent on outdoor operations, and lead to increased energy costs for cooling. This places a financial strain on households and commercial establishments.
	Natural, Historic, and	*Vulnerability:* Outdoor cultural sites, activities, and historic buildings are vulnerable to heat waves.

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
	Cultural Resources	*Impacts:* Extreme heat can deter tourism and participation in outdoor activities. Historic buildings may suffer degradation due to constant exposure to heat, which can accelerate wear on materials and increase the cost of preservation.
	Critical Facilities and Infrastructure	*Vulnerability:* Infrastructure, such as power lines and road surfaces, is at risk during extreme heat. *Impacts:* High temperatures can lead to increased power consumption, risking power outages. The heat can also damage asphalt and rail lines, disrupting transportation on major roadways such as I-215. Damage to roadways can disrupt economic activity and limit the mobility of residents.
	Community Activities	*Vulnerability:* Community events and outdoor activities are vulnerable to extreme heat. *Impacts:* Extreme heat can curtail community events, as gatherings and festivals held outdoors might have to be rescheduled or canceled due to the health risks posed by high temperatures. This can lead to economic and social disruption of the community's normal activities and affect revenue.
Extreme Cold	People	*Vulnerability:* Extreme cold can affect the entire city. All residents are vulnerable to extreme cold events in Millcreek. Children, the elderly, and those experiencing homelessness are particularly vulnerable. *Impacts:* People are vulnerable to hypothermia and frostbite, especially the elderly, young children, and homeless populations without adequate shelter or heating. Approximately 5.9% of residents are under age 5 and 15.7% are over age 65. It is unknown how many individuals experiencing homelessness are in the city who may be vulnerable to cold.
	Structures	*Vulnerability:* All structures are vulnerable to extreme cold. *Impacts:* There is a risk of burst pipes and structural damage from ice buildup, and there might be a strain on heating systems.
	Economic Assets	*Vulnerability:* All businesses are vulnerable to extreme cold. *Impacts:* Businesses may experience increased heating costs, reduced outdoor productivity, and possibly temporary closures.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Historic buildings, outdoor cultural sites, and natural ecosystems are vulnerable to extreme cold. *Impacts:* Structures can experience ice damage, damage from burst water pipes, or a lack of heating infrastructure. Extreme cold can damage ecosystems and wildlife, causing plant die-offs and limiting forage for animal populations.
	Critical Facilities and Infrastructure	*Vulnerability:* Water systems and roads are vulnerable to extreme cold. *Impacts:* Water pipes may freeze and break, disrupting the water supply. Transportation networks are at high risk during freezing conditions.
	Community Activities	*Vulnerability:* Community events are vulnerable to extreme cold. *Impacts:* Outdoor events and community gatherings may be halted, impacting social functions and community cohesion.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
Flooding	People	*Vulnerability:* Millcreek runs through the city flood maps included in Volume 1 show areas of the city that are within the 1% and 0.2% annual chance of flood. Residents who live, work, or engage in recreational activities in these areas are at risk. *Impacts:* Flooding can lead to injury, displacement, and loss of homes.
	Structures	*Vulnerability:* Structures within flood hazard zones are vulnerable to flooding. *Impacts:* Water damage to homes and buildings is possible, especially those in flood-prone zones without proper elevation or floodproofing. Hazus results indicate that an estimated $45 million in structural losses is possible in Millcreek from a 1% annual chance flood.
	Economic Assets	*Vulnerability:* Businesses in flood hazard zones are vulnerable to flooding. *Impacts:* Commercial properties face flood damage, causing business closures and revenue loss. Hazus estimates almost $17 million in indirect/business interruption losses from a 1% annual chance flood.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Historic homes and ecosystems are vulnerable to flooding. *Impacts:* Historic sites are at risk of water damage to their structures and contents. Floodwaters can erode soil, degrade water quality, and damage ecosystems, affecting wildlife habitats.
	Critical Facilities and Infrastructure	*Vulnerability:* One fire station is located within the 1% and 0.2% annual chance flood zone and is at risk of flooding. Major transportation routes that intersect these 1% or 0.2% flood zones and are at risk of damage from flooding include I-215, Highland Drive, 1300 East, 700 East, and 3900 South, as well as numerous other roads. *Impacts:* Flooding of 3900 South could affect access to St. Mark's Hospital. Damage to roads and bridges can cause long-term disruptions for residents and businesses and can affect emergency response.
	Community Activities	*Vulnerability:* City facilities and activities are vulnerable to flooding. *Impacts:* Community centers and public spaces can become unusable, disrupting normal activities and events.
Landslide/ Slope Failure	People	*Vulnerability:* Areas on the east side of Millcreek are built in the foothills and could be affected by landslides and other slope failures. Some neighborhoods are built on alluvial fans or have moderate landslide susceptibility. *Impacts:* A landslide could cause injuries or fatalities to residents in these areas. Residents could be displaced from homes.
	Structures	*Vulnerability:* Homes and businesses in landslide-susceptible areas on the east benches are vulnerable to landslides. *Impacts:* Structures such as homes and businesses could sustain damage or collapse if a landslide/slope failure were to occur. The ability of residents or local business owners to rebuild depends on whether they have insurance or other funds.
	Economic Assets	*Vulnerability:* Businesses in eastern Millcreek are vulnerable to landslides.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		Impacts: Damage to businesses or closures due to transportation disruptions could cause economic losses. The local economy would be affected by road closures from a landslide, especially if this occurs near I-215.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Vegetation and wildlife are vulnerable to landslides. No historic sites were identified in susceptible areas. *Impacts:* Local vegetation and wildlife are at risk. Landslides can cause soil erosion.
	Critical Facilities and Infrastructure	*Vulnerability:* Transportation routes are vulnerable to landslides. No critical facilities were identified in susceptible areas, but they are vulnerable to transportation disruption. *Impacts:* I-215, a major transportation route through Millcreek, or the I-215/I-80 interchange could be damaged by a landslide. Numerous smaller roads in the Mount Olympus and Canyon Rim areas could potentially be damaged by landslides, which could limit access to residences. Critical infrastructure and facilities are at risk due to transportation disruptions, especially if essential services like police or fire departments cannot access the area in a timely manner.
	Community Activities	*Vulnerability:* Recreation access is vulnerable to landslides. *Impacts:* Outdoor recreation could be restricted following a landslide, especially if people engage in recreational activities in the canyons close to Millcreek. Millcreek Canyon Road could be closed, and access to recreation areas could be limited.
Radon	People	*Vulnerability:* Between 35 and 54% of homes tested in Millcreek have elevated radon levels, placing many residents at higher risk of lung cancer. *Impacts:* Radon can impact the health of the local population, causing cancer and respiratory problems. Many residents may not test for radon, making them unaware of dangerous levels. Increased awareness and public health initiatives are vital for protection
	Structures	*Vulnerability:* In Millcreek, 54% of homes have high radon test levels, according to the Utah Radon website (https://utahradon.org/). Structures themselves are not at risk from radon, but radon can accumulate in structures and occupants can be exposed. *Impacts:* If a business owner or homeowner does not have the money to complete radon mitigation, they are at risk of radon exposure.
	Economic Assets	*Vulnerability:* Businesses may be exposed, but losses are expected to be minimal. *Impacts:* People may avoid visiting locations with high radon levels, which may lead to economic losses.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Historic buildings are vulnerable to radon accumulation. *Impacts:* Historic buildings are at risk if they are not properly maintained or ventilated, or if there is insufficient funding to complete mitigation work. Local vegetation and wildlife are not typically impacted by radon, which disperses in open space.
	Critical Facilities and Infrastructure	*Vulnerability:* Critical facilities are vulnerable to radon accumulation.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		Impacts: Schools, fire stations, police stations, and city facilities could potentially accumulate unsafe radon levels, which would expose students, employees, or other occupants.
	Community Activities	*Vulnerability:* There is limited vulnerability to community events. *Impacts:* Indoor community activities could potentially expose people to radon. If people do not feel safe entering a building, they might stay home or go elsewhere, which may disrupt economic activities.
Heavy Rain	People	*Vulnerability:* People near waterways, drainage systems, or low-lying areas are vulnerable to heavy rain. *Impacts:* People near drainage systems and waterways may be at risk of injury or drowning during flash flooding from heavy rain. Residences could be damaged by flooding and occupants may be displaced. Flash flooding places those traveling on roadways in danger, particularly if they choose to drive through floodwaters. Vehicles can be carried away in floodwaters and occupants injured or killed.
	Structures	*Vulnerability:* All structures can be damaged by heavy rain, particularly those near creeks or in low-lying areas. *Impacts:* Heavy rain can lead to water infiltration and damage to roofs, basements, and poorly sealed buildings.
	Economic Assets	*Vulnerability:* Businesses are vulnerable to losses from heavy rain. *Impacts:* Outdoor workers may be unable to work, and outdoor operations or projects may be delayed by heavy rain or related flooding. Fewer people may visit retail businesses during and following heavy rain.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Soil, slope stability, water resources, and historical sites are vulnerable to heavy rain. *Impacts:* Intense rainfall can cause soil erosion and water pollution, harming local ecosystems. Water damage can affect archives, historical structures, and outdoor cultural sites.
	Critical Facilities and Infrastructure	*Vulnerability:* Drainage/stormwater systems and roads are vulnerable to heavy rain. *Impacts:* Drainage systems can be overwhelmed, and floodwaters may begin to accumulate on roadways or other areas. Roads can be inundated or washed out, causing transportation disruptions. Transportation delays or road closures may slow emergency response.
	Community Activities	*Vulnerability:* Outdoor events and recreation are vulnerable to heavy rain. *Impacts:* Rain can cancel or delay outdoor events and social activities, leading to economic losses.
High Wind	People	*Vulnerability:* All of Millcreek is vulnerable to strong winds, including downslope winds, and all residents are at risk. *Impacts:* People could be injured by flying debris, falling tree limbs, and structural collapses. Residents in in mobile homes and older buildings may be more vulnerable to injury because these buildings may be more likely to be damaged. Outdoor workers and those without immediate shelter may be especially vulnerable. Power outages may place those who rely on medical equipment at risk.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		Winds pose hazards for pedestrians and drivers and can worsen air quality by stirring up dust and pollutants, affecting residents' health.
	Structures	*Vulnerability:* All structures in Millcreek are vulnerable to high winds. *Impacts:* High winds can damage roofs, windows, and siding, particularly in buildings not designed to withstand strong gusts such as sheds, carports, or other accessory structures. Older buildings may be more susceptible to damage. Millcreek has one mobile home park. These homes are at higher risk of damage from high wind.
	Economic Assets	*Vulnerability:* All businesses, particularly those with outdoor inventory, are vulnerable to high winds. *Impacts:* Outdoor businesses and agriculture suffer losses from wind damage to crops, signs, storefronts, and outdoor infrastructure. Extended power outages and structural repairs may lead to operational downtime and lost revenue. Recurrent wind-related damage can also drive up insurance premiums for both commercial and residential property owners.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Parks, trees, habitats, and historic buildings are vulnerable to high winds. *Impacts:* Historic buildings and monuments are susceptible to wind damage if not properly maintained or retrofitted for high wind events. Strong winds can uproot mature trees in parks or in open spaces, affecting recreational use. Strong winds can damage trees, destabilize soils, and disrupt animal habitats.
	Critical Facilities and Infrastructure	*Vulnerability:* Power lines, utility poles, transformers, substations, and communications towers are at high risk of damage from high wind and blowing debris. *Impacts:* Damage to these assets can lead to widespread service outages. Roads and transit systems could be blocked by debris, which can contribute to economic losses if people cannot access businesses and workplaces. Emergency responders may be delayed by road closures and communication disruptions.
	Community Activities	*Vulnerability:* Outdoor events are vulnerable to high winds. *Impacts:* Outdoor events are often canceled, and public safety measures must be enacted quickly. People at outdoor events may be unable to find shelter in fast-moving storms and could be injured.
Lightning	People	*Vulnerability:* Lightning presents a serious risk throughout Millcreek during summer thunderstorms, especially for individuals engaged in outdoor activities such as hiking, cycling, or team sports in Millcreek's foothills and open spaces. Outdoor workers may lack adequate shelter from lightning. Unhoused populations are also at high risk. *Impacts:* People can be injured or killed by direct lightning strikes or ground currents.
	Structures	*Vulnerability:* All structures in Millcreek are vulnerable to lightning. *Impacts:* Lightning can strike buildings directly or cause fires through indirect contact, especially in homes with metal roofing or poor grounding. Outbuildings, barns, and utility sheds are particularly vulnerable. Surges caused by strikes can damage appliances and internal electrical systems if protective devices are not in place.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
	Economic Assets	*Vulnerability:* All businesses, particularly those with outdoor equipment or inventory, are vulnerable to lightning. *Impacts:* Outdoor businesses face operational delays and potential fire hazards from lightning-induced fires. Power surges and outages resulting from lightning can interrupt business operations, damage electronic equipment, and result in costly repairs or data loss. Businesses that rely on uninterrupted power or internet access may suffer immediate financial setbacks. The economic burden includes increased insurance claims and repair costs.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Parks and the natural environment are vulnerable to lightning. *Impacts:* Lightning strikes can start wildfires, which threaten forests and wildlife habitats. The eastern area of Millcreek is at high risk of wildfire due to the proximity of homes and other structures to undeveloped forest land. Lightning can also damage public parks and open spaces where residents engage in recreational activities, including Millcreek Canyon.
	Critical Facilities and Infrastructure	*Vulnerability:* Utility facilities and all critical facilities are vulnerable to lightning. *Impacts:* Lightning strikes on power substations, communication towers, or utility poles can lead to outages. Power outages and damage to communications infrastructure can delay emergency response. Government offices, healthcare facilities such as St. Mark's Hospital, and schools may face closures if they lack backup power or if backup systems fail to activate.
	Community Activities	*Vulnerability:* Outdoor events are vulnerable to lightning. *Impacts:* Sporting events, festivals, and outdoor gatherings may be disrupted or canceled for safety. Sudden storms may cause hazardous conditions for people attending outdoor events, particularly if they are not able to quickly access shelter.
Severe Winter Weather	People	*Vulnerability:* All Millcreek residents are vulnerable to severe winter weather. *Impacts:* All residents are at increased risk of injuries due to slips and falls and health impacts from prolonged exposure to cold. Older residents or people with disabilities may be particularly vulnerable to injury. People can be injured in car accidents while driving in severe winter weather conditions. People who rely on home health or other home delivery services may be at risk due to travel delays.
	Structures	*Vulnerability:* All structures are vulnerable to severe winter weather. *Impacts:* Roofs, particularly flat or poorly maintained ones, are vulnerable to collapse under heavy snow. Walkways and parking areas must be cleared of snow to prevent injury.
	Economic Assets	*Vulnerability:* All businesses are vulnerable to severe winter weather. *Impacts:* Businesses may have fewer customers during severe weather and earn less revenue as a result. Snow disrupts transportation and delivery services, affecting businesses that rely on shipping and commuting.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
	Natural, Historic, and Cultural Resources	*Vulnerability:* Historic sites, plants, and animals are vulnerable to severe winter weather. *Impacts:* Snow and ice can damage the roofs of historic buildings and outdoor cultural sites not built for heavy winter weather. Heavy snow accumulation can impact plant life and displace animals, altering local ecosystems.
	Critical Facilities and Infrastructure	*Vulnerability:* Roads and power distribution networks are vulnerable to severe winter weather. *Impacts:* Roads and power lines are particularly vulnerable to snow buildup, causing transport delays and power outages. Essential services like police and fire departments could be slow to respond. Neighborhoods in the eastern foothills of the city often receive higher snow accumulation. Access in and out of neighborhoods can be difficult during heavy snow.
	Community Activities	*Vulnerability:* Community events are vulnerable to severe winter weather. *Impacts:* Community activities may be delayed or canceled due to severe winter weather. Community centers may serve as warming stations, but other activities can be halted due to travel difficulties.
Tornado	People	*Vulnerability:* Tornadoes are rare in Millcreek due to the proximity to the Wasatch Mountains. Tornadoes could occur in the western part of the city in the valley, and all residents in proximity are vulnerable. *Impacts:* Similar to downslope and other high wind events, residents are at risk of injury or death from flying debris and collapsing buildings, especially those in mobile homes or weak structures. Individuals without access to basements or similar storm shelters are more vulnerable to injury. Older residents and those with limited mobility or other disabilities are also vulnerable. Outdoor workers or others without shelter are at high risk of injury.
	Structures	*Vulnerability:* Tornadoes are more likely to occur farther away from the Wasatch mountains. All structures in this area are vulnerable. *Impacts:* Tornadoes can cause extensive damage to homes, commercial buildings, and public facilities. Roofs may be torn off, windows shattered, and walls damaged by the wind or by blowing debris. Mature trees can be toppled and land on homes or vehicles. Mobile homes and other structures that are not firmly anchored are at extreme risk.
	Economic Assets	*Vulnerability:* All businesses in or near a tornado path are vulnerable to damage from tornadoes. *Impacts:* Significant property damage disrupts businesses, causing revenue loss and long-term rebuilding. Tornado damage can have long-lasting impacts on the local economy. Retail businesses can experience significant structural damage, inventory loss, and losses from operational downtime due to damage or power outages. Power and transportation interruptions can contribute to lost revenue.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Trees, other vegetation, and historic structures are vulnerable to tornadoes.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		Impacts: Tornadoes can uproot trees and destroy wildlife habitats, impacting local biodiversity. Tornadoes can destroy historic structures and monuments that are not reinforced.
	Critical Facilities and Infrastructure	*Vulnerability:* Essential services in Millcreek—including power distribution lines, substations, and communications systems—are susceptible to tornado damage. Roads, hospitals, and public safety facilities are also vulnerable. *Impacts:* Downed infrastructure can leave neighborhoods and business corridors without electricity, internet, or water service. Major roadways such as I-215, 3900 South, 1300 East, and Highland Drive could be blocked by debris. Traffic signals, public safety buildings, St. Mark's Hospital, and schools may require emergency repairs to remain functional.
	Community Activities	*Vulnerability:* All community events are vulnerable to tornadoes. *Impacts:* Public gatherings and services are halted during and after a tornado. Tornadoes can disrupt everyday life and halt scheduled activities. Public schools and city-owned facilities may need to close for inspections or repairs, while parks and community centers could be temporarily unsafe. Events such as farmers markets, sports tournaments, and local festivals may be postponed or canceled, reducing opportunities for social engagement and community support.
Wildfire	People	*Vulnerability:* Much of the eastern area of Millcreek is in the wildland-urban interface (WUI), due to the proximity of neighborhoods to undeveloped, forested land. Residents in the WUI are at direct risk of fire, smoke inhalation, and evacuation. *Impacts:* Wildfire can result in injury or death if people are unable to flee in time. Older residents and those with access or functional needs may face difficulty if evacuation is needed. Older and younger residents and those with underlying pulmonary or cardiac health conditions may face serious health consequences from poor air quality.
	Structures	*Vulnerability:* Hundreds of residences in eastern Millcreek, such as Mount Olympus and Canyon Rim, are near the WUI and are at risk of damage from wildfire. Homes without defensible space are highly susceptible to fire damage. *Impacts:* Homes and businesses can be damaged or destroyed by wildfire. Wind-blown embers can start spot fires and damage structures not immediately in the WUI. Structures can also be damaged by secondary hazards, such as post-fire debris flows.
	Economic Assets	*Vulnerability:* Businesses throughout Millcreek, but particularly in the eastern part of the city closer to the WUI, are vulnerable to wildfire. Impact: Businesses in fire zones may suffer structural damage or closure due to poor air quality or may be affected by evacuations. Those not directly affected by fire may see a decline in customer visits and revenue during and following a wildfire.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Natural ecosystems, water, vegetation, wildlife, and historic sites are vulnerable to wildfire. *Impacts:* Wildfires devastate forests by destroying vegetation, displacing wildlife, and altering natural landscapes. Wildfire removes

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		surface vegetation, and intense heat can lead to hydrophobic soils, which can increase surface runoff and erosion in burned areas. The risk of debris flow is high following a wildfire, which can cause further damage to natural resources and waterways, as well as additional damage to structures downslope. Fire can destroy historic landmarks and artifacts, especially those in rural or wildland areas.
	Critical Facilities and Infrastructure	*Vulnerability:* Utility lines and roads are vulnerable to wildfire. *Impacts:* Utility lines, such as electrical transformers and transmission lines, can be damaged by fires. Roads may be closed due to flames, smoke, fallen trees, or evacuation facilitation. Emergency services may be overwhelmed. Many of the roads in the eastern foothills are dead end spur roads which can limit the ability of residents to evacuate. Narrow or winding roads can also make it difficult for some firefighting vehicles to access affected areas.
	Community Activities	*Vulnerability:* Outdoor events are vulnerable to wildfire. *Impacts:* Outdoor events may be canceled due to safety concerns and poor air quality. Workplaces may be closed for days or weeks due to evacuation and/or damage.
Dam Failure	People	*Vulnerability:* One high hazard and two significant hazard dams are located within Millcreek. In addition, Millcreek is vulnerable to dam failure from dams upstream. A small area of northern Millcreek is within the inundation boundary for Little Dell Reservoir. Southern portions of Millcreek could be affected by dam failure at Lake Mary-Phoebe or Twin Lakes dams in Big Cottonwood Canyon. All residents within dam inundation boundaries are at risk. *Impacts:* Dam failure from high hazard dams indicates immediate danger to life due to sudden flooding, particularly for those living downstream of dams. Residents are at risk of injury or displacement from flooding caused by significant hazard dams.
	Structures	*Vulnerability:* Potentially hundreds of structures, including homes and businesses, are located within dam failure inundation boundaries and are at risk of damage in Millcreek. *Impacts:* Homes and businesses downstream face destruction from rapid flooding. Millcreek is vulnerable to failure from significant hazard dams, meaning these dams have the potential to cause damage to structures and infrastructure if they were to fail.
	Economic Assets	*Vulnerability:* Businesses in dam inundation boundaries are vulnerable to dam failure. *Impacts:* Flooded commercial properties can lead to prolonged business interruptions, revenue losses, and costly rebuilding.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Plants and habitat are vulnerable to dam failure. *Impacts:* Dam failure can result in catastrophic flooding, disrupting ecosystems and potentially destroying habitats. Soil, trees, and other plants, particularly in riparian areas, can be washed away.
	Critical Facilities and Infrastructure	*Vulnerability:* Roads, bridges, and utilities in the path of floodwaters might be damaged or completely fail. *Impacts:* The I-215/I-80 interchange near Parley's Canyon is within the inundation boundary for Little Dell Reservoir and could be damaged.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		Other roads may become impassable, and emergency services may be unable to reach people. Flooding could also damage electrical power or communication infrastructure and could lead to service outages.
	Community Activities	*Vulnerability:* Events and city services are vulnerable to disruption due to dam failure. *Impacts:* Community evacuation and loss of local resources due to fam failure can disrupt normal activities and social services.
Civil Disturbance	People	Risk of injury from violent confrontations, particularly in areas of concentrated protests or riots.
	Structures	Businesses and public buildings face damage from vandalism, looting, and arson.
	Economic Assets	Widespread property damage impacts local businesses and financial stability.
	Natural, Historic, and Cultural Resources	Public monuments and government buildings can be damaged during disturbances. Parks and public natural areas might have minimal direct impact, but they might be closed or restricted during unrest.
	Critical Facilities and Infrastructure	Key transport routes and government facilities may be targeted or blocked.
	Community Activities	Public services and events may be halted or rescheduled due to security concerns.
Cyberattack	People	Personal information and financial data are at risk, affecting public trust and security.
	Structures	Building security systems can be hacked into, compromising critical infrastructure and local businesses.
	Economic Assets	Businesses are exposed to financial losses and data breaches, impacting operations and trust.
	Natural, Historic, and Cultural Resources	Digital archives and records can be compromised or lost in a cyberattack.
	Critical Facilities and Infrastructure	Power grids, water systems, and communications networks face risks of hacking and disruption.
	Community Activities	Disrupted services and loss of public trust impact community services and governmental functions.
Hazardous Materials Incident (Transporta-tion & Fixed Facility)	People	Direct exposure risks include respiratory issues and chemical burns, with vulnerable populations being the most at risk.
	Structures	Contamination can damage or render structures unusable without extensive cleanup.
	Economic Assets	Businesses in affected areas face closures and costly decontamination processes.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
	Natural, Historic, and Cultural Resources	Sites in contamination zones are at risk of long-term damage. Hazardous spills can contaminate soil and water sources, harming plants, animals, and entire ecosystems.
	Critical Facilities and Infrastructure	Water supplies and transportation routes can be impacted, leading to service shutdowns.
	Community Activities	Disruption of public services and events is common due to safety and evacuation measures.
Public Health Epidemic/ Pandemic	People	Health risks are widespread, particularly for elderly and immunocompromised individuals.
	Structures	Limited direct impact, but public buildings may require modifications for infection control. This can include social distancing, turning people away if they have a fever, or limiting the number of people in a building.
	Economic Assets	Extended closures and reduced operations lead to economic losses for businesses and public services.
	Natural, Historic, and Cultural Resources	Historical or cultural resources could be affected by reduced tourism. People may choose to stay home or avoid public areas, which impacts revenue.
	Critical Facilities and Infrastructure	Healthcare systems and public services are strained, affecting service availability.
	Community Activities	Events are postponed or moved online, reducing social interactions and community engagement.
Terrorism	People	Threat to public safety and psychological impacts on communities.
	Structures	Key targets include government buildings, public spaces, and transportation hubs.
	Economic Assets	Major financial impacts from property damage, heightened security measures, and loss of consumer confidence.
	Natural, Historic, and Cultural Resources	Certain types of attacks, like those involving explosives or chemicals, could have damaging effects on local environments. Terrorist attacks could target significant historical landmarks, causing irreversible loss of cultural heritage.
	Critical Facilities and Infrastructure	Essential services and public utilities are common targets, affecting large populations.
	Community Activities	Public fear and security concerns lead to event cancellations and changes in social behavior.

Jurisdiction-Specific Changes in Vulnerability

Hazard events can impact communities, infrastructures, and ecosystems. The severity of these impacts can be influenced by climate change, population patterns, and land use developments. Understanding

these factors is crucial for the city of Millcreek to develop a resilient community and minimize the impacts of hazards. Table 11 displays the unique changes within the community and the related effects on each identified hazard affecting the city of Millcreek.

DRAFT

Table 11: Jurisdiction-Specific Changes in Vulnerability in the City of Millcreek

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
Avalanche	Higher temperatures can lead to more rain, destabilizing snowpack and increasing the risk of wet avalanches. In addition, changes in snowfall can cause denser snow layering on slopes, making them more prone to sliding.	Avalanches can influence population patterns by deterring people from moving to or remaining in high-risk areas, leading to decreased density in these locations. The threat of avalanches prompts many to seek safer environments in urban or lower-risk regions. In addition, when avalanches occur, they can disrupt infrastructure, causing residents to relocate.	Development in Millcreek since the previous hazard mitigation plan has not increased avalanche risk. Avalanche risk comes from the Wasatch Mountains to the east of Millcreek and development has been minimal in proximity to the Wasatch Mountains.	Decreased
Drought	Climate change affects drought incidents by altering precipitation patterns and increasing temperatures. Warmer weather can lead to longer dry periods and more severe droughts, while changes in rainfall can reduce snowpack in nearby mountains, crucial for summer water supply. Higher temperatures also increase evaporation rates, further straining local water resources.	Drought can significantly influence population patterns by impacting economic opportunities and the quality of life. Water scarcity often leads to reduced agricultural productivity, prompting residents to migrate to areas with more stable job prospects. Increased water costs can make living less affordable, driving some residents away. Conversely, efforts to address drought, such as sustainable development or improved water management, may attract newcomers, resulting in changes in the community's demographic composition over time.	Increasing development throughout the City will continue to put strain on Millcreek's water sources.	Increased
Earthquake	Rising temperatures can lead to glacial melting, which affects pressure on tectonic plates and may trigger	Earthquakes can significantly alter population patterns by prompting residents to leave for safer areas after a seismic event. This	Development in Millcreek, much of which is infill development, has not substantially increased earthquake risk.	Stayed the same

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	seismic activity through isostatic rebound. In addition, increased rainfall and flooding can erode soils, weakening structural integrity and heightening vulnerability during earthquakes. Although the direct links between climate change and earthquakes are still under investigation, environmental effects may impact the region's seismic risk.	migration can lead to changes in population density and attract new residents and businesses during the rebuilding process. The perception of the area as a safe place to live may shift, impacting long-term demographics, as some residents return to rebuild while others relocate permanently.		
Extreme Heat	Climate change significantly impacts extreme heat by increasing the frequency and intensity of heat waves. Rising global temperatures lead to longer and hotter summers, affecting residents and local infrastructure while heightening health risks, especially for vulnerable populations. Urban heat islands resulting from reduced vegetation and extensive pavement further amplify these effects.	Residents may relocate due to damaged homes or safety concerns. Some may move to areas perceived as safer or seek better job opportunities elsewhere. The economic impact and infrastructure damage can also make certain neighborhoods less desirable, leading to shifts in demographics and the socioeconomic landscape as new residents with different backgrounds move in.	As Millcreek becomes denser around transit hubs through infill development, the possibility of higher temperatures during extreme heat events increases.	Increased
Extreme Cold	By increasing the intensity of winter storms. Higher atmospheric temperatures allow for more moisture, resulting in heavier snowfall and potentially lower temperatures during these	By driving some residents to relocate to warmer areas. Harsh winters can hinder economic activities and deter new residents and businesses, influencing housing demand and the attractiveness of certain	Increased growth of commercial and residential developments in Millcreek increases energy demand during extreme cold events, stressing the electrical grid.	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	events. In addition, fluctuations in weather patterns may disrupt seasonal cycles, leading to unpredictable periods of extreme cold mixed with warmer spells.	neighborhoods. This may disproportionately affect lower-income families, leading to changes in demographics and socioeconomic stratification in the community.		
Flooding	Higher temperatures increase the frequency and intensity of extreme weather events and alter precipitation patterns. They lead to more intense rainstorms and accelerated snowmelt from nearby mountains, raising water levels in rivers and streams. This combination raises the risk of flooding, especially in areas with inadequate drainage and urban development in flood-prone zones, heightening the potential for damage to homes and infrastructure.	Flooding can significantly alter population patterns by displacing residents from affected areas, leading them to seek shelter elsewhere. This may cause a population decline where flooding occurs, as individuals might hesitate to return due to ongoing risks or property damage. As neighborhoods become less desirable, people may migrate to safer areas, changing demographic trends and putting pressure on housing in those regions. Over time, these shifts can influence urban planning and development, as local governments address flooding risks and changing population needs.	Development has been outside of the 100-year flood zone, but increased infill development and density may lead to an increase in ponding and pluvial flooding.	Decreased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
Landslide/ Slope Failure	Climate change increases the risk of landslides through heavier rainfall and temperature fluctuations. Intense rain saturates soil, destabilizing slopes, while freeze–thaw cycles weaken the ground. Changes in vegetation can also reduce stability, leading to a higher potential for landslides.	Landslides and slope failures can impact population patterns by making some areas unsafe, leading to displacement and lower property values. This prompts residents to move to safer regions, thereby increasing density in more stable areas. Concerns about future landslides also may deter newcomers from high-risk zones, shaping long-term demographic trends.	Development has not increased the risk of landslides in Millcreek.	Increased
Radon	Climate change can affect radon levels by altering soil temperatures and moisture conditions. Higher temperatures may increase radon emissions from the ground, while heavy rainfall can change groundwater and soil saturation, impacting radon migration into buildings.	Radon exposure can influence population patterns as increased health awareness may drive families to move away from areas with high radon levels. This shift could particularly affect vulnerable groups, changing demographics and demand in the housing market. Homes with lower radon levels may become more sought after, and public health campaigns can encourage community action, making previously undesirable areas more attractive once mitigation measures are implemented.	Development has not increased the risk of radon exposure in Millcreek.	Decreased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
Heavy Rain	Climate change increases the frequency and intensity of heavy rain, as higher temperatures allow the atmosphere to hold more moisture. This leads to stronger storms, flash flooding, and inundated drainage systems.	Heavy rain can shift population patterns by pushing residents out of flood-prone areas and attracting them to safer neighborhoods. Frequent flooding may lead to evacuations and economic disruptions, prompting relocations. Over time, ongoing heavy rains can affect housing demand and community stability, altering the city's population distribution.	Increased impervious surfaces from infill development across Millcreek could contribute to ponding and other pluvial flooding.	Increased
High Wind	Climate change affects high winds by altering atmospheric patterns and increasing extreme weather events. Rising temperatures may lead to more substantial, unpredictable winds and more frequent thunderstorms, posing risks to infrastructure and air quality.	High winds can alter population patterns by making certain areas less desirable. Frequent damage may drive residents to safer neighborhoods, deter newcomers, and slow growth in affected regions.	Development in Millcreek has not increased the risk of high winds.	Increased
Lightning	Climate change increases temperatures and alters precipitation, leading to more intense thunderstorms and frequent lightning strikes. Urbanization can enhance this effect, posing risks to public safety and infrastructure.	Lightning can influence population patterns by causing property damage and wildfires, leading some residents to relocate. Areas with higher lightning activity may deter new residents, while safer locations could increase migration as people seek protection from severe weather.	Development in Millcreek has not increased the risk of lightning strikes.	Increased
Severe Winter Weather	Climate change impacts heavy snow and blizzards by altering precipitation patterns. Higher temperatures can lead to	Increased population equals an increased number of people needing to get to work and quicker snow removal.	Increased density in places like Meadowbrook Station and Olympus Hills Center introduces new risk to Millcreek from heavy snow events, including changes	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	more rain than snow, affecting snowpack levels—additionally, increased storm intensity results in heavier, more unpredictable snowfall.	Heavy snow or blizzards can impact population patterns by influencing where people live and work. Transportation disruptions may lead residents to seek housing closer to jobs, increasing density in some areas while depopulating others. Families might also avoid regions with frequent heavy snowfall, shifting demand to milder areas. Over time, these trends can alter community demographics and economic activity, prompting adjustments in city planning and resource allocation.	in plowing, rescues, and evacuations.	
Tornado	Climate change may increase the frequency and intensity of tornadoes. Higher temperatures lead to more moisture in the air, creating conditions for severe thunderstorms. Changes in wind patterns and precipitation can also heighten tornado risks, resulting in more destructive storms and greater threats to infrastructure and communities.	Tornadoes can influence population patterns by prompting residents to move to safer areas after damage occurs. This can decrease density in affected neighborhoods while increasing the demand for housing in safer regions. New residents may also move in for recovery opportunities, altering demographics. Over time, repeated tornado threats might push long-term residents to areas with better disaster preparedness, reshaping the city's population distribution.	Increased development slightly raises risks of tornado damage in Millcreek.	Increased
Wildfire	By raising temperatures and creating drier conditions, prolonged droughts lead to more dry vegetation, which serves as fuel for fires.	Displaced individuals often seek safer areas, shifting demographics, while declining property values might deter newcomers. Conversely, some	Developments in east Millcreek, like Olympus Hills Center, are adjacent to a high-risk fire area and therefore are at slightly higher risk themselves.	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	Erratic seasons extend the growing period, while more lightning strikes can ignite wildfires. These factors heighten the threat to ecosystems and community safety.	may be drawn to rebuilding efforts, impacting long-term growth and community dynamics.		
Dam Failure	Climate change raises the risk of dam failure by causing heavier rainfall and rapid snowmelt. These changes can overwhelm dams and compromise their integrity, highlighting the need for urgent safety assessments and upgrades to protect communities downstream.	Dam failure can impact population patterns by displacing residents and altering demographics. Evacuations can lead to an influx in safer areas, while destruction may deter new residents and contribute to population decline. Fear of future disasters may also prompt remaining individuals to relocate, changing the community's composition and affecting population density and economic activity.	Development in Millcreek has not increased the risk of dam failure.	Increased
Civil Disturbance	Climate change can increase civil disturbances by intensifying environmental stresses and social tensions. Rising temperatures may lead to droughts, wildfires, and poor air quality, particularly affecting vulnerable communities. Resource scarcity, especially water, can spark conflicts and protests. In addition, an influx of migrants from harder-hit areas may strain local resources, further	By encouraging residents to move for safety, leading to outflows and new arrivals. These events can reveal social issues, impacting community dynamics, employment, and property values, ultimately reshaping demographics and social cohesion.	Development in Millcreek has not increased the risk of civil disturbance.	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	escalating tensions. This cycle of unrest is driven by the impacts of climate change on the environment and community dynamics.			
Cyberattack	Possible attack on the industry, which is seen as producing large amounts of greenhouse gases and burning fossil fuels. Climate change can heighten cyberattack risk by increasing vulnerabilities during extreme weather. Disruptions like power outages offer cybercriminals opportunities, but focusing on emergency responses can weaken cybersecurity measures. As organizations adopt new technologies to cope with climate impacts, they may unintentionally introduce additional vulnerabilities.	Cyberattacks can change population patterns by eroding trust in essential services. Compromised systems may cause residents to leave due to safety concerns, while high-profile incidents can deter businesses, leading to job losses. This perception of vulnerability may also make the city less appealing to newcomers, resulting in demographic shifts and affecting local development.	Development in Millcreek has not increased the risk of cyberattack.	Increased
Hazardous Materials Incident (Transportation & Fixed Facility)	Climate change elevates the risk of hazardous materials incidents by increasing extreme weather events like heavy rain and wildfires. These events can breach storage tanks and heighten material volatility. Vulnerable infrastructure can lead to more spills or accidents, while climate shifts may	By causing evacuations and temporary declines in density. In the long run, unsafe areas may deter new residents, affecting growth and diversity. In addition, negative perceptions can lower property values and economic prospects, leading families to relocate, which impacts local demographics.	Development in Millcreek has not increased the risk of hazard materials incidents.	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	introduce new challenges for managing hazardous substances and public health.			
Public Health Epidemic/ Pandemic	By increasing the spread of vector-borne diseases and raising the risk of waterborne illnesses due to flooding or drought. Worsening air quality can also exacerbate respiratory conditions like asthma, especially in vulnerable populations.	By prompting migration for safety and better healthcare. Vulnerable groups may move to areas with improved services, while economic instability can drive people to seek new employment opportunities. In addition, restrictions like quarantine measures can limit movement and social interactions, reshaping the community's demographics and impacting local economies.	Development in Millcreek has not increased the risk of a pandemic/epidemic.	Increased
Terrorism	Terroristic activity is sometimes centered around climate change. Climate change impacts terrorism incidents by creating conditions of resource scarcity and social unrest. Increased competition for essential resources, such as water, can fuel tensions, making communities more vulnerable to extremist ideologies. Extreme weather events may disrupt social order and infrastructure, offering terrorist groups opportunities to exploit crises. In addition, climate-driven population	Terrorism incidents can alter population patterns by instilling fear and prompting residents to relocate to perceived safer areas, resulting in demographic shifts and potential declines in property values. Some neighborhoods may see an outflow of residents, while others could experience an influx of people seeking refuge from violence. In addition, increased security measures may deter businesses and residents from certain locations, leading to long-term changes in population density and urban development patterns.	Development in Millcreek has not increased the risk of a terrorism incident.	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	displacement can heighten tensions in receiving areas, raising the risk of domestic terrorism. Law enforcement's focus on climate-related challenges can also limit its capacity to address terrorism threats. Ultimately, while climate change may not directly cause terrorism, its effects can create an environment conducive to extremist activities.			

DRAFT

Additional Public Involvement

The City of Millcreek offered several opportunities for public involvement and participation. Figure 1 provides examples of public outreach.

Figure 1: Social Media Post for the Survey (*left*) and the Draft Plan Review (*right*)

Plan Integration

Incorporating the underlying principles of the Hazard Mitigation Plan and its recommendations into other plans is a highly effective and low-cost way to expand their influence. All plan participants will use existing methods and programs to implement hazard mitigation actions where possible. As previously stated, mitigation is most successful when it is incorporated into the day-to-day functions and priorities of government and public service. This plan builds on the momentum developed through previous and related planning efforts and mitigation programs, and it recommends implementing actions where possible through these other program mechanisms. These existing mechanisms include the following:

- Regularity Capabilities
- Administrative Capabilities
- Fiscal Capabilities

Respective planning stakeholders will conduct implementation and incorporation into existing planning mechanisms and will be done through the routine actions of:

- Monitoring other planning/program agendas
- Attending other planning/program meetings

- Participating in other planning processes; and
- Monitoring community budget meetings for other community program opportunities.

The successful implementation of this plan will require constant and vigilant review of existing plans and programs for coordination and multi-objective opportunities that promote a safe, sustainable community. Regular efforts should be made to monitor the progress of mitigation actions implemented through other planning mechanisms. Where appropriate, priority actions should be incorporated into planning updates. Table 12 lists existing planning mechanisms in which the Hazard Mitigation Plan has been integrated.

Table 13 lists the opportunities for integrating elements of this plan into other plans

Table 12: Integration of Previous Plans by the City of Millcreek

Plan	Description
None	N/A

Table 13: Opportunities for Integration with Future Plans of the City of Millcreek

Plan	Description
Comprehensive Emergency Management Plan	Framework for preparedness, response, recovery, and mitigation in the city.
General Plan	Can support emergency response efforts
Stormwater Pollution Prevention Plan	Merge flood mitigation and public health efforts into the plan
Development Plan	Merge mitigation efforts with fiscal responsibility

Capability Assessment

Local mitigation capabilities are existing authorities, policies, programs, and resources that reduce hazard impacts or could help carry out hazard mitigation activities.

Planning and Regulatory Capabilities

Planning and regulatory capabilities are the plans, policies, codes, and ordinances that prevent and reduce the impacts of hazards.

Table 14: Assessment of the Planning Capabilities of the City of Millcreek

Plan	Does it address hazards? (Y/N)	How can it be used to implement mitigation actions?	When was the last update? When is the next update?
General Plan	Yes	Provides overarching policy guidance for development in hazard-prone areas.	2019, next significant update in 2029.

DRAFT

Plan	Does it address hazards? (Y/N)	How can it be used to implement mitigation actions?	When was the last update? When is the next update?
Capital Improvement Plan	Yes	Allocates resources to critical infrastructure projects that enhance resilience.	Unknown
Climate Change Adaptation Plan	No	Unknown	Unknown
Community Wildfire Protection Plan	Yes	Unknown	Unknown
Economic Development Plan	Yes	Prioritizes economic activities in low-risk areas, reducing vulnerability.	2019
Land Use Plan	Yes	Directs growth away from hazard-prone areas.	Unknown
Local Emergency Operations Plan	Yes	Facilitates structured response and recovery actions during disasters.	2024. Reviewed annually.
Stormwater Management Plan	Yes	Guides stormwater infrastructure improvements to prevent flooding.	2020. Next update in 2025.
Transportation Plan	Yes	Integrates resilient infrastructure considerations in road planning.	2019
Substantial Damage Plan	Unknown	Unknown	Unknown
Other? (Describe)			

Table 15: Assessment of the Regulations and Ordinances of the City of Millcreek

Regulation/Ordinance	Does it effectively reduce hazard impacts?	Is it adequately administered and enforced?	When was the last update? When is the next update?
Building Code	Yes; Millcreek effectively enforces the adopted building codes, the International Building Code (IBC 2021), and the International Residential Code (IRC 2021).	Yes	2021
Flood Insurance Rate Maps	Yes	Yes	2022
Floodplain Ordinance	Yes	Yes	2021
Subdivision Ordinance	Yes	Yes	2023
Zoning Ordinance	Yes	Yes	2023
Natural Hazard-Specific Ordinance (Stormwater, Steep Slope, Wildfire)	Yes	Yes	2019

Regulation/Ordinance	Does it effectively reduce hazard impacts?	Is it adequately administered and enforced?	When was the last update? When is the next update?
Acquisition of Land for Open Space and Public Recreation Use	Yes	Yes	2018
Prohibition of Building in At-Risk Areas	Yes	Yes	Yes
Other? (Describe)			

Administrative and Technical Capabilities

Administrative and technical capabilities include staff and their skills. They also include tools that can help carry out mitigation actions.

Table 16: Assessment of the Administrative Capabilities of the City of Millcreek

Administrative Capability	In Place? (Y/N)	Is staffing adequate?	Are staff trained on hazards and mitigation?	Is coordination between agencies and staff effective?
Chief Building Official	Yes	Yes	Yes	Yes
Civil Engineer	Yes	Yes	Yes	Yes
Community Planner	Yes	Yes	Yes	Yes
Emergency Manager	Yes	Yes	Yes	Yes
Floodplain Administrator			Yes	Yes
Geographic Information System (GIS) Coordinator	Yes	Yes	Yes	Yes
Planning Commission	Yes	Yes	Yes	Yes
Fire Safe Council	N, served by the United Fire Authority	N	N/A	N/A
CERT (Community Emergency Response Team)	Yes	No	Yes	Yes
Active VOAD (Voluntary Agencies Active in Disasters)	Yes	Yes	Yes	Yes
Other? (Please describe.)				

DRAFT

Table 17: Assessment of the Technical Capabilities of the City of Millcreek

Technical Capability	In Place? (Y/N)	How has it been used to assess/mitigate risk in the past?	How can it be used to assess/mitigate risk in the future?
Mitigation Grant Writing	Yes	Completion of mitigation actions, communication of hazards to the public	Implementation of mitigation actions
Hazard Data and Information	No	Yes	Grant applications, justification for mitigation work, mitigation project tracking, and hazard analysis
GIS	Yes	Yes	Grant applications, justification for mitigation work, mitigation project tracking, and hazard analysis
Mutual Aid Agreements	Yes	Volunteer management and coordination with other agencies	Identify gaps
Other? (Please describe.)			

Financial Capabilities

Financial capabilities are the resources to fund mitigation actions. Talking about funding and financial capabilities is important to determine what kinds of projects are feasible, given their cost. Mitigation actions like outreach programs are lower cost and often use staff time and existing budgets. Other actions, such as earthquake retrofits, could require substantial funding from local, state, and federal partners. Partnerships, including those willing to donate land, supplies, in-kind matches, and cash, can be included.

Table 18: Assessment of the Financial Capabilities of the City of Millcreek

Funding Resource	In Place? (Y/N)	Has it been used in the past and for what types of activities?	Could it be used to fund future mitigation actions?	Can it be used as the local cost match for a federal grant?
Capital Improvement Project Funding	Yes	Infrastructure improvements	Infrastructure and resilience projects	Yes
General Funds	Yes	Operating expenses	Smaller mitigation activities	Yes
Hazard Mitigation Grant Program (HMGP/404)	Yes	No	Yes	No
Building Resilient Infrastructure & Communities (BRIC)	Yes	No, but have applied in the past	Yes	No
Flood Mitigation Assistance (FMA)	Yes	No, but should receive an award soon	Yes	No

Funding Resource	In Place? (Y/N)	Has it been used in the past and for what types of activities?	Could it be used to fund future mitigation actions?	Can it be used as the local cost match for a federal grant?
Public Assistance Mitigation (PA Mitigation/406)	Yes	No	Yes	No
Community Development Block Grant (CDBG)	Yes	Yes, but traditionally has been used for public works projects	Yes	No
Natural Resources Conservation Services (NRCS) Programs	Yes, but have not applied	No	Yes	No
U.S. Army Corps (USACE) Programs	Yes, but have not applied	No	Yes	No
Property, Sales, Income, or Special Purpose Taxes	Yes	No, but could be in the future	Yes	Yes
Stormwater Utility Fee	Yes	Runoff control, water protection	Yes	Yes
Fees for Water, Sewer, Gas, or Electric Services	Yes	Flood mitigation, critical infrastructure protection	Yes	Yes
Impact Fees from New Development and Redevelopment	Yes	Stormwater management	Yes	Yes
General Obligation or Special Purpose Bonds	Yes	Yes	Yes	Yes
Federal-funded Programs (Please describe)	Yes	Could be used	Yes	No
Private Sector or Nonprofit Programs	Yes	Yes	Yes	Yes
Other?				

Education and Outreach Capabilities

Education and outreach capabilities are programs and methods that could communicate about and encourage risk reduction. These programs may be run by a participant or a community-based partner. Partners, especially those who work with underserved communities, can help identify additional education and outreach capabilities.

DRAFT

Table 19: Assessment of the Education and Outreach Capabilities of the City of Millcreek

Education and Outreach Capability	In Place? (Y/N)	Does it currently incorporate hazard mitigation?	Could it be used to support mitigation in the future?
Community Newsletter(s)	Yes	Yes	Yes
Hazard Awareness Campaigns (such as Firewise, Storm Ready, Severe Weather Awareness Week, School Programs)	Yes	Yes	Yes
Public Meetings/Events (Please describe.)	Yes. Fire mitigation events, disaster prep seminars.	Yes	Yes
Emergency Management Listserv	No	No	Yes
Local News	Yes	Yes	Yes
Distributing Hard Copies of Notices (e.g., public libraries, door-to-door outreach)	Yes	Yes	Yes
Insurance Disclosures/ Outreach	No	Unknown	Yes
Organizations that Represent, Advocate for, or Interact with Underserved and Vulnerable Communities (Please describe.)	Yes	Yes	Yes
Social Media (Please describe.)	Yes	Yes	Yes
Other? (Please describe.)			

Opportunities to Expand and/or Improve Capabilities

Actions that can expand and improve existing authorities, plans, policies, and resources for mitigation include budgeting for mitigation actions, passing policies and procedures for mitigation actions, adopting and implementing stricter mitigation regulations, approving mitigation updates, and making additions to existing plans as new needs are recognized. Table 20 lists the opportunities for the city of Millcreek.

Table 20: Opportunities to Expand and/or Improve the Capabilities of the City of Millcreek

Capability	Opportunity to Expand and/or Improve
Planning and Regulation	The updated General Plan can incorporate additional information from the updated hazard mitigation plan, such as on risks, vulnerabilities, and actions. Plan alignment can also help ensure future development takes hazard risk into consideration. Additionally, the city can create a more detailed Substantial Damage Plan that includes identifying the tools and data sources that should be used to make substantial damage determination, guidelines for notifying property owners, and a framework for integrating this information into stormwater management and land use planning strategies.
Administrative and Technical	Millcreek can identify and implement a procedure for collecting current hazard data, such as records of previous disaster events and impacts. This information can be

DRAFT

Capability	Opportunity to Expand and/or Improve
	used to justify additional mitigation projects and assess losses avoided, as well as enhance the next hazard mitigation plan update.
Financial	The city has had limited success with pre-disaster mitigation funding, such as the Building Resilient Infrastructure & Communities (BRIC) and Flood Mitigation Assistance (FMA) grant programs. The city should consider additional opportunities for pre-disaster mitigation and expanding this mitigation funding capability. For example, the city could be supported through a state or FEMA-led technical assistance program.
Education and Outreach	The city could utilize the city council meetings to share key messages regarding mitigation. Additional direct outreach could be conducted through workshops on hazards, including workshops for vulnerable populations, such as seniors. Furthermore, the city could develop an emergency management listserv through which mitigation information could be shared. Additionally, the city can pursue opportunities to engage real estate and development professionals to ensure they are supporting disclosure of risks in high-risk areas and encouraging mitigation.

Mitigation Strategy

Mitigation strategies provide proactive measures that are designed to minimize the impacts of hazards on the city of Millcreek. Table 21 shows mitigation action alternatives, and Table 22 shows the status of previous mitigation activities. Table 23 is the 2025 mitigation action plan for the city of Millcreek.

Table 21: Mitigation Action Alternatives for the City of Millcreek

Action	Type of Action	Selected for inclusion in the plan?	If not selected, why not?
Community Wildfire Protection Plan	Local Plans and Regulations	Yes	N/A
Strengthen Building Codes	Local Plans and Regulations	Yes	N/A
Utility Undergrounding	Structure and Infrastructure Projects	Yes	N/A
Floodwalls and Detention Basins	Structure and Infrastructure Projects	Yes	N/A
Community Tree Planting Program	Natural Systems Protection	Yes	N/A
Erosion Control in Landslide-Prone Areas	Natural Systems Protection	Yes	N/A
Community Outreach on Flood/Wildfire Risks	Education and Awareness Programs	Yes	N/A
Emergency Preparedness Workshop	Education and Awareness Programs	Yes	N/A

Table 22: Status of Prior Mitigation Actions of the City of Millcreek[3]

Action	Hazard(s)	Agency Lead	Support Agency(ies)	Status Update
Install debris basin and/or storm drain/ culvert.	Flood (Riverine), Landslide/ Slope Failure	US Forest Service	SLCo, Millcreek City Emergency Management, SLCo Public Works and Millcreek City Public Works	Ongoing. Undergoing HMGP grant process for improved mitigation.
Hazardous materials removal.	Hazardous Materials Release, Public Health (Pandemic/ Epidemic)	Millcreek	SLCo Health Department, UFA	Ongoing. The mayor, city manager, emergency manager, and public works will be required to maintain situation awareness and coordinate with the Emergency Communications Center.
Reinforce masonry and chimneys.	All hazards	Millcreek	City	Incomplete. 65% of building stock is unreinforced masonry. Of this stock, 80% is residential.
Install generators at assisted living centers.	Extreme Cold and Extreme Heat	Millcreek	SLCO EM	Incomplete. Extreme high and low temperatures adversely impact the aging population. Millcreek has the second highest elderly in the county, with over 55 care and assisted living centers. No known generators installed.
Generators and hookup installation for publicly owned and critical facilities.	All hazards	Millcreek	SLCo, Millcreek City Emergency Management. SLCo Public Works, Millcreek Public Works	Ongoing. Millcreek City Hall has backup power.
Conduct a Hazardous Materials Flow Study.	Hazardous Materials	Millcreek	Millcreek City Emergency Management	Incomplete. No study conducted.
Draft a WUI Plan with fire mitigation goal development including defensible space.	Wildfire	Millcreek	Millcreek City Emergency Management, SLCo EM	Complete, but carried forward as a CWPP update. Millcreek adopted a Community Wildfire Preparedness Plan in 2021. The eastern border of the community is considered a

Table 23: 2025 Mitigation Action Plan for the City of Millcreek[4]

#	Action	Hazard(s)	Lead Agency	Potential Partners	Benefits (Losses Avoided)	Cost Estimate	Funding Source(s)	Timeframe	Priority	Comments
1	Install debris basin and/or storm drain/ culvert.	Flood (Riverine), Landslide/Slope Failure	U.S. Forest Service	SLCo, Millcreek City Emergency Management, SLCo Public Works and Millcreek City Public Works	Reduce property damage and loss of life from flooding.	High	FMA, HMA, BRIC, Millcreek Capital Improvements Fund, Millcreek staff time	Short-term	High	Undergoing HMGP grant process for improved mitigation.
2	Remove hazardous materials.	Hazardous Materials Release, Public Health (Pandemic/ Epidemic)	Millcreek	SLCo Health Department, UFA		Medium	Millcreek City General Fund	Long-term	Low	
3	Reinforce masonry and chimneys.	Earthquake	Millcreek	City	Reduce structural damage and potential injury from collapsing chimneys and URMs caused by earthquake.	High	Millcreek City General Fund, CWDG grant, HMGP grant, BRIC	Long-term	Medium	Sixty-five percent of building stock is unreinforced masonry. Of this stock, 80% is residential.
4	Install generators at assisted living centers.	Extreme Cold and Extreme Heat, High Wind, Heavy Rain, Lightning, Severe Winter Weather, Tornado	Millcreek	SLCO EM	Ensure life-sustaining medical equipment and general functionality of facilities are operational if severe weather or other events lead to power outages.	Medium	Millcreek City General Fund	Medium	Medium	Millcreek has the second-highest elderly in the county, with over-55 care and assisted living centers. No known generators installed.
5	Install generators and hookups for publicly owned and critical facilities.	Avalanche, Dam Failure, Drought, Earthquake, Extreme Heat, Extreme Cold, Flooding, Heavy Rain, High Wind, Landslide/ Slope Failure, Lightning, Severe Winter Weather, Tornado, Wildfire, Civil Disturbance, Hazardous Materials, Terrorism/ Cyberterrorism, Public Health Epidemic/Pandemic	Millcreek	SLCo, Millcreek City Emergency Management. SLCo Public Works, Millcreek Public Works	Ensure critical facilities, emergency response, and government operations continue to function during all types of hazard events.	Medium	Millcreek City General Fund	Medium	Medium	Millcreek City Hall has backup power. Other facilities still need backup power.
6	Conduct a Hazardous Materials Flow Study.	Hazardous Materials	Millcreek	Millcreek City Emergency Management	Identify potential risks of hazardous materials that may be transported in city.	Medium	Millcreek City General Fund, EMPG	Medium	Medium	
7	Update the Community Wildfire Protection Plan.	Wildfire, Drought, Lightning, Extreme Heat	UFA	Millcreek Emergency Management, U.S. Forest Service, SLCo EM, UDEM	Reduces wildfire spread and protects property, involves the public in mitigation and preparedness activities on their property.	Medium	HMGP, WUIPPM grant, CWDG grant, SLCo EM, Millcreek City General Fund	Medium-term	High	The eastern border of the community is considered a WUI and managed by the U.S. Forest Service, in coordination with UFA. Wooded stream channels are also a concern. Other areas of concern are Grandeur Park, Mount Olympus, Mill Creek, Parley's Creek, Big Cottonwood Creek, and Big Cottonwood Park.

[4] BRIC = Building Resilient Infrastructure and Communities, CWDG = Community Wildfire Defense Grant, FMA Flood Mitigation Assistance, HMA = Hazard Mitigation Assistance, HMGP = Hazard Mitigation Grant Program, SLCo = Salt Lake County, SLCo EM = Salt Lake County Emergency Management, UDEM = Utah Division of Emergency Management, UFA = Unified Fire Authority, UPD = Unified Police Department, USDA = United States Department of Agriculture, WUI = Wildland–Urban Interface, WUIPPM = Wildland–Urban Interface Prevention, Preparedness and Mitigation (Fund).

DRAFT

#	Action	Hazard(s)	Lead Agency	Potential Partners	Benefits (Losses Avoided)	Cost Estimate	Funding Source(s)	Timeframe	Priority	Comments
8	Improve Millcreek's building codes to ensure that new structures are earthquake and wind-resistant.	Earthquake, High Winds, Tornado, Flooding, Dam Failure, Avalanche	Millcreek City Building Department	SLCo EM, UFA, UDEM	Enhances building safety, and minimizes damage and recovery costs.	Low	Millcreek City General Fund, UFA, SLCo EM, BRIC grant	Short-term	High	Unreinforced masonry buildings are a concern.
9	Coordinate with private utility companies for Utility undergrounding.	High Wind, Heavy Rain, Severe Winter Weather, Extreme Cold, Landslide/Slope Failure, Wildfire, Flooding, Tornado, Lightning, Dam Failure	Rocky Mountain Power	Millcreek City Public Works, Salt Lake County Public Works, SLCo EM	Reduces power outages and infrastructure damage, including from trees breaking down to hazards like high wind and extreme cold.	High	Millcreek City General Fund, Millcreek Capital Improvements Fund, Private Utility Funding, SLCo EM, BRIC grant	Long-term	Medium	Collaboration with utility companies is needed.
10	Create floodwalls and detention basins in areas identified to be at risk of flooding.	Flood, Landslide/ Slope Failure, Heavy Rain, Severe Winter Weather, Dam Failure	Millcreek City Public Works	Salt Lake County Public Works, SLCo EM	Reduces flood risk and mitigates landslide impacts.	High	HMGP grant, Millcreek City General Fund, Millcreek City Capital Improvements Fund, SLCo Public Works	Long-term	High	Targeting the Neffs Canyon area.
11	Develop a community tree planting program.	Flood, Drought, Extreme Heat, Landslide/Slope Failure	Millcreek City Emergency Management	U.S. Forest Service, SLCo Parks and Recreation, SLCo EM, Millcreek City Planning and Zoning, UFA, Millcreek Public Works, SLCo Public Works	Improves stormwater management and increases shade coverage.	Low	Millcreek City General Fund, SLCo Public Works, SLCo Parks and Recreation, UFA, USDA's Community Forestry Partnership grant	Short-term	Medium	
12	Implement erosion control in landslide-prone areas, such as Canyon Rim area.	Landslide/ Slope Failure, Drought, Dam Failure, Wildfire, Flooding	Millcreek City Public Works	Salt Lake County Public Works, UDEM, UFA	Reduces landslide risk in vulnerable areas.	Medium	Millcreek City General Fund, Millcreek Capital Improvements Fund, SLCo EM, BRIC grant, HMGP grant	Short-term		Focus on the Canyon Rim area.
13	Conduct community outreach about flood, earthquake, and wildfire risks in community council and city meetings.	Flood, Wildfire, Drought, Extreme Heat, Heavy Rain, Severe Winter Weather, Lightning, Landslide/ Slope Failure, Dam Failure	Millcreek City Emergency Management	SLCo EM, UFA, Millcreek Communications	Increases community preparedness, especially in vulnerable areas.	Low	Millcreek City General Fund, SLCo EM, HMGP grant, BRIC grant	Short-term	High	Targeted to high-risk residents.

DRAFT

#	Action	Hazard(s)	Lead Agency	Potential Partners	Benefits (Losses Avoided)	Cost Estimate	Funding Source(s)	Timeframe	Priority	Comments
14	Provide education through workshops, websites, print, and social media annually for all hazards impacting Millcreek City. Include educational information for vulnerable populations, particularly the elderly.	Avalanche, Dam Failure, Drought, Earthquake, Extreme Heat, Extreme Cold, Flooding, Heavy Rain, High Wind, Landslide/Slope Failure, Lightning, Radon, Severe Winter Weather, Tornado, Wildfire, Civil Disturbance, Hazardous Materials, Terrorism/ Cyberterrorism, Public Health Epidemic/Pandemic	Millcreek City Emergency Management	UPD, UFA, St. Mark's Hospital, SLCo EM, UDEM, SLCo Public Works	Increased local understanding of natural hazards and ways in which residents can reduce their risk, minimizing displacement. Examples of educational materials to reduce risk: • Avalanche: Share information from UAC on understanding avalanche conditions and areas to avoid during high risk alerts. • Drought: Share water conservation techniques and strategies for drought-resistant landscaping. • Earthquake: Provide instruction or resources on home retrofitting. • Extreme Heat: Offer information on staying cool and hydrated. • Extreme Cold: Discuss home insulation techniques, safe heating practices, and preparing vehicles for winter conditions. • Flood/Heavy Rain/Dam Failure: Teach floodproofing methods, avoiding areas of high risk, and "Turn Around, Don't Drown." • Landslide: Inform residents on recognizing warning signs. • Radon: Explain the risks of radon risks and provide resources for testing radon levels in homes. • Lightning: Share safety tips for outdoor lightning protection. • Severe Winter Weather, Tornado, High Wind: Educate residents on locating safe shelter locations and home weatherization. • Wildfire: Offer information on creating defensible space and using fire-resistant landscaping • Pandemic/Epidemic: Provide resources on hygiene and public health resources.	Low	Millcreek City General Fund, EMPG grant, SLCo EM, BRIC grant	Short-term	High	Includes focus on the elderly. Consider providing education annually.

Mitigation Action Prioritization

The mitigation actions were evaluated based on the STAPLEE criteria.

Table 24: Mitigation Action Prioritization – STAPLEE

Action	Social	Technical	Administrative	Political	Legal	Economic	Environ-mental	Priority
1	4	4	3	4	4	3	4	High
2	4	4	4	4	4	3	4	High
3	3	4	4	4	3	3	4	Medium
4	3	4	4	4	4	3	3	High
5	4	3	3	4	4	4	4	Medium
6	3	3	4	3	4	4	3	Medium
7	4	3	3	4	4	4	4	High
8	4	4	4	4	4	4	4	High

Mitigation Success Story

Neffs Canyon Emergency Facilities & Flood Mitigation Improvement project is a coordinated effort led by Millcreek, the U.S. Forest Service, Utah Division of Emergency Management (DEM), Salt Lake County Flood Control, including support from the Federal Emergency Management Agency (FEMA) and the Mount Olympus community, to reduce flood risk, improve wildfire response, and enhance public safety in the Neffs Creek area.[5] Neffs Creek is located on an active alluvial fan that is subject to sudden and unpredictable flooding. This risk has increased over time due to development, erosion, severe storms, and wildfire damage. Flooding in 2019 and a wildfire event in 2020 highlighted the risks in this area. A floodplain mapping study was completed in 2016 and was discussed among the collaborating jurisdictions from 2016 to 2019, resulting in a new preliminary FIRM. This has implications for property owners now categorized within newly established flood zones. Additionally, Unified Fire Authority (UFA) Station 112 is located within the floodplain and cannot be upgraded or modernized. Addressing the flood hazard will allow UFA to upgrade Station 112 to expand capabilities for wildfire response and other emergencies.

Phase One includes parking lot improvements to facilitate emergency vehicle access and a helicopter pad and water well to support wildfire response in the mountains on the east side of Salt Lake County, not just Neffs Canyon. Construction is expected to start in the summer of 2025.

Phase Two involves the construction of a below-natural-grade debris basin featuring a stormwater outlet pipe. The proposed basin will be situated near the mouth of the canyon to collect debris, sediment, and

[5] Neffs Canyon Emergency Facilities Improvement. “Project Purpose.” https://millcreekut.gov/584/Neffs-Canyon-Emergency-Facilities-Improv

floodwater from the canyon's catchment area. The design will allow the water to flow through the basin and into a new storm drainpipe below local roads back to Neffs Creek. Millcreek was awarded a Legislative Pre-Disaster Mitigation grant to complete the geotechnical investigation, environmental documents, and design phase of the debris basin. The city was awarded a FEMA Flood Mitigation Assistance (FMA) grant to fund the construction of the project. Phase Two is expected to take place in 2026.

City of Murray Annex

To participate in this multi-jurisdictional hazard mitigation plan (MJHMP) update for Salt Lake County (SLCo), the governing body of the city of Murray passed a formal resolution, a copy of which is maintained at the local government offices.

Planning Process Contact Information

Table 1 provides information on the point of contact during the updating of the MJHMP.

Table 1: Contact Information for the City of Murray

Name	Contact Information
Nick Haskin	**Phone:** 801-264-2789; **email:** Nhaskin@murray.utah.gov
Joseph Mittelman	**Phone:** 801-264-2780; **email:** jmittelman@murray.utah.gov

The city of Murray has a fully integrated approach to hazard mitigation planning and program implementation. During the 2024 update process, the MJHMP participation roles in Table 2 were recorded.

Jurisdiction Profile

Date of Incorporation

January 3, 1903

Location and Description

Situated in the heart of Salt Lake Valley, Murray spans 12.32 square miles. It is bordered by Taylorsvile, Millcreek, Holladay, Midvale, and Cottonwood Heights. The area now incorporated as Murray City has been occupied continuously since 1848. Explosive growth occurred after the 1870 construction of the valley's first smelter. Murray's central location in the larger metropolitan area makes it important for the city to be aware of its regional context. Regional issues such as growth, transportation, the economy, natural resources, air quality, and open space all impact the quality of life of Murray and provide the city with many opportunities.

DRAFT

Population

The 2022 American Community Survey 5-Year Estimate from the U.S. Census Bureau records the population of the city of Murray as 49,904 people.

Demographics

Most of the 49,904 people are between the ages of 25 and 34, with a median age of 38.2; 25,051 are males (50.2%) and 24,853 are females (49.8%). English is the primary language in 84.4% of homes,, with 7.7% Spanish, and 7.9% other languages.

Brief History

Mormon pioneers arrived in the Salt Lake Valley in 1847, and in the fall of 1848, the Mississippi Saints followed, establishing a dispersed settlement in the southern part of the valley. This area was known by various names, such as Mississippi Ward, Cottonwood, Big Cottonwood, and South Cottonwood. Historical records indicate that by the 1860s, at least 20 families resided in the South Cottonwood area. The region remained largely agricultural until 1869, when ore was discovered in Park City and Little Cottonwood Canyon. Due to the city's central location and railroad access, the first smelter in the region was constructed in the city of Murray in 1870, leading to the establishment of some of the largest smelters over the next 30 years. That same year, the South Cottonwood Post Office was established. The area evolved with the expansion of the railroad, increased smelting activity, the establishment of the territorial road (later known as State Street), and the development of trolley transportation. A business district began to form along the transportation corridor. The post office, and subsequently the city, officially changed its name from South Cottonwood to Murray in 1883, in honor of territorial governor and Civil War general, Eli Murray.

Climate

The city of Murray experiences a humid continental climate (Dfb Köppen classification) characterized by warm summers and cold winters with constant precipitation throughout the year. Average high temperatures are approximately 85°F in the summer and approximately 18°F in the winter. Rain each year is approximately 20.9 inches, and snowfall averages 22 inches.

Public Services

Over the years, the city of Murray's crews have responded to various disasters, including riverbank flooding, trees being toppled by microburst winds, and other weather-related hazards. Three separate entities in the city provide drinking water: Murray City, the Jordan Valley Water Conservancy District (JVWCD), and Salt Lake City Public Utilities (SLCPU). The city of Murray's water system generally serves areas west of 900 East and relies primarily on well water, which accounts for about 84 percent of the annual demand for system water. Water in the city of Murray's service area is supplied by eight springs and nineteen wells, each dependent on pumps and motors to deliver water to the distribution system. The city has emergency standby power generation at six locations and five tanks or reservoirs with a

DRAFT

combined storage capacity of 12 million gallons for operating and emergency storage. In emergencies, the city of Murray has an exchange agreement with SLCPU to provide water. The JVWCD and SLCPU water systems generally supply areas east of 900 East and provide retail delivery only, with no water sources in the city of Murray.

Murray City Power is unique in Salt Lake County as the only municipally owned power system. Murray City Power operates the power system in a 9.9 square mile service area, comprising 206 miles of transmission and distribution lines, and serving approximately 14,000 residential and 3,000 commercial customers. The system load peaks at just over 100 MW in the summer and 60 MW in the winter. To ensure a reliable energy supply, even during disasters, the city of Murray installed three generators at the central substation with a generating capacity of approximately 39 MW. These generators are used as a peaking resource during summer months and remain idle until needed. In emergencies, they can provide power to necessary areas as long as the natural gas supply is available. Fire Station 81 was rebuilt and opened in early 2020.

Governing Body

The city of Murray originally established a Mayor–Council form of government. In 1911, state legislation changed the government structure for first and second class cities in Utah from the Council form to the Commission form. This change was reversed in 1981, when the city of Murray re-adopted the Mayor–Council form of government, featuring an elected Mayor and five City Council members. To ensure staggered terms, elections are held every two years for half of the Council members, each serving a four-year term.

Development Trends

As the hub of Salt Lake County, the city of Murray provides a strong foundation for flourishing businesses. The community boasts robust medical, transportation, retail/professional office, educational, and community services, creating an ideal environment for businesses. The city is home to Intermountain Medical Center, the largest facility of the Intermountain Healthcare system in the state. In addition, Fashion Place Mall, a premier shopping destination, significantly contributes to sales tax revenue. The loss of either of these employers would displace thousands of employees and create a substantial loss of sales tax revenue.

The city of Murray has seen significant growth in both housing and commercial development. This growth is partly due to the city's proximity to light rail transportation and freeway access, the appeal of its medical services community, and an excellent school district. Known for being a safe, close-knit, and friendly community, the city of Murray is an attractive place to raise a family. However, land in the city is becoming scarce due to land-locked boundaries, limiting future development to infill construction and redevelopment of underutilized areas. Recent zoning changes encourage mixed-use projects and increased building heights in certain commercial zones. Remodeling efforts are underway throughout the city, including the rebuilding/remodeling of Fashion Place Mall and the ongoing renovations at Intermountain Medical Center, which are expected to continue for at least the next five years.

DRAFT

Jurisdiction-Specific Hazards and Risk

The Calculated Priority Risk Index (CPRI) is a comprehensive assessment tool for evaluating and prioritizing risks in a given context. It considers various factors, such as probability, impact, and urgency, to determine the level of risk associated with events or situations. The results for each hazard, including its risk factor (RF) value, are shown in Table 3. The results are based on the criteria in Table 4 and the equation that follows it. The CPRI helps organizations and individuals make informed decisions about risk management and mitigation strategies. It provides a systematic approach to identifying and addressing potential issues, allowing for a more efficient allocation of resources and proactive risk prevention. With the CPRI, stakeholders can prioritize their focus on the most critical risks, leading to more effective risk management and, ultimately, better outcomes.

Table 3: Calculated Priority Risk Index Values for the City of Murray

Type of Hazard Event	Probability of Future Events	Spatial Extent	Severity of Life/ Property Impact	Warning Time	Duration	Response Capacity	Risk Factor Value
Avalanche	4	1	2	4	2	1	2.6
Drought	4	4	2	1	4	1	2.8
Earthquake	3	4	4	4	3	2	3.4
Extreme Heat	4	4	3	1	3	1	3
Extreme Cold	3	4	2	1	3	1	2.4
Flooding	4	3	3	3	3	1	3.1
Landslide/ Slope Failure	2	1	2	4	1	2	2
Radon	4	4	2	1	4	2	2.9
Heavy Rain	4	3	2	3	1	1	2.6
High Wind	4	3	3	3	2	1	3
Lightning	4	2	2	4	1	1	2.6
Severe Winter Weather	4	3	2	2	2	1	2.6
Tornado	2	2	3	4	1	2	2.4
Wildfire	4	3	3	4	3	1	3.2
Dam Failure	2	2	3	2	2	3	2.4
Civil Disturbance	2	1	2	4	2	2	2.1
Cyberattack	2	3	3	4	3	2	2.7
Hazardous Materials Incident (Transportation & Fixed Facility)	3	1	2	4	1	1	2.2

DRAFT

Type of Hazard Event	Probability of Future Events	Spatial Extent	Severity of Life/ Property Impact	Warning Time	Duration	Response Capacity	Risk Factor Value
Public Health Epidemic/ Pandemic	3	4	3	1	4	1	2.8
Terrorism	2	1	3	4	2	1	2.3

Table 4: Criteria for the Calculated Priority Risk Index

Risk Index Factor	Degree of Risk Level		Criteria	Factor Weight for Degree of Risk Level
Probability of Future Events	1	Unlikely	Less than 1 percent probability of occurrence in the next year or a recurrence interval of greater than every 100 years.	30%
	2	Occasional	1 to 10 percent probability of occurrence in the next year or a recurrence interval of 11 to 100 years.	
	3	Likely	11 to 90 percent probability of occurrence in the next year or a recurrence interval of 1 to 10 years.	
	4	Highly Likely	91 to 100 percent probability of occurrence in the next year or a recurrence interval of less than 1 year.	
Spatial Extent	1	Limited	Less than 10% of the planning area could be impacted.	10%
	2	Small	10%–25% of the planning area could be impacted	
	3	Significant	25%–50% of the planning area could be impacted.	
	4	Extensive	50%–100% of the planning area could be impacted.	
Severity of Life/Property Impact	1	Negligible	Less than 5% of the affected area's critical and non-critical facilities and structures are damaged/destroyed. Only minor property damage and minimal disruption of life. Temporary shutdown of critical facilities.	30%
	2	Limited	More than 5% and less than 25% percent of property in the affected area is damaged/destroyed. Complete shutdown of critical facilities for more than one day but less than one week.	
	3	Critical	More than 25% and less than 50% of property in the affected area was damaged/destroyed. Complete shutdown of critical facilities for over a week but less than one month.	

DRAFT

Risk Index Factor	Degree of Risk Level		Criteria	Factor Weight for Degree of Risk Level
	4	Catastrophic	Over 50% of critical and non-critical facilities and infrastructures in the affected area are damaged/destroyed. Complete shutdown of critical facilities for more than one month.	
Warning Time	1	Self-defined	More than 24 hours	10%
	2	Self-defined	12 to 24 hours.	
	3	Self-defined	6 to 12 hours.	
	4	Self-defined	Less than 6 hours.	
Duration	1	Brief	Up to 6 hours.	10%
	2	Intermediate	Up to one day.	
	3	Extended	Up to one week.	
	4	Prolonged	More than one week.	
Response Capacity	1	High	Significant resources and capability to respond to this kind of event; staff are trained, experienced, and ready.	10%
	2	Medium	Some resources and capability to respond to this kind of staff; some staff may be trained, experienced, and ready while others may need additional support.	
	3	Low	Limited resources and capability to respond to this kind of event; additional staff or staff training needed.	
	4	None	No resources and capability to respond this kind of event; additional outside support would be required.	

RISK FACTOR (RF) EQUATION

RF Value = [(Probability x 0.30) + (Spatial Extent x 0.10) + (Severity of Life/Property Impact x 0.30) + (Warning Time x 0.10) + (Duration x 0.10) + (Response Capacity x 0.10)]

Hazards with an RF value greater than or equal to 2.5 are considered high risk. Those with RF values of 2.0 to 2.4 are considered moderate risk hazards, and those with an RF value less than 2.0 are considered low risk. The highest possible RF value is 4.

Hazard Event History

Examining hazard event histories provides valuable insights to inform decision-making and help prioritize resources for risk prevention and response efforts. Per the Storm Events Database from the National Centers for Environmental Information, there have been no significant events to impact the city of Murray planning area since the last update.

DRAFT

National Flood Insurance Program Summary

The city of Murray participates in the National Flood Insurance Program (NFIP). Table 5 and Table 6 display statistics related to the NFIP. The city of Murray does not participate in the Community Rating System (CRS).

Table 5: National Flood Insurance Program Status for the City of Murray[1]

Init FHBM Identified	Init FIRM Identified	Current Effective Map Date	Adopted Date	Date Joined NFIP	Tribal
12/18/1985	12/18/1985	09/25/2009	2009	06/03/2020	No

Table 6: National Flood Insurance Program Status for the City of Murray

Community ID	Number of Losses	Total Net Payment	Active Policies	Total Coverage
490103	54	$256,826.36	212	$48,856,000

The city of Murray has designated the City Engineer as the Floodplain Administrator. The city's current Flood Damage Prevention Ordinance was adopted in 2022. The current effective FIRM maps are dated 9/25/2009. The city issues Floodplain Development Permits including in the SFHA through the Floodplain Administrator. No work is allowed to begin until a permit has been issued. Substantial damage/substantial improvement determinations are made through the permitting process, including inspections.

Jurisdiction-Specific Vulnerabilities and Impacts

Table 7 provides information on the vulnerable assets in the city of Murray, including its critical facilities, highlighting the city's vulnerability to identified hazards. It also describes the potential impacts on the community arising from those vulnerabilities. Impacts are the consequences or effects of each hazard on the assets. By understanding the risks associated with these assets, local authorities can develop proactive strategies to mitigate vulnerabilities and ensure the safety and functionality of these important assets during hazard events. These data are invaluable for decision-making and prioritizing resources for emergency response and preparedness efforts, ultimately contributing to more effective risk management and greater resilience in the community.

Table 7: Jurisdiction-Specific Vulnerabilities and Impacts in the City of Murray

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
Avalanche	People	*Vulnerability:* Avalanche risk is primarily limited to mountains with steep terrain and higher snow accumulation. Murray is located in the valley and does not have terrain or snow accumulations that pose a risk within the city. Individuals vulnerable to avalanches primarily

[1] FIRM = Flood Insurance Rate Map, FHBM = Flood Hazard Boundary Map

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		include outdoor enthusiasts like skiers and hikers who may lack proper avalanche knowledge and safety precautions or do not monitor avalanche forecasts. *Impacts:* No impacts within Murray are expected.
	Structures	*Vulnerability:* No structures in Murray are considered to be at risk from avalanches.
	Economic Assets	*Vulnerability:* Risk to Murray businesses is very low. *Impacts:* Tourism-related businesses, such as ski resorts and outdoor recreation facilities, may face disruptions due to avalanches, leading to financial losses. Murray could experience indirect economic losses if an avalanche affects neighboring jurisdictions.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Risk to natural, historic, and cultural resources from avalanches is minimal in Murray, with no direct impacts expected.
	Critical Facilities and Infrastructure	*Vulnerability:* No critical facilities in Murray are vulnerable to avalanches. *Impacts:* Murray residents may experience indirect impacts if transportation routes near the canyons are closed or damaged by an avalanche.
	Community Activities	*Vulnerability:* Activities within Murray have minimal vulnerability to avalanches. *Impacts:* Residents may be affected if recreating elsewhere in the county. Activities like skiing, snowboarding, snowmobiling, snowshoeing, and other winter outdoor recreation are vulnerable to avalanches due to heavy snowfall, variable temperatures that affect snow stability, and participants' lack of safety knowledge.
Drought	People	*Vulnerability:* All residents in Murray are vulnerable to drought. *Impacts:* Extended drought can lead to restrictions on water use, increased costs for water, or limited drinking water supply. Drought can also contribute to poor air quality and other public health impacts from increased dust and wildfires, which can cause respiratory problems, especially for children and the elderly.
	Structures	*Vulnerability:* All structures are vulnerable to drought. *Impacts:* Limits to water supply may lead officials or developers to restrict growth and place restrictions on water use. Severe drought can contribute to changes in soil conditions that may result in cracking foundations or walls.
	Economic Assets	*Vulnerability:* All businesses are vulnerable to drought, particularly those that rely on water, such as landscaping, car washes, and manufacturing. *Impacts:* Businesses may face water restrictions and financial losses. Water conservation measures may also lead to an increase in costs for water use which may reduce revenue for businesses, Increased water costs may decrease consumer spending due to their impact on household budgets. Agricultural-related business is limited in Murray and does not represent a significant vulnerability.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
	Natural, Historic, and Cultural Resources	*Vulnerability:* Parks, golf courses, and urban forests are vulnerable to drought. *Impacts:* Open spaces with abundant vegetation may suffer from drought conditions, making the city less green and increasing heat levels. Wheeler Historic Farm and other outdoor recreation areas such as parks and golf courses may experience deterioration in the health of vegetation and a loss of aesthetic appeal during drought.
	Critical Facilities and Infrastructure	*Vulnerability:* Water supply systems are susceptible to drought. *Impacts:* Water suppliers may struggle to deliver an adequate water supply to the community. Reduced precipitation may increase demand on fire departments for wildfire management. Public health facilities face water quality and availability challenges that affect drinking water and sanitation. An adequate water supply needs to be maintained for the Intermountain Medical Center and other healthcare facilities.
	Community Activities	*Vulnerability:* Recreational spaces, such as parks, golf courses, pools, and other open spaces, may be vulnerable to drought. *Impacts:* Outdoor recreation areas may experience poor vegetation health and reduced appeal during drought. Communities may struggle with maintenance and increased costs for landscaping and pools.
Earthquake	People	*Vulnerability:* All of the more than 50,000 Murray residents are potentially vulnerable to earthquakes. The Wasatch Fault and West Valley Fault could both produce very strong ground shaking that would affect Murray. *Impacts:* Those living in older buildings that are not up to seismic standards, such as unreinforced masonry, are vulnerable to injury or death if the building collapses. People can also be injured by falling objects such as bookshelves or other heavy furniture that has not been anchored. Families with young children, the elderly, and individuals with disabilities may be displaced from damaged homes and may struggle to relocate. Residents near fault lines and those in densely populated areas are at higher risk. In addition, individuals lacking resources for disaster preparedness, such as emergency supplies and evacuation information, or those who do not speak English well, may find it difficult to respond effectively during an earthquake, thus increasing their vulnerability.
	Structures	*Vulnerability:* All structures in Murray are vulnerable to damage from earthquakes. *Impacts:* Older buildings that are not built according to modern seismic codes, unreinforced masonry, and homes with inadequate foundations may be vulnerable. Many lack the retrofitting needed to withstand earthquakes, and those built on unstable soil or near fault lines are at higher risk. Most of Murray also has moderate to high liquefaction potential, which makes structures more vulnerable to damage from an earthquake. Large commercial buildings without flexible designs can sustain severe damage. Overall, outdated construction practices and poor site selection contribute to their vulnerability. Hazus estimates structural losses in Murray could total over $51 million.
	Economic Assets	*Vulnerability:* Key economic assets in Murray include commercial buildings that may experience structural damage or damage to contents and inventory from an earthquake.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		Impacts: The local economy, reliant on retail and services, could face significant disruptions during and following seismic events. Many businesses may be slow to reopen in the immediate aftermath of an earthquake. Damage to roads and utility systems, such as power, water, and communication, may also limit businesses' ability to operate. The flow of goods may be severely limited, and employees may not be able to travel to work. Spending may also be reduced due to losses experienced by consumers. Additional economic loss information is available in Volume 1.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Historic structures and landmarks often lack modern seismic retrofitting, making them susceptible to damage. The Murray Downtown Historic District and Historic Residential District near the city center include mixed-use commercial/residential buildings with unique architecture and a distinctive streetscape. Murray also has several other homes, a theater, and other properties on the National Historic Register, which are vulnerable to earthquake damage. *Impacts:* These cultural resources are at risk due to their architectural styles, with many having been built before modern building codes, compromising their integrity and the heritage they represent.
	Critical Facilities and Infrastructure	*Vulnerability:* Schools, hospitals, and emergency services buildings and other government facilities are vulnerable to earthquakes. All infrastructure systems, such as transportation, water and wastewater, power distribution, natural gas, and communications, are also at risk of being damaged. Some facilities or systems may have higher vulnerability due to age and construction standards. *Impacts:* Intermountain Medical Center is a significant asset to Murray and surrounding cities. Though built in 2007 with modern seismic codes, it remains vulnerable to damage to the structure, contents, or supporting systems such as power, communication, or water. Significant transportation routes through or near Murray include Interstate 15, Interstate 215, the Front Runner and Trax lines, Central Station, State Street, and numerous other arterial routes. Bridges and overpasses that lack modern engineering safeguards are also at risk. Seven school campuses were identified as having URM structures vulnerable to earthquake, and retrofits have been performed on six of these to reduce vulnerability. In addition, water supply systems and power lines are susceptible to disruption from ground shaking. The lack of retrofitting in older structures exacerbates these vulnerabilities.
	Community Activities	*Vulnerability:* Public gatherings, school events, and day-to-day activities are vulnerable to earthquakes due to the area's geological conditions and dependence on urban infrastructure. *Impacts:* Many day-to-day activities will be disrupted following a strong earthquake, and there is a possibility of damage to recreational spaces and government services. Vulnerability stems from factors such as buildings' age and structural integrity, and high population density, which can lead to increased risks and casualties during an earthquake.

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
Extreme Heat	People	*Vulnerability:* All individuals in Murray are vulnerable to the effects of extreme heat. Vulnerable populations during extreme heat include adults over 65, individuals with pre-existing health conditions, and young children, as they struggle to regulate body temperature. *Impacts:* Extreme heat can lead to heat-related illnesses such as dehydration, heat exhaustion, or heat stroke. Some populations may be more susceptible to illness, but could affect anyone if they do not have access to a place to get relief from the heat. Socioeconomically disadvantaged individuals may lack access to air conditioning or other cooling resources, while outdoor workers are at higher risk of heat-related illnesses due to physical labor without adequate hydration and rest. Individuals without housing may lack a place to seek relief from extreme heat and are vulnerable to heat-related illnesses. Extreme heat can hinder students' learning.
	Structures	*Vulnerability:* All residential and commercial buildings are vulnerable. *Impacts:* Residential buildings with inadequate insulation and ventilation, and commercial buildings lacking reflective roofing and proper shading, may be vulnerable. Materials like metal and glass can amplify heat retention, while areas with limited green space typically experience higher temperatures.
	Economic Assets	*Vulnerability:* Agricultural and recreation businesses are vulnerable. *Impacts:* Agricultural operations can experience reduced yields and higher water demand due to heat stress. The outdoor recreation industry may see decreased participation during heat waves, affecting local businesses that rely on visitors. In addition, the energy infrastructure could face strain from increased cooling demands, leading to outages.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Local plant species and wildlife habitats, historic buildings, and parks are vulnerable. *Impacts:* Plants and wildlife can suffer from extreme heat conditions, leading to reduced biodiversity. Historic buildings may degrade due to high temperatures, causing materials to deteriorate and paint to peel. In addition, parks and recreational areas may experience overuse and risk their preservation, as residents seek relief from the heat. Extreme heat can have compounding effects on drought conditions affecting plant and wildlife health. It can also contribute to an increased risk of wildfire.
	Critical Facilities and Infrastructure	*Vulnerability:* Healthcare facilities and transportation networks are vulnerable. *Impacts:* Healthcare facilities may experience increased demand because of heat-related medical issues, while schools can suffer from the strain on cooling resources. Transportation systems are at risk of damage, such as buckling roads and warped train tracks. In Murray, this could affect I-15, I-215, State Street, and FrontRunner or Trax transit lines. Power grids may be strained by higher demands for electricity for cooling, leading to potential outages.
	Community Activities	*Vulnerability:* Activities like outdoor sports, fairs, and agricultural practices are vulnerable to extreme heat. *Impacts:* These events can pose risks, particularly for participants such as youth athletes and elderly residents, who may suffer from

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		heat-related illnesses. In addition, high temperatures can stress crops, impacting local farming.
Extreme Cold	People	*Vulnerability:* All Murray residents are potentially vulnerable to extreme cold; however, the elderly face increased risks due to health issues and mobility challenges. Children may be susceptible if they lack proper winter clothing. Approximately 17% of Murray residents are over age 65, and 5.4% are under age 5, which means approximately 21% of residents are at increased vulnerability of extreme cold. *Impacts:* Individuals who do not have adequate shelter during extreme cold are vulnerable to cold related illnesses such as hypothermia and frostbite. Individuals experiencing homelessness or financial hardship often lack access to heated shelters and resources for protection against the cold. It is currently unknown how many people may be without shelter during extreme cold in Murray. Those with pre-existing health conditions may find their symptoms worsening at low temperatures.
	Structures	*Vulnerability:* Residential homes, commercial buildings, and unheated spaces like sheds may be vulnerable. *Impacts:* Homes with poor insulation or inadequately sealed windows and doors are prone to significant heat loss. Older buildings lacking modern energy efficiency standards may also suffer from freezing pipes and related structural damage.
	Economic Assets	*Vulnerability:* Agriculture, infrastructure, and energy-related businesses are at risk. *Impacts:* Agricultural operations, such as greenhouses and livestock farms, may experience crop and livestock losses, impacting revenue. Icy roads can disrupt transportation networks, affecting logistics and supply chains, while power lines risk outages from ice accumulation, impacting local businesses. Energy-intensive facilities may face higher operational costs due to increased heating needs.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Vegetation, wildlife habitat, historic structures, and cultural sites are vulnerable. *Impacts:* Due to prolonged cold, local vegetation and wildlife habitats may suffer from plant stress and reduced food availability. Historic districts and homes in Murray, especially those not built for severe weather, can deteriorate from below-freezing temperatures and ice. Culturally significant sites, including monuments and public art, may also be damaged, while infrastructure such as water pipes and roadways may be compromised during extreme cold events, leading to service disruptions and safety hazards.
	Critical Facilities and Infrastructure	*Vulnerability:* Water systems and transportation systems are vulnerable. *Impacts:* Water systems can experience frozen pipes and equipment failures. Extreme cold can contribute to icy conditions and may increase accident risks and delays on transportation infrastructure. Major routes such as I-15, I-215, State Street, and other roads could experience delays due to traffic accidents. Power generation facilities may struggle to meet heating demands. Residential and commercial buildings lacking proper insulation are also at risk of heating system

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		failures, endangering occupants. City resources or facilities may be needed to provide warming centers during Code Blue alerts.
	Community Activities	*Vulnerability:* Youth sports, festivals, and outdoor markets are vulnerable to extreme cold. *Impacts:* Harsh temperatures can deter participation and reduce community engagement. At-risk groups, such as the elderly and young children, face health risks like frostbite and hypothermia, further limiting outdoor involvement. In addition, poorly insulated buildings or inadequate heating in community centers can make gatherings uncomfortable.
Flooding (and Heavy Rain)	People	*Vulnerability:* Murray is vulnerable to flooding, primarily along Little Cottonwood Creek, which passes through the city, and the Jordan River on the western city border. Flooding in the creek can be caused by rapid snowmelt or heavy rain events, or a combination of both. Localized flooding can also occur following heavy rain, and may accumulate on roadways or other low-lying areas. Residences, commercial areas, and infrastructure can all be affected by flooding. *Impacts:* Both the 1% annual chance flood and 0.2% annual chance flood zones can affect residences in Murray. Flooding can cause injury or death to people who may be swept away by rapid-moving floodwaters. Flooding can also damage homes and may displace residents. Individuals without reliable transportation may struggle to evacuate quickly, while low-income families often lack resources for flood-prevention measures. The elderly and those with disabilities may face mobility challenges, increasing their risk during emergencies. Overall, factors such as geographic location, economic status, and physical ability contribute to the community's varying levels of vulnerability to flooding.
	Structures	*Vulnerability:* Structures vulnerable to flooding primarily include those in low-lying areas or near the Jordan River and Little Cottonwood Creek. Several commercial properties along 900 E and west of I-15 near 4500 South are within the 0.2% flood zone. *Impacts:* Residential properties in flood plains and commercial buildings without proper drainage systems or flood-resistant designs face significant risks of damage during flooding from heavy rain or snowmelt. Overall, a combination of location and construction features contributes to their vulnerability to flooding.
	Economic Assets	*Vulnerability:* Commercial properties, especially retail centers and warehouses near rivers or low-lying areas, are at high risk during heavy rainfall. *Impacts:* As previously noted, several large commercial areas in Murray are within the 0.2% annual chance flood zone and could experience significant economic losses from structural or contents damage in a major flood, and may incur costly repairs. Residential developments in flood-prone zones also can suffer damage, impacting property values. Public infrastructure, such as roads and utilities, may experience disruptions, which may affect businesses' ability to operate and contribute to revenue losses. Agricultural land can be affected by excess water, reducing crop yields.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
	Natural, Historic, and Cultural Resources	*Vulnerability:* Streams, wetlands, cultural sites, and parks are vulnerable. *Impacts:* Natural areas like wetlands and streams are at risk of habitat destruction, while historic sites and landmarks may sustain structural damage. Cultural resources, such as parks and public spaces, can become unusable, affecting community events. Murray Park has experienced closures in the past due to flooding. Factors contributing to their vulnerability include inadequate flood management, urban development that alters water flow, and the increasing frequency of extreme weather events due to climate change.
	Critical Facilities and Infrastructure	*Vulnerability:* No critical facilities in Murray were identified in the 1% annual chance flood zone. One city facility and one county facility are within the 0.2% annual chance flood. Roads are vulnerable. *Impacts:* Flooding may damage or block transportation networks, particularly those close to rivers, which can overflow during snowmelt, or where water may accumulate in low-lying areas during heavy rain. Flooding can disrupt emergency services, require schools to evacuate, block transportation routes, and isolate individuals and communities. In addition, inadequate drainage systems and urban development encroaching on floodplains increase these risks.
	Community Activities	*Vulnerability:* Outdoor events are vulnerable. *Impacts:* Due to the area's geography and infrastructure, outdoor events, sports, and farmers' markets are vulnerable to flooding. Parks and open spaces can quickly become inundated during heavy rainfall or rapid snowmelt.
Landslide/ Slope Failure	People	*Vulnerability:* Landslides are primarily a risk near steep or unstable slopes. The topography in Murray is relatively flat, and landslide risk to people and structures is minimal. *Impacts:* Residents who commute to neighboring cities could potentially be affected if transportation routes closer to the mountains are blocked by landslides. Small localized slope failure may occur in areas with human-made slopes, such as along freeway over and underpasses or other development, or due to erosion along stream banks.
	Structures	*Vulnerability:* Risk to structures in Murray is minimal due to relatively few steep slopes within the city. *Impacts:* Heavy rainfall, ground shaking from an earthquake, or loose soil may contribute to small, localized slope failures near homes, commercial buildings, roads, or bridges. In addition, inadequate construction practices and a lack of erosion control measures can contribute to the risk of slope failures, particularly for properties not designed with their environmental context in mind.
	Economic Assets	*Vulnerability:* Potential economic impacts from landslides in Murray are low due to relatively low risk of landslide occurrence. *Impacts:* Infrastructure like roads and bridges, and utility services like water and power lines, may be vulnerable to damage from slope failure, which could contribute to economic losses for nearby businesses. These assets are at risk due to heavy rainfall, earthquake-induced landslides, poor drainage systems, and development practices that destabilize slopes.

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
	Natural, Historic, and Cultural Resources	*Vulnerability:* Landslides pose a low risk in Murray. *Impacts:* Natural resources along creeks and the Jordan River could see minor disruptions to vegetation and wildlife habitat if slopes along the banks fail. No risks to historic and cultural resources from landslides were identified.
	Critical Facilities and Infrastructure	*Vulnerability:* Roadways and essential services like water supply and power lines may be at risk, but the risk in Murray is low. *Impacts:* Heavy rain, earthquake, or destabilization of slopes during development may contribute to small slope failures that may lead to disruptions in infrastructure in the immediate vicinity.
	Community Activities	*Vulnerability:* Landslides pose minimal risk to community activities in Murray.
Radon	People	*Vulnerability*: 35-41% of homes tested in Murray have dangerous levels of radon. *Impacts:* People within homes and other structures with high levels of radon are at an increased risk of lung cancer. Homeowners in older buildings in areas with high radon potential are the most at risk. Families with young children or elderly members are especially at risk due to their increased sensitivity to health impacts.
	Structures	*Vulnerability:* Structures with concrete slabs or basements are particularly vulnerable to radon exposure, as radon can seep in from the soil. *Impacts:* Cracks in floors and walls can allow radon to enter. Although radon does not damage structures directly, some structures may be more likely to accumulate radon gas and increase exposure to occupants. Homes in areas with high uranium content are at greater risk, especially in older houses with inadequate ventilation.
	Economic Assets	*Vulnerability:* Residential properties, commercial buildings, and rental units are vulnerable to radon. *Impacts:* Structures built on radon-prone soil and older buildings lacking modern building standards pose higher risks to occupants. The presence of radon can lead to health issues, decrease property values, and complicate real estate transactions, impacting homeowners and investors alike.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Natural resources, historic structures, and cultural sites are all potentially vulnerable. *Impacts:* Natural resources, such as underground water sources and soil, can accumulate radon, particularly in areas with granite or uranium deposits. Historic structures made from stone or concrete with high uranium content may trap radon indoors, exposing occupants to health risks. Cultural resources such as museums, built with similar materials, also face threats from radon, potentially endangering both the preservation of artifacts and the health of visitors and staff.
	Critical Facilities and Infrastructure	*Vulnerability:* All city facilities can accumulate radon, possibly at similar levels to homes and other structures. *Impacts:* Schools in high-radon areas pose risks for children if they do not have proper ventilation. Healthcare facilities are also at risk,

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		affecting both patients and staff. Inadequate construction practices and a lack of awareness about radon risks may heighten vulnerability.
	Community Activities	*Vulnerability:* Risk to activity communities is low, as exposure at events is short-term. *Impacts:* Indoor gatherings in homes, particularly in basements, where radon tends to accumulate, may increase risk. Construction and renovation can expose workers and residents to radon if proper testing and ventilation are not used.
High Wind	People	*Vulnerability:* All residents of Murray are potentially vulnerable to high wind, which can affect the entire city. Straight-line wind and downslope wind events have previously occurred in Murray. *Impacts:* Wind can cause injury or death from blowing debris or falling tree limbs. The elderly may face mobility challenges that hinder their ability to seek shelter, while children might not fully grasp the dangers of severe weather. Individuals with disabilities or health issues may struggle to react quickly or seek shelter. Mobile homes or poorly constructed houses are at greater risk of damage, and residents are more vulnerable to injury. People who work outdoors and those who are unhoused may be exposed during sudden wind events.
	Structures	*Vulnerability:* Structures throughout Murray are potentially at risk of damage from high wind. *Impacts:* Single-story homes, commercial buildings, and agricultural facilities like barns may be at risk. Residential homes with large, flat roofs or lightweight materials may struggle to withstand strong winds, while commercial buildings with extensive glass can suffer from breakage and structural damage. Structures can also be damaged by trees uprooted by high wind. Carports, sheds, fences, and other accessory structures are easily damaged by high winds and can contribute to blowing debris. The vulnerability of these buildings is heightened in open areas with no landscaping or natural windbreaks, which can help diffuse wind energy.
	Economic Assets	*Vulnerability:* Commercial buildings, such as retail stores, throughout Murray could experience losses from high wind. *Impacts:* Businesses might have large signage and awnings that can be damaged, and damage to roofs could lead to business interruptions or closures. Infrastructure, including power lines and roads, can be compromised, resulting in outages, which may disrupt business operations. Extended power outages and structural repairs may lead to operational downtime and lost revenue. The vulnerability of these assets is largely due to construction quality, location, and the presence of loose materials that can become projectiles.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Parks, trees, historic buildings, and cultural sites are vulnerable. *Impacts:* Natural resources like parks and open spaces with mature trees are vulnerable to high winds, which can cause uprooting and wind erosion. Historic structures also may be at risk if their materials are not resilient, potentially leading to damage or collapse. Cultural resources, such as outdoor art installations and community spaces, can be disrupted or damaged by strong winds. These vulnerabilities

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		are primarily due to the structural integrity of the resources and their exposure to the elements.
	Critical Facilities and Infrastructure	*Vulnerability:* City buildings, hospitals, fire and police stations, and schools could all potentially experience damage or service disruptions due to high wind. Utilities, such as power and communication towers, are at risk. *Impacts:* Utility infrastructure, such as power lines and communications towers, can be damaged by high winds, resulting in outages. Power and communication outages can disrupt emergency response and medical care. Falling tree branches and other debris can block access to property and may block roadways.
	Community Activities	*Vulnerability:* Outdoor events and recreation activities are vulnerable. *Impacts:* Outdoor events like festivals and sporting activities may involve injury from falling debris and damaged structures. Farmers' markets and open-air concerts also can face challenges, with high winds blowing away tents and products. In addition, recreational activities in parks—such as picnics and playground use—become unsafe during high winds. The vulnerability of these activities stems from their outdoor settings, where structures and unattached items can easily be compromised, leading to safety risks and disruptions.
Lightning	People	*Vulnerability:* Lightning can occur anywhere in Murray, and all residents could potentially be exposed. *Impacts:* Lightning can cause severe injury or death to those in close proximity to a strike. Golfing and other forms of outdoor recreation can expose people to lightning risk in open areas during thunderstorms. Athletes and spectators participating in outdoor sports may also struggle to find shelter quickly. In addition, young children and the elderly are more vulnerable, as they may not be aware of the dangers of lightning or may be slower to seek protection. Those lacking access to warning systems or education on lightning safety are at further risk during severe weather.
	Structures	*Vulnerability:* Structures anywhere in Murray could potentially be vulnerable to lightning. Due to their height and exposure, tall buildings, communications towers, and open-frame agricultural barns are particularly vulnerable to lightning strikes. Those with metallic components or inadequate grounding systems face increased risk because metal conducts electricity. In addition, residential homes near tall trees may be at risk if the trees are struck and energy is transferred to the structure. *Impacts:* Lightning can ignite a structural fire. Electrical surges may disrupt power and communication systems within homes and businesses.
	Economic Assets	*Vulnerability:* All businesses are at risk. *Impacts:* Tall structures like communications towers and power lines are at high risk, as are agricultural buildings, such as barns and silos, which can suffer damage to stored crops and livestock. Commercial buildings with metal roofing or equipment may face electrical surges, disrupting operations. In addition, outdoor recreational areas that attract crowds are at risk during thunderstorms, posing dangers to infrastructure and public safety.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
	Natural, Historic, and Cultural Resources	*Vulnerability:* Trees, parks, and historic buildings are vulnerable. *Impacts:* Mature trees in parks can attract lightning due to their height, while historic buildings made of wood or flammable materials are at risk of igniting. Cultural resources, such as monuments and outdoor sculptures, can also be damaged by lightning. The risk increases in areas with frequent thunderstorms and dry conditions.
	Critical Facilities and Infrastructure	*Vulnerability:* Communications towers and power lines are at risk. *Impacts:* Communications towers attract lightning due to their height and metal structure. Power lines and substations are also susceptible, and lightning strikes can lead to power outages. Power and communication outages can disrupt essential functions of emergency facilities, hospitals, or schools. Schools and hospitals, as public gathering places, can be at risk if they do not have proper lightning protection systems.
	Community Activities	*Vulnerability:* Sports, recreation, and outdoor events are vulnerable. *Impacts:* Sports practices, concerts, picnics, and festivals are particularly vulnerable to lightning strikes. Participants in these events often find themselves in open areas without adequate shelter and may be unprepared for sudden weather changes, leading to dangerous situations. Murray Park, Mick Riley Golf Course, Murray Parkway Golf Course, Wheeler Farm, the Jordan River Parkway, and school sports fields are among the outdoor venues where people may be at risk from lightning. Water-related activities such as swimming, boating, and fishing also increase the risk due to water's conductivity.
Severe Winter Weather	People	*Vulnerability:* All residents in Murray are potentially vulnerable to severe winter weather, such as heavy snow. *Impacts:* People are at risk of injuries from slips and falls on slick conditions on sidewalks and other walkways. Heavy snow and blizzards contribute to traffic accidents, which may cause injury to drivers. Elderly individuals may struggle with mobility and health issues, while young children lack the awareness needed to navigate severe weather safely. People with disabilities often depend on assistance that might not be available during storms. In addition, those without reliable transportation can become stranded, and low-income families in inadequate housing may lack resources for heating and snow removal. Unhoused individuals or others exposed to severe winter weather are at risk of hypothermia or frostbite.
	Structures	*Vulnerability:* Severe winter weather can affect structures anywhere in Murray. *Impacts:* Flat-roofed buildings are prone to snow accumulation, risking roof collapse if not cleared. Older homes might have weakened roofs or inadequate insulation, making them susceptible to snow loads and ice dams. Commercial buildings with large open spaces may face risks if their roofs do not meet snow load requirements. Temporary structures like tents are especially vulnerable, as they are not designed to handle heavy snow. Roof design, material quality, and the age of the building are key factors in determining how well a structure can withstand heavy snowfall.
	Economic Assets	*Vulnerability:* Retail businesses throughout Murray are vulnerable.

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		Impacts: Businesses can experience significant losses from decreased customer traffic and delayed shipments. Construction projects may face delays and increased costs. Transportation and logistics companies are particularly impacted, as snow can hinder vehicle movement, leading to delivery delays. In addition, public services may struggle to maintain continuity during severe weather events.
	Natural, Historic, and Cultural Resources	*Vulnerability:* All trees, historic buildings, and cultural sites in Murray are vulnerable. *Impacts:* Natural resources like trees can break under heavy snow, disrupting habitats. Historic sites risk structural damage from snow accumulation. Historic homes and older structures may be unable to bear the weight of heavy snow accumulation. Cultural resources, including public art and community spaces, face access issues.
	Critical Facilities and Infrastructure	*Vulnerability:* All roads, transportation in Murray, and city facilities are vulnerable. *Impacts:* Transportation networks like roads and bridges throughout Murray can become impassable, hindering emergency responses. I-15, I-215, State Street, and other major routes may become impassable during heavy snow or blizzard conditions and travelers may be temporarily stranded. Power systems are at risk from disruption if high wind or ice accumulation during winter storms damages power lines. Roofs on public buildings, including schools and hospitals, may collapse from the weight of excessive snow. Communications infrastructure can be damaged, impeding signals. These vulnerabilities stem from reliance on systems that may not be equipped to handle extreme winter weather.
	Community Activities	*Vulnerability:* Community events are vulnerable. *Impacts:* Outdoor events, public transportation, and community gatherings may be at risk. Severe weather can lead to low attendance, travel delays, and access issues for essential services, such as emergency response and healthcare. Severe winter weather may force schools to close. Warming centers may see increased demand during extreme cold and severe winter weather conditions.
Tornado	People	*Vulnerability:* Tornadoes are rare in Murray, but could potentially occur anywhere in the city, and all residents are at risk. *Impacts:* If a tornado were to occur, residents are vulnerable to serious injury from blowing debris, uprooted trees, and structural collapse. Individuals living in mobile homes face higher risks, as these structures can be easily damaged. Those with limited mobility, such as the elderly and people with disabilities, may struggle to reach safety quickly. Families with young children might have difficulty ensuring everyone's safety during a warning. In addition, residents unfamiliar with tornado preparedness or without timely weather alerts are at greater risk. Those in lower socioeconomic conditions often live in areas less equipped for disaster response.
	Structures	*Vulnerability:* All structures are vulnerable. *Impacts:* Homes and businesses in Murray could sustain heavy damage from a tornado. Roofs can be torn from homes, windows broken, and walls damaged and compromised. Mobile homes are particularly at risk due to their light weight and insecure foundations.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		Older commercial buildings that do not meet modern codes may also be weak, and large-span structures, such as warehouses, can have roofs easily lifted by tornado winds. Overall, inadequate materials, poor design, and age increase the risk of damage from tornadoes.
	Economic Assets	*Vulnerability:* All Murray businesses are vulnerable. *Impacts:* Tornadoes can cause economic losses in Murray through damage to businesses and interruption of economic activity. Retail businesses, hotels, restaurants, and industrial sites may be damaged and may face operational downtime or closures due to structural damage or interruption of power or communication systems. Closures may lead to lost wages or layoffs, lost revenue, and interruption of supply chains. Roads and bridges can be blocked or compromised, which disrupts transportation and service access.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Historic buildings, cultural sites, and Murray parks are vulnerable to damage from tornadoes. *Impacts:* Historic structures may suffer damage because their age and construction methods might make them less able to withstand high winds. Cultural resources, including monuments and parks that are vital to community heritage, may also be at risk. Murray's parks and open spaces could be severely affected by a tornado. Mature trees could be uprooted, and vegetation damage can affect wildlife habitat and increase erosion.
	Critical Facilities and Infrastructure	*Vulnerability:* Hospitals, schools, and emergency response centers are vulnerable to tornadoes due to their structural design and large open spaces that may not withstand high winds. *Impacts:* Public safety buildings, schools, or other civic facilities may need emergency inspections or repairs. Utilities, like power stations, also are at risk, as damage to these facilities can disrupt essential services. In addition, any structures not built to modern codes might lack the reinforcements necessary to endure severe weather, increasing vulnerability for the facilities and surrounding communities. Major transportation routes, such as I-15, I-215, State Street, and other arterial roads, may be blocked by debris.
	Community Activities	*Vulnerability:* Outdoor recreation and events are vulnerable to disruption by tornadoes. *Impacts:* Outdoor festivals, sports events, and markets are vulnerable to tornadoes due to their open spaces and limited options to provide shelter. Temporary structures, such as tents, can be easily damaged by high winds, and patrons may be unable to find shelter. Events may be postponed or canceled, reducing opportunities for social engagement and community support. Schools and recreational facilities with large glass windows or weak roofs also face significant risks.
Wildfire	People	*Vulnerability:* Wildfire risk is relatively low in Murray due to its location in the middle of the valley, which is mostly urban development. Some areas of open space near parks and along the Jordan River may be vulnerable to wildfire. *Impacts:* Wildfires are likely to be small and only affect a few structures. Wildfire smoke can affect individuals in Murray city, even if the fire is not located within the city itself. Individuals with underlying

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		health conditions may be particularly vulnerable to the effects of poor air quality. Individuals with physical disabilities or health issues might struggle to evacuate, and low-income families lacking resources for fire safety measures may be vulnerable. Older adults might have reduced mobility, making them more dependent on others for assistance.
	Structures	*Vulnerability:* A few structures near open space have some risk. *Impacts:* Residential homes, especially those made of wood or near heavily vegetated areas, may be vulnerable. Inadequate defensible space, such as insufficient clearing of dry grass and shrubs, increases susceptibility. Roofs made of combustible materials, and buildings that lack fire-resistant features, are particularly at risk during wildfire events.
	Economic Assets	*Vulnerability:* Vulnerability to economic assets is relatively low in Murray, as it is primarily developed land. *Impacts:* Commercial assets, such as retail centers close to undeveloped/vegetated regions, can suffer damage from flames and smoke, affecting the local economy. Vital infrastructure, such as power lines and water pipelines, including those outside of Murray, can be disrupted by wildfires, causing further economic repercussions. These vulnerabilities are heightened by drought conditions, extreme heat, and/or high winds, which can facilitate the spread of fires.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Grasslands along the Jordan River are vulnerable to wildfires. *Impacts:* Natural areas are at risk because dry vegetation and accumulated brush can easily ignite. Historic sites made of wood and cultural landmarks can also be affected, particularly when located near undeveloped areas. The increasing frequency of drought and extreme heat, exacerbated by climate change, heightens these vulnerabilities.
	Critical Facilities and Infrastructure	*Vulnerability:* Utilities, like power lines and communication systems, may be at risk. *Impacts:* Critical facilities and infrastructure within Murray have low wildfire risk as they are not in close proximity to the Wildland-Urban Interface. Wildfires outside of Murray City may cause disruptions to services within Murray.
	Community Activities	*Vulnerability:* Outdoor events are vulnerable to the impacts of wildfires. *Impacts:* Wildfire smoke may deter attendance at outdoor events, like festivals and sports, especially during hot, windy conditions. The Jordan River Trail may be inaccessible for recreational activities, such as biking or running, during and following a wildfire in the area.
Dam Failure	People	*Vulnerability:* Murray residents are vulnerable to the failure of dams. Inundation boundaries from dams in upper Big and Little Cottonwood Canyons could affect portions of Murray City near Big Cottonwood and Little Cottonwood Creeks. *Impacts:* Dam failure can cause swift-moving floodwaters downstream that can cause injury. Individuals living near dams or within potential inundation areas, particularly in low-lying areas, are most vulnerable to dam failure and potential flooding. Damage to homes may lead to residents being displaced. Families with young children, the elderly,

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		and low-income residents may struggle to evacuate quickly, while individuals with disabilities may face significant barriers during emergencies.
	Structures	*Vulnerability:* Structures in the northern area of Murray are at risk of flooding from a dam failure. Many of these are commercial or industrial structures, but some residences along creeks could also be affected. *Impacts:* Fast-moving floodwaters can cause significant structural damage downstream.
	Economic Assets	*Vulnerability:* Businesses in the inundation boundaries are vulnerable to flood damage. *Impacts:* Businesses may experience direct losses to structures and inventory if located downstream of a dam failure. They can also be affected by interruptions of services. Roads, bridges, and utilities could suffer damage, disrupting transport and services. Residential and commercial properties downstream face significant flood risks, leading to property damage and economic loss. The proximity of these assets to failure zones highlights their vulnerability to dam failure.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Natural resources, like local waterways such as Big Cottonwood Creek and Little Cottonwood Creek, are vulnerable. Historic buildings and cultural sites are also at risk. *Impacts:* Creeks could suffer damage to ecosystems and habitat loss. Historically significant sites and historic homes may be at risk of flooding and deterioration. Cultural resources, such as community centers and parks, also may face damage, affecting local gatherings.
	Critical Facilities and Infrastructure	*Vulnerability:* One fire station, five schools, and one healthcare facility are in dam failure inundation areas and may be damaged by flooding following a dam failure. *Impacts:* Schools and hospitals face safety risks and evacuation challenges, which could lead to injury or loss of life and property. Transportation infrastructure, such as roads and bridges, may be compromised, hampering emergency response.
	Community Activities	*Vulnerability:* Recreational pursuits, like fishing in creeks downstream, may be at risk from dam failure. *Impacts:* Murray Park and Wheeler Farm are vulnerable to dam failure, and events in these areas may be disrupted. These activities are vulnerable to sudden flooding from a dam breach.
Civil Disturbance	People	Low-income individuals may lack the resources for safety, while the elderly or disabled may struggle to navigate emergencies. Young people, particularly teenagers, may be drawn into unrest, influenced by social dynamics. In addition, marginalized individuals may feel targeted or compelled to participate. A lack of community cohesion and trust in authorities can further heighten tensions.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
	Structures	Government buildings, commercial properties, and infrastructure, such as bridges and transportation hubs may be vulnerable. Government buildings may be targeted for their symbolic authority, while retail stores can attract crowds during protests. Residential neighborhoods also can be affected, especially in areas with heightened tensions. The vulnerability of these structures stems from their visibility and importance to the community, combined with factors such as location and ongoing social issues.
	Economic Assets	Retail establishments, especially shopping centers, are at risk as they often become focal points for protests. Transportation systems can be disrupted by blockades, hindering access to services. Financial institutions may face vandalism or theft, while critical service providers, such as hospitals, could experience strain during unrest. Several economic assets are vulnerable to civil disturbances, primarily due to their visibility and reliance on foot traffic.
	Natural, Historic, and Cultural Resources	Parks and open spaces may suffer from vandalism or destruction during uncontrolled events. Historic sites can become targets, as they symbolize authority or cultural significance. Cultural resources such as community centers and places of worship also may be affected, as they play a vital role in community identity. Their vulnerability lies in the potential for damage during protests.
	Critical Facilities and Infrastructure	Governmental buildings, schools, and healthcare facilities may be at risk, since they often symbolize authority and serve as community hubs, making them targets during unrest. Utility infrastructure, such as water and power facilities, is also at risk of disruption. Its visibility and essential services contribute to its vulnerability during civil disturbances.
	Community Activities	Public demonstrations, parades, and local government meetings are particularly vulnerable to civil disturbances. These events often attract large crowds and can become tense, especially around contentious social or political issues. Factors such as the local demographic, economic conditions, and recent events can heighten these vulnerabilities, making it easier for conflicts to arise during passionate public gatherings.
Cyberattack	People	Older adults often lack familiarity with technology and online security, making them easy targets for phishing scams. Individuals engaging in online banking or shopping without strong security measures also face heightened risks. Families with children may be less vigilant about internet safety, allowing cybercriminals to exploit personal information. In addition, small business owners without robust cybersecurity practices are prime targets for attacks that can disrupt operations.
	Structures	Critical infrastructure, such as power plants, water treatment facilities, and transportation systems, often lack robust cybersecurity measures. Commercial businesses, especially financial institutions and healthcare providers, also are at risk due to weaker data protection and employee training. Educational institutions may be vulnerable because of limited funding for cybersecurity and outdated software. Obsolete technology and insufficient training enhance the susceptibility of these structures to cyber threats.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
	Economic Assets	Financial institutions, such as banks and credit unions, are at risk of data theft and service disruption. Small and medium-sized businesses often lack robust cybersecurity measures, making them attractive targets. In addition, local government agencies and critical infrastructure, such as water treatment facilities, might have outdated security protocols, posing threats to public safety. The rise of remote work further exacerbates vulnerabilities, as employees accessing networks from home can unintentionally expose systems to risks. Overall, the combination of outdated technology and insufficient cybersecurity practices increases the vulnerability of an area's economic assets.
	Natural, Historic, and Cultural Resources	Natural resources like water management systems and wildlife databases can be compromised, disrupting ecosystems. Historic sites and museums that digitize collections are at risk of losing valuable artifacts and data. In addition, cultural organizations managing events may face threats if their systems lack adequate security. The limited resources of smaller organizations further increase this vulnerability
	Critical Facilities and Infrastructure	Energy and utility services, such as electricity and water systems, which often rely on outdated technology, may be vulnerable. Transportation infrastructure, such as traffic management and public transit, is also at risk due to networked systems. Healthcare facilities that use electronic records and connected medical devices face vulnerabilities that can compromise patient safety.
	Community Activities	Online registration for events, local government services, and educational programs that rely on digital tools may be targeted due to inadequate security measures, outdated software, and insufficient staff training.
Hazardous Materials Incident (Transporta-tion & Fixed Facility)	People	Individuals with pre-existing health conditions, such as respiratory issues, and the elderly are at higher risk due to their compromised health. Children also are more susceptible. Those living near industrial areas or transport routes for hazardous materials face increased exposure risk, while low-income families may lack resources and information to effectively prepare for incidents.
	Structures	Industrial facilities, such as manufacturing plants and warehouses, often store hazardous chemicals which may leak. Residential buildings, schools, and hospitals also are at risk, particularly if located along transportation routes for hazardous materials. Older buildings may lack modern safety features, increasing their vulnerability.
	Economic Assets	Industrial facilities, transportation infrastructure, and nearby commercial properties may be affected. Industrial facilities handling chemicals are at risk of spills or leaks, while roads and railways used for transporting hazardous materials can lead to accidents and contamination. In addition, nearby commercial and residential areas face potential health risks and economic losses.
	Natural, Historic, and Cultural Resources	Waterways and habitats are vulnerable to hazardous materials incidents, which can disrupt ecosystems. Historic sites and structures may suffer damage from toxic exposure, leading to degradation over time. In addition, cultural landmarks risk losing their significance due to contamination events. The proximity of these resources to industrial areas or transport routes exacerbates their risk.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
	Critical Facilities and Infrastructure	Chemical manufacturing plants, waste treatment facilities, and transportation networks, such as highways and railroads may be at risk. Their vulnerability stems from factors such as proximity to residential areas, aging infrastructure, and inadequate safety measures. Natural hazards, such as flooding and earthquakes, can further increase risks by damaging containment systems.
	Community Activities	Local markets, school events, and outdoor gatherings are vulnerable to hazardous materials incidents if they are near industrial zones and transport corridors. This risk is heightened by inadequate emergency preparedness, lack of public awareness, and the potential for spills during transport. Large crowds at events can complicate evacuation efforts, increasing the risks for participants and nearby residents.
Public Health Epidemic/ Pandemic	People	Individuals with pre-existing health conditions like asthma and heart disease and adults over 65 may be vulnerable. Low-income families may struggle to access healthcare and vaccinations, increasing their risk. Marginalized communities with limited access to information and those living in high-density conditions also are at greater risk due to the rapid spread of diseases and the challenges in implementing preventive measures.
	Structures	Several structures are vulnerable to public health epidemics or pandemics, particularly due to their ability to facilitate the spread of disease. High-density residential areas, such as apartment complexes, are at risk, as close living quarters can lead to faster transmission. Public gathering spaces, such as schools and community centers, also pose significant threats because large groups are in confined spaces. Healthcare facilities can become hotspots for infections if infection control measures are insufficient. In addition, workplaces with high foot traffic, such as retail stores, contribute to vulnerability.
	Economic Assets	Small businesses in retail, hospitality, and food service are particularly vulnerable to public health epidemics or pandemics. These sectors face risks from fluctuating consumer demand and potential operational restrictions. The tourism industry also is affected, as travelers may avoid high-risk areas. Healthcare facilities can become overwhelmed, straining resources and impacting operations. In addition, local supply chains may experience disruptions, leading to shortages and inflation. Overall, the direct effects of illness, along with prolonged shutdowns and consumer hesitance, leave these economic assets exposed to significant downturns.
	Natural, Historic, and Cultural Resources	Natural resources like wildlife and ecosystems can be disrupted by increased human activity, raising the risk of zoonotic diseases. Historic sites may deteriorate due to reduced visitor access and funding, while cultural resources, such as community events, face cancelations, impacting social connections.
	Critical Facilities and Infrastructure	Public health epidemic or pandemic incidents can affect healthcare facilities, nursing homes, public transportation systems, schools, and food supply chains. Hospitals and clinics may become overwhelmed with patients, while vulnerable populations in nursing homes are at higher risk. Public transportation can facilitate the spread of disease, and schools gather large groups, thereby increasing transmission potential. These facilities often lack adequate resources, including

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		medical supplies and testing capabilities, making them more susceptible to the impacts of a health crisis.
	Community Activities	Large gatherings like festivals and sporting events can facilitate the rapid spread of diseases due to close contact. Public transportation also is at risk, as it serves many people in confined spaces. Schools and childcare facilities are particularly susceptible, given that children can easily transmit infections. In addition, food-related events, such as farmers' markets, can pose risks if hygiene practices are not followed. The interconnectedness of community members and varying adherence to health guidelines further exacerbate these vulnerabilities.
Terrorism	People	Young children and newcomers may lack awareness of potential threats, while the elderly and individuals with disabilities may struggle to respond quickly in emergencies. Marginalized communities often face bias, making them more susceptible to targeting. In addition, those with lower socioeconomic status may lack access to security measures and emergency preparedness resources.
	Structures	Government buildings, transportation hubs, commercial centers, and public spaces are particularly vulnerable to terrorism incidents. Government buildings are symbolic targets, while transportation hubs and commercial centers are attractive due to their potential for high casualties and crowd presence. Public spaces also are at risk due to their open nature and lack of security. Their vulnerability is heightened by inadequate security measures, high occupancy rates, and their locations in densely populated areas, which can amplify the impact of incidents.
	Economic Assets	Infrastructure, commercial establishments, and community facilities may be vulnerable. Critical infrastructure, such as transportation networks and power grids, could disrupt the economy if targeted. Commercial establishments, especially those with high foot traffic, and community facilities like schools and hospitals also are at risk, as they can provoke widespread concern and disruption. Their accessibility and interconnectivity increase vulnerability, meaning that damage to one asset can have a broader economic impact and hinder recovery efforts.
	Natural, Historic, and Cultural Resources	Natural resources like water supplies and parks could be targeted for their significance to the community. Historic sites and cultural resources, such as museums or community centers, also are at risk due to their accessibility and importance to local identity. Their vulnerability is often heightened by inadequate security measures.
	Critical Facilities and Infrastructure	Public transportation systems, healthcare facilities, schools, and utility services like water and power plants may be affected. Their vulnerability arises from high accessibility and the potential impact of an attack, as crowded transportation and public spaces can lead to mass casualties and panic. Attacking utility services could disrupt the town's essential functions, creating chaos.
	Community Activities	Festivals, parades, and sporting events are particularly vulnerable to terrorism incidents. These events attract large crowds, making it easier for perpetrators to inflict harm and instill fear. In addition, community centers and places of worship serve as social hubs, increasing their

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		risk. Factors such as limited security measures and open access to public spaces, contribute to this vulnerability.

Hazards Not Profiled

Avalanche hazard has been omitted from further discussion of hazard impacts and from mitigation actions. As shown in the hazard description in Volume 1, avalanche risk is primarily located in the Wasatch and Oquirrh Mountains in Salt Lake County. Murray City has mostly flat terrain and minimal risk from these hazards. No previous occurrences of avalanches have impacted Murray.

Jurisdiction-Specific Changes in Vulnerability

Hazard events can impact communities, infrastructures, and ecosystems. The severity of these impacts can be influenced by climate change, population patterns, and land use developments. Understanding these factors is crucial for the city of Murray to develop a resilient community and minimize the impacts of hazards. Table 8 displays the unique changes within the community and the related effects on each identified hazard affecting the city of Murray.

DRAFT

Table 8: Jurisdiction-Specific Changes in Vulnerability in the City of Murray

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
Drought	Climate change affects drought incidents by altering precipitation patterns and increasing temperatures. Warmer weather can lead to longer dry periods and more severe droughts, while changes in rainfall can reduce snowpack in nearby mountains, crucial for summer water supply. Higher temperatures also increase evaporation rates, further straining local water resources.	Drought can significantly influence population patterns by impacting economic opportunities and the quality of life. Water scarcity often leads to reduced agricultural productivity, prompting residents to migrate to areas with more stable job prospects. Increased water costs can make living less affordable, driving some residents away. Conversely, efforts to address drought, such as sustainable development or improved water management, may attract newcomers, resulting in changes in the community's demographic composition over time.	Increasing population and development projects (Murray Tower Plaza, Downtown Block One) will continue to put a strain on Murray's water sources.	Increased
Earthquake	Rising temperatures can lead to glacial melting, which affects pressure on tectonic plates and may trigger seismic activity through isostatic rebound. In addition, increased rainfall and flooding can erode soils, weakening structural integrity and heightening vulnerability during earthquakes. Although the direct links between climate change and earthquakes are still under investigation, environmental effects may impact the region's seismic risk.	Earthquakes can significantly alter population patterns by prompting residents to leave for safer areas after a seismic event. This migration can lead to changes in population density and attract new residents and businesses during the rebuilding process. The perception of the area as a safe place to live may shift, impacting long-term demographics, as some residents return to rebuild while others relocate permanently.	Development has increased, but it has been built to current earthquake-building codes to mitigate the risk.	Stayed the same

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
Extreme Heat	Climate change significantly impacts extreme heat by increasing the frequency and intensity of heat waves. Rising global temperatures lead to longer and hotter summers, affecting residents and local infrastructure while heightening health risks, especially for vulnerable populations. Urban heat islands resulting from reduced vegetation and extensive pavement further amplify these effects.	Residents may relocate due to damaged homes or safety concerns. Some may move to areas perceived as safer or seek better job opportunities elsewhere. The economic impact and infrastructure damage can also make certain neighborhoods less desirable, leading to shifts in demographics and the socioeconomic landscape as new residents with different backgrounds move in.	Increased density, particularly in Murray Downtown and Fashion Place West, can lead to increased temperatures during extreme heat events.	Increased
Extreme Cold	Climate change can increase the intensity of winter storms. Higher atmospheric temperatures allow for more moisture, resulting in heavier snowfall and potentially lower temperatures during these events. In addition, fluctuations in weather patterns may disrupt seasonal cycles, leading to unpredictable periods of extreme cold mixed with warmer spells.	Some residents may relocate to warmer areas. Harsh winters can hinder economic activities and deter new residents and businesses, influencing housing demand and the attractiveness of certain neighborhoods. This may disproportionately affect lower-income families, leading to changes in demographics and socioeconomic stratification in the community.	Increased growth of commercial and residential developments in Murray leads to increased energy demand during extreme cold events, stressing the electrical grid.	Increased
Flooding	Higher temperatures increase the frequency and intensity of extreme weather events and alter precipitation patterns. They lead to more intense rainstorms and accelerated snowmelt from nearby mountains, raising water levels in rivers and streams. This	Flooding can significantly alter population patterns by displacing residents from affected areas, leading them to seek shelter elsewhere. This may cause a population decline where flooding occurs, as individuals might hesitate to return due to ongoing risks or property damage. As	Development since the previous hazard mitigation has not been in the 1% and 0.2% annual chance flood zone. Increased impervious surfaces due to development across Murray could contribute to ponding and other pluvial flooding.	Decreased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	combination raises the risk of flooding, especially in areas with inadequate drainage and urban development in flood-prone zones, heightening the potential for damage to homes and infrastructure.	neighborhoods become less desirable, people may migrate to safer areas, changing demographic trends and putting pressure on housing in those regions. Over time, these shifts can influence urban planning and development, as local governments address flooding risks and changing population needs.		
Landslide/ Slope Failure	Climate change increases the risk of landslides through heavier rainfall and temperature fluctuations. Intense rain saturates soil, destabilizing slopes, while freeze–thaw cycles weaken the ground. Changes in vegetation can also reduce stability, leading to a higher potential for landslides.	Landslides and slope failures can impact population patterns by making some areas unsafe, leading to displacement and lower property values. This prompts residents to move to safer regions, thereby increasing density in more stable areas. Concerns about future landslides may also deter newcomers from high-risk zones, shaping long-term demographic trends.	Development in Murray has not increased landslide risk.	Increased
Radon	Climate change can affect radon levels by altering soil temperatures and moisture conditions. Higher temperatures may increase radon emissions from the ground, while heavy rainfall can change groundwater and soil saturation, impacting radon migration into buildings.	Radon exposure can influence population patterns as increased health awareness may drive families to move away from areas with high radon levels. This shift could particularly affect vulnerable groups, changing demographics and demand in the housing market. Homes with lower radon levels may become more sought after, and public health campaigns can encourage community action, making	Development in Murray has not increased radon risk.	Decreased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
		previously undesirable areas more attractive once mitigation measures are implemented.		
Heavy Rain	Climate change increases the frequency and intensity of heavy rain, as higher temperatures allow the atmosphere to hold more moisture. This leads to stronger storms, flash flooding, and overwhelmed drainage systems.	Heavy rain can shift population patterns by pushing residents out of flood-prone areas and attracting them to safer neighborhoods. Frequent flooding may lead to evacuations and economic disruptions, prompting relocations. Over time, ongoing heavy rains can affect housing demand and community stability, altering the town's population distribution.	Increased impervious surfaces due to development across Murray could contribute to ponding and other pluvial flooding.	Increased
High Wind	Climate change affects high winds by altering atmospheric patterns and increasing extreme weather events. Rising temperatures may lead to more substantial, unpredictable winds and more frequent thunderstorms, posing risks to infrastructure and air quality.	High winds can alter population patterns by making certain areas less desirable. Frequent damage may drive residents to safer neighborhoods, deter newcomers, and slow growth in affected regions.	Multistory developments add a slight risk of damage from high winds.	Increased
Lightning	Climate change increases temperatures and alters precipitation, leading to more intense thunderstorms and frequent lightning strikes. Urbanization can enhance this effect, posing risks to public safety and infrastructure.	Lightning can influence population patterns by causing property damage and wildfires, leading some residents to relocate. Areas with higher lightning activity may deter new residents, while safer locations could increase migration as people seek protection from severe weather.	Increased development, including multistory buildings, slightly increases the risk of lightning damage in Murray.	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
Severe Winter Weather	Climate change impacts heavy snow and blizzards by altering precipitation patterns. Higher temperatures can lead to more rain than snow, affecting snowpack levels—additionally, increased storm intensity results in heavier, more unpredictable snowfall.	Increased population equals an increased number of people needing to get to work and quicker snow removal. Heavy snow or blizzards can impact population patterns by influencing where people live and work. Transportation disruptions may lead residents to seek housing closer to jobs, increasing density in some areas while depopulating others. Families might also avoid regions with frequent heavy snowfall, shifting demand to milder areas. Over time, these trends can alter community demographics and economic activity, prompting adjustments in town planning and resource allocation.	As new developments have been constructed, additional risks have emerged for the city during extreme winter weather. The city now takes on more responsibility for clearing these developments and infrastructure, as well as conducting rescues and evacuations during heavy snow events.	Increased
Tornado	Climate change may increase the frequency and intensity of tornadoes. Higher temperatures lead to more moisture in the air, creating conditions for severe thunderstorms. Changes in wind patterns and precipitation can also heighten tornado risks, resulting in more destructive storms and greater threats to infrastructure and communities.	Tornadoes can influence population patterns by prompting residents to move to safer areas after damage occurs. This can decrease density in affected neighborhoods while increasing the demand for housing in safer regions. New residents may also move in for recovery opportunities, altering demographics. Over time, repeated tornado threats might push long-term residents to areas with better disaster preparedness, reshaping the town's population distribution.	Increased development slightly raises the risks of tornado damage in Murray.	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
Wildfire	By raising temperatures and creating drier conditions, prolonged droughts lead to more dry vegetation, which serves as fuel for fires. Erratic seasons extend the growing period, while more lightning strikes can ignite wildfires. These factors heighten the threat to ecosystems and community safety.	Displaced individuals often seek safer areas, shifting demographics, while declining property values might deter newcomers. Conversely, some may be drawn to rebuilding efforts, impacting long-term growth and community dynamics.	Development in Murray has not increased the risk of wildfire.	Increased
Dam Failure	Climate change raises the risk of dam failure by causing heavier rainfall and rapid snowmelt. These changes can overwhelm dams and compromise their integrity, highlighting the need for urgent safety assessments and upgrades to protect communities downstream.	Dam failure can impact population patterns by displacing residents and altering demographics. Evacuations can lead to an influx in safer areas, while destruction may deter new residents and contribute to population decline. Fear of future disasters may also prompt remaining individuals to relocate, changing the community's composition and affecting population density and economic activity.	Development in Murray has not increased the risk of dam failure.	Increased
Civil Disturbance	Climate change can increase civil disturbances by intensifying environmental stresses and social tensions. Rising temperatures may lead to droughts, wildfires, and poor air quality, particularly affecting vulnerable communities. Resource scarcity, especially water, can spark conflicts and protests. In addition, an influx of	By encouraging residents to move for safety, leading to outflows and new arrivals. These events can reveal social issues, impacting community dynamics, employment, and property values, ultimately reshaping demographics, and social cohesion.	Development in Murray has not increased the risk of civil disturbance.	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	migrants from harder-hit areas may strain local resources, further escalating tensions. This cycle of unrest is driven by the impacts of climate change on the environment and community dynamics.			
Cyberattack	Possible attack on the industry, which is seen as producing large amounts of greenhouse gases and burning fossil fuels. Climate change can heighten cyberattack risk by increasing vulnerabilities during extreme weather. Disruptions like power outages offer cybercriminals opportunities, as focusing on emergency responses can weaken cybersecurity measures. As organizations adopt new technologies to cope with climate impacts, they may unintentionally introduce additional vulnerabilities.	Cyberattacks can change population patterns by eroding trust in essential services. Compromised systems may cause residents to leave due to safety concerns, while high-profile incidents can deter businesses, leading to job losses. This perception of vulnerability may also make the town less appealing to newcomers, resulting in demographic shifts and affecting local development.	Development in Murray has not increased the risk of a cyberattack.	Increased
Hazardous Materials Incident (Transportation & Fixed Facility)	Climate change elevates the risk of hazardous materials incidents by increasing extreme weather events like heavy rain and wildfires. These events can breach storage tanks and heighten material volatility. Vulnerable infrastructure can lead to more spills or accidents, while climate shifts may also introduce new challenges for	By causing evacuations and temporary declines in density. In the long run, unsafe areas may deter new residents, affecting growth and diversity. In addition, negative perceptions can lower property values and economic prospects, leading families to relocate, which impacts local demographics.	Development in Murray has not increased the risk of hazardous materials incidents.	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	managing hazardous substances and public health.			
Public Health Epidemic/ Pandemic	By increasing the spread of vector-borne diseases and raising the risk of waterborne illnesses due to flooding or drought. Worsening air quality can also exacerbate respiratory conditions like asthma, especially in vulnerable populations.	By prompting migration for safety and better healthcare. Vulnerable groups may move to areas with improved services, while economic instability can drive people to seek new employment opportunities. In addition, restrictions like quarantine measures can limit movement and social interactions, reshaping the community's demographics and impacting local economies.	Development in Murray has not increased the risk of an epidemic/pandemic.	Increased
Terrorism	Terroristic activity is sometimes centered around climate change. Climate change impacts terrorism incidents by creating conditions of resource scarcity and social unrest. Increased competition for essential resources, such as water, can fuel tensions, making communities more vulnerable to extremist ideologies. Extreme weather events may disrupt social order and infrastructure, offering terrorist groups opportunities to exploit crises. In addition, climate-driven population displacement can heighten tensions in receiving areas, raising the risk of domestic terrorism. Law enforcement's focus on climate-	Terrorism incidents can alter population patterns by instilling fear and prompting residents to relocate to perceived safer areas, resulting in demographic shifts and potential declines in property values. Some neighborhoods may see an outflow of residents, while others could experience an influx of people seeking refuge from violence. In addition, increased security measures may deter businesses and residents from certain locations, leading to long-term changes in population density and urban development patterns.	Development in Murray has not increased the risk of terrorism incidents.	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	related challenges can also limit its capacity to address terrorism threats. Ultimately, while climate change may not directly cause terrorism, its effects can create an environment conducive to extremist activities.			

DRAFT

Additional Public Involvement

The city of Murray provided several opportunities for public participation. Figure 1 provides examples of public outreach. An announcement of the mitigation plan and a link to the survey was also included in the City Journal mailer sent to residents.

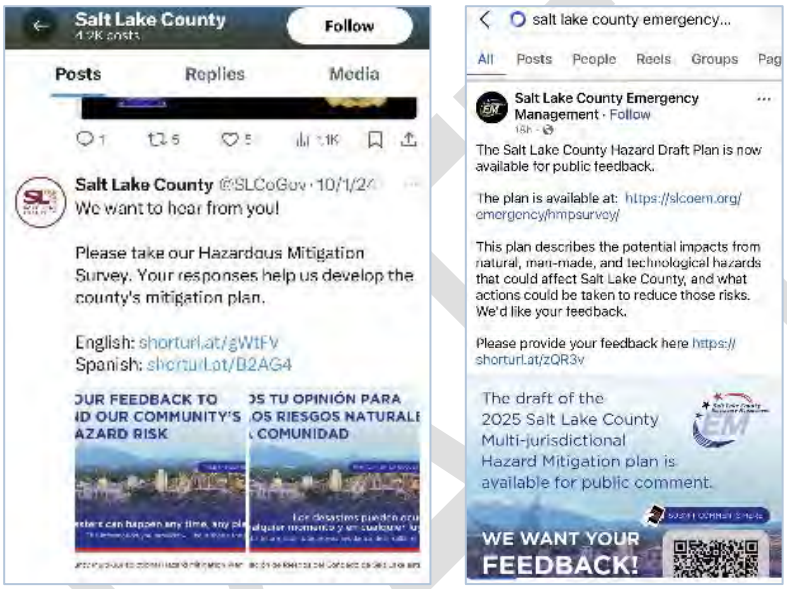

Figure 1: Social Media Posts for the Hazard Mitigation Survey (*left*) and the Draft Plan Review (*right*)

Plan Integration

Incorporating the underlying principles of the Hazard Mitigation Plan and its recommendations into other plans is a highly effective and low-cost way to expand their influence. All plan participants will use existing methods and programs to implement hazard mitigation actions where possible. As previously stated, mitigation is most successful when it is incorporated into the day-to-day functions and priorities of government and public service. This plan builds on the momentum developed through previous and related planning efforts and mitigation programs, and it recommends implementing actions where possible through these other program mechanisms. These existing mechanisms include the following:

- Regularity Capabilities
- Administrative Capabilities
- Fiscal Capabilities

Respective planning stakeholders will conduct implementation and incorporation into existing planning mechanisms and will be done through the routine actions of:

- Monitoring other planning/programming agendas
- Attending other planning/program meetings

- Participating in other planning processes; and
- Monitoring community budget meetings for other community program opportunities.

The successful implementation of this plan will require constant and vigilant review of existing plans and programs for coordination and multi-objective opportunities that promote a safe, sustainable community. Regular efforts should be made to monitor the progress of mitigation actions implemented through other planning mechanisms. Where appropriate, priority actions should be incorporated into planning updates. Table 9 lists existing planning mechanisms into which the Hazard Mitigation Plan has been integrated.

Table 10 lists opportunities for integrating elements of this plan into other plans.

Table 9: Integration of Previous Plans by the City of Murray

Plan	Description
Emergency Operations Plan (soon to be updated to a Comprehensive Emergency Management Plan)	Summary of operations in the event of a major incident or disaster in the city.
City Ordinances	Flood hazard reduction and stormwater management are established in the zoning code.

Table 10: Opportunities for Integration with Future Plans of the City of Murray

Plan	Description
General Plan	Overview of the city's long-term goals and initiatives.
Stormwater Management Plan	Maintain healthy habitats and reduce contaminants from entering waterways.
Transportation Master Plan	The plan does not currently specifically address hazards in its plans to address future transportation needs. Mitigation could be added to the capital facilities planning section.
Fashion Place West, Murray North Station, and Murray Central Station Small Area Plans	Opportunities to address potential hazard mitigation actions in focused areas of development/revitalization.

Capability Assessment

Local mitigation capabilities are existing authorities, policies, programs, and resources that reduce hazard impacts or could help carry out hazard mitigation activities.

Planning and Regulatory Capabilities

Planning and regulatory capabilities are the plans, policies, codes, and ordinances that prevent and reduce the impacts of hazards.

Table 11: Assessment of the Planning Capabilities of the City of Murray

Plan	Does it address hazards? (Y/N)	How can it be used to implement mitigation actions?	When was the last update? When is the next update?
General Plan	Y	Can be incorporated into long-term goals and initiatives that are referenced	2017
Capital Improvement Plan	Y	Provides information on the funding source	2017
Climate Change Adaptation Plan	N/A	N/A	N/A
Community Wildfire Protection Plan	N/A	N/A	N/A
Economic Development Plan	Y – referenced in General Plan	Provides information on funding sources for mitigation actions	2024
Land Use Plan	Y – referenced in General Plan	Provides information on long-term initiatives and goals, which can be incorporated into mitigation actions	2017
Local Emergency Operations Plan	Y	Informs mitigation actions as far as priority tasks and areas within the city	2018
Stormwater Management Plan	Y	Can be used to inform flooding mitigation actions	2020
Transportation Plan	Y	Can inform mitigation actions as far as priority areas and tasks	2021
Substantial Damage Plan	N/A	N/A	N/A
Other? (Describe)	Sanitary Sewer Management Plan	Can inform water-related mitigation actions for the city	2022
Other	Flooding Plan	Provides information on responsibilities and the chain of command in the event of a flood	2011

DRAFT

Table 12: Assessment of the Regulations and Ordinances of the City of Murray

Regulation/Ordinance	Does it effectively reduce hazard impacts?	Is it adequately administered and enforced?	When was the last update? When is the next update?
Building Code	Y; the city effectively enforces the adopted building codes. The adopted codes include the state building codes, the current version being the International Building Code (IBC 2021) as amended, as well as the 1997 edition of the Uniform Code for Abatement of Dangerous Buildings (ISSN 0896-971X), published by the International Conference of Building Officials and Voluntary Seismic Retrofit: The Guidelines for the Seismic Retrofit of Existing Buildings (ISBN 1580010709), published by the International Conference of Building Officials.	Y	2025

Floodplain Ordinance	Y	Y	2022
Subdivision Ordinance	Y	Y	2023
Zoning Ordinance	Y	Y	2023
Natural Hazard-Specific Ordinance (Stormwater, Steep Slope, Wildfire)	Y	Y	2023
Acquisition of Land for Open Space and Public Recreation Use	Y	Y	2023
Prohibition of Building in At-Risk Areas	Y	Y	2023
Other? (Describe)			

DRAFT

Administrative and Technical Capabilities

Administrative and technical capabilities include staff and their skills. They also include tools that can help carry out mitigation actions.

Table 13: Assessment of the Administrative Capabilities of the City of Murray

Administrative Capability	In Place? (Y/N)	Is staffing adequate?	Are staff trained on hazards and mitigation?	Is coordination between agencies and staff effective?
Chief Building Official	Y	Y	Y	Y

Administrative Capability	In Place? (Y/N)	Is staffing adequate?	Are staff trained on hazards and mitigation?	Is coordination between agencies and staff effective?
Civil Engineer	Y	Y	Y	Y
Community Planner	Y	Y	Y	Y
Emergency Manager	Y	Y	Y	Y
Floodplain Administrator	Y	Y	Y	Y
Geographic Information System (GIS) Coordinator	Y	Y	Y	Y
Planning Commission	Y	Y	Y	Y
Fire Safe Council	N – have local Fire Department	N/A	N/A	N/A
CERT (Community Emergency Response Team)	Y	Y	Y	Y
Active VOAD (Voluntary Agencies Active in Disasters)	Y	Y	Y	Y
Other? (Please describe.)				

Table 14: Assessment of the Technical Capabilities of the City of Murray

Technical Capability	In Place? (Y/N)	How has it been used to assess/mitigate risk in the past?	How can it be used to assess/mitigate risk in the future?
Mitigation Grant Writing	Y	Grant funds can be used to support mitigation actions.	Grants can be an additional pool of money for mitigation actions.
Hazard Data and Information	Y	Identify areas of concern or areas to prioritize for mitigation actions	Monitor areas of concern or high risk over time
GIS	Y	Heat mapping of areas of concern	Mitigation action tracking and project management
Mutual Aid Agreements	Y	Agreements with surrounding jurisdictions and local agencies/organizations to mitigate risk	Mutual aid agreements are helpful for mitigating risks, especially on projects that cross jurisdictional boundaries.
Other? (Please describe.)			

DRAFT

Financial Capabilities

Financial capabilities are the resources to fund mitigation actions. Talking about funding and financial capabilities is important to determine what kinds of projects are feasible, given their cost. Mitigation actions like outreach programs are lower cost and often use staff time and existing budgets. Other actions, such as earthquake retrofits, could require substantial funding from local, state, and federal partners. Partnerships, including those willing to donate land, supplies, in-kind matches, and cash, can be included.

Table 15: Assessment of the Financial Capabilities of the City of Murray

Funding Resource	In Place? (Y/N)	Has it been used in the past and for what types of activities?	Could it be used to fund future mitigation actions?	Can it be used as the local cost match for a federal grant?
Capital Improvement Project Funding	Y	Stormwater management and operations	Y	Y

Other?				

Education and Outreach Capabilities

Education and outreach capabilities are programs and methods that could communicate about and encourage risk reduction. These programs may be run by a participant or a community-based partner. Partners, especially those who work with underserved communities, can help identify additional education and outreach capabilities.

Table 16: Assessment of the Education and Outreach Capabilities of the City of Murray

Education and Outreach Capability	In Place? (Y/N)	Does it currently incorporate hazard mitigation?	Could it be used to support mitigation in the future?

Other? (Please describe.)			

Opportunities to Expand and/or Improve Capabilities

Actions that can expand and improve existing authorities, plans, policies, and resources for mitigation include budgeting for mitigation actions, passing policies and procedures for mitigation actions, adopting and implementing stricter mitigation regulations, approving mitigation updates, and making additions to existing plans as new needs are recognized. Table 17 lists the opportunities for the city of Murray.

Table 17: Opportunities to Expand and/or Improve the Capabilities of the City of Murray

Capability	Opportunity to Expand and/or Improve
Planning and Regulation	The city can expand the current substantial damage provisions by creating a Substantial Damage Plan, which clearly designates roles and responsibilities, resources and data sources, and approaches to educating and implementing substantial damage determination requirements and retrofits.
Administrative and Technical	Partnerships, including those with organizations like the National Weather Service (NWS), can be expanded to improve coordination on hazard awareness activities and the collection of disaster data, which can be used to demonstrate the cost-effectiveness of mitigation actions.
Financial	This city can apply for federal mitigation grants, such as the Hazard Mitigation Grant Program (HMGP), Flood Mitigation Assistance (FMA), and other pre-disaster mitigation funding as available.
Education and Outreach	The city can develop new multi-modal education approaches (such as live trainings, web, print, and broadcast media materials). Additionally, education programs can be more targeted, focusing on vulnerable populations, such as people with special needs.

Mitigation Strategy

Mitigation strategies provide proactive measures that are designed to minimize the impacts of hazards on the city of Murray. Table 18 shows mitigation action alternatives, and

Table 19 shows the status of previous mitigation activities. Table 20 is the 2025 mitigation action plan for the city of Murray.

Table 18: Mitigation Action Alternatives for the City of Murray

Action	Type of Action	Selected for inclusion in the plan?	If not selected, why not?
Identify evacuation routes and shelters.	All hazards	No	Not mitigation

DRAFT

Action	Type of Action	Selected for inclusion in the plan?	If not selected, why not?
Develop an evacuation plan for the city.	All hazards	No	Not mitigation

Table 19: Status of Prior Mitigation Actions of the City of Murray[2]

Action	Hazard(s)	Agency Lead	Support Agency(ies)	Status Update
Structural improvement in public buildings.	Earthquake	Murray EM	Public Works	Completed. All four Murray schools needing seismic retrofit were completed.
Procure generators for the assisted living facility and schools.	All hazards	Murray EM	Public Works	Incomplete. Funding issue.
Conduct reinforcements for the Power Department headquarters.	Earthquake	Murray EM	Public Works	Complete. New SCADA system in service for off-site operations.
Conduct a Flood Study, improve culverts and drainage, elevate roads and bridges, and build up berms	Flooding	Murray EM	Public Works	Complete. Murray Park upgrades to the riverbank and flood retaining walls installed in trouble spots.
Remove tailings from the old towers.	All hazards	Murray EM	Public Works	Deleted. Tailings are going to be left in place.
Conduct training and awareness activities on communications equipment, tools, and systems.	All hazards	Murray EM	SLCo EM	Ongoing. FD conducts regular trainings. Emergency management training annually with the Mayor's Office and all city department heads.
Improve EOC to allow for a more functional working environment during EOC activations.	All hazards	Murray EM		Ongoing. Chairs added, a large screen TV added, and a plotter/printer added.
Evaluate vulnerability of critical communications systems.	All hazards	Murray EM	SLCo EM, VECC, UCA	Ongoing. Ham radio repeater installed on tower at the Humane Society.
Establish redundancy for dispatch centers and other critical communications systems.	All hazards	Murray EM	SLCo EM, VECC, UCA	Ongoing. Purchase of dual-band radios for the FD.

[2] EM = Emergency Management, FD = Fire Department, NWS = National Weather Service, SCADA = Supervisory Control and Data Acquisition, SLCo EM = Salt Lake County Emergency Management, UCA = Utah Communications Authority, UDEM = Utah Division of Emergency Management, VECC = Valley Emergency Communications Center.

Action	Hazard(s)	Agency Lead	Support Agency(ies)	Status Update
Establish a coordinating group to address long-term communications needs and implementation strategies.	All hazards	Murray EM	SLCo EM, VECC, UCA	Ongoing.
Acquire, upgrade, and/or integrate communications equipment and systems as determined by coordinating group.	All hazards	Murray EM	SLCo EM, VECC, UCA	Ongoing. A new P25 system is being installed across the state.
Provide education regarding all-natural hazards through live trainings and web-based, print, and broadcast media.	All hazards	Murray EM	SLCo EM	Ongoing. The Rotary Club and Monte Cristo Apartments receive education. All Murray second graders receive annual fire prevention and safety training.
Develop education programs to target specific groups including homeowners, developers, schools, and people with special needs.	All hazards	Murray EM	SLCo EM, Murray School District	Ongoing. The Fire Marshal's Office regularly briefs new construction projects. All Murray 2nd graders receive annual fire prevention and safety training.
Ensure that current hazard ordinances are available for viewing online.	All hazards	Murray EM	Murray Planning and Development	Incomplete.
Provide information on landscaping alternatives for persons subject to green area requirements.	Drought	Murray EM	SLCo EM	Ongoing. The city of Murray publishes and provides incentives to Murray residents on the city website.
Identify structures at risk of earthquake damage.	Earthquake	Public Works	SLCo EM, UDEM	Incomplete.
Research feasibility of an incentive program for retrofitting privately owned buildings, particularly unreinforced masonry.	Earthquake	Public Works	SLCo EM, UDEM	Incomplete.
Complete seismic rehabilitation/retrofitting projects of public buildings at risk.	Earthquake	Public Works	SLCo EM, UDEM	Incomplete. Need project leader and funding.

DRAFT

Action	Hazard(s)	Agency Lead	Support Agency(ies)	Status Update
Procure an Engineering Consultant to perform the nonstructural design and geotechnical assessment and review. CUWCD staff will procure contractor and/or install nonstructural bracing per consultant's design.	Earthquake	Public Works		Incomplete.
Determine potential flood impacts and identify areas in need of additional flood control structures.	Flooding	Public Works	SLCo Flood Control, SLCo EM, UDEM	Ongoing. Trouble spot at Little Cottonwood Creek and Murray Power. Six-inch pump purchased with a state grant to help mitigate issues in that area.
Address identified problems through construction of debris basins, flood retention ponds, energy dissipaters, and other flood control structures.	Flooding	Public Works	SLCo Flood Control, SLCo EM, UDEM	Ongoing. Murray Park received multiple upgrades, including retaining walls alongside the creek and flood barriers in all low-lying areas in the park.
Establish maintenance and repair programs to remove debris, improve resistance, and otherwise maintain effectiveness of stormwater and flood control systems.	Flooding	Public Works	SLCo Flood Control	Ongoing. Reporting program to County Flood Control in place to notify of problem areas and debris needing creek bed removal.
Modify/upgrade structures and conveyances as needed to address deficiencies.	Flooding	Public Works	SLCo Flood Control, SLCo EM	Incomplete. Need champion and funding.
Maintain contact with NWS before re-application.	Severe Weather	Murray EM	SLCo EM, NWS	Ongoing. Good communications with the NWS through cell phone contact and online requests for NWS support.
Install larger and higher vent piping.	Gas Turbine Plant	Public Works	Local utility companies	Incomplete.
Fix existing gas line connections that are earthquake resilient.	Gas Turbine Plant	Public Works	Local utility companies	Incomplete. Revised wording.

DRAFT

THIS PAGE INTENTIONALLY LEFT BLANK

Table 20: 2025 Mitigation Action Plan for the City of Murray[3]

#	Action	Hazard(s)	Lead Agency	Potential Partners	Benefits (Losses Avoided)	Cost Estimate	Funding Source(s)	Timeframe	Priority	Comments
1	Procure generators for the assisted living facility and schools.	Earthquake, Extreme Heat, Extreme Cold, Flooding, Heavy Rain, High Wind, Lightning, Severe Winter Weather, Tornado, Dam Failure, Cyberattack	Murray EM	SLCo EM	Ensures safety and well-being of residents in assisted living during power outages, including continued operation of life-sustaining medical equipment. Ensures the safety of students and continuing functionality of educational activities.	Medium	Murray General Fund	Ongoing	Medium	Funding has been a barrier to completion.
2	Conduct training and awareness activities on communications equipment, tools, and systems.	Drought, Earthquake, Extreme Heat, Extreme Cold, Flooding, Landslide/Slope Failure, Radon, Heavy Rain, High Wind, Lightning, Severe Winter Weather, Tornado, Wildfire, Dam Failure, Civil Disturbance, Cyberattack, Hazardous Materials, Public Health Epidemic/Pandemic, Terrorism	Murray EM	SLCo EM, VECC, UCA, NGO partners	Ensures key departments and agencies are connected.	Medium	Murray General Fund, SLCo EM, BRIC grant, HMGP grant	Ongoing	High	There is a need for more personnel trained in amateur radio; currently working to try to get fire department members to take an amateur radio class at a local university.
3	Improve EOC to allow for a more functional working environment during EOC activations.	Drought, Earthquake, Extreme Heat, Extreme Cold, Flooding, Landslide/Slope Failure, Radon, Heavy Rain, High Wind, Lightning, Severe Winter Weather, Tornado, Wildfire, Dam Failure, Civil Disturbance, Cyberattack, Hazardous Materials, Public Health Epidemic/Pandemic, Terrorism	Murray EM	SLCo EM, Murray FD, Murray PD	Improves communication and coordination between different departments, agencies, and outside organizations	Medium	Murray General Fund, EMPG, HMGP grant, BRIC grant, EOC grant	Ongoing	High	Some improvements have been completed. An EMPG competitive grant has been obtained, which will allow for the purchase of another monitor, a speaker system in the EOC, and table and chairs for an additional work/break area.
4	Evaluate vulnerability of critical communications systems.	Drought, Earthquake, Extreme Heat, Extreme Cold, Flooding, Landslide/Slope Failure, Radon, Heavy Rain, High Wind, Lightning, Severe Winter Weather, Tornado, Wildfire, Dam Failure, Civil Disturbance, Cyberattack, Hazardous Materials, Public Health Epidemic/Pandemic, Terrorism	Murray EM	Murray Communications, SLCo EM, Murray PD, Murray FD	Improved understanding of vulnerabilities to make needed improvements	Medium	Murray General Fund, SHSP grant	Ongoing	High	Satellite phones have been purchased; there is a need to train more members on their use.
5	Establish redundancy for dispatch centers and other critical communications systems.	Drought, Earthquake, Extreme Heat, Extreme Cold, Flooding, Landslide/Slope Failure, Radon, Heavy Rain, High Wind, Lightning, Severe Winter Weather, Tornado, Wildfire, Dam Failure, Civil Disturbance, Cyberattack,	Murray EM	Murray Communications, SLCo EM, VECC, UCA, Murray PD, Murray FD	Ensures coordination and communication between the city and local agencies/jurisdictions	Medium	Murray General Fund, County General Fund, SHSP grant	Ongoing	High	Installing backup server for the city.

[3] BRIC = Building Resilient Infrastructure and Communities, CUWCD = Central Utah Water Conservancy District, EM = Emergency Management, EOC = Emergency Operations Center, FD = Fire Department, HMGP = Hazard Mitigation Grant Program, MSD = Municipal Services District, NGO = nongovernmental organization, NWS = National Weather Service, PD = Police Department, SCADA = Supervisory Control and Data Acquisition, SLCo EM = Salt Lake County Emergency Management, SHSP = State Homeland Security Program, UCA = Utah Communications Authority, UDEM = Utah Division of Emergency Management, VECC = Valley Emergency Communications Center.

#	Action	Hazard(s)	Lead Agency	Potential Partners	Benefits (Losses Avoided)	Cost Estimate	Funding Source(s)	Timeframe	Priority	Comments
		Hazardous Materials, Public Health Epidemic/Pandemic, Terrorism								
6	Utilize coordinating group to address long-term communication needs and implementation strategies.	Drought, Earthquake, Extreme Heat, Extreme Cold, Flooding, Landslide/Slope Failure, Radon, Heavy Rain, High Wind, Lightning, Severe Winter Weather, Tornado, Wildfire, Dam Failure, Civil Disturbance, Cyberattack, Hazardous Materials, Public Health Epidemic/Pandemic, Terrorism	Murray EM	Murray Communications, SLCo EM, VECC, UCA, Murray FD, Murray PD, SLCo Public Works, Murray Public Works	Identifies communication needs and solutions for the city	Medium	Murray General Fund, SLCo EM	Ongoing	High	The group was established as noted in previous plan actions. The administrative staff of the fire department makes up the group. Currently working with amateur radio volunteers to help determine which equipment is still needed.
7	Acquire, upgrade, and/or integrate communications equipment and systems as determined by the coordinating group.	Drought, Earthquake, Extreme Heat, Extreme Cold, Flooding, Landslide/Slope Failure, Radon, Heavy Rain, High Wind, Lightning, Severe Winter Weather, Tornado, Wildfire, Dam Failure, Civil Disturbance, Cyberattack, Hazardous Materials, Public Health Epidemic/Pandemic, Terrorism	Murray EM	Murray Communications, SLCo EM, UCA, Murray Public Works, Murray FD, Murray PD	Improved understanding of communications capabilities	Medium	Murray General Fund, SHSP grant	Ongoing	High	An EMPG competitive grant was awarded in 2014 to help update amateur radio equipment and install speakers in the EOC.
8	Provide education regarding all-natural hazards through live trainings and web-based, print, and broadcast media.	Drought, Earthquake, Extreme Heat, Extreme Cold, Flooding, Landslide/Slope Failure, Radon, Heavy Rain, High Wind, Lightning, Severe Winter Weather, Tornado, Wildfire, Dam Failure, Civil Disturbance, Cyberattack, Hazardous Materials, Public Health Epidemic/Pandemic, Terrorism	Murray EM	NWS, SLCo EM, local jurisdictions, NGO partners, Murray Public Works	Increased local understanding of natural hazards and ways in which residents can reduce their risk. For example, the following techniques will help the public reduce their risk: • Drought: Share water conservation techniques and strategies for drought-resistant landscaping. • Earthquake: Provide instruction on home retrofitting and "Drop, Cover, and Hold On" drills. • Extreme Heat: Offer guidelines on staying hydrated, using cooling centers, and energy-efficient home cooling. • Extreme Cold: Discuss insulation techniques, safe heating practices, and preparing vehicles for winter conditions.	Low	Murray General Fund, BRIC grant, HMGP grant, NWS	Ongoing	High	Mainly through CERT and *Murray Journal* articles.

DRAFT

#	Action	Hazard(s)	Lead Agency	Potential Partners	Benefits (Losses Avoided)	Cost Estimate	Funding Source(s)	Timeframe	Priority	Comments
					• Flooding, Dam Failure, Heavy Rain: Teach flood-proofing methods like elevating utilities, using rain barrels, and having proper drainage systems. • Landslide/Slope Failure: Inform residents on recognizing warning signs and stabilizing slopes with vegetation. • Radon: Explain testing procedures and mitigation strategies for radon gas in homes. • Lightning: Share safety tips for indoor and outdoor lightning protection. • Severe Winter Weather, Tornado: Educate residents on identifying safe shelter locations and home weatherization. • Wildfire: Offer guidance on creating defensible space and using fire-resistant landscaping. • Public Health Epidemic/Pandemic: Provide resources on hygiene practices, vaccination, and community health strategies.					
9	Develop education programs to target specific groups, including homeowners, developers, schools, and people with special needs. DRAFT

City of Riverton Annex

To participate in this multi-jurisdictional hazard mitigation plan (MJHMP) update for Salt Lake County (SLCo), the governing body of the city of Riverton passed a formal resolution, a copy of which is maintained at the local government offices.

Planning Process Contact Information

Table 1 provides information on the point of contact during the updating of the MJHMP.

Table 1: Contact Information for the City of Riverton

DRAFT

Location and Description

The city occupies 12.6 square miles (32.6 km²). Riverton shares its borders with South Jordan to the north, Draper to the east, Bluffdale to the south, and Herriman to the west. It is located in the southwestern corner of the Salt Lake Valley.

Population

The city of Riverton had a population in July 2018 of 45,600,[1] an increase of 14.4% from the April 2010 census, which reported a population of 44,419.

Table 3: Population Data for the City of Riverton

2018 Population	22018 Population Estimate	Estimated Change 2010–2023	2023 # of Housing Units	2018 Estimated # of Housing Units	Estimated change 2010–2023
45,600	44,419	2.65%	13,101	11,212	16.85%

Demographics

The city of Riverton is a growing community characterized by its diverse demographics. The median household income in Riverton is approximately $115,869, reflecting the city's economic stability and attraction for families. The poverty rate in the area is around 3.5%, which is lower than the national average, indicating that most residents have access to economic opportunities. The median age of males in Riverton is about 33 years, while for females, it is slightly higher at around 35 years.[2] This age distribution suggests a family-oriented community, with many residents in their prime working years. Overall, Riverton's demographics depict a prosperous and thriving suburban environment. 90% of the population speak English at home, 5.4% speak Spanish, and 1.8% speak Asian and Pacific Island languages.[3]

Brief History

The area that is now the city of Riverton was settled in the 1850s. The people lived in crude, widely scattered dugout homes along the river bottoms. Archibald Gardner was the largest landowner, and he might have been the first to live on Riverton land, though early accounts disagree. Because of this, the land along the Jordan River and the surrounding area was called Gardnerville. Due to the lack of irrigation water, initial growth was slow. However, the town began to grow as settlers developed a cooperative to build a ditch, which was later expanded to a canal. This expanded cultivation, which attracted new residents. Riverton became incorporated into a town in 1948 and a city of the third class on July 3, 1967.

[2] Ibid.
[3] U.S. Census, American Community Survey 2023. https://data.census.gov/table/ACSST5Y2023.S1601?q=riverton,+utah+language.

By 1914, Riverton began to prosper as an agricultural community, due to additional water and people. Riverton's business district also thrived. In 1879, a judicial precinct was established, and the settlement's name was officially changed from Gardnerville to Riverton by Judge Charles Smith. The first meetinghouse was constructed in 1879, which also served as a church and a schoolhouse. A new meetinghouse was planned, and the architect selected was Richard Kletting, who also designed the Utah State Capitol. The entire community worked to haul material, by wagons, including granite from Little Cottonwood Canyon. The Old Dome Church, as it came to be known, was used by the residents until it was torn down in 1940.

In the late 1800s, Riverton farmers gradually changed from self-sufficient to commercial farming. They specialized in alfalfa, wheat, sugar beets, tomatoes, poultry, sheep, and dairy cows. At this time, the LDS Church began storing tithed produce and livestock on land at 1150 West 12400 South. This area is now known as Tithing Hill. In 1912, electricity came to Riverton, and in 1913, the Salt Lake and Utah Railroad (Orem Line) passed through Riverton west of Redwood Road. It stretched from Salt Lake to Payson and was used as a commuter and freight line. Riverton had its own train depot, and trains used this line from 1914 to 1945, after which the rails and ties were removed and the depot was torn down.

The city of Riverton has worked with residents to continue traditions such as the annual Town Days event. Residents in the Salt Lake Valley have quick access to many recreational activities. The Wasatch Mountains, ski resorts, and Utah Lake are just a short drive to satisfy the city's many active residents.

Climate

The average high temperature is 67.3°F, and the low temperature is 43.1°F, with an overall average of 55.2°F. The city gets 16 inches of rain each year and 43 inches of snow. Although warmer than many other places in Utah, the city of Riverton has around 133 days each year in which nighttime temperatures drop below freezing, and it has an average of 46 days that reach a temperature above 90°F.

Public Services

The city of Riverton provides a full range of services to its residents and businesses. General governmental services include building inspection, construction, and maintenance of street lighting, roadways, and parks, as well as recreation and cultural events. The city also provides utility services for culinary water, secondary water, sanitation, and stormwater. In July 2019, the police department was created.

Governing Body

Riverton, Utah, is a third class city as defined by the Utah State Code and operates as a "six-member council" form of government. That is, the governing body consists of a mayor and five council members (see: Utah Code § 10-3b-301). City Council members are elected for terms of four years. The city council holds all authority to adopt ordinances, pass resolutions, adopt annual budgets, regulate zoning and land development, establish city fees, create long-range plans for city services and utilities, and set regulatory standards for providing other city services. The mayor serves as chair of the city council and chief

DRAFT

executive officer. On December 6, 2011, the Riverton City Council re-codified its municipal ordinances and reaffirmed the long-standing office of the City Manager, a full-time position that oversees all city departments and directly reports to the city council and mayor.

Development Trends

According to its website, the city of Riverton is one of the fastest-growing cities in America. It has grown from a rural farming town into a suburban city. Businesses, housing, and roads have replaced many farms and cattle ranges. The growth was supported by the opening of the Intermountain Riverton Hospital in November 2009 and the Mountain View Village shopping center in 2018. The city anticipates continued growth and business expansion while maintaining its 30 community parks. Much like the rest of the southwestern corner of the Salt Lake Valley, rapid growth in the community is anticipated in the coming years. To encourage new businesses to come to the city, business licensing fees were eliminated in 2018.

Jurisdiction-Specific Hazards and Risk

The Calculated Priority Risk Index (CPRI) is a comprehensive assessment tool for evaluating and prioritizing risks in a given context. It considers various factors, such as probability, impact, and urgency, to determine the level of risk associated with events or situations. The results for each hazard, including its risk factor (RF) value, are shown in Table 4. The results are based on the criteria in

Table 5 and the equation that follows it. The CPRI helps organizations and individuals make informed decisions about risk management and mitigation strategies. It provides a systematic approach to identifying and addressing potential issues, allowing for a more efficient allocation of resources and proactive risk prevention. With the CPRI, stakeholders can prioritize their focus on the most critical risks, leading to more effective risk management and, ultimately, better outcomes.

Table 4: Calculated Priority Risk Index Values for the City of Riverton

Type of Hazard Event	Probability of Future Events	Spatial Extent	Severity of Life/ Property Impact	Warning Time	Duration	Response Capacity	Risk Factor Value
Avalanche	1	1	1	1	1	1	1
Drought	2	2	2	1	3	1	1.9
Earthquake	2	4	4	4	4	2	3.2
Extreme Heat	2	2	1	1	3	1	1.6
Extreme Cold	2	2	1	1	3	1	1.6
Flooding	1	2	2	3	3	1	1.8
Landslide/ Slope Failure	1	1	1	4	1	2	1.4
Radon	3	1	2	1	4	2	2.3
Heavy Rain	3	2	1	2	2	1	1.9

Type of Hazard Event	Probability of Future Events	Spatial Extent	Severity of Life/ Property Impact	Warning Time	Duration	Response Capacity	Risk Factor Value
High Wind	2	2	1	2	2	1	1.6
Lightning	2	1	1	4	1	1	1.6
Severe Winter Weather	2	2	1	1	2	1	1.5
Tornado	1	1	1	4	1	2	1.4
Wildfire	2	2	2	2	3	2	2.1
Dam Failure	1	2	3	2	1	2	2.1
Civil Disturbance	1	1	1	3	1	2	1.3
Cyberattack	2	2	1	4	1	2	1.8
Hazardous Materials Incident (Transportation & Fixed Facility)	2	2	1	4	1	1	1.7
Public Health Epidemic/ Pandemic	2	2	1	1	4	1	1.7
Terrorism	1	1	1	4	1	1	1.3

Table 5: Criteria for the Calculated Priority Risk Index

Risk Index Factor	Degree of Risk Level		Criteria	Factor Weight for Degree of Risk Level
Probability of Future Events	1	Unlikely	Less than 1 percent probability of occurrence in the next year or a recurrence interval of greater than every 100 years.	30%
	2	Occasional	1 to 10 percent probability of occurrence in the next year or a recurrence interval of 11 to 100 years.	
	3	Likely	11 to 90 percent probability of occurrence in the next year or a recurrence interval of 1 to 10 years.	
	4	Highly Likely	91 to 100 percent probability of occurrence in the next year or a recurrence interval of less than 1 year.	
Spatial Extent	1	Limited	Less than 10% of the planning area could be impacted.	10%
	2	Small	10%–25% of the planning area could be impacted	
	3	Significant	25%–50% of the planning area could be impacted.	

DRAFT

Risk Index Factor	Degree of Risk Level		Criteria	Factor Weight for Degree of Risk Level
	4	Extensive	50%–100% of the planning area could be impacted.	
Severity of Life/Property Impact	1	Negligible	Less than 5% of the affected area's critical and non-critical facilities and structures are damaged/ destroyed. Only minor property damage and minimal disruption of life. Temporary shutdown of critical facilities.	30%
	2	Limited	More than 5% and less than 25% percent of property in the affected area is damaged/ destroyed. Complete shutdown of critical facilities for more than one day but less than one week.	
	3	Critical	More than 25% and less than 50% of property in the affected area was damaged/ destroyed. Complete shutdown of critical facilities for over a week but less than one month.	
	4	Catastrophic	Over 50% of critical and non-critical facilities and infrastructures in the affected area are damaged/ destroyed. Complete shutdown of critical facilities for more than one month.	
Warning Time	1	Self-defined	More than 24 hours	10%
	2	Self-defined	12 to 24 hours.	
	3	Self-defined	6 to 12 hours.	
	4	Self-defined	Less than 6 hours.	
Duration	1	Brief	Up to 6 hours.	10%
	2	Intermediate	Up to one day.	
	3	Extended	Up to one week.	
	4	Prolonged	More than one week.	
Response Capacity	1	High	Significant resources and capability to respond to this kind of event; staff are trained, experienced, and ready.	10%
	2	Medium	Some resources and capability to respond to this kind of staff; some staff may be trained, experienced, and ready while others may need additional support.	
	3	Low	Limited resources and capability to respond to this kind of event; additional staff or staff training needed.	
	4	None	No resources and capability to respond this kind of event; additional outside support would be required.	

DRAFT

RISK FACTOR (RF) EQUATION

RF Value = [(Probability x 0.30) + (Spatial Extent x 0.10) + (Severity of Life/Property Impact x 0.30) + (Warning Time x 0.10) + (Duration x 0.10) + (Response Capacity x 0.10)]

Hazards with an RF value greater than or equal to 2.5 are considered high risk. Those with RF values of 2.0 to 2.4 are considered moderate risk hazards, and those with an RF value less than 2.0 are considered low risk. The highest possible RF value is 4.

Hazard Event History

Examining hazard event histories provides valuable insights to inform decision-making and help prioritize resources for risk prevention and response efforts. Table 6 lists the hazard events impacting the city of Riverton since 2019, according to the Storm Events Database from the National Centers for Environmental Information.

Table 6: History of Hazard Events in the City of Riverton

Location	Date	Event Type	Deaths	Injuries	Property Damage	Crop Damage
Riverton	06/21/2024	Hail	0	0	$0	$0

National Flood Insurance Program Summary

The city of Riverton participates in the National Flood Insurance Program (NFIP). Table 7 displays statistics related to the NFIP. The city of Riverton does not participate in the Community Rating System (CRS).

Table 7: National Flood Insurance Program Status for the City of Riverton[4]

Initial FHBM Identified	Initial FIRM Identified	Current Effective Map Date	Adopted Date	Date Joined NFIP	Tribal
11/01/1974	02/19/1986	11/19/2021	2021	02/19/1986	No

Table 8: National Flood Insurance Overview for the City of Riverton

Community ID	Number of Losses	Total Net Payment	Active Policies	Total Coverage
490104	14	$28,777.17	28	$8,275,000

Questions in Table 9 were answered to the best of the city of Riverton's ability.

[4] FIRM = Flood Insurance Rate Map, FHBM = Flood Hazard Boundary Map.

Table 9: NFIP Floodplain Management Capabilities and Compliance

Question	Response
What department is responsible for floodplain management in your jurisdiction?	Public Works
Who is your jurisdiction's floodplain administrator? (department/position)	Flood Control Engineer, Public Works Department
Are any certified floodplain managers on staff in your jurisdiction?	No
Does your jurisdiction have any outstanding NFIP compliance violations that need to be addressed? If so, please state what they are.	No
Do your flood hazard maps adequately address the flood risk within your jurisdiction? (If no, please state why)	Yes
Does your floodplain management staff need any assistance or training to support its floodplain management program? If so, what type of assistance/ training is needed?	No
Does your jurisdiction participate in the Community Rating System (CRS)? If so, is your jurisdiction seeking to improve its CRS Classification? If not, is your jurisdiction interested in joining the CRS program?	No

The city of Riverton's Floodplain Administrator is the city manager or designee, in this case the Flood Control Engineer. The current Flood Damage Prevention Ordinance was adopted on 5/20/2025. The current Flood Insurance Rate Map is dated 11/19/2021. The city requires detailed Floodplain Development Permits for construction in the Special Flood Hazard Area. These permits are submitted to the Stormwater Division, which includes the Flood Control Engineer. Substantial damage/substantial improvement determinations are made through the permitting process. Structures that meet these definitions are required to comply with current codes and standards.

Jurisdiction-Specific Vulnerabilities and Impacts

Table 10 provides information on the vulnerable assets in the city of Riverton, including its critical facilities, highlighting the city's vulnerability to identified hazards. It also describes the potential impacts to the community arising from those vulnerabilities. Impacts are the consequences or effects of each hazard on the assets. By understanding the risks associated with these assets, local authorities can develop proactive strategies to mitigate vulnerabilities and ensure the safety and functionality of these important assets during hazard events. These data are invaluable for decision-making and prioritizing resources for emergency response and preparedness efforts, ultimately contributing to more effective risk management and greater resilience in the community.

DRAFT

Table 10: Jurisdictional Vulnerabilities and Impacts in the City of Riverton

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
Avalanche	People	*Vulnerability:* Avalanche risk is primarily limited to mountains with steep terrain and higher snow accumulation. Riverton is located in the valley and does not have terrain or snow accumulations that create avalanche conditions within the city. *Impacts:* There are no known impacts within the city. Individuals vulnerable to avalanches primarily include backcountry outdoor enthusiasts like skiers and hikers who may lack proper avalanche knowledge and safety precautions or do not monitor avalanche forecasts.
	Structures	There are no structures in Riverton that are considered to be at risk from avalanches.
	Economic Assets	The economic risk in Riverton due to avalanches is low. Tourism-related businesses, such as ski resorts and outdoor recreation facilities, may face disruptions, leading to financial losses. In addition, critical infrastructure in neighboring communities, such as roads and power lines, could be compromised, which may have indirect effects on local businesses and emergency response efforts.
	Natural, Historic, and Cultural Resources	Risk to natural, historic, and cultural resources from avalanches is minimal in Riverton.
	Critical Facilities and Infrastructure	There are no critical facilities in Riverton that are vulnerable to avalanches. Riverton residents who commute to other cities may be vulnerable to indirect effects if transportation routes near the canyons are closed or damaged by an avalanche.
	Community Activities	There is no risk to Riverton community activities from avalanches.
Drought	People	*Vulnerability:* All residents in Riverton are vulnerable to drought. Public health is vulnerable to deterioration in air, soil, and water quality. *Impacts:* Extended drought can lead to restrictions on water use, increased costs for water, or limited drinking water supply. Drought can contribute to poor air and water quality, which can increase vulnerability for people with respiratory problems, especially children and the elderly. Limited drinking water places those with access and functional needs at higher risk. Utility bills may be higher, and lower income households are more vulnerable to the effects of higher costs.
	Structures	*Vulnerability:* All structures are vulnerable to drought. *Impacts:* Water use could be restricted and may lead to changes in landscaping. Prolonged drought and limits to water supply may restrict future growth or development. Prolonged drought can lead to contraction of soils, which may lead to cracks in foundations or walls.
	Economic Assets	*Vulnerability:* Riverton businesses are vulnerable to drought. *Impacts:* Prolonged drought may lead to water restrictions or increased costs for culinary water and irrigation water for landscaping. Increased costs may lead to losses for businesses. Consumer spending may decrease due to changes in household budgets. There

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		may be higher operational costs for local businesses. Store hours may be reduced, and local landscaping companies could suffer.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Parks, open spaces, and historic buildings are vulnerable to drought conditions. *Impacts:* Historic and cultural buildings may need alternative landscaping. Drought may affect the health of trees and other vegetation in the city. City parks and open spaces may see deterioration in the health of vegetation and increased erosion. Additionally, scenic and culturally valued open spaces used by residents for outdoor activities could become inaccessible or permanently altered. Riverbend Golf Course, Riverton City Park, CR Hamilton Sports Complex, Jordan River Parkway Trails, and other community gathering spaces are vulnerable.
	Critical Facilities and Infrastructure	*Vulnerability:* Water supply systems, emergency response, and public health facilities are vulnerable to drought conditions. *Impacts:* Water supply systems are susceptible to drought as they strive to deliver adequate water to the community. Emergency services are also susceptible to drought. Reduced precipitation may increase demand on fire departments for wildfire management. Public health facilities face water quality and availability challenges that affect drinking water and sanitation. Riverton Hospital and other healthcare facilities may be vulnerable to restrictions on the water supply.
	Community Activities	*Vulnerability:* Recreational spaces such as parks, golf courses, pools, and other open spaces are vulnerable. *Impacts:* Drought results in poor vegetation health and reduced appeal of parks and open spaces during drought. The city may struggle with maintenance of landscaping at city facilities. Households may encounter restrictions and costs for landscaping and pools.
Earthquake	People	*Vulnerability:* All of the more than 46,000 residents of Riverton are vulnerable to earthquakes. *Impacts:* An earthquake in the Salt Lake Valley or neighboring counties could produce strong ground shaking that would affect Riverton. Residents can be injured by falling objects or heavy furniture that has not been anchored. Those living in older buildings not up to seismic standards are vulnerable to injury or death if buildings collapse. Families with young children, the elderly, and individuals with disabilities who may struggle to seek cover during an earthquake are vulnerable. Residents near fault lines and those in densely populated areas are also at higher risk. In addition, individuals lacking resources for disaster preparedness, such as emergency supplies and evacuation information, may find it difficult to respond effectively during an earthquake, thus increasing their vulnerability.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
	Structures	*Vulnerability:* Many homes, businesses, and government facilities and their contents are vulnerable to damage from earthquakes. Older buildings not built according to modern seismic codes, unreinforced masonry, and homes with inadequate foundations may be particularly vulnerable. *Impacts:* Structures can experience extensive damage in an earthquake. Some lack the retrofitting needed to withstand earthquakes, and those built on unstable soil or near fault lines are at higher risk. Most of Riverton has low liquefaction potential, but the eastern part of the city near the Jordan River has moderate to high liquefaction potential. Structures in this area are more vulnerable to damage. Large commercial buildings without flexible designs can sustain severe damage. Overall, outdated construction practices and poor site selection contribute to their vulnerability.
	Economic Assets	*Vulnerability:* All businesses in Riverton are vulnerable to earthquakes. *Impacts:* Businesses in Riverton are likely to experience losses from an earthquake. Buildings and contents may be damaged, and businesses may be slow to reopen while repairs are completed. Damage to roads and utility systems, such as power, water, and communication, may also limit businesses' ability to operate. The flow of goods may be severely limited, and employees may not be able to travel to work. Spending may also be reduced due to losses experienced by consumers. Key assets include commercial buildings that may not meet modern earthquake-resistant codes and are at higher risk of damage. The local economy, reliant on retail and services, could face significant disruptions during seismic events. In addition, certain soil types can amplify ground shaking, increasing the risk of damage to these assets.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Riverton City Hall, historic structures, and community centers are vulnerable to earthquakes. *Impacts:* Historic structures and landmarks often lack modern seismic retrofitting, making them susceptible to damage. Riverton City Hall, which was originally constructed in 1925 and is on the National Register of Historic Places, may be vulnerable to damage in an earthquake. Cultural resources, including community centers, may also be at risk due to their architectural styles and inadequate building codes, compromising their integrity and the heritage they represent.
	Critical Facilities and Infrastructure	*Vulnerability:* Schools, Riverton Hospital and other healthcare facilities, and emergency services buildings such as fire and police stations are vulnerable to earthquakes. Transportation, water, wastewater, power, natural gas, and communications infrastructure are also vulnerable. *Impacts:* Damage to emergency response facilities and vehicles may delay response and contribute to the vulnerability of residents. All infrastructure systems may also be damaged and services interrupted due to ground shaking. Some facilities or systems may have higher vulnerability due to age and construction standards. Disruption to these systems may inhibit emergency response and place residents at additional risk. Significant transportation routes through or near Riverton include Bangerter Highway, Redwood Road, 13400 South, and 12600 South.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		No school campuses in Riverton were identified as having unreinforced masonry structures, but they may still be vulnerable to damage in a strong magnitude earthquake. Bridges and overpasses that lack modern engineering safeguards are also at risk.
	Community Activities	*Vulnerability:* All community activities and events are vulnerable to earthquakes. *Impacts:* Public gatherings, school events, and day-to-day activities are vulnerable to earthquakes due to the area's geological conditions and urban infrastructure. Vulnerability stems from factors such as buildings' age and structural integrity, inadequate emergency preparedness, and high population density, which can lead to increased risks and casualties during an earthquake.
Extreme Heat	People	*Vulnerability:* Extreme heat can affect all individuals in Riverton. *Impacts:* Extreme heat contributes to illness such as heat exhaustion, heat stroke, and dehydration. Particularly vulnerable populations during extreme heat include adults over 65, individuals with pre-existing health conditions, and young children, as they struggle to regulate body temperature. Socioeconomically disadvantaged individuals may lack access to cooling resources, while outdoor workers are at higher risk of heat-related illnesses due to physical labor without adequate hydration and rest. Individuals without housing may lack a place to seek relief from extreme heat and are vulnerable to heat-related illness. An estimated 8% of Riverton's population is under age 5, and 11% is over age 65, indicating at least 19% of the population is particularly vulnerable to the effects of extreme heat. In addition, 3.4% of the population is below the poverty level and is also more vulnerable. Extreme heat can worsen air quality by raising ozone levels, which poses respiratory risks.
	Structures	*Vulnerability:* All structures are vulnerable to extreme heat. *Impacts:* Residential buildings with inadequate insulation and ventilation and commercial buildings lacking reflective roofing and proper shading may be vulnerable. Materials like metal and glass can amplify heat retention, while areas with limited green space typically experience higher temperatures.
	Economic Assets	*Vulnerability:* Businesses and agriculture are vulnerable to extreme heat. *Impacts:* Agricultural operations can have reduced yields and higher water demand due to heat stress. The outdoor recreation industry may see decreased participation during heat waves, affecting local businesses that rely on visitors. In addition, the energy infrastructure could face strain from increased cooling demands, leading to outages. Canceled events can lead to economic losses.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Vegetation, wildfires, and historic buildings are vulnerable to extreme heat. *Impacts:* Local plant species and wildlife habitats can suffer from extreme heat conditions, leading to reduced biodiversity. Historic buildings may degrade due to high temperatures, causing materials to deteriorate and paint to peel. In addition, parks and recreational areas may experience overuse and risk their preservation, as residents seek relief from the heat. Extreme heat can have compounding effects on

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		drought and plant and wildlife health. It can also contribute to an increased risk of wildfires.
	Critical Facilities and Infrastructure	*Vulnerability:* Hospitals, schools, roads, and power grids are vulnerable to extreme heat. *Impacts:* Healthcare facilities, including Riverton Hospital, may experience increased demand due to heat-related medical issues, while schools can suffer from the strain on cooling resources. Transportation systems are at risk of damage, such as buckling roads and warped train tracks. In Riverton, this could affect Bangerter Highway, Redwood Road, 13400 South, or 12600 South. Damage to roadways can disrupt economic activity and limit the mobility of residents. Power grids may be strained by higher demand for electricity for cooling, leading to potential outages.
	Community Activities	*Vulnerability:* Activities like outdoor sports, fairs, and agricultural practices are vulnerable to extreme heat. *Impacts:* These events can pose risks, particularly for participants such as youth athletes and elderly residents who may suffer from heat-related illnesses. Parks, walking trails, and outdoor events may see decreased activity.
Extreme Cold	People	*Vulnerability:* Extreme cold could affect all Riverton residents. The elderly, children, and individuals experiencing homelessness face higher risk. *Impacts:* People are vulnerable to hypothermia and frostbite with prolonged exposure to extreme cold. The elderly face increased risks due to health issues and mobility challenges, while children may be susceptible if they lack proper winter clothing. Individuals experiencing homelessness or financial hardship often lack access to heated shelters and resources for protection against the cold. Those with pre-existing health conditions may experience worsened symptoms at low temperatures. An estimated 8% of Riverton's population is under age 5, and 11% is over age 65, indicating at least 19% of the population is particularly vulnerable to effects of extreme cold. In addition, 3.4% of the population is below the poverty level and is also more vulnerable.
	Structures	*Vulnerability:* Residential homes, commercial buildings, and unheated spaces like sheds may be vulnerable to extreme cold. *Impacts:* Homes with poor insulation or inadequately sealed windows and doors are prone to significant heat loss. Older buildings lacking modern energy efficiency standards may also suffer from freezing pipes and structural damage from water if pipes burst.
	Economic Assets	*Vulnerability:* Agriculture, infrastructure, and energy-related businesses may be at risk from extreme cold. *Impacts:* Agricultural operations, such as greenhouses and livestock farms, may experience crop and livestock losses and lost revenue. Icy roads can disrupt transportation networks, affecting logistics and supply chains, while power lines risk outages from ice accumulation, and businesses may close temporarily. Energy-intensive facilities may face higher operational costs due to increased heating needs.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
	Natural, Historic, and Cultural Resources	*Vulnerability:* Vegetation, wildlife, and historic structures are vulnerable to extreme cold. *Impacts:* Due to prolonged cold, local vegetation and wildlife habitats may suffer from plant stress and reduced food availability. Historic structures in Riverton, especially those not built for severe weather, can deteriorate from below-freezing temperatures and ice. Culturally significant sites, including monuments and public art, may also be damaged, while infrastructure such as water pipes and roadways may be compromised during extreme cold events, leading to service disruptions and safety hazards.
	Critical Facilities and Infrastructure	*Vulnerability:* Water treatment, water distribution systems, and transportation networks are vulnerable to extreme cold. *Impacts:* Water treatment systems and distribution systems can face frozen pipes and equipment failures. Icy conditions may increase the risk of accidents and travel delay on transportation infrastructure. Major routes such as Bangerter Highway could experience a higher volume of accidents and traffic delays. Power generation facilities may struggle to meet heating demands. Residential and commercial buildings lacking proper insulation are also at risk of heating system failures, endangering occupants. City resources or facilities may be needed to provide warming centers during Code Blue alerts.
	Community Activities	*Vulnerability:* Community events and recreational activities are vulnerable to extreme cold conditions. *Impacts:* Youth sports, festivals, and outdoor markets are vulnerable to extreme cold. Harsh temperatures can deter participation, and reduce community engagement. At-risk groups, such as the elderly and young children, face health risks like frostbite and hypothermia, further limiting outdoor involvement. In addition, poorly insulated buildings or inadequate heating in community centers can make gatherings uncomfortable.
Flooding (and Heavy Rain)	People	*Vulnerability:* Riverton is vulnerable to flooding, primarily along the Jordan River along the eastern city border, and Midas and Rose Creeks that pass through the city. People who live or work in these areas are vulnerable. *Impacts:* Flooding in the creeks can be caused by rapid snowmelt or heavy rain events, or a combination of both. Localized flooding can also occur following heavy rain, and may accumulate on roadways or in other low-lying areas. Both the 1% annual chance flood and 0.2% annual chance flood zones can affect residences in Riverton. Flooding can cause injury or death to people who may be swept away by rapid moving floodwaters. Flooding can also damage homes and may displace residents. Flooding primarily affects residents in low-lying areas near rivers and streams, especially during heavy rainfall or snowmelt. Individuals without reliable transportation may struggle to evacuate quickly, while low-income families often lack resources for flood-prevention measures. The elderly and those with disabilities may face mobility challenges, increasing their risk during emergencies. Overall, factors such as geographic location, economic status, and physical ability contribute to the community's varying levels of vulnerability to flooding.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
	Structures	*Vulnerability:* Structures vulnerable to flooding primarily include those in low-lying areas or near the Jordan River as well as Midas Creek and Rose Creek. *Impacts:* Residential properties in flood plains and commercial buildings without proper drainage systems or flood-resistant designs face significant risks of damage during heavy rain or snowmelt. Older structures may be more susceptible due to outdated construction standards. Overall, a combination of location and construction features contributes to their vulnerability to flooding.
	Economic Assets	*Vulnerability:* Commercial properties, especially retail centers and warehouses near rivers or low-lying areas, are at high risk during heavy rainfall. *Impacts:* Businesses in flooded areas can experience significant losses from flood damage to structures or inventory. Residential developments in flood-prone zones can also suffer damage, which can influence property values. Public infrastructure, such as roads and utilities, may experience disruptions, leading to costly repairs, which may affect businesses' ability to operate and contribute to revenue losses. Agricultural land can be affected by excess water, reducing crop yields.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Streams, wetlands, historic sites, and parks and open spaces are vulnerable to flooding. *Impacts:* Natural areas like wetlands and streams are at risk of habitat destruction, while historic sites and landmarks may sustain structural damage. Cultural resources, such as parks and public spaces, can become unusable, affecting community events. Factors contributing to their vulnerability include inadequate flood management, urban development that alters water flow, and the increasing frequency of extreme weather events due to climate change.
	Critical Facilities and Infrastructure	*Vulnerability:* No critical facilities in Riverton were identified within the 1% of 0.2% annual chance of flood zones. These facilities may be affected by localized flooding from heavy rain or disruptions to transportation or utility networks. Roads are vulnerable. *Impacts:* Flooding can disrupt emergency services, require schools to evacuate, block transportation routes, and isolate communities.
	Community Activities	*Vulnerability:* Outdoor events, sports, and farmers' markets are vulnerable to flooding. *Impacts:* Parks and open spaces can quickly become inundated during heavy rainfall or rapid snowmelt. Events may be canceled and outdoor recreation activities may be unavailable during recovery.
Landslide/ Slope Failure	People	*Vulnerability:* Landslide is primarily a risk near steep or unstable slopes. The topography in Riverton is relatively flat, and landslide risk to people and structures is minimal. *Impacts*: Residents who commute to neighboring cities could potentially be affected if transportation routes closer to the mountains are blocked by landslides. Small localized slope failure may occur in areas with human-made slopes, such as along freeway overpasses and underpasses or other developments, or due to erosion along

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		stream banks. In Riverton, there is some moderate landslide susceptibility near the Jordan River.
	Structures	Risk to structures in Riverton is minimal due to relatively few steep slopes within the city. Heavy rainfall, ground shaking from an earthquake, or loose soil may contribute to small, localized slope failures.
	Economic Assets	Economic vulnerability from landslide in Riverton is low due to relatively low risk of landslide occurrence.
	Natural, Historic, and Cultural Resources	Landslides pose low risk in Riverton. Natural resources along creeks and the Jordan River may see minor disruptions to vegetation and wildlife habitat if slopes along the banks fail. No risks to historic and cultural resources from landslide were identified.
	Critical Facilities and Infrastructure	Roadways, and essential services like water supply and power lines may be at risk, but the likelihood of occurrence in Riverton is low.
	Community Activities	Landslides pose minimal risk to community activities in Riverton.
Radon	People	*Vulnerability:* Sixty-four percent of homes tested in Riverton have dangerous levels of radon. *Impacts:* People within homes and other structures with high levels of radon are vulnerable to increased risk of lung cancer. Homeowners in older buildings in areas with high radon potential are most at risk. Families with young children or elderly members are especially at risk due to their increased sensitivity to illness.
	Structures	*Vulnerability:* Structures throughout Riverton are vulnerable to radon exposure. Homes in areas with high uranium content are at greater risk, especially in older houses with inadequate ventilation. *Impacts:* Structures with concrete slabs or basements are particularly vulnerable to radon exposure, as radon can seep in from the soil. Cracks in floors and walls can allow radon to enter. Although radon does not damage structure directly, some structures may be more likely to accumulate radon gas and increase exposure to occupants.
	Economic Assets	*Vulnerability:* Residential properties, commercial buildings, and rental units are vulnerable to radon due to the area's geological characteristics. *Impacts:* Structures built on radon-prone soil and older buildings lacking modern building standards face higher risks. The presence of radon can lead to health issues, decrease property values, and complicate real estate transactions for homeowners and investors.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Water, soil, and historic structures are vulnerable to radon accumulation. *Impacts:* Natural resources, such as underground water sources and soil, can accumulate radon, particularly in areas with granite or uranium deposits. Historic structures made from stone or concrete with high uranium content may trap radon indoors, thereby exposing occupants to health risks.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
	Critical Facilities and Infrastructure	*Vulnerability:* City facilities, schools, hospitals, and other critical facilities can accumulate radon, possibly at similar levels to homes and other structures. *Impacts:* Schools in high-radon areas pose risks for children if they do not have proper ventilation. Healthcare facilities also are at risk, which affects both patients and staff. Inadequate construction practices and a lack of awareness about radon risks may heighten vulnerability.
	Community Activities	*Vulnerability:* Community activities have limited vulnerability to radon exposure. *Impacts:* Indoor gatherings in homes, particularly in basements where radon tends to accumulate, may increase risk. Construction and renovation activities can expose workers and residents to radon if proper testing and ventilation are not implemented.
High Wind	People	*Vulnerability:* All Riverton residents are potentially vulnerable to high wind, which can affect the entire city. *Impacts:* Wind can cause injury or death from blowing debris or falling tree limbs. The elderly may face mobility challenges that hinder their ability to seek shelter, while children might not fully grasp the dangers of severe weather. Individuals with disabilities or health issues may struggle to react quickly or seek shelter. Those living in mobile homes or poorly constructed houses are at greater risk of damage, and occupants are more vulnerable to injury. People who work outdoors are particularly exposed during sudden wind events. Winds can worsen air quality by stirring up dust and pollutants, affecting residents' health.
	Structures	*Vulnerability:* Structures throughout Riverton are potentially exposed to damage from high wind. Single-story homes, commercial buildings, and agricultural facilities like barns may be at risk. *Impacts:* Residential homes with large, flat roofs or lightweight materials may struggle to withstand strong winds, while commercial buildings with extensive glass can suffer from breakage and structural damage. Structures can also be damaged by trees uprooted by high wind. Carports, sheds, fences, and other accessory structures are easily damaged by high winds and can contribute to blowing debris. Agricultural structures often lack proper reinforcement, making them prone to collapse. The vulnerability of these buildings is heightened in open areas with no landscaping or natural windbreaks, which can help disperse wind energy.
	Economic Assets	*Vulnerability:* Commercial buildings, such as retail stores throughout Riverton, are vulnerable to losses from high wind. *Impacts:* Businesses might have large signs and awnings that can be damaged, leading to business interruptions. Agricultural assets such as greenhouses and livestock facilities face risks from wind destruction, and crops and animals are vulnerable to damage or injury. Infrastructure, including power lines and roads, can be compromised, resulting in outages that may disrupt business operations. Extended power outages and structural repairs may lead to operational downtime and lost revenue. The vulnerability of these assets is largely due to construction quality, location, and the presence of loose materials that can become projectiles.

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
	Natural, Historic, and Cultural Resources	*Vulnerability:* Parks, trees, historic and cultural structures. *Impacts:* Natural resources like park and open spaces with mature trees are vulnerable to high winds, which can cause uprooting and wind erosion. Historic structures may also be at risk if their materials are not resilient, potentially leading to damage or collapse. Cultural resources, such as outdoor art installations and community spaces, can be disrupted or damaged by strong winds. These vulnerabilities are primarily due to the structural integrity of the resources and their exposure to the elements.
	Critical Facilities and Infrastructure	*Vulnerability:* City buildings, hospitals, fire and police stations, and schools could all potentially experience damage or service disruptions due to high wind. *Impacts:* Utility infrastructure, such as power lines and communications towers, can be damaged by high winds and are vulnerable to service outages. Power and communication outages can disrupt emergency response and medical care. Falling tree branches and other debris can block access to properties and may block roadways.
	Community Activities	*Vulnerability:* Outdoor activities, recreation are vulnerable to high winds. *Impacts:* Outdoor events like festivals and sporting activities may involve injury from falling debris and damaged structures. Farmers' markets and open-air concerts can also face challenges, with high winds blowing away tents and products. In addition, recreational activities in parks—such as picnics and playground use—can become unsafe during high winds. The vulnerability of these activities stems from their outdoor settings, where structures and unattached items can easily be compromised, leading to safety risks and disruptions.
Lightning	People	*Vulnerability:* Lightning can occur anywhere in Riverton, and all residents could be exposed. People who participate in golfing, swimming, and other outdoor sports and recreation are exposed to lightning risk. *Impacts:* A lightning strike can cause serious injury or death to people near the strike. Athletes and spectators participating in outdoor sports in open areas also may struggle to find shelter quickly, particularly in fast-moving thunderstorms. In addition, young children and the elderly are more vulnerable, as they may not be aware of the dangers of lightning or may be slower to seek protection. Those lacking access to warning systems or education on lightning safety are at further risk during severe weather.
	Structures	*Vulnerability:* Structures anywhere in Riverton could potentially be vulnerable to lightning. *Impacts:* Due to their height and exposure, tall buildings, communications towers, and open-frame agricultural barns are particularly vulnerable to lightning strikes. Those with metallic components or inadequate grounding systems face increased risk because metal conducts electricity. In addition, residential homes near tall trees may be at risk if the trees are struck and energy is transferred to the structure. Electrical surges may disrupt power, internet, and communication systems within homes and businesses.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
	Economic Assets	*Vulnerability:* Businesses and agricultural structures are vulnerable to lightning strikes. *Impacts:* Agricultural buildings, such as barns and silos, are vulnerable to lightning strikes, which can cause damage to stored crops and livestock. Commercial buildings with metal roofing or equipment may face electrical surges, disrupting operations. In addition, outdoor recreational areas that attract crowds are at risk during thunderstorms, posing dangers to infrastructure and public safety.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Parks, historic buildings, and outdoor sculptures are vulnerable to lightning strikes. *Impacts:* Mature trees in parks can attract lightning due to their height, while historic buildings made of wood or flammable materials are at risk of igniting. Cultural resources, such as monuments and outdoor sculptures, can also be damaged by lightning. The risk increases in areas with frequent thunderstorms and dry conditions.
	Critical Facilities and Infrastructure	*Vulnerability:* Communications towers and power lines may be at risk. *Impacts:* Communications towers attract lightning due to their height and metal structure. Power lines and substations also are susceptible, and lightning strikes can lead to power outages. Power and communication outages can disrupt essential functions of emergency facilities, hospitals, or schools. Schools, fire and police stations, and hospitals can be at risk if they do not have proper lightning protection systems.
	Community Activities	*Vulnerability:* Outdoor events such as sports practices, concerts, picnics, and festivals are particularly vulnerable to lightning strikes. *Impacts:* Participants in these events often find themselves in open areas without adequate shelter and may be unprepared for sudden weather changes, leading to dangerous situations. CR Hamilton Sports Complex, Centennial Park, Riverton City Park, Riverbend Golf Course, the Jordan River Parkway, and school sports fields are among outdoor venues where people may be at risk from lightning. Water-related activities, such as swimming, also increase risk due to water's conductivity.
Severe Winter Weather	People	*Vulnerability:* All Riverton residents are vulnerable to severe winter weather. *Impacts:* Heavy snow can increase the risk of injuries due to slips and falls, along with illnesses and other health consequences from exposure to cold. People can be injured in car accidents while driving in severe winter weather conditions. Elderly individuals may struggle with mobility and health issues, while young children lack the awareness needed to navigate severe weather safely. People with disabilities often depend on assistance that might not be available during storms. Census data indicates that 7.2% of Riverton residents are individuals with disabilities under age 65. In addition, those without reliable transportation can become stranded, and low-income families in inadequate housing may lack resources for heating and snow removal.
	Structures	*Vulnerability:* All structures are vulnerable to severe winter weather. *Impacts:* Flat-roofed buildings are prone to snow accumulation, risking roof collapse if not cleared. Older homes might have weakened roofs

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		or inadequate insulation, making them susceptible to snow load and ice dams. Commercial buildings with large open spaces may face risks if their roofs do not meet snow load requirements. Temporary structures like tents are especially vulnerable, as they are not designed to handle heavy snow. Roof design, material quality, and the age of the building are key factors in how well a structure can withstand heavy snowfall.
	Economic Assets	*Vulnerability:* All businesses are vulnerable to severe winter weather. *Impacts:* Retail businesses can experience significant losses from decreased customer traffic and delayed shipments. Construction projects may face delays and increased costs. Transportation and logistics companies are particularly impacted, as snow can hinder vehicle movement, leading to delivery delays. In addition, public services may struggle to maintain continuity during severe weather events.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Trees, historic buildings, and cultural resources are vulnerable to severe winter weather. *Impacts:* Natural resources like trees can break under heavy snow, disrupting habitats. Historic sites risk structural damage from snow accumulation, while cultural resources, including public art and community spaces, face access issues.
	Critical Facilities and Infrastructure	*Vulnerability:* Transportation and utility networks are vulnerable to severe winter weather. *Impacts:* Transportation networks like roads and bridges can become impassable, hindering emergency responses. Bangerter Highway, Redwood Road, 13400 South, 12600 South, and other major routes may become impassable during heavy snow or blizzard conditions, and travelers may be temporarily stranded. Utilities such as power and water supply systems are at risk of disruptions from downed lines. Roofs on public buildings, including schools and hospitals, may collapse from the weight of excessive snow. Communications infrastructure can be damaged, impeding signals. These vulnerabilities stem from reliance on systems that may not be equipped to handle extreme winter weather.
	Community Activities	*Vulnerability:* Community events and community facilities are vulnerable to severe winter weather. *Impacts:* Community activities may be delayed or canceled due to severe winter weather. Community centers may be repurposed to serve as warming stations, but other activities can be halted due to travel difficulties. Outdoor events, public transportation, and community gatherings may be at risk. Severe weather can lead to low attendance, travel delays, and access issues for essential services, such as emergency response and healthcare.
Tornado	People	*Vulnerability:* Tornadoes are uncommon in Riverton but could potentially occur anywhere in the city, and all residents are vulnerable. *Impacts:* If a tornado were to occur, residents are vulnerable to serious injury from blowing debris, uprooted trees, and structural collapse. Individuals living in mobile homes face higher risks, as these structures can be easily damaged. Those with limited mobility, such as the elderly and people with disabilities, may struggle to reach safety

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		quickly. Families with young children might have difficulty ensuring everyone's safety during a warning. In addition, residents unfamiliar with tornado preparedness or without timely weather alerts are at greater risk. Those in lower socioeconomic conditions often live in areas less equipped for disaster response.
	Structures	*Vulnerability:* Homes and businesses in Riverton are all vulnerable to tornado damage. *Impacts:* All structures could sustain heavy damage from a tornado. Roofs can be torn from homes, windows broken, and walls damaged and compromised. Mobile homes are particularly at risk due to their light weight and insecure foundations. Older commercial buildings that do not meet modern codes also may be weak, and large-span structures, such as warehouses, can have roofs easily lifted by tornado winds. Overall, inadequate materials, poor design, and age increase the risk of damage from tornadoes.
	Economic Assets	*Vulnerability:* All businesses are vulnerable to tornado damage. *Impacts:* Tornadoes can cause economic losses in Riverton through damage to businesses and interruption of economic activity. Retail buildings, warehouses, hotels, restaurants, office complexes, and other businesses can all experience operational downtime or closures due to structural damage or interruption of power or communication systems. Closures may lead to lost wages or layoffs, lost revenue, and interruption of supply chains. Larger commercial spaces may be at risk due to their size and materials. Roads and bridges can be blocked by debris or compromised, disrupting transportation and service access.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Parks, trees, and historic and cultural structures are vulnerable to tornado damage. *Impacts:* Natural resources like trees and wetlands can be severely damaged, disrupting ecosystems. Historic structures may suffer because their age and construction methods might make them less able to withstand high winds. Cultural resources, including monuments and parks that are vital to community heritage, may also be at risk. Riverton's parks and open spaces could be severely affected by a tornado. Mature trees could be uprooted, and damage to vegetation and wildlife habitats can increase erosion.
	Critical Facilities and Infrastructure	*Vulnerability:* Hospitals, schools, and emergency response centers are vulnerable to tornadoes due to their structural design and large open spaces that may not withstand high winds. *Impacts:* Public safety buildings, schools, or other civic facilities may need emergency inspections or repairs. Utilities like power stations and communication facilities also are at risk, as damage to these facilities can disrupt essential services. In addition, any structures not built to modern codes might lack the reinforcements necessary to endure severe weather, increasing vulnerability for the facilities and surrounding communities. Major transportation routes such as Bangerter Highway, Redwood Road, 13400 South, 12600 South, and other arterial roads may be blocked by debris.
	Community Activities	*Vulnerability:* Outdoor festivals, sports events, and markets are vulnerable to tornadoes due to their open spaces and limited options for providing shelter.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		Impacts: Temporary structures, such as tents, can be easily damaged by high winds, and patrons may be unable to find shelter. Events may be postponed or canceled, reducing opportunities for social engagement and community support. Schools and recreational facilities with large glass windows or weak roofs also face significant risks.
Wildfire	People	*Vulnerability:* Wildfire risk is relatively low in Riverton due to its location in the middle of the valley, which is mostly urban development. Some areas of open space near parks and along the Jordan River are vulnerable to wildfire. *Impacts:* Wildfires are likely to be small and affect only a limited number of people. Wildfire smoke can affect individuals in Riverton, even if the fire is not located within the city itself. Individuals with underlying health conditions may be particularly vulnerable to effects of poor air quality. Residents with physical disabilities or health issues may struggle to evacuate. Low-income families lacking resources for fire safety measures may be more vulnerable. Older adults might have reduced mobility, making them more dependent on others for assistance.
	Structures	*Vulnerability:* Residential homes, especially those made of wood or in heavily vegetated areas, may be vulnerable. Properties near the Wildland-Urban Interface are at higher risk due to surrounding flammable vegetation. Inadequate defensible space, such as insufficient clearing of dry grass and shrubs, increases susceptibility. *Impacts:* Structures are at risk from damage or complete loss from wildfire. Roofs made of combustible materials and buildings that lack fire-resistant features are particularly at risk during wildfire events.
	Economic Assets	*Vulnerability:* Businesses near undeveloped lands are vulnerable to wildfire damage. *Impacts:* Commercial assets, such as retail centers close to undeveloped areas, can suffer damage from flames and smoke, affecting the local economy. Agricultural lands also are susceptible, as wildfires can destroy crops and livestock, leading to financial losses. Vital infrastructure, such as power lines and water pipelines, can be disrupted, causing further economic repercussions. These vulnerabilities are heightened by drought conditions, extreme heat, and/or high winds, which can facilitate the spread of fires.
	Natural, Historic, and Cultural Resources	*Vulnerability:* The Jordan River and historic structures are vulnerable to wildfire damage. *Impacts:* Natural resources like grasslands and riparian areas along the Jordan River are at risk because dry vegetation and accumulated brush can easily ignite. Historic sites made of wood and cultural landmarks can also be affected, particularly when located near wildland areas. The increasing frequency of drought and extreme heat, exacerbated by climate change, heightens these vulnerabilities.
	Critical Facilities and Infrastructure	*Vulnerability:* Critical facilities in Riverton have a low risk of damage from wildfire, but power infrastructure may be at risk. *Impacts:* Utilities like power lines and communication systems are at risk, as sparks or falling trees can ignite fires.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
	Community Activities	*Vulnerability:* Outdoor events and recreation areas are vulnerable to wildfire impacts. *Impacts:* Wildfire smoke may deter attendance at outdoor events like festivals and sports, especially during hot, windy conditions. The Jordan River Trail may be inaccessible for recreational activities, such as biking or running during and following a wildfire.
Dam Failure	People	*Vulnerability:* Riverton residents are vulnerable to failure of dams. There are two significant and one high hazard dam in Riverton. Inundation boundaries from dams in neighboring communities also overlap areas in Riverton. *Impacts:* Failure of dams at Black Ridge Reservoir or Jordan Valley Water Purification Upper Reservoir could cause flooding and property damage in Riverton. Areas vulnerable to flooding following a dam failure include the areas near the southern and eastern borders of the city. Individuals living near dams, particularly in low-lying areas, are most vulnerable to dam failure and potential flooding. They may be injured if caught in fast-moving water or may be displaced if their homes are damaged by flooding. Families with young children, the elderly, low-income residents, and individuals with disabilities may struggle to evacuate quickly and are more vulnerable to dam failure.
	Structures	*Vulnerability:* Structures in dam inundation boundaries are at risk of flooding and damage from a dam failure. Residential homes in low-lying areas, bridges, and roadways may be vulnerable. Commercial and retail buildings in these areas are also vulnerable. Outdated dam infrastructure, insufficient spillway capacity, and a lack of warning systems can worsen the risk of dam failure and increase vulnerability of lives and property downstream. *Impacts:* Structures downstream of a dam can suffer extensive damage from flooding following a dam failure. Damage is often worst close to the dam site because of the volume and velocity of water released. Because dams are not within Riverton, damage may be lessened as water begins to spread out and slow down.
	Economic Assets	*Vulnerability*: Roads, bridges, and utilities are vulnerable to damage, disrupting transport and services. *Impacts:* Residential and commercial properties downstream face significant flood risks, leading to property damage and economic loss. Agricultural assets, including farmland and livestock, can be severely affected, especially if irrigation systems are compromised. In addition, businesses that rely on water, such as manufacturing plants, may experience operational disruptions. The proximity of these assets to failure zones and their dependence on a stable water supply highlight their vulnerability in the event of a dam failure.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Rose Creek, Jordan River, and historic and cultural sites are vulnerable to flooding. *Impacts:* Natural resources like local waterways along Rose Creek and Jordan River could suffer damage to ecosystems and habitat loss. Historically significant sites, such as historic homes, are at risk of flooding and deterioration. Cultural resources, such as community centers and parks, may also face damage, affecting local gatherings.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
	Critical Facilities and Infrastructure	*Vulnerability:* Jordan Valley Water Conservancy District (JVWDC), two schools, and roads are vulnerable to dam failure. *Impacts:* JVWCD provides retail water service to Riverton. A failure of the JVWCD water purification reservoirs could not only cause flood damage downstream, but it may also affect the city water supply. Inundation maps indicate that two Riverton schools may be vulnerable to damage from dam failure. Transportation infrastructure, such as roads and bridges, may be compromised, hampering emergency response. Bangerter Highway and Redwood Road are also potentially vulnerable to damage following a dam failure. Water treatment plants, schools, hospitals, and nearby residential areas may be vulnerable. Water treatment plants rely on a consistent water supply, and dam failure can disrupt operations and compromise public health. Schools and hospitals face safety risks and evacuation challenges, while residential areas could suffer catastrophic flooding, leading to loss of life and property.
	Community Activities	*Vulnerability:* Community events and recreation activities are vulnerable to flooding from dam failure. *Impacts:* Recreational pursuits like fishing, boating, and swimming in reservoirs, as well as events in parks located downstream, may be at risk. These activities are vulnerable to sudden flooding from a dam breach. Community events and activities may be postponed or canceled.
Civil Disturbance	People	Low-income individuals may lack the resources for safety, while the elderly or disabled may struggle to navigate emergencies. Young people, particularly teenagers, may be drawn into unrest, influenced by social dynamics. In addition, marginalized individuals may feel targeted or compelled to participate. A lack of community cohesion and trust in authorities can further heighten tensions.
	Structures	Government buildings, commercial properties, and infrastructure, such as bridges and transportation hubs may be vulnerable. Government buildings may be targeted for their symbolic authority, while retail stores can attract crowds during protests. Residential neighborhoods also can be affected, especially in areas with heightened tensions. The vulnerability of these structures stems from their visibility and importance to the community, combined with factors such as location and ongoing social issues.
	Economic Assets	Retail establishments, especially shopping centers, are at risk as they often become focal points for protests. Transportation systems can be disrupted by blockades, hindering access to services. Financial institutions may face vandalism or theft, while critical service providers, such as hospitals, could experience strain during unrest. Several economic assets are vulnerable to civil disturbances, primarily due to their visibility and reliance on foot traffic.
	Natural, Historic, and Cultural Resources	Parks and open spaces may suffer from vandalism or destruction during uncontrolled events. Historic sites can become targets, as they symbolize authority or cultural significance. Cultural resources such as community centers and places of worship also may be affected, as they play a vital role in community identity. Their vulnerability lies in the potential for damage during protests.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
	Critical Facilities and Infrastructure	Governmental buildings, schools, and healthcare facilities may be at risk, since they often symbolize authority and serve as community hubs, making them targets during unrest. Utility infrastructure, such as water and power facilities, is also at risk of disruption. Its visibility and essential services contribute to its vulnerability during civil disturbances.
	Community Activities	Public demonstrations, parades, and local government meetings are particularly vulnerable to civil disturbances. These events often attract large crowds and can become tense, especially around contentious social or political issues. Factors such as the local demographic, economic conditions, and recent events can heighten these vulnerabilities, making it easier for conflicts to arise during passionate public gatherings.
Cyberattack	People	Older adults often lack familiarity with technology and online security, making them easy targets for phishing scams. Individuals engaging in online banking or shopping without strong security measures also face heightened risks. Families with children may be less vigilant about internet safety, allowing cybercriminals to exploit personal information. In addition, small business owners without robust cybersecurity practices are prime targets for attacks that can disrupt operations.
	Structures	Critical infrastructure, such as power plants, water treatment facilities, and transportation systems, often lack robust cybersecurity measures. Commercial businesses, especially financial institutions and healthcare providers, also are at risk due to weaker data protection and employee training. Educational institutions may be vulnerable because of limited funding for cybersecurity and outdated software. Obsolete technology and insufficient training enhance the susceptibility of these structures to cyber threats.
	Economic Assets	Financial institutions, such as banks and credit unions, are at risk of data theft and service disruption. Small and medium-sized businesses often lack robust cybersecurity measures, making them attractive targets. In addition, local government agencies and critical infrastructure, such as water treatment facilities, might have outdated security protocols, posing threats to public safety. The rise of remote work further exacerbates vulnerabilities, as employees accessing networks from home can unintentionally expose systems to risks. Overall, the combination of outdated technology and insufficient cybersecurity practices increases the vulnerability of an area's economic assets.
	Natural, Historic, and Cultural Resources	Natural resources like water management systems and wildlife databases can be compromised, disrupting ecosystems. Historic sites and museums that digitize collections are at risk of losing valuable artifacts and data. In addition, cultural organizations managing events may face threats if their systems lack adequate security. The limited resources of smaller organizations further increase this vulnerability
	Critical Facilities and Infrastructure	Energy and utility services, such as electricity and water systems, which often rely on outdated technology, may be vulnerable. Transportation infrastructure, such as traffic management and public transit, is also at risk due to networked systems. Healthcare facilities

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		that use electronic records and connected medical devices face vulnerabilities that can compromise patient safety.
	Community Activities	Online registration for events, local government services, and educational programs that rely on digital tools may be targeted due to inadequate security measures, outdated software, and insufficient staff training.
Hazardous Materials Incident (Transporta-tion & Fixed Facility)	People	Individuals with pre-existing health conditions, such as respiratory issues, and the elderly are at higher risk due to their compromised health. Children also are more susceptible. Those living near industrial areas or transport routes for hazardous materials face increased exposure risk, while low-income families may lack resources and information to effectively prepare for incidents.
	Structures	Industrial facilities, such as manufacturing plants and warehouses, often store hazardous chemicals which may leak. Residential buildings, schools, and hospitals also are at risk, particularly if located along transportation routes for hazardous materials. Older buildings may lack modern safety features, increasing their vulnerability.
	Economic Assets	Industrial facilities, transportation infrastructure, and nearby commercial properties may be affected. Industrial facilities handling chemicals are at risk of spills or leaks, while roads and railways used for transporting hazardous materials can lead to accidents and contamination. In addition, nearby commercial and residential areas face potential health risks and economic losses.
	Natural, Historic, and Cultural Resources	Waterways and habitats are vulnerable to hazardous materials incidents, which can disrupt ecosystems. Historic sites and structures may suffer damage from toxic exposure, leading to degradation over time. In addition, cultural landmarks risk losing their significance due to contamination events. The proximity of these resources to industrial areas or transport routes exacerbates their risk.
	Critical Facilities and Infrastructure	Chemical manufacturing plants, waste treatment facilities, and transportation networks, such as highways and railroads may be at risk. Their vulnerability stems from factors such as proximity to residential areas, aging infrastructure, and inadequate safety measures. Natural hazards, such as flooding and earthquakes, can further increase risks by damaging containment systems.
	Community Activities	Local markets, school events, and outdoor gatherings are vulnerable to hazardous materials incidents if they are near industrial zones and transport corridors. This risk is heightened by inadequate emergency preparedness, lack of public awareness, and the potential for spills during transport. Large crowds at events can complicate evacuation efforts, increasing the risks for participants and nearby residents.
Public Health Epidemic/ Pandemic	People	Individuals with pre-existing health conditions like asthma and heart disease and adults over 65 may be vulnerable. Low-income families may struggle to access healthcare and vaccinations, increasing their risk. Marginalized communities with limited access to information and those living in high-density conditions also are at greater risk due to the rapid spread of diseases and the challenges in implementing preventive measures.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
	Structures	Several structures are vulnerable to public health epidemics or pandemics, particularly due to their ability to facilitate the spread of disease. High-density residential areas, such as apartment complexes, are at risk, as close living quarters can lead to faster transmission. Public gathering spaces, such as schools and community centers, also pose significant threats because large groups are in confined spaces. Healthcare facilities can become hotspots for infections if infection control measures are insufficient. In addition, workplaces with high foot traffic, such as retail stores, contribute to vulnerability.
	Economic Assets	Small businesses in retail, hospitality, and food service are particularly vulnerable to public health epidemics or pandemics. These sectors face risks from fluctuating consumer demand and potential operational restrictions. The tourism industry also is affected, as travelers may avoid high-risk areas. Healthcare facilities can become overwhelmed, straining resources and impacting operations. In addition, local supply chains may experience disruptions, leading to shortages and inflation. Overall, the direct effects of illness, along with prolonged shutdowns and consumer hesitance, leave these economic assets exposed to significant downturns.
	Natural, Historic, and Cultural Resources	Natural resources like wildlife and ecosystems can be disrupted by increased human activity, raising the risk of zoonotic diseases. Historic sites may deteriorate due to reduced visitor access and funding, while cultural resources, such as community events, face cancelations, impacting social connections.
	Critical Facilities and Infrastructure	Public health epidemic or pandemic incidents can affect healthcare facilities, nursing homes, public transportation systems, schools, and food supply chains. Hospitals and clinics may become overwhelmed with patients, while vulnerable populations in nursing homes are at higher risk. Public transportation can facilitate the spread of disease, and schools gather large groups, thereby increasing transmission potential. These facilities often lack adequate resources, including medical supplies and testing capabilities, making them more susceptible to the impacts of a health crisis.
	Community Activities	Large gatherings like festivals and sporting events can facilitate the rapid spread of diseases due to close contact. Public transportation also is at risk, as it serves many people in confined spaces. Schools and childcare facilities are particularly susceptible, given that children can easily transmit infections. In addition, food-related events, such as farmers' markets, can pose risks if hygiene practices are not followed. The interconnectedness of community members and varying adherence to health guidelines further exacerbate these vulnerabilities.
Terrorism	People	Young children and newcomers may lack awareness of potential threats, while the elderly and individuals with disabilities may struggle to respond quickly in emergencies. Marginalized communities often face bias, making them more susceptible to targeting. In addition, those with lower socioeconomic status may lack access to security measures and emergency preparedness resources.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
	Structures	Government buildings, transportation hubs, commercial centers, and public spaces are particularly vulnerable to terrorism incidents. Government buildings are symbolic targets, while transportation hubs and commercial centers are attractive due to their potential for high casualties and crowd presence. Public spaces also are at risk due to their open nature and lack of security. Their vulnerability is heightened by inadequate security measures, high occupancy rates, and their locations in densely populated areas, which can amplify the impact of incidents.
	Economic Assets	Infrastructure, commercial establishments, and community facilities may be vulnerable. Critical infrastructure, such as transportation networks and power grids, could disrupt the economy if targeted. Commercial establishments, especially those with high foot traffic, and community facilities like schools and hospitals also are at risk, as they can provoke widespread concern and disruption. Their accessibility and interconnectivity increase vulnerability, meaning that damage to one asset can have a broader economic impact and hinder recovery efforts.
	Natural, Historic, and Cultural Resources	Natural resources like water supplies and parks could be targeted for their significance to the community. Historic sites and cultural resources, such as museums or community centers, also are at risk due to their accessibility and importance to local identity. Their vulnerability is often heightened by inadequate security measures.
	Critical Facilities and Infrastructure	Public transportation systems, healthcare facilities, schools, and utility services like water and power plants may be affected. Their vulnerability arises from high accessibility and the potential impact of an attack, as crowded transportation and public spaces can lead to mass casualties and panic. Attacking utility services could disrupt the town's essential functions, creating chaos.
	Community Activities	Festivals, parades, and sporting events are particularly vulnerable to terrorism incidents. These events attract large crowds, making it easier for perpetrators to inflict harm and instill fear. In addition, community centers and places of worship serve as social hubs, increasing their risk. Factors such as limited security measures and open access to public spaces, contribute to this vulnerability.

Hazards Not Profiled

Avalanche and landslide/slope failure have been omitted from further discussion of hazard impacts and mitigation actions. As shown in the hazard description in Volume 1, avalanche and landslide risk is primarily located in the Wasatch and Oquirrh Mountains in Salt Lake County. Riverton has mostly flat terrain and faces minimal risk of impacts from these hazards. No previous occurrences of avalanche or landslide have impacted Riverton.

DRAFT

Jurisdiction-Specific Changes in Vulnerability

Hazard events can impact communities, infrastructures, and ecosystems. The severity of these impacts can be influenced by climate change, population patterns, and land use developments. Understanding these factors is crucial for the city of Riverton to develop a resilient community and minimize the impacts of hazards. Table 11 displays the unique changes within the community and the related effects on each hazard affecting Riverton.

DRAFT

Table 11: Jurisdiction-Specific Changes in Vulnerability in the City of Riverton

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
Avalanche	N/A	N/A	N/A	N/A
Drought	Climate change affects drought incidents by altering precipitation patterns and increasing temperatures. Warmer weather can lead to longer dry periods and more severe droughts, while changes in rainfall can reduce snowpack in nearby mountains, crucial for summer water supply. Higher temperatures also increase evaporation rates, further straining local water resources.	Drought can significantly influence population patterns by impacting economic opportunities and the quality of life. Water scarcity often leads to reduced agricultural productivity, prompting residents to migrate to areas with more stable job prospects. Increased water costs can make living less affordable, driving some residents away. Conversely, efforts to address drought, such as sustainable development or improved water management, may attract newcomers, resulting in changes in the community's demographic composition over time.	Riverton has seen a significant amount of growth and development, including thousands of new residential units and hundreds of new commercial spaces. This level of development increases the water demand in Riverton and the risk of drought.	Increased
Earthquake	Rising temperatures can lead to glacial melting, which affects pressure on tectonic plates and may trigger seismic activity through isostatic rebound. In addition, increased rainfall and flooding can erode soils, weakening structural integrity and heightening vulnerability during earthquakes. Although the direct links between climate change and earthquakes are still under investigation, environmental effects may impact the region's seismic risk.	Earthquakes can significantly alter population patterns by prompting residents to leave for safer areas after a seismic event. This migration can lead to changes in population density and attract new residents and businesses during the rebuilding process. The perception of the area as a safe place to live may shift, impacting long-term demographics, as some residents return to rebuild while others relocate permanently.	The high level of development exposes more properties to earthquake risk, but they have also been built to modern codes that protect against earthquake damage.	Stayed the same
Extreme Heat	Climate change significantly impacts extreme heat by increasing the frequency and intensity of heat waves. Rising global temperatures lead to	By prompting residents to relocate due to damaged homes or safety concerns. Some may move to areas perceived as safer or seek better job	The high amount of development increases density and reduces vegetation, both of	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	longer and hotter summers, affecting residents and local infrastructure while heightening health risks, especially for vulnerable populations. Urban heat islands resulting from reduced vegetation and extensive pavement further amplify these effects.	opportunities elsewhere. The economic impact and infrastructure damage can also make certain neighborhoods less desirable, leading to shifts in demographics and the socioeconomic landscape as new residents with different backgrounds move in.	which can increase temperatures during extreme heat events.	
Extreme Cold	Climate change impacts extreme cold by increasing the intensity of winter storms. Higher atmospheric temperatures allow for more moisture, resulting in heavier snowfall and potentially lower temperatures during these events. In addition, fluctuations in weather patterns may disrupt seasonal cycles, leading to unpredictable periods of extreme cold mixed with warmer spells.	By driving some residents to relocate to warmer areas. Harsh winters can hinder economic activities and deter new residents and businesses, influencing housing demand and the attractiveness of certain neighborhoods. This may disproportionately affect lower-income families, leading to changes in demographics and socioeconomic stratification in the community.	Increased growth of commercial and residential developments in Riverton increases energy demand during extreme cold events, stressing the electrical grid.	Increased
Flooding	Higher temperatures increase the frequency and intensity of extreme weather events and alter precipitation patterns. They lead to more intense rainstorms and accelerated snowmelt from nearby mountains, raising water levels in rivers and streams. This combination raises the risk of flooding, especially in areas with inadequate drainage and urban development in flood-prone zones, heightening the potential for damage to homes and infrastructure.	Flooding can significantly alter population patterns by displacing residents from affected areas, leading them to seek shelter elsewhere. This may cause a population decline where flooding occurs, as individuals might hesitate to return due to ongoing risks or property damage. As neighborhoods become less desirable, people may migrate to safer areas, changing demographic trends and putting pressure on housing in those regions. Over time, these shifts can influence urban planning and development, as local governments	No developments in Riverton have been in the special flood hazard area. Increased impervious surfaces due to development across Riverton could contribute to ponding and other pluvial flooding.	Decreased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
		address flooding risks and changing population needs.		
Landslide/ Slope Failure	N/A	N/A	N/A	N/A
Radon	Climate change can affect radon levels by altering soil temperatures and moisture conditions. Higher temperatures may increase radon emissions from the ground, while heavy rainfall can change groundwater and soil saturation, impacting radon migration into buildings.	Radon exposure can influence population patterns as increased health awareness may drive families to move away from areas with high radon levels. This shift could particularly affect vulnerable groups, changing demographics and demand in the housing market. Homes with lower radon levels may become more sought after, and public health campaigns can encourage community action, making previously undesirable areas more attractive once mitigation measures are implemented.	Development in Riverton has not increased radon risk.	Decreased
Heavy Rain	Climate change increases the frequency and intensity of heavy rain, as higher temperatures allow the atmosphere to hold more moisture. This leads to stronger storms, flash flooding, and overwhelmed drainage systems.	Heavy rain can shift population patterns by pushing residents out of flood-prone areas and attracting them to safer neighborhoods. Frequent flooding may lead to evacuations and economic disruptions, prompting relocations. Over time, ongoing heavy rains can affect housing demand and community stability, altering the town's population distribution.	Increased impervious surfaces due to development across Riverton could contribute to ponding and other pluvial flooding.	Increased
High Wind	Climate change affects high winds by altering atmospheric patterns and increasing extreme weather events. Rising temperatures may lead to more substantial, unpredictable winds and	High winds can alter population patterns by making certain areas less desirable. Frequent damage may drive residents to safer	New developments in Riverton do not increase the risk of high wind.	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	more frequent thunderstorms, posing risks to infrastructure and air quality.	neighborhoods, deter newcomers, and slow growth in affected regions.		
Lightning	Climate change increases temperatures and alters precipitation, leading to more intense thunderstorms and frequent lightning strikes. Urbanization can enhance this effect, posing risks to public safety and infrastructure.	Lightning can influence population patterns by causing property damage and wildfires, leading some residents to relocate. Areas with higher lightning activity may deter new residents, while safer locations could increase migration as people seek protection from severe weather.	New development in Mountain View Village and Downtown Riverton are at risk of lightning strikes.	Increased
Severe Winter Weather	Climate change impacts heavy snow and blizzards by altering precipitation patterns. Higher temperatures can lead to more rain than snow, affecting snowpack levels—additionally, increased storm intensity results in heavier, more unpredictable snowfall.	Increased population means an increased number of people needing to get to work and requiring quicker snow removal. Heavy snow or blizzards can impact population patterns by influencing where people live and work. Transportation disruptions may lead residents to seek housing closer to jobs, increasing density in some areas while depopulating others. Families might also avoid regions with frequent heavy snowfall, shifting demand to milder areas. Over time, these trends can alter community demographics and economic activity, prompting adjustments in town planning and resource allocation.	With large development increases in Riverton, the risk of damage and increased responsibility due to severe winter storms has gone up. With new subdivisions, the city is responsible for plowing, rescues, and evacuations from heavy snow events.	Increased
Tornado	Climate change may increase the frequency and intensity of tornadoes. Higher temperatures lead to more moisture in the air, creating conditions for severe thunderstorms. Changes in wind patterns and precipitation can also	Tornadoes can influence population patterns by prompting residents to move to safer areas after damage occurs. This can decrease density in affected neighborhoods while increasing the demand for housing	Riverton is not at high risk for tornadoes, but increased development slightly raises the risk by adding more structures	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	heighten tornado risks, resulting in more destructive storms and greater threats to infrastructure and communities.	in safer regions. New residents may also move in for recovery opportunities, altering demographics. Over time, repeated tornado threats might push long-term residents to areas with better disaster preparedness, reshaping the town's population distribution.	in the city that could be damaged.	
Wildfire	By raising temperatures and creating drier conditions, prolonged droughts lead to more dry vegetation, which serves as fuel for fires. Erratic seasons extend the growing period, while more lightning strikes can ignite wildfires. These factors heighten the threat to ecosystems and community safety.	Displaced individuals often seek safer areas, shifting demographics, while declining property values might deter newcomers. Conversely, some may be drawn to rebuilding efforts, impacting long-term growth and community dynamics.	Development, especially in the southwest corner of Riverton, is located close to high-risk wildfire areas. These neighborhoods face heightened risk of wildfire damage.	Increased
Dam Failure	Climate change raises the risk of dam failure by causing heavier rainfall and rapid snowmelt. These changes can overwhelm dams and compromise their integrity, highlighting the need for urgent safety assessments and upgrades to protect communities downstream.	Dam failure tornadoes can impact population patterns by displacing residents and altering demographics. Evacuations can lead to an influx in safer areas, while destruction may deter new residents and contribute to population decline. Fear of future disasters may also prompt remaining individuals to relocate, changing the community's composition and affecting population density and economic activity.	Development in Riverton has not increased the risk of dam failure.	Increased
Civil Disturbance	Climate change can increase civil disturbances by intensifying environmental stresses and social tensions. Rising temperatures may lead to droughts, wildfires, and poor air quality, particularly affecting vulnerable communities. Resource scarcity, especially water, can spark conflicts and	By encouraging residents to move for safety, leading to outflows and new arrivals. These events can reveal social issues, impacting community dynamics, employment, and property values, ultimately reshaping demographics, and social cohesion.	Development in Riverton has not increased the risk of civil disturbance.	Increased

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	protests. In addition, an influx of migrants from harder-hit areas may strain local resources, further escalating tensions. This cycle of unrest is driven by the impacts of climate change on the environment and community dynamics.			
Cyberattack	Possible attack on the industry, which is seen as producing large amounts of greenhouse gases and burning fossil fuels. Climate change can heighten cyberattack risk by increasing vulnerabilities during extreme weather. Disruptions like power outages offer cybercriminals opportunities, but focusing on emergency responses can weaken cybersecurity measures. As organizations adopt new technologies to cope with climate impacts, they may unintentionally introduce additional vulnerabilities.	Cyberattacks can change population patterns by eroding trust in essential services. Compromised systems may cause residents to leave due to safety concerns, while high-profile incidents can deter businesses, leading to job losses. This perception of vulnerability may also make the town less appealing to newcomers, resulting in demographic shifts and affecting local development.	Development in Riverton has not increased the risk of cyberattack.	Increased
Hazardous Materials Incident (Transportation & Fixed Facility)	Climate change elevates the risk of hazardous materials incidents by increasing extreme weather events like heavy rain and wildfires. These events can breach storage tanks and heighten material volatility. Vulnerable infrastructure can lead to more spills or accidents, while climate shifts may also introduce new challenges for managing hazardous substances and public health.	By causing evacuations and temporary declines in density. In the long run, unsafe areas may deter new residents, affecting growth and diversity. In addition, negative perceptions can lower property values and economic prospects, leading families to relocate, which impacts local demographics.	Development in Riverton has not increased the risk of hazardous materials incidents.	Increased
Public Health Epidemic/ Pandemic	By increasing the spread of vector-borne diseases and raising the risk of waterborne illnesses due to flooding or drought. Worsening air quality can also exacerbate respiratory conditions like	By prompting migration for safety and better healthcare. Vulnerable groups may move to areas with improved services, while economic instability can drive people to seek	Development in Riverton has not increased the risk of an epidemic/pandemic.	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	asthma, especially in vulnerable populations.	new employment opportunities. In addition, restrictions like quarantine measures can limit movement and social interactions, reshaping the community's demographics and impacting local economies.		
Terrorism	Terroristic activity is sometimes centered around climate change. Climate change impacts terrorism incidents by creating conditions of resource scarcity and social unrest. Increased competition for essential resources, such as water, can fuel tensions, making communities more vulnerable to extremist ideologies. Extreme weather events may disrupt social order and infrastructure, offering terrorist groups opportunities to exploit crises. In addition, climate-driven population displacement can heighten tensions in receiving areas, raising the risk of domestic terrorism. Law enforcement's focus on climate-related challenges can also limit its capacity to address terrorism threats. Ultimately, while climate change may not directly cause terrorism, its effects can create an environment conducive to extremist activities.	Terrorism incidents can alter population patterns by instilling fear and prompting residents to relocate to perceived safer areas, resulting in demographic shifts and potential declines in property values. Some neighborhoods may see an outflow of residents, while others could experience an influx of people seeking refuge from violence. In addition, increased security measures may deter businesses and residents from certain locations, leading to long-term changes in population density and urban development patterns.	Development in Riverton has not increased the risk of a terrorism incident.	Increased

DRAFT

Additional Public Involvement

Public involvement in Riverton, Utah, is crucial for enhancing community resilience to various hazards, including public health epidemics and natural disasters. Community newsletters effectively disseminate vital information, keeping residents informed about ongoing initiatives, upcoming events, and safety protocols. Programs like Firewise and StormReady proactively engage citizens in hazard awareness campaigns, educating them on ways to mitigate fire risks and severe weather risks. Severe Weather Awareness Week raises community consciousness about potential threats, encouraging preparedness and proactive planning. In addition, school programs play a vital role in instilling hazard awareness in younger generations, fostering a culture of safety and resilience from an early age. Through these collaborative efforts, Riverton strengthens its collective response to emergencies and enhances public health and safety outcomes.

Riverton provided several opportunities for public participation in the update of this plan. Besides the City Journal mailer that went out to residents, an announcement of the plan update and link to public outreach survey was posted on social media sites. Figure 1 shows examples of public outreach.

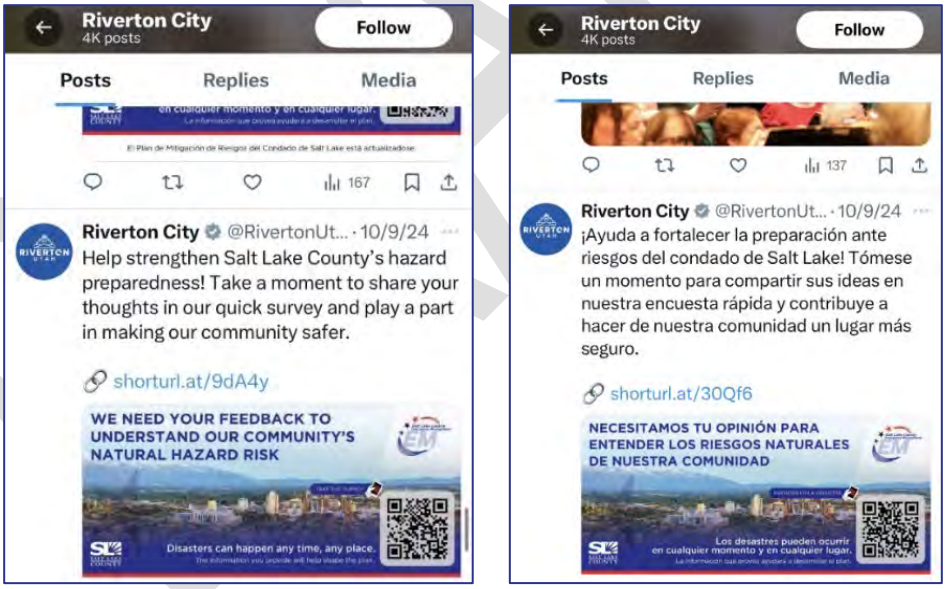

Figure 1: Social Media Posts for the Hazard Mitigation Survey in English (*left*) and Spanish (*right*)

Plan Integration

Incorporating the underlying principles of the Hazard Mitigation Plan and its recommendations into other plans is a highly effective and low-cost way to expand their influence. All plan participants will use existing methods and programs to implement hazard mitigation actions where possible. As previously stated, mitigation is most successful when it is incorporated into the day-to-day functions and priorities of government and public service. This plan builds on the momentum developed through previous and related planning efforts and mitigation programs, and it recommends implementing actions where possible through these other program mechanisms. These existing mechanisms include the following:

- Regularity Capabilities
- Administrative Capabilities
- Fiscal Capabilities

Respective planning stakeholders will conduct implementation and incorporation into existing planning mechanisms and will be done through the routine actions of:

- Monitoring other planning/program agendas
- Attending other planning/program meetings
- Participating in other planning processes; and
- Monitoring community budget meetings for other community program opportunities.

The successful implementation of this plan will require constant and vigilant review of existing plans and programs for coordination and multi-objective opportunities that promote a safe, sustainable community. Regular efforts should be made to monitor the progress of mitigation actions implemented through other planning mechanisms. Where appropriate, priority actions should be incorporated into planning updates. Table 12 lists existing planning mechanisms into which the Hazard Mitigation Plan has been integrated.

Table 13 lists the opportunities for integrating elements of this plan into other plans.

Table 12: Integration of Previous Plans by the City of Riverton

Plan	Description
None	N/A

Table 13: Opportunities for Integration with Future Plans of the City of Riverton

Plan	Description
Comprehensive Emergency Management Plan	City framework for disaster preparedness, response, recovery, and mitigation.
Community Wildfire Protection Plan	Plan to mitigate against wildland fires.
Active Transportation Plan	Address hazards and potential safety barriers in active transportation network.
Impact Fee Facilities Plans: Transportation, Culinary Water, Secondary Water Storm Water.	These plans discuss needs for potential future development and funding of infrastructure via impact fees. They could integrate goals for reducing risk to infrastructure in new development.
Moderate Income Housing Plan	Inform mitigation actions and policies to prevent resident exposure to hazards.
Stormwater Management Plan	Align stormwater management goals and address risks related to flooding and heavy rain in stormwater management.

DRAFT

Capability Assessment

Local mitigation capabilities are existing authorities, policies, programs, and resources that reduce hazard impacts or could help carry out hazard mitigation activities.

Planning and Regulatory Capabilities

Planning and regulatory capabilities are the plans, policies, codes, and ordinances that prevent and reduce the impacts of hazards.

Table 14: Assessment of the Planning Capabilities of the City of Riverton

Plan	Does it address hazards? (Y/N)	How can it be used to implement mitigation actions?	When was the last update? When is the next update?
General Plan	Y	Can inform local initiatives and responsible departments or individuals	2023
Capital Improvement Plan	Y	Can be used to identify funding sources	2018
Climate Change Adaptation Plan	N/A	N/A	N/A
Community Wildfire Protection Plan	Y	Can inform wildfire mitigation actions	2021
Economic Development Plan	Y	Can inform funding sources for mitigation actions	2023
Land Use Plan	Y	Can inform any new programs being developed related to land use or management for mitigation actions	2023
Local Emergency Operations Plan	Y	Can provide information on responsible departments for mitigation actions	2024
Stormwater Management Plan	Y	Can inform flood mitigation strategies	2022
Transportation Plan	Y	Can provide information on any traffic concerns or areas to prioritize	2021
Substantial Damage Plan	N/A	N/A	N/A
Other? (Describe)	Y	Can inform any heavy snow or severe winter weather mitigation actions	Snow Removal Plan

Table 17: Assessment of the Technical Capabilities of the City of Riverton

Technical Capability	In Place? (Y/N)	How has it been used to assess/mitigate risk in the past?	How can it be used to assess/mitigate risk in the future?
Mitigation Grant Writing	Y	Capital improvement projects, historic preservation,	Can be used to fund mitigation projects
Hazard Data and Information	Y	Used to identify areas of concern in the city	Can be used for grant applications and to support mitigation needs
GIS	Y	Used to identify and map areas of concern	Can be used for mitigation project tracking
Mutual Aid Agreements	Y	Used for assistance on small mitigation projects	Established agreements in place to assist with mitigation projects and tracking
Other? (Please describe.)			

Financial Capabilities

Financial capabilities are the resources to fund mitigation actions. Talking about funding and financial capabilities is important to determine what kinds of projects are feasible, given their cost. Mitigation

actions like outreach programs are lower cost and often use staff time and existing budgets. Other actions, such as earthquake retrofits, could require substantial funding from local, state, and federal partners. Partnerships, including those willing to donate land, supplies, in-kind matches, and cash, can be included.

Table 18: Assessment of the Financial Capabilities of the City of Riverton

Funding Resource	In Place? (Y/N)	Has it been used in the past and for what types of activities?	Could it be used to fund future mitigation actions?	Can it be used as the local cost match for a federal grant?
Capital Improvement Project Funding	Y	Infrastructure management	Y	Y
General Funds	Y	Infrastructure management and improvements	Y	N
Hazard Mitigation Grant Program (HMGP/404)	Y	Has not been used yet	Y	N
Building Resilient Infrastructure & Communities (BRIC)	Y	Has not been used yet	Y	N

Education and Outreach Capabilities

Education and outreach capabilities are programs and methods that could communicate about and encourage risk reduction. These programs may be run by a participant or a community-based partner. Partners, especially those who work with underserved communities, can help identify additional education and outreach capabilities.

Table 19: Assessment of the Education and Outreach Capabilities of the City of Riverton[5]

Education and Outreach Capability	In Place? (Y/N)	Does it currently incorporate hazard mitigation?	Could it be used to support mitigation in the future?
Community Newsletter(s)	Y	Y	Y
Hazard Awareness Campaigns (such as Firewise, Storm Ready, Severe Weather Awareness Week, School Programs)	Y	Y	Y
Public Meetings/Events (Please describe.)	Y	Y	Y
Emergency Management Listserv	Y	Y	Y
Local News	Y – through PIO services	Y	Y
Distributing Hard Copies of Notices (e.g., public libraries, door-to-door outreach)	Y	Y	Y
Insurance Disclosures/ Outreach	N	N/A	Y
Organizations that Represent, Advocate for, or Interact with Underserved and Vulnerable Communities (Please describe.)	Y	Y – Emergency Preparedness committee in place that meets monthly with the Emergency manager.	Y
Social Media (Please describe.)	Yes – quarterly newsletter	Y – messages from our PIO department to the public, on personal Preparation in an	Y

Education and Outreach Capability	In Place? (Y/N)	Does it currently incorporate hazard mitigation?	Could it be used to support mitigation in the future?
		Emergency. City website	
Other? (Please describe.)			

Opportunities to Expand and/or Improve Capabilities

Actions that can expand and improve existing authorities, plans, policies, and resources for mitigation include budgeting for mitigation actions, passing policies and procedures for mitigation actions, adopting and implementing stricter mitigation regulations, approving mitigation updates, and making additions to existing plans as new needs are recognized. Table 20 lists the opportunities for the city of Riverton.

Table 20: Opportunities to Expand and/or Improve the Capabilities of the City of Riverton

Capability	Opportunity to Expand and/or Improve
Planning and Regulation	Plans can be enhanced by finalizing mapping of the culinary water systems. Understanding locations of water systems can help identify high-risk areas to hazards like flooding. This data can be incorporated into the next hazard mitigation plan and other land use planning mechanisms, as appropriate.
Administrative and Technical	Floodplain management capabilities will have to be expanded, including training for inspectors. The city will also have to look at additional staffing in the city's Emergency Management division. Additional support for floodplain management and emergency management will help enable local staff to support mitigation.
Financial	Pursue **additional grant funding**, including Hazard Mitigation Grant Program (HMGP), Building Resilient Infrastructure & Communities (BRIC), and Community Development Block Grants (CDBG), to finance large-scale mitigation projects. The city could be supported through a state or FEMA-led technical assistance program.
Education and Outreach	The city can apply for federal funding through post-disaster and pre-disaster mitigation grant programs such as the Hazard Mitigation Grant Program (HMGP) and Flood Mitigation Assistance (FMA) grant programs.

Mitigation Strategy

Mitigation strategies provide proactive measures that are designed to minimize the impacts of hazards on the city of Riverton. Table 21 shows mitigation action alternatives, and Table 22 shows the status of previous mitigation activities. Table 23 is the 2025 mitigation action plan for the city of Riverton.

Table 21: Mitigation Action Alternatives for the City of Riverton

Action	Type of Action	Selected for inclusion in the plan?	If not selected, why not?
Develop an evacuation plan for the city for all-hazards.		No	Currently working on this – will be incorporated into plan updates.

DRAFT

Table 22: Status of Prior Mitigation Actions of the City of Riverton[6]

Action	Hazard(s)	Agency Lead	Support Agency(ies)	Status Update
Bury the canal and install piping and lining to open the canal	Flood (Riverine and Urban/Flash Flooding)	Riverton Public Works	Riverton EM	Incomplete
Augment the bridges and canals to increase stormwater capacity	All hazards, primarily	Riverton Public Works		Ongoing with UDOT and Salt Lake County
Increase stormwater culvert and collection area	Flood (Riverine and Urban/Flash Flooding)	Riverton Public Works, Salt Lake County	Riverton EM	Ongoing with UDOT reconfiguration. 13400 south Bangerter intersection
Establish Post-Disaster Action Plan for City Continuity of Operations Plan	All hazards	Riverton EM		Incomplete
Train and Certify City Inspectors to Conduct Post-Disaster Damage Assessment	All hazards	Riverton Public Works and Riverton EM, Public Works Drone operators.		Ongoing: Sent GIS drone operator to FEMA drone class in disaster management
Setup and Operate City Emergency Operations Centers	All hazards	Riverton EM		Incomplete
Update and Enhance the Riverton City's Communications Plans	All hazards	Riverton Communications		Partially complete; ongoing. Purchased a Starlink in July 2024
Complete City Culinary Water System Mapping and Models	Flooding and Drought	Riverton Public Works and Water Resources Engineer		Incomplete
Complete Critical Storm Drain Facilities	Flooding	Riverton Public Works		Incomplete
Train Personnel on emergency plans and SOPs	All hazards	Riverton EM		Ongoing
Implement a GPS Tracking System on City Maintenance Vehicles	All hazards	Riverton EM		Complete: All city vehicles are equipped with GPS tracking
Conduct an inventory and assessment of communications equipment and systems and identify needs	All hazards	Riverton EM		Ongoing

[6] EM = Emergency Management, SOP = Standard Operating Procedure, UDOT = Utah Department of Transportation.

DRAFT

Action	Hazard(s)	Agency Lead	Support Agency(ies)	Status Update
Conduct Training and awareness activities on communication equipment, tools, and systems	All hazards	Riverton EM		Ongoing
Examine current data availability and sharing capabilities, evaluate needs, and identify shortcomings	All hazards	Riverton EM and GIS		Incomplete
Integrate existing hazard monitoring networks in emergency operations centers. Utilize sensors, such as weather stations, stream gages, seismograph stations, road conditions, etc.	All hazards	Riverton EM		Partially complete. Pump houses monitored by computer
Utilize GIS to identify facilities and infrastructure at risk	All hazards	Riverton EM and GIS		Ongoing
Assess critical facilities for hazard exposure, structural weaknesses, power, communications and equipment resources and redundancy, and adequate emergency procedures	All hazards	Riverton Public Works		Incomplete
Implement improvements to address hazards identified in the assessment	All hazards	Riverton EM		Incomplete
Provide education regarding all-natural hazards through live trainings and web-based, print, and broadcast media	All hazards	Riverton EM		Incomplete
Utilize maps and similar products on County EM website and other media to educate the public on areas at risk of hazards	All hazards	Riverton EM and GIS		Incomplete
Coordinate with existing public education programs, such as the American Red Cross, Utah Living with Fire, Be Ready Utah, the National Weather Service, etc.	All hazards	Riverton EM		Incomplete

DRAFT

Action	Hazard(s)	Agency Lead	Support Agency(ies)	Status Update
Emergency Managers will coordinate with local water districts/public utilities to support ongoing conservation efforts	Drought	Riverton EM		Incomplete
Provide information on landscaping alternatives for persons subject to green area requirements	Drought	Riverton EM		Incomplete
Identify structures at risk of earthquake damage	Earthquake	Riverton GIS, Fire, and EM		Incomplete
Determine potential flood impacts and identify areas in need of additional flood control structures	Flooding	Riverton City Engineer and Public Works		Incomplete
Address identified problems through construction of debris basins, flood retention ponds, energy dissipaters or other flood control structures	Flooding	Riverton City Engineer and Public Works		Incomplete
Establish maintenance and repair programs to remove debris, improve resistance and otherwise maintain the effectiveness stormwater and flood control systems	Flooding	Riverton City Engineer and Public Works		Incomplete
Identify and assess structures for deficiencies	Flooding	Riverton City Engineer and Public Works		Incomplete
Modify structures as needed to address deficiencies	Flooding	Riverton City Engineer and Public Works		Incomplete
Assist NWS in making other agencies and departments aware of available resources	Severe Weather	Riverton EM		Incomplete
Assist Forest Service Utah Avalanche Forecast Center and other organizations in promoting avalanche hazard awareness for backcountry users	Severe Weather	Riverton EM		Deleted. No longer relevant

THIS PAGE INTENTIONALLY LEFT BLANK

Table 23: 2025 Mitigation Action Plan for the City of Riverton[7]

#	Action	Hazard(s)	Lead Agency	Potential Partners	Benefits (Losses Avoided)	Cost Estimate	Funding Source(s)	Time-frame	Priority	Comments
1	Bury the canal and install piping and lining to open the canal	Flooding (Riverine and Urban/ Flash Flooding), Heavy Rain	Riverton Public Works	Riverton EM, SLCo Flood Control, SLCo EM, SLCo Public Works	Reduce potential for property damage from overflow or other damage to canal.	High	Riverton General Fund, Riverton Capital Improvement Fund, BRIC grant, HMGP grant	Long-term	High	The Eastside Canal (1300W) and South Jordan Canal (primarily southeast portion by the new development) are prone to flooding. This project would strengthen the structural integrity of the canals. Some canals receive excess surface flows, both protecting in the short term but increasing potential for canal breaching.
2	Augment the bridges and canals to increase stormwater capacity.	Flooding (Riverine and Urban/ Flash Flooding), Heavy Rain	Riverton Public Works	Riverton EM, SLCo EM, SLCo Flood Control, SLCo Public Works	Reduce risk of damage to bridges and ensure access to emergency responders.	High	Riverton General Fund, Riverton Capital Improvement Fund, BRIC grant, HMGP grant	Long-term	High	This project would ensure the bridges can be utilized by first responders during an emergency event and the bridges would not be flooded. Limiting runoff to canals, upsizing some creek bridges, managing creek sediment and debris, and limiting residential encroachment and dumping will have a greater benefit.
3	Increase stormwater culvert and collection area.	Flooding (Urban/Flash Flooding), Heavy Rain	Riverton Public Works	Riverton EM, SLCo Flood Control, SLCo EM, SLCo Public Works	Reduce risk of damage caused by water accumulation.	High	BRIC grant, HMGP grant, Riverton General Fund, Riverton Capital Improvement Fund, HMA, PDM	Long-term	Medium	Unknown
4	Establish Post-Disaster Action Plan for City Continuity of Operations Plan.	Civil Disturbance, Dam Failure, Drought, Earthquake, Extreme Cold, Extreme Heat, Flooding, Hazardous Materials Incident, Heavy Rain, High Wind, Lightning, Public Health Epidemic/ Pandemic, Radon, Severe Winter Weather, Terrorism, Tornado, Wildfire	Riverton EM	SLCo EM, Riverton Public Works, Riverton PD, UFA, NGO partners, Riverton Parks	Ensure city services continue to function during hazard events.	Medium	HMA, Riverton General Fund	Short-term	High	Each city department has been given the assignment to write SOPs for their day-to-day operations. These procedures are shared across departments, and employees are being cross-trained in these procedures.
5	Train and certify City Inspectors to conduct post-disaster damage assessment.	Civil Disturbance, Dam Failure, Drought, Earthquake, Extreme Cold, Extreme Heat, Flooding, Hazardous Materials Incident, Heavy Rain, High Wind, Lightning, Public Health Epidemic/ Pandemic, Radon, Severe Winter Weather, Terrorism, Tornado, Wildfire	Riverton Public Works and Riverton EM	Riverton Communications, SLCo EM, UDEM	Minimize time occupants are displaced from homes and other structures.	Medium	Riverton General Fund, HMA	Long-term	High	In the event of an emergency where structural damage has been encountered, the Engineers, Building Inspectors, and Public Works inspectors will be paired to assess the stability and safety of the structure. Two Engineers have been trained in damage assessment. Over the next two years, the city will pursue and train the remainder of the assessment teams.

[7] BRIC = Building Resilient Infrastructure and Communities, EM = Emergency Management, EOC = Emergency Operations Center, FFSL = Division of Forestry, Fire, and State Lands, HMA = Hazard Mitigation Assistance, HMGP = Hazard Mitigation Grant Program, NGO = nongovernmental organization, NWS = National Weather Service, PD = Police Department, PDM = Pre-Disaster Mitigation, SHSP = State Homeland Security Program, SLCo = Salt Lake County, SLCo EM = Salt Lake County Emergency Management, SOP = Standard Operating Procedure, UDEM = Utah Division of Emergency Management, UFA = Unified Fire Authority, VECC = Valley Emergency Communications Center.

#	Action	Hazard(s)	Lead Agency	Potential Partners	Benefits (Losses Avoided)	Cost Estimate	Funding Source(s)	Time-frame	Priority	Comments
6	Set up and operate city emergency operations centers.	Civil Disturbance, Dam Failure, Drought, Earthquake, Extreme Cold, Extreme Heat, Flooding, Hazardous Materials Incident, Heavy Rain, High Wind, Lightning, Public Health Epidemic/ Pandemic, Radon, Severe Winter Weather, Terrorism, Tornado, Wildfire	Riverton EM	Riverton Public Works, Riverton Communications, Riverton Parks, SLCo EM	Ensure coordinated response in hazard events.	High	HMA, BRIC grant, HMGP grant, SHSP grant, Riverton General Fund	Short-term	High	The city recently built a new public works facility to house the city EOC. The building has training, conference, and meeting rooms to house the various branches of the EOC. The facility has a 1400 AMP generator and multiple outbuildings which can be used for various purposes during an emergency. Over the next 3 years or as budgets dictate, the city will add equipment, supplies, and communications capabilities to the facility. Additional facilities will be identified and equipped in the future.
7	Update and enhance the City of Riverton's communications plans.	Civil Disturbance, Dam Failure, Drought, Earthquake, Extreme Cold, Extreme Heat, Flooding, Hazardous Materials Incident, Heavy Rain, High Wind, Lightning, Public Health Epidemic/ Pandemic, Radon, Severe Winter Weather, Terrorism, Tornado, Wildfire	Riverton Communications	Riverton EM, Riverton Public Works, VECC, UFA, Riverton PD, SLCo EM, SLCo Public Works, SLCo Flood Control	Maintain communication between city departments and other agencies.	Medium	Riverton General Fund, BRIC grant, HMGP grant	Short-term	High	Riverton hired a full-time media and communications expert. One of the responsibilities of this position is to set up and provide multiple modes of communication for public outreach in the event of an emergency.
8	Complete city culinary water system mapping and models.	Flooding, Heavy Rain, and Drought	Riverton Public Works and Water Resources Engineer	SLCo Public Works, SLCo Flood Control, SLCo EM, Riverton Parks, Riverton EM	Improved understanding of system and ability to identify vulnerabilities.	High	Riverton General Fund, BRIC grant, HMGP grant, capital improvement funds	Long-term	High	In 2014, the city moved the responsibility of all engineering related to the water system to the Public Works Department and hired a Water Resources Engineer and began to update the model and mapping the City Network. The process will identify weaknesses and be used to build redundancy in the system.
9	Complete critical storm drain facilities.	Flooding, Heavy Rain	Riverton Public Works	Riverton EM, SLCo EM, SLCo Public Works, SLCo Flood Control	Reduce risk of flooding following heavy rain or high runoff events.	High	Riverton General Fund, Riverton Capital Improvement Fund, HMGP grant, BRIC grant	Long-term	High	In 2011, the city hired a consultant to study a region prone to flooding and property damage. This study was completed along with other studies conducted by the Engineering Division. From these studies, a list of capital improvement projects and procedures was generated and prioritized. These projects were placed on a 5- to 7-year project list which is being funded by the Stormwater Utility. Approximately $1,500,000 has been spent on updating the city's infrastructure
10	Train personnel on emergency plans and SOPs.	Civil Disturbance, Dam Failure, Drought, Earthquake, Extreme Cold, Extreme Heat, Flooding, Hazardous Materials Incident, Heavy Rain, High Wind, Lightning, Public Health Epidemic/ Pandemic, Radon, Severe Winter Weather, Terrorism, Tornado, Wildfire	Riverton EM	Riverton Public Works, Riverton Communications, Riverton PD, UFA, SLCo EM	Ensure personnel are able to complete emergency responsibilities.	Low	Riverton General Fund, staff time	Short-term	High	The city of Riverton has multiple emergency plans and SOPs as it relates to dams, severe weather, and flooding. the plans are familiar to only a few City Supervisors. The city will familiarize, train, and cross-train all maintenance and field personal in the emergency operation of these plans.
11	Conduct an inventory and assessment of communications	Civil Disturbance, Dam Failure, Drought, Earthquake, Extreme Cold, Extreme Heat, Flooding, Hazardous Materials Incident, Heavy	Riverton EM	Riverton Communications, Riverton PD, UFA, SLCo EM, UCA,	Identify city assets that may be vulnerable and identify solutions.	Low	Riverton General Fund	Short-term	Medium	The city of Riverton continues to improve and maintain its communications capabilities.

DRAFT

#	Action	Hazard(s)	Lead Agency	Potential Partners	Benefits (Losses Avoided)	Cost Estimate	Funding Source(s)	Time-frame	Priority	Comments
	equipment and systems and identify needs.	Rain, High Wind, Lightning, Public Health Epidemic/ Pandemic, Radon, Severe Winter Weather, Terrorism, Tornado, Wildfire		VECC, Riverton Public Works						
12	Conduct training and awareness activities on communications equipment, tools, and systems.	Civil Disturbance, Dam Failure, Drought, Earthquake, Extreme Cold, Extreme Heat, Flooding, Hazardous Materials Incident, Heavy Rain, High Wind, Lightning, Public Health Epidemic/ Pandemic, Radon, Severe Winter Weather, Terrorism, Tornado, Wildfire	Riverton EM	Riverton Public Works, VECC, UCA, SLCo EM, Riverton PD, Riverton Communications, UFA	Increase awareness of hazard risks and appropriate safety measures.	Low	Riverton General Fund	Short-term		The city of Riverton continues to participate in training and exercises designed to practice using communications tools and equipment.
13	Examine current data availability and sharing capabilities, evaluate needs, and identify shortcomings.	Civil Disturbance, Dam Failure, Drought, Earthquake, Extreme Cold, Extreme Heat, Flooding, Hazardous Materials Incident, Heavy Rain, High Wind, Lightning, Public Health Epidemic/ Pandemic, Radon, Severe Winter Weather, Terrorism, Tornado, Wildfire	Riverton EM	Riverton Public Works, Riverton GIS, Riverton Communications, SLCo EM, Riverton PD, UFA	Use data to identify city assets and possible vulnerabilities to hazards.	Low	Riverton General Fund	Short-term		The city of Riverton GIS personnel actively participate in several coordinating
14	Integrate existing hazard monitoring networks in emergency operations centers. Use sensors, such as weather stations, stream gages, seismograph stations, and road condition monitors.	Civil Disturbance, Dam Failure, Drought, Earthquake, Extreme Cold, Extreme Heat, Flooding, Hazardous Materials Incident, Heavy Rain, High Wind, Lightning, Public Health Epidemic/Pandemic, Radon, Severe Winter Weather, Terrorism, Tornado, Wildfire	Riverton EM	NWS, SLCo EM, UFA, Riverton PD, Riverton Public Works, Riverton Communications	Monitor conditions to provide access to information for taking appropriate safety precautions during hazard events.	Low	Riverton General Fund	Short-term	Medium	The city of Riverton continues to educate and implement hazard monitoring networks in its EOC.
15	Use GIS to identify facilities and infrastructure at risk.	Civil Disturbance, Dam Failure, Drought, Earthquake, Extreme Cold, Extreme Heat, Flooding, Hazardous Materials Incident, Heavy Rain, High Wind, Lightning, Public Health Epidemic/ Pandemic, Radon, Severe Winter Weather, Terrorism, Tornado, Wildfire	Riverton EM and GIS	SLCo EM, Riverton Public Works, Riverton Parks, Riverton PD	Use data to identify city assets and possible vulnerabilities to hazards.	Medium	Riverton General Fund	Short-term	Medium	As part of the city of Riverton public works facility, an EOC component has been added to its infrastructure, efforts to complete other components of the EOC are in progress.
16	Assess critical facilities for hazard exposure, structural weaknesses, power, communications and equipment resources and	Civil Disturbance, Dam Failure, Drought, Earthquake, Extreme Cold, Extreme Heat, Flooding, Hazardous Materials Incident, Heavy Rain, High Wind, Lightning,	Riverton Public Works	SLCo Public Works, SLCo EM, UFA, Riverton PD, Riverton Parks	Use data to identify city assets and possible vulnerabilities to hazards to plan	Medium	Riverton General Fund, BRIC grant, HMGP grant	Short-term	Medium	The city of Riverton continues to inspect facilities to identify potential needs.

	redundancy, and adequate emergency procedures.	Public Health Epidemic/ Pandemic, Radon, Severe Winter Weather, Terrorism, Tornado, Wildfire			risk reduction actions.					
17	Implement improvements to address hazards identified in the assessment.	Civil Disturbance, Dam Failure, Drought, Earthquake, Extreme Cold, Extreme Heat, Flooding, Hazardous Materials Incident, Heavy Rain, High Wind, Lightning, Public Health Epidemic/ Pandemic, Radon, Severe Winter Weather, Terrorism, Tornado, Wildfire	Riverton EM	Riverton Public Works, Riverton Communications, SLCo EM, Riverton PD, Riverton Parks	Reduce risk of damage to facilities and minimize potential for injury to occupants.	High	Riverton General Fund, Capital Improvement Fund	Long-term	High	The city of Riverton is identifying options and opportunities to address issues.
18	Provide education regarding all natural hazards through live trainings and web-based, print, and broadcast media.	Civil Disturbance, Dam Failure, Drought, Earthquake, Extreme Cold, Extreme Heat, Flooding, Hazardous Materials Incident, Heavy Rain, High Wind, Lightning, Public Health Epidemic/ Pandemic, Radon, Severe Winter Weather, Terrorism, Tornado, Wildfire	Riverton EM	Riverton PD, Riverton Public Works, Riverton Communications, SLCo EM, SLCo Public Works, SLCo Flood Control, NWS, Riverton GIS	Increased local understanding of natural hazards and ways in which residents can reduce their risk.	Low	Riverton General Fund, NWS	Short-term	Medium	The city of Riverton attends and participates in community-based trainings. Personnel can share information from these trainings with the public both in person and through digital outreach methods, such as social media. Additional hazard-specific materials also contain good information to share with the public on how to reduce their own risk, such as early warning signs, cascading impacts, seismic and non-seismic retrofits (earthquake), rain gardens, utility elevation, and flood-resistant building materials (flooding, dam failure, heavy rain), home weatherization (extreme cold, extreme heat, severe winter weather), tree pruning and wind resistant building materials (high wind, tornado, lightning), warning signs and vegetation mitigation measures (landslide/slope failure), at-home testing and radon mitigation measures (radon), and defensible space and home hardening (wildfire).
19	Use maps and similar products on the county EM website and other media to educate the public on areas at risk of hazards.	Civil Disturbance, Dam Failure, Drought, Earthquake, Extreme Cold, Extreme Heat, Flooding, Hazardous Materials Incident, Heavy Rain, High Wind, Lightning, Public Health Epidemic/ Pandemic, Radon, Severe Winter Weather, Terrorism, Tornado, Wildfire	Riverton EM and GIS	Riverton PD, Riverton Public Works, Riverton Communications, SLCo EM, SLCo Public Works, SLCo Flood Control, NWS	Visual tools help residents understand areas potentially at risk from hazards and identify those they may need to mitigate.	Low	Riverton General Fund	Short-term	Medium	Personnel of the city of Riverton are working to compile and make available hazard maps to help educate the public on potential hazards in the city.
20	Coordinate with existing public education programs, such as the American Red Cross, Utah Living with Fire, Be Ready Utah, and the National Weather Service.	Civil Disturbance, Dam Failure, Drought, Earthquake, Extreme Cold, Extreme Heat, Flooding, Hazardous Materials Incident, Heavy Rain, High Wind, Lightning, Public Health Epidemic/ Pandemic, Radon, Severe	Riverton EM	Riverton Public Works, SLCo EM, NGO partners, Riverton PD, UFA, UDEM, FFSL	Increased local understanding of natural hazards and ways in which residents can reduce their risk.	Low	Riverton General Fund, SLCo EM, UFA, NWS	Short-term	High	The city of Riverton educates the community by using programs, such as Be Ready Utah to help educate the community during various events.

		Winter Weather, Terrorism, Tornado, Wildfire								
21	Emergency Managers will coordinate with local water districts/ public utilities to support ongoing conservation efforts	Drought, Extreme Heat	Riverton EM	Riverton Public Works, Riverton Communications, water districts, local utilities, SLCo EM, SLCo Public Works	Broader establishment and implementation of water conservation goals to reduce effects of drought and heat.	Low	Riverton General Fund, water districts	Short-term	Medium	The city of Riverton continues to educate citizens concerning water consumption.
22	Provide information on landscaping alternatives for persons subject to green area requirements	Drought, Extreme Heat	Riverton EM	Riverton Parks, Riverton Public Works, SLCo EM, SLCo Health Department, SLCo Parks and Recreation	Reduce impacts of drought and improve long-term resilience.	Low	Riverton General Fund, SLCo Office of Regional Development	Short-term	Medium	Through social media and monthly newsletters, the city of Riverton educates and offers information to citizens concerning water consumption.
23	Identify structures at risk of earthquake damage and retrofit them as needed to reduce risk.	Earthquake	Riverton EM and GIS	UFA, SLCo EM, UDEM, Riverton Public Works, Riverton PD	Identify and prioritize structures for retrofit to reduce risk of damage and injury.	Medium	Riverton General Fund	Short-term	Medium	The city of Riverton is working with GIS, Fire, and Emergency Management on a risk management plan to evaluate its level of risk from earthquakes.
24	Determine potential flood impacts and identify areas in need of additional flood control structures.	Flooding, Heavy Rain, Dam Failure	Riverton City Engineer and Public Works	SLCo Flood Control, SLCo EM, Riverton GIS, Riverton EM	Identify structures at risk for structural improvements, relocation, or other actions to reduce risk.	Medium	Riverton General Fund	Short-term	Medium	The City Engineer and Public Works Director regularly review the impact of development and the need for flood control infrastructure and make recommendations as needed.
25	Address identified problems through construction of debris basins, flood retention ponds, energy dissipaters, and other flood control structures.	Flooding, Heavy Rain	Riverton City Engineer and Public Works	Riverton EM, SLCo Flood Control, SLCo Public Works, SLCo EM	Reduce risk of damage or injury from flooding.	High	Riverton General Fund, Capital Improvement Fund, BRIC grant, HMGP grant	Long-term	Medium	The City Engineer and Public Works Director oversee the construction of flood control structures.
26	Establish maintenance and repair programs to remove debris, improve resistance and otherwise maintain the effectiveness of stormwater and flood control systems.	Flooding, Heavy Rain	Riverton City Engineer and Public Works	SLCo Flood Control, SLCo EM, SLCo Public Works, water districts, local utilities	Ensure systems function effectively to avoid ponding or other water drainage issues.	High	Riverton General Fund, Capital Improvement Fund	Long-term	High	The Stormwater Division of the Public Works Department continues to maintain and repair all drainage systems in the city.
27	Identify and assess structures for deficiencies.	Flooding, Heavy Rain, High Wind, Heavy Snow, Tornado	Riverton City Engineer and Public Works	Riverton EM, SLCo EM, SLCo Public Works, SLCo Flood Control, SLCo Parks and	Identify and prioritize facilities for hardening to reduce damage and loss of	Medium	Capital Improvement Fund	Long-term	Medium	The city's Engineering Division, in cooperation with the Public Works Department, regularly reviews and inspects city-owned infrastructure and makes recommendations as needed.

Salt Lake City Annex

To participate in this multi-jurisdictional hazard mitigation plan (MJHMP) update for Salt Lake County (SLCo), the governing body of Salt Lake City passed a formal resolution, a copy of which is maintained at the local government offices.

Planning Process Contact Information

Table 1 provides information on the point of contact during the updating of the MJHMP.

Table 1: Contact Information for Salt Lake City

Name	Contact Information
Ty Shepherd	**Phone: 801-577-9008 email: tyler.shepherd@slc.gov**

Salt Lake City has a fully integrated approach to hazard mitigation planning and program implementation. During the 2024 update process, the MJHMP participation roles in Table 2 were recorded. Participation opportunities included invitations to meetings, completing the public survey, reviewing and contributing to forms, and reviewing the plan draft.

Table 2: Participant List for Salt Lake City

Name	Title	Jurisdiction
Kevin Barjenbruch	Warning Coordination Meteorologist	National Weather Service
Gary Carter	Planning Section Chief	Salt Lake City
Ty Shepherd	Division Chief/Emergency Manager	Salt Lake City
Jason Draper	Chief Engineer Floodplain Administrator	Salt Lake City
Matt Wilson	Emergency Management Planning Coordinator	Salt Lake City
Hannah Youell	Emergency Management Public Information Officer/Joint Information Center Coordinator	Salt Lake City
Nick Bleckert	Urban Forestry Operations Manager	Salt Lake City Urban Forestry Public Lands
Mike Guymon	Deputy Chief Engineer	Salt Lake City Public Utilities
Kyle Shields	Parks Operations Manager	Salt Lake City Parks and Public Lands
Tyler Fanarow	Recreation Trails Project Manager	Salt Lake City Parks and Public Lands
Tom Simons	Emergency Management Operations Captain	Salt Lake City
Tess Alexander	Emergency Management Community Preparedness	Salt Lake City
Eric Witt	Emergency Management Training Specialist	Salt Lake City
Audrey Pierce	Emergency Management Critical Infrastructure	Salt Lake City

DRAFT

Name	Title	Jurisdiction

Alex DeSmet	Meteorologist	National Weather Service

Jurisdiction Profile

Date of Incorporation

1847

Location and Description

Salt Lake City is in the northeast corner of the Salt Lake Valley, surrounded by the Great Salt Lake to the northwest and the steep Wasatch and Oquirrh mountain ranges on the eastern and southwestern borders, respectively. Its encircling mountains contain several narrow glacial and stream-carved canyons. City Creek, Emigration Canyon, Millcreek Canyon, and Parley's Canyon border the eastern city limits. Salt Lake City covers 110.4 mi^2 and has an average elevation of 4,327 feet above sea level. The lowest point in the city's boundaries is 4,210 feet above sea level, near the Jordan River and the Great Salt Lake, and the highest is Grandview Peak, at 9,410 feet.

Salt Lake City is separated from the Great Salt Lake by extensive marshlands and mudflats. Two to three times a year, the metabolic activities of bacteria in the lake create a phenomenon known as "lake stink," a scent reminiscent of foul poultry eggs, for a few hours. The Jordan River, which is a drainage of Utah Lake, flows through the city and empties into the Great Salt Lake.

The Salt Lake Valley floor is the ancient lakebed of Lake Bonneville, which existed at the end of the last Ice Age. Several Lake Bonneville shorelines appear distinctly on the foothills or benches of nearby mountains.

DRAFT

Population

The estimated population of Salt Lake City in 2024 was 212,570, up from 200,660 in 2020, reflecting a 5.94% increase.[1]

Demographics

The average household income in Salt Lake City is $107,280, and the city has a poverty rate of 14.1%. The median age in Salt Lake City is 32.5 years, with males averaging 32.6 years and females 32.3 years.

Salt Lake City, often abbreviated as SLC, is Utah's capital and most populous city. SLC and Reno, Nevada, are the only two major urban areas in the Great Basin, and SLC is the largest city in the Intermountain West.

Salt Lake City represents 6.75% of Utah's total population and 18% of Salt Lake County's population. The city has a higher population density than the surrounding area, with over 1,689 people per square mile.[2]

Brief History

The city was founded in 1847 by Brigham Young, Isaac Morley, George Washington Bradley, and several other Mormon followers, who extensively irrigated and cultivated the arid valley. Immigration of international members of the Church of Jesus Christ of Latter-Day Saints (or LDS), mining booms, and the construction of the first transcontinental railroad initially brought economic growth, and the city was nicknamed the Crossroads of the West. The Lincoln Highway, completed in 1913, was the first transcontinental highway, and it passes through the city. At present, two major cross-country freeways, I-15 and I-80, intersect in the city. Salt Lake City has developed a strong outdoor recreation tourist industry, based primarily on skiing and hosted the 2002 Winter Olympics. It is the industrial banking center of the United States.

Climate

The climate of the Salt Lake City area is characterized as semi-arid. Under the Köppen climate classification, Salt Lake City has a dry-summer continental climate (DSA), a relatively rare form of the continental climate in which a region experiences dry summers and wet winters. The city has four distinct seasons but the summers and winters are long. Spring is the wettest season, while summer is very dry.

The nearby Great Salt Lake contributes significantly to precipitation in the city. The lake effect can help enhance rain from summer thunderstorms, and it produces lake effect snow approximately 6 to 8 times per year—some of which can be excessive snowfalls. It is estimated that about 10% of the annual precipitation in the city can be attributed to the lake effect.

[1] World Population Review, "Salt Lake City, Utah Population 2024." https://worldpopulationreview.com/us-cities/utah/salt-lake-city.
[2] Ibid.

Salt Lake City features significant variations in temperatures between seasons. During summer, there is an average of 56 days per year with temperatures of at least 90°F (32.2°C), 23 days of at least 95°F (35°C), and five days of 100°F (37.8°C). However, the average daytime humidity in July is only 22%. Winters are cold but rarely frigid. Although there is an average of 127 days that drop to or below freezing and 26 days with high temperatures that fail to rise above freezing, the city averages only 2.3 days at or below 0°F (−17.8°C). The record high temperature is 107°F (42°C), which occurred first on July 26, 1960, and again on July 13, 2002, while the record low is −30°F (−34°C), which occurred on February 9, 1933.

Substantial areas of high pressure often situate themselves over the Great Basin during mid-winter, leading to strong temperature inversions. This causes air stagnation and thick smog in the valley for several days or weeks and can lead to the worst air pollution levels in the U.S., reducing air quality to unhealthful levels.

Public Services

Given the nature of Utah's population concentration along the Wasatch Front, Salt Lake City must support regional planning and maintain relationships with Salt Lake County and the other municipalities in the county. Salt Lake City has participated in area Gap Analysis and Threat Assessments and was funded to develop a Local Energy Assurance Plan. The city has also participated in the Regional Resilience and Assessment Program (RRAP), which looks at critical lifelines and interdependencies and deeply examines valley-wide water systems and critical nodes. Numerous participating agencies in Salt Lake City have also participated in the Urban Area Security Initiative (UASI), a program that uses a Whole Community Approach to help high-threat, high-density urban areas build and sustain the capabilities needed to prevent, protect against, mitigate, respond to, and recover from acts of terrorism. Salt Lake County received UASI funding for this mission in 2008, 2009, 2010, 2014, and 2017. The Urban Area Working Group (UAWG) includes Salt Lake County, with representatives from public safety agencies, volunteer organizations, and the state for regional all-hazards planning, mitigation, response, and recovery. Under Salt Lake City Code, Title 22 et al., Salt Lake City executives are responsible for carrying out plans and policies. The city government must be prepared to participate in the post-disaster hazard mitigation team process and pre-mitigation planning as outlined in the code to effectively protect its citizens.

Governing Body

The city has a seven-member elected council that sets the overall policy direction and determines resource allocation by adopting annual budgets and ordinances. In Salt Lake City, the Mayor and Council are separate but equal branches of government. The Mayor is the chief executive, and the City Council is the legislative body. Council Members serve four-year terms, work for the city part-time, and are paid. Each Council Member represents one of the city's seven geographical Council Districts, which are of similar population size.

DRAFT

Development Trends

Salt Lake City is the capital of Utah and also the most populous city. It lies roughly in the center of the Salt Lake–Ogden–Provo Combined Statistical Area, which is a region of contiguous urban and suburban development along the Wasatch Front. Salt Lake City is central to the regional economy and is experiencing growth and development across several sectors, including real estate, technology, and infrastructure. Construction of new commercial and residential properties has occurred and is expected to continue. Possible development in the downtown area to expand entertainment venues is under consideration. The city is scheduled to host the 2034 Winter Olympics which may prompt additional development in the city.

Jurisdiction-Specific Hazards and Risk

The Calculated Priority Risk Index (CPRI) is a comprehensive assessment tool for evaluating and prioritizing risks in a given context. It considers various factors, such as probability, impact, and urgency, to determine the level of risk associated with events or situations. The results for each hazard, including its risk factor (RF) value, are shown in Table 3. The results are based on the criteria in

Table 4 and the equation that follows it. The CPRI helps organizations and individuals make informed decisions about risk management and mitigation strategies. It provides a systematic approach to identifying and addressing potential issues, allowing for a more efficient allocation of resources and proactive risk prevention. With the CPRI, stakeholders can prioritize their focus on the most critical risks, leading to more effective risk management and, ultimately, better outcomes.

Table 3: Calculated Priority Risk Index Values for Salt Lake City

Type of Hazard Event	Probability of Future Events	Spatial Extent	Severity of Life/ Property Impact	Warning Time	Duration	Response Capacity	Risk Factor Value
Avalanche	4	1	2	4	2	1	2.6
Drought	4	4	2	1	4	1	2.8
Earthquake	3	4	4	4	3	2	3.4
Extreme Heat	4	4	3	1	3	1	3
Extreme Cold	3	4	2	1	3	1	2.4
Flooding	4	3	3	3	3	1	3.1
Landslide/ Slope Failure	2	1	2	4	1	2	2

Heavy Rain	4	3	2	3	1	1	2.6
High Wind	4	3	3	3	2	1	3
Lightning	4	2	2	4	1	1	2.6
Severe Winter Weather	4	3	2	2	2	1	2.6

DRAFT

Type of Hazard Event	Probability of Future Events	Spatial Extent	Severity of Life/ Property Impact	Warning Time	Duration	Response Capacity	Risk Factor Value
Tornado	2	2	3	4	1	2	2.4
Wildfire	4	3	3	4	3	1	3.2
Dam Failure	2	2	3	2	2	3	2.4
Civil Disturbance	2	1	2	4	2	2	2.1
Cyberattack	2	3	3	4	3	2	2.7
Hazardous Materials Incident (Transportation & Fixed Facility)	3	1	2	4	1	1	2.2
Public Health Epidemic/ Pandemic	3	4	3	1	4	1	2.8
Terrorism	2	1	3	4	2	1	2.3

Table 4: Criteria for the Calculated Priority Risk Index

Risk Index Factor	Degree of Risk Level		Criteria	Factor Weight for Degree of Risk Level
Probability of Future Events	1	Unlikely	Less than 1 percent probability of occurrence in the next year or a recurrence interval of greater than every 100 years.	30%
	2	Occasional	1 to 10 percent probability of occurrence in the next year or a recurrence interval of 11 to 100 years.	
	3	Likely	11 to 90 percent probability of occurrence in the next year or a recurrence interval of 1 to 10 years.	
	4	Highly Likely	91 to 100 percent probability of occurrence in the next year or a recurrence interval of less than 1 year.	
Spatial Extent	1	Limited	Less than 10% of the planning area could be impacted.	10%
	2	Small	10%–25% of the planning area could be impacted	
	3	Significant	25%–50% of the planning area could be impacted.	
	4	Extensive	50%–100% of the planning area could be impacted.	
	1	Negligible	Less than 5% of the affected area's critical and non-critical facilities and structures are	30%

DRAFT

Risk Index Factor	Degree of Risk Level		Criteria	Factor Weight for Degree of Risk Level
Severity of Life/Property Impact			damaged/destroyed. Only minor property damage and minimal disruption of life. Temporary shutdown of critical facilities.	
	2	Limited	More than 5% and less than 25% percent of property in the affected area is damaged/destroyed. Complete shutdown of critical facilities for more than one day but less than one week.	
	3	Critical	More than 25% and less than 50% of property in the affected area was damaged/destroyed. Complete shutdown of critical facilities for over a week but less than one month.	
	4	Catastrophic	Over 50% of critical and non-critical facilities and infrastructures in the affected area are damaged/destroyed. Complete shutdown of critical facilities for more than one month.	
Warning Time	1	Self-defined	More than 24 hours	10%
	2	Self-defined	12 to 24 hours.	
	3	Self-defined	6 to 12 hours.	
	4	Self-defined	Less than 6 hours.	
Duration	1	Brief	Up to 6 hours.	10%
	2	Intermediate	Up to one day.	
	3	Extended	Up to one week.	
	4	Prolonged	More than one week.	
Response Capacity	1	High	Significant resources and capability to respond to this kind of event; staff are trained, experienced, and ready.	10%
	2	Medium	Some resources and capability to respond to this kind of staff; some staff may be trained, experienced, and ready while others may need additional support.	
	3	Low	Limited resources and capability to respond to this kind of event; additional staff or staff training needed.	
	4	None	No resources and capability to respond this kind of event; additional outside support would be required.	

RISK FACTOR (RF) EQUATION

RF Value = [(Probability x 0.30) + (Spatial Extent x 0.10) + (Severity of Life/Property Impact x 0.30) +

DRAFT

(Warning Time x 0.10) + (Duration x 0.10) + (Response Capacity x 0.10)]

Hazards with an RF value greater than or equal to 2.5 are considered high risk. Those with RF values of 2.0 to 2.4 are considered moderate risk hazards, and those with an RF value less than 2.0 are considered low risk. The highest possible RF value is 4.

Hazard Event History

Examining hazard event histories provides valuable insights to inform decision-making and help prioritize resources for risk prevention and response efforts. Table 5 lists the weather hazard events impacting Salt Lake City since the 2019 plan update, as recorded in the Storm Events Database from the National Centers for Environmental Information. Table 6 lists other hazard events that have impacted Salt Lake City.

Table 5: History of Weather Hazard Events in Salt Lake City since 2019[3]

Location	Date	Event Type	Deaths	Injuries	Property Damage	Crop Damage
Salt Lake City	06/13/2019	Thunderstorm Wind	0	0	$0	$0
Salt Lake City	07/04/2019	Thunderstorm Wind	0	0	$0	$0

Salt Lake City	08/09/2024	Thunderstorm Wind	0	0	$0	$0

Table 6: History of Hazard Events in Salt Lake City

Type of Hazard Event	FEMA Disaster #	Date(s)	Damage or Impacts	Description
Avalanche		N/A		
Drought		N/A	Drought is a recurring problem in the region	Air quality issues, water restrictions
Earthquake	DR-4548-UT	03/18/2020		5.7 magnitude
Extreme Heat		N/A	Summers of 2020–2024	Reported 9 deaths in Northern Utah, an upward trend in heat exposure and heat-related deaths since 2015. Excessive heat can also affect infrastructure. General impacts include increased risk for heat-related illness and increased power demand for cooling systems.
Extreme Cold		N/A	Winter of 2022 and 2023	2022: 5 people experiencing homelessness died from cold-related exposure in Salt Lake City. Extreme cold can contribute to hypothermia and other cold-related illness/injury. Increased demand for heating systems. Potential for frozen pipes or other service disruptions.
Flooding		N/A		
Landslide/ Slope Failure		N/A		

DRAFT

Type of Hazard Event	FEMA Disaster #	Date(s)	Damage or Impacts	Description
Radon		N/A	Over 25% of homes in Salt Lake are at or above WHO's mitigation threshold.	Unhealthy levels of radon gas have been measured in Salt Lake City homes.
Heavy Rain		N/A		
High Wind	DR-4578-UT	09/08/2020	Winds caused thousands of trees to fall and damaged sidewalks and vehicles and left extensive debris. Nearly 200,000 homes and businesses were without power. One individual was killed.	Hurricane-force winds affected multiple cities along the Wasatch Front.
Lightning		N/A		
Severe Winter Weather		N/A		
Tornado	DR-1285-UT	08/11/1999	One person was killed; 80 injured, and there was $170 million in damage.	F2 tornado damaged downtown Salt Lake City
Wildfire		07/20/2024		Sandhurst Fire burned on Ensign Peak near the State Capitol, prompting evacuation of 40 homes.
Dam Failure		N/A		
Civil Disturbance		05/30/2020	Rioters overturned a police vehicle and set it on fire. Buildings were sprayed with graffiti, and windows were broken.	A peaceful protest in response to the death of George Floyd turned violent. Rioters overturned a police vehicle and set it on fire. Buildings were sprayed with graffiti and windows were broken.
Cyberattack		N/A		
Hazardous Materials Incident (Transporta-tion & Fixed Facility)		N/A		
Public Health Epidemic/ Pandemic	DR-4525-UT	03/2019	COVID-19	Temporary business closures, economic impacts
Terrorism		N/A		

DRAFT

National Flood Insurance Program Summary

Salt Lake City participates in the National Flood Insurance Program (NFIP). Table 7 displays statistics related to the NFIP. Salt Lake City will continue to adopt and enforce floodplain management requirements, including regulating new construction of Special Flood Hazard Areas, making substantial improvement and/or damage determinations, or determining the permits required of owners to bring a substantially improved or damaged structure back into compliance. Salt Lake City participates in the Community Rating System (CRS).

Table 7: National Flood Insurance Program Status for Salt Lake City[4]

Init FHBM Identified	Init FIRM Identified	Current Effective Map Date	Adopted Date	Date Joined NFIP	Tribal
12/27/74	08/01/83	11/19/21	2021	08/01/83	No

Table 8: National Flood Insurance Policies for White City

Community ID	Number of Losses	Total Net Payment	Active Policies	Total Coverage
490105D	177	$407,411.90	187	$74,054,000

The questions in Table 9 were answered to the best of Salt Lake City's ability.

Table 9: NFIP Floodplain Management Capabilities and Compliance

Question	Response
Who is the floodplain manager? Is this their primary or secondary role?	Jason Draper
Does the floodplain manager have adequate training and capacity for their role? If not, what else is needed?	Yes. Ongoing education on the latest FEMA guidelines and floodplain management practices is essential to maintain proficiency.
How does the community enforce its floodplain rules? Does enforcement include monitoring compliance and acting to correct violations?	The city enforces floodplain regulations through permitting processes, inspections, and compliance monitoring. Enforcement includes monitoring compliance and addressing violations through corrective actions.
When was the community's most recent Community Assistance Visit (CAV)?	Unknown
Were any violations noted on the community's most recent CAV?	Unknown
Is there an upcoming CAV? If not, is one needed?	Unknown
When was the most recent floodplain management ordinance adopted?	2016
Does your community participate in the Community Rating System (CRS)? If so,	Participation**:** Yes

[4] FIRM = Flood Insurance Rate Map, FHBM = Flood Hazard Boundary Map

Question	Response
describe the steps the community has taken to achieve the CRS goals.	The city has implemented public outreach programs, higher regulatory standards, and flood data maintenance.
Does the community's floodplain management ordinance include any higher standards? If so, please list.	The ordinance includes freeboard requirements, floodway development restrictions, and cumulative substantial improvement rules.
Who is responsible for permitting?	The city's Building Services and Public Utilities departments issue development permits in flood-prone areas.
How does the community issue development permits in the special flood hazard area?	Applicants must submit detailed plans demonstrating compliance with floodplain regulations, including elevation certificates and floodproofing measures.
Does the community maintain elevation certificates?	Yes, the city maintains elevation certificates for structures in Special Flood Hazard Areas (SFHAs).
Does the community track the number of buildings in the special flood hazard area? If yes, are there any trends?	Monitoring: The city tracks the number of buildings in SFHAs. Trends: Data on trends is not publicly available.
How many repetitive loss (RL) structures does the community have? (List number and type of structure)	The city has identified several RL structures, primarily residential. Information on SRL structures is limited. Some RL properties have been mitigated through elevation or acquisition.
How many severe repetitive loss (SRL) structures does the community have? (List number and type of structure)	The Building Services Department is responsible for these determinations. Assessments are conducted post-event to evaluate damage relative to the structure's market value. Additional training and resources are needed to enhance capacity for these assessments. Information is disseminated through the city's website and community meetings. Several substantially damaged structures have been elevated or retrofitted.
Have any RL/SRL properties been mitigated since the last plan update?	The city plans to update ordinances, enhance public education, and improve data management to maintain NFIP compliance.
Who is responsible for making substantial damage/substantial improvement determinations?	Building Services
How does the substantial damage/substantial improvement process work in your community?	Assessments are conducted post-event to evaluate damage relative to the structure's market value.
Is there sufficient staff and training to make substantial damage/substantial improvement determinations?	Additional training and resources are needed to enhance capacity for these assessments.

DRAFT

Question	Response
How are substantial damage/substantial improvement requirements messaged to the public before and after an event?	Information is disseminated through the city's website and community meetings.
Have any substantially damaged/substantially improved structures been mitigated since the last plan update?	Some buildings with unreinforced masonry have been updated.
How will the community remain in compliance with the NFIP moving forward? (Simply stating "the community will continue to comply with the NFIP" will not meet FEMA's planning requirements)	The city plans to update ordinances, enhance public education, and improve data management to maintain NFIP compliance.

Table 10: NFIP Floodplain Mapping Capabilities and Compliance

Question	Response
How does the community support map change requests? This could be requested during the Risk MAP process or through Letters of Map Amendment or Revision.	The city assists property owners with applications for Letters of Map Amendment (LOMA) and Letters of Map Revision (LOMR).
When did the latest Flood Insurance Rate Map (FIRM) become effective?	2016
When was the latest FIRM adopted?	2016
Is the FIRM and Flood Insurance Study (FIS) report in an accessible location? How would the public get access to their flood map information?	FIRM and FIS reports are available on the city's website and at public libraries.
Does the community use any Risk MAP products? If so, describe.	Yes, the city uses Risk MAP products for planning and outreach.
Does the community collect updated floodplain data or modeling? Is this shared with partners and with FEMA?	The city collects updated data and shares it with FEMA and relevant partners.
Other comments?	None

Table 11: NFIP Flood Insurance and Outreach Information

Question	Response
How does the community educate the public on floodplain management and the availability of flood insurance, in and out of the floodplain?	It encourages communities to actively participate in NFIP (update from 2009)
How does the community engage with insurance agents on flood insurance?	Collaborations include informational sessions and resource sharing.
Does the community (or state) have flood hazard disclosure laws?	Yes, the state requires disclosure of flood hazards during property transactions.
How familiar is the public with their flood insurance options?	Awareness is moderate; ongoing education efforts are in place.

Question	Response
How many properties have flood insurance in the community?	Awareness is moderate; ongoing education efforts are in place.
Are there any areas where flood insurance is lacking?	Some older neighborhoods have lower insurance uptake.
Other comments?	None

Jurisdiction-Specific Vulnerabilities and Impacts

In addition to the 212,570 residents of Salt Lake City who may be vulnerable to hazards, there are a significant number of assets in the city that are at risk. Critical facilities in the city include 14 fire stations, 2 emergency operations centers (EOCs), 5 hospitals, 9 police stations, and 85 schools. As the state capital and largest city in Utah, there are significant cultural and historic sites. Salt Lake City contains 32 county-owned facilities, including senior centers, recreation centers, sports complexes, performing arts venues, and government offices. There are 230 properties and districts listed on the National Register of Historic Places in Salt Lake City, including 4 National Historic Landmarks.

Trax, FrontRunner, UTA bus lines, Amtrak, and Salt Lake City International Airport are critical transportation assets in the city. Major roads include I-15, I-80, I-215, Bangerter Highway, Highway 201, US-89/State Street, Redwood Road, Foothill Blvd., 700 East, and numerous others. Outdoor amenities include the International Peace Gardens, Sugarhouse Park, Liberty Park, City Creek Natural Area, Red Butte Garden, Hogle Zoo, 6 golf courses, and several trailheads. Salt Lake City manages a large watershed that includes City Creek, Parleys, Big Cottonwood, and Little Cottonwood Canyons in the Wasatch Mountains. Large capacity venues, such as the Salt Palace Convention Center, the Delta Center arena, the LDS Conference Center, Utah State Fairpark, Rice Eccles Stadium, and the Huntsman Center arena, may face unique challenges during hazard events.

Table 12 provides information on the vulnerable assets in Salt Lake City, including its critical facilities, highlighting the city's vulnerability to identified hazards. It also describes the potential impacts on the community arising from those vulnerabilities. Impacts are the consequences or effects of each hazard on the assets. By understanding the risks associated with these assets, local authorities can develop proactive strategies to mitigate vulnerabilities and ensure the safety and functionality of these important assets during hazard events. These data are invaluable for decision-making and prioritizing resources for emergency response and preparedness efforts, ultimately contributing to more effective risk management and greater resilience in the community.

Table 12: Jurisdiction-Specific Vulnerabilities and Impacts in Salt Lake City

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
Avalanche	People	*Vulnerability:* • Recreational enthusiasts: Skiers, snowboarders, and snowshoers who venture into backcountry areas are at higher risk because

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		they may not be familiar with avalanche terrain or conditions. Their activities often take them into areas prone to avalanches. • Inexperienced individuals: People without adequate training or knowledge about snow safety and avalanche risk are particularly vulnerable. The lack of awareness about signs of instability in the snowpack or how to respond in an avalanche situation can increase risk. • Tourists and non-locals: Visitors who are unfamiliar with the local geography and snow conditions might not recognize potential hazards. They might not know the terrain features that can influence avalanche risk. • Professionals in high-risk areas: Workers such as mountain guides and construction crews operating in mountainous regions may be at risk, especially during avalanche control work or if they are required to traverse unstable areas as part of their job. • Groups without proper gear: Those without appropriate safety equipment (such as avalanche beacons, probes, and shovels) are at greater risk because they may not be able to respond effectively to an avalanche event. • Individuals ignoring warnings: People who do not heed avalanche warnings or neglect to check avalanche forecasts before going into the backcountry may place themselves in harm's way. *Impacts:* Avalanches pose a direct threat to outdoor enthusiasts, which can lead to injuries or fatalities.
	Structures	*Vulnerability:* • Residential buildings: Homes in or near avalanche-prone areas are at risk. • Industrial facilities: Warehouses and manufacturing plants in high-risk zones may be threatened by sliding snow and ice, which can cause significant property damage. • Parking lots and garages: Open areas can be particularly susceptible, as snow can slide off slopes and collect in these spaces, leading to vehicle damage. *Impacts:* Property damage can occur to structures in avalanche paths and along transportation routes. Roofs may not be designed to withstand the weight of accumulated snow, which increases the likelihood of structural failure.
	Economic Assets	*Vulnerability:* Businesses throughout the city are vulnerable to direct and indirect losses from avalanche. Residential properties, commercial buildings, tourism-related businesses, agricultural businesses, and travel- and transportation-related assets are at risk. *Impacts:* The local economy may suffer, especially businesses reliant on winter tourism along with increased insurance costs. • Roads and highways: Critical transportation routes may be blocked or destroyed by avalanches, disrupting trade and travel. • Railways: Similar to roads, railway tracks can be buried or damaged, which affects goods transport and passenger services. • Bridges: Avalanche debris can damage bridge structures, leading to costly repairs and safety risks.

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		• Residential properties: Homes in avalanche-prone areas may suffer damage or total loss, leading to significant financial impacts on their owners. • Commercial buildings: Businesses in vulnerable areas might face closures or property damage, resulting in lost revenue and increased insurance costs. • Hotels and lodges: Properties that attract tourists might be at risk, which affects occupancy rates and local economies. • Crops and livestock: Avalanches can destroy farmland and harm livestock, leading to economic losses for farmers and disruptions in the local food supply. • Recreational facilities: Recreational sites can suffer damage, which affects tourism and local economies.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Wildlife habitat, forests and vegetation, water resources, historic sites, cultural sites, archaeological sites, and recreation areas are at risk. *Impacts:* • Wildlife habitat: The mountainous areas surrounding Salt Lake City are home to diverse wildlife, including species that rely on specific habitats. Avalanches can destroy nesting areas and food sources. • Forests and vegetation: Mountain forests, including pine and aspen trees, can be damaged or destroyed by avalanches, which impacts local ecosystems and alters water runoff patterns. • Water sources: Streams and rivers originating from the mountains may become blocked or altered by avalanche debris, which affects water quality and availability. • Historic sites and structures: Some historical landmarks or sites in vulnerable mountainous areas could be at risk of avalanches. These might include old mining structures or historic cabins. • Cultural trails: Various trails with historical significance, used for recreation or as routes for indigenous peoples, may be impacted, making them unsafe or inaccessible. Cultural institutions: Museums and historical sites in elevated areas may face risks from avalanches. • Archaeological sites: Sites tied to Native American history or early settler activity may be susceptible to avalanche damage, potentially resulting in the loss of valuable artifacts and information about the region's past. • Recreational areas: Popular recreational sites can face risks from avalanches, which affect community activities and local tourism.
	Critical Facilities and Infrastructure	*Vulnerability:* I-80, I-215, and major roads, power substations and distribution lines, water treatment facilities and infrastructure, and emergency response capacity are all vulnerable to avalanches. *Impacts:* • Transportation: Major highways like I-80 and I-215 can be obstructed by avalanches, impacting travel and transit systems. Avalanches can heavily affect transportation infrastructure,

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		leading to blockages and the potential for damage to vehicles and road surfaces. • Utilities: Power lines, substations, and water supply infrastructure may be damaged by avalanche debris, disrupting essential services. These events can bring down power lines, causing outages and costly remediation efforts. Structures that support critical infrastructure, such as communication towers, can be compromised during avalanche events, affecting service delivery. • Water supply systems: Damage to water treatment plants or pipelines can disrupt access to clean water. • Emergency services: Fire stations and hospitals near mountainous areas are at risk of inaccessibility during avalanche events, hindering emergency responses.
	Community Activities	*Vulnerability:* Outdoor recreation is a significant community asset that can be severely disrupted by avalanches. Skiing, snowboarding, hiking, snowshoeing, winter sports competitions, and snowmobiling are vulnerable to both potential risks for participants and the possible cancellation of activities, leading to associated losses. *Impacts:* • Skiing and snowboarding: The nearby ski resorts attract a large number of visitors each winter. Areas with steep slopes and fresh snowfall can pose significant avalanche risks. • Hiking and snowshoeing: Many residents and tourists participate in winter hiking and snowshoeing in the Wasatch Mountains. Trails that traverse avalanche-prone zones can expose hikers to dangerous conditions, especially during or after heavy snowfall. • Backcountry recreation: Adventurers seeking untouched snow often venture into backcountry areas. These individuals may not be fully aware of avalanche risks and conditions, which makes them susceptible to accidents. • Mountain climbing: Climbing in steep or snowy areas can be dangerous, particularly if the weather changes suddenly or if climbers are not equipped with the necessary safety gear. • Snowmobiling: Off-trail snowmobiling in mountainous regions can trigger avalanches due to the added weight and disturbance caused by the machines.
Drought	People	*Vulnerability:* A lack of drinking water affects all populations. *Impacts:* Extended drought can lead to restrictions on water use, increased costs for water, and limited drinking water supply. Drought can contribute to poor air and water quality.
	Structures	*Vulnerability:* Structures are vulnerable to drought because a lack of water for landscaping poses challenges. *Impacts:* Lack of water can impact future development, especially regarding landscaping needs.
	Economic Assets	*Vulnerability:* Outdoor recreation businesses and agriculture are vulnerable to drought, particularly due to a lack of snow. *Impacts:* Low snowpack can cause a decline in winter tourism and potentially significant economic losses to ski and other outdoor recreation businesses. Drought directly affects farms and irrigation

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		systems, as an insufficient water supply can hinder crop production and livestock health.
	Natural, Historic, and Cultural Resources	*Vulnerability:* The decline of the Great Salt Lake affects bird and other wildlife habitats. *Impacts:* A dry lakebed impacts public health, causes economic loss related to the lake, and affects migratory birds.
	Critical Facilities and Infrastructure	*Vulnerability:* The city water supply, fire service, transportation networks, healthcare facilities, energy sector, wastewater treatment are all vulnerable to drought. *Impacts:* • Water supply systems: The municipal water supply relies heavily on snowmelt and reservoir storage. During prolonged droughts, reduced snowpack can diminish water availability, impacting water treatment plants and distribution systems. • Fire services: Fire stations and emergency services may face challenges in suppressing wildfires, which can be exacerbated by dry conditions. Drought reduces water availability for firefighting efforts. • Transportation infrastructure: Drought can affect road maintenance, particularly in areas where water is used for dust control or where deteriorating soil conditions could affect road stability. • Public health facilities: Hospitals and clinics may experience increased strain during droughts due to health complications arising from water scarcity, such as heat-related illnesses and the spread of vector-borne diseases. • Alternative energy facilities: Renewable energy installations, such as hydroelectric dams, may experience reduced water levels, which can impact their efficiency and output. • Wastewater treatment facilities: Drought can affect the efficiency of waste treatment processes, especially if water levels in receiving waters decline, impacting the community's sanitation.
	Community Activities	*Vulnerability:* Tourism and outdoor recreation are vulnerable to drought. *Impacts:* Tourism can be impacted, especially outdoor community events. Reduced water availability for irrigation may affect parks and recreational facilities, leading to degraded landscapes and limited public use.
Earthquake	People	*Vulnerability:* All people who live and work in Salt Lake City are vulnerable to earthquakes. *Impacts:* A strong earthquake disrupts every aspect of life. Residents and those who work in the city are vulnerable to loss of life and injuries. Healthcare capabilities may be overrun, and residents may be displaced from homes, with some requiring public shelter.
	Structures	*Vulnerability:* Residential and all other occupancy types are vulnerable to damage. Mitigation efforts for unreinforced masonry (URM) buildings may not be complete, and these are at higher risk. Assisted living facilities are vulnerable. Liquefaction potential is high

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		for approximately the western two-thirds of the city, which adds additional vulnerability for damage to structures in this area. *Impacts:* Damage to or collapse of buildings is likely.
	Economic Assets	*Vulnerability:* All businesses in Salt Lake City are vulnerable to earthquakes. *Impacts:* Salt Lake City is an economic hub in the Intermountain West. Businesses may experience direct losses through structural damage, or they may be unable to operate due to damage and disruption to transportation and utility networks. Commerce may shut down for an undetermined amount of time, and businesses may close permanently or move out of the area to restart in a safer location. There could be a decline in tourism, and food and supply access may be disrupted.
	Natural, Historic, and Cultural Resources	*Vulnerability:* The Capitol and Temple Square have been retrofitted, but other historic buildings and monuments may still be vulnerable. There are 230 sites on the National Register of Historic Places located in Salt Lake City that are vulnerable to damage from earthquakes. *Impacts:* Many of the historic structures in Salt Lake City may be severely damaged or destroyed by an earthquake due to their age and construction, which lack seismic building standards. Cultural venues may also be damaged.
	Critical Facilities and Infrastructure	*Vulnerability:* All facilities and infrastructure are vulnerable to earthquakes. Refineries, hospitals, police and fire stations, water plants, power plants, roads/transportation, bus and rail transit systems, communication systems, prison, inland port, airport, federal reserve bank, bike lanes, sewer systems, and schools are all vulnerable. *Impacts:* Damage to emergency response facilities and vehicles may delay response and contribute to the vulnerability of residents. All infrastructure systems may also be damaged, and services may be interrupted due to ground shaking. Some facilities or systems may have higher vulnerability due to age and construction standards. Disruption to these systems may inhibit emergency response and place residents at additional risk.
	Community Activities	*Vulnerability:* All community events and activities are vulnerable to earthquakes. *Impacts:* Day-to-day activities may shut down until after recovery efforts. This may affect education, recreation, business, government services, and social activities for an extended period.
Extreme Heat	People	*Vulnerability:* Unsheltered populations and vulnerable groups such as the elderly, young children, those with chronic health problems, and low-income households are at higher risk. People working outdoors in hot weather are also at risk. *Impacts:* Unsheltered and other at-risk populations may experience heat illness such as dehydration, heat exhaustion, and heat stroke.
	Structures	*Vulnerability:* Older homes, cooling centers under strain, and a higher probability of structure fires are factors that increase the vulnerability of structures to extreme heat.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		Impacts: Older homes are less likely to have good insulation and may not have air conditioning or other cooling systems. Prolonged heat exposure can weaken building materials, cause cracks in concrete, warp wood, and deteriorate roofing materials. Older structures within the city may be more at risk. Salt Lake City is vulnerable to urban heat island effects and may not cool off even at night.
	Economic Assets	*Vulnerability:* All businesses are vulnerable to extreme heat. *Impacts:* Businesses face increased energy costs and reduced worker productivity in outdoor projects/work. There is increased demand on climate-controlled products. Some businesses may see less customer traffic during extreme heat.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Parks and open spaces, air quality, and increased wildfire risk are vulnerable to extreme heat. *Impacts:* Air quality may be negatively affected. Extreme heat can dry out vegetation and increase the risk of wildland fires. Parks and open spaces may experience a decline in vegetation health and lose their appeal.
	Critical Facilities and Infrastructure	*Vulnerability:* Power utilities, healthcare facilities, and transportation networks are vulnerable to extreme heat. *Impacts:* There is a strain on utility systems to meet increased power demands. Hospitals and healthcare facilities may experience a surge in heat-related illnesses or injuries. Roadways and rails can buckle or warp due to extreme heat. In Salt Lake City, I-15, I-80, Highway 201, Bangerter Highway, State Street/US 89, Redwood Road, Trax, FrontRunner, airport runways, and numerous other transportation routes are vulnerable to heat damage.
	Community Activities	*Vulnerability:* Outdoor events and tourism are vulnerable to extreme heat. *Impacts:* Decreased tourism. Outdoor events and activities may need to be postponed or canceled due to heat risks. Farmers' markets, outdoor sporting events, and concerts are vulnerable to these cancellations, leading to lost revenue. Parks, hiking trails, and other outdoor facilities may see decreased activity.
Extreme Cold	People	*Vulnerability:* Extreme cold can affect all Salt Lake City residents. The elderly, children, low-income households, and unhoused individuals face a higher risk. *Impacts:* People are vulnerable to hypothermia and frostbite with prolonged exposure to extreme cold. Low-income households may struggle with increased heating costs for homes and buildings. Those with access and functional needs are at greater risk.
	Structures	*Vulnerability:* Older homes, mobile homes, commercial spaces, and unheated structures are vulnerable to extreme cold. *Impacts:* • Older homes: Many older homes may not have adequate insulation or might have outdated heating systems. This makes them less efficient in retaining heat, leading to cold drafts and higher heating costs.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		• Mobile homes: Many mobile homes may not be built with the same insulation standards as permanent structures, making them more vulnerable to cold weather. • Commercial and industrial buildings: Structures used for storage or manufacturing that are not properly insulated can be at risk, especially if they are not occupied regularly and the heating is inconsistent.
	Economic Assets	*Vulnerability:* All businesses in Salt Lake City are vulnerable. *Impacts:* • Agriculture and landscaping: Cold temperatures can damage crops, especially sensitive varieties like fruits and vegetables. Seasonal changes can affect the landscaping industry, which relies on mild temperatures for planting and maintenance. • Construction: Cold weather can halt construction projects or slow progress. Concrete curing rates, material performance, and worker safety are all impacted by low temperatures, leading to delays and increased costs. • Manufacturing: Factories that rely on outdoor processes or shipping might face operational difficulties. Extreme cold can affect machinery performance and the supply chain, leading to potential financial losses. • Retail and hospitality: Businesses in these sectors may suffer from decreased foot traffic during extremely cold weather. Customers are less likely to venture out, impacting sales in shops, restaurants, and hotels. • Transportation and logistics: Cold weather can lead to hazardous road conditions and disruptions in public transport. This can affect the timely delivery of goods and services, impacting overall economic productivity. • Energy supply and utilities: Cold weather increases the demand for heating, which can strain energy resources. Infrastructure like power lines and gas pipelines can be vulnerable to freezing temperatures, leading to potential outages. • Tourism and recreation: Although some winter sports benefit from cold weather, extreme cold can deter tourists, affecting local businesses that rely on seasonal visitors. Ski resorts, for example, may face fewer visitors if temperatures drop severely.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Vegetation, wildlife, water systems, and historical, archaeological, and cultural sites are vulnerable to extreme cold. *Impacts:* • Vegetation: Some plant species, especially non-native or sensitive flora, may struggle to survive extreme cold temperatures. • Wildlife: Certain animal species that are not well adapted to extreme cold could face challenges in finding food and shelter during harsh winters. • Water bodies: Streams and ponds can freeze over, affecting aquatic ecosystems. This can disrupt habitats for fish and other aquatic life, along with impacting local recreational activities.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		• Historic buildings: Older buildings or structures constructed without modern materials may be more susceptible to damage from extreme cold. Issues such as frozen pipes, roof collapses due to heavy snow, and structural damage from temperature fluctuations can occur. • Archeological sites: Sites that lack proper preservation methods may face degradation or damage during extreme frost and thaw cycles, which can alter soil structures and expose artifacts. • Cultural artifacts: Items in museums or community centers, especially those made from organic materials like wood or textiles, can be damaged by extreme cold if not properly climate-controlled. • Outdoor public art: Sculptures and installations might experience damage from freezing temperatures and ice formation, which can compromise their integrity.
	Critical Facilities and Infrastructure	*Vulnerability:* Transportation networks are vulnerable to extreme cold. *Impacts:* Access to essential services could be disrupted.
	Community Activities	*Vulnerability:* Cultural events are vulnerable to extreme cold. *Impacts:* Cultural events and practices may be delayed or canceled. Cold weather can impact community events, festivals, and traditions that rely on outdoor spaces, limiting public engagement and cultural expression.
Flooding	People	*Vulnerability:* Residents near flood hazard zones along the Jordan River, City Creek, Red Butte Creek, Emigration Creek, Parleys Creek, and other waterways are vulnerable. Low-lying areas may also experience localized flooding during heavy rain events. *Impacts:* Flooding can damage homes and displace residents. Individuals without reliable transportation may struggle to evacuate quickly, while low-income families often lack resources for flood-prevention measures. The elderly and those with disabilities may face mobility challenges, increasing their risk during emergencies. Flooding can occur in areas of the city where storm drains cannot keep up with heavy rain events (such as the Ballpark area near 1300 South). Flooding can lead to the spread of disease or other health risks from contaminated water. The unsheltered population along the river is vulnerable to illness and injury.
	Structures	*Vulnerability:* Homes, commercial buildings, businesses, and other structures near flood zones or low-lying areas are vulnerable to flooding. *Impacts:* Residential properties in floodplains and commercial buildings without proper drainage systems or flood-resistant designs face significant risks of damage during heavy rain or snowmelt. Older structures may be more susceptible due to outdated construction standards.
	Economic Assets	*Vulnerability:* Commercial properties, especially retail centers and warehouses near rivers or low-lying areas, are at high risk during heavy rainfall. The Inland Port is at risk.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		Impacts: Businesses in flooded areas can experience significant losses from flood damage to structures or inventory. Residential developments in flood-prone zones can also suffer damage, which can influence property values. Public infrastructure, such as roads and utilities, may experience disruptions, leading to costly repairs, which may affect businesses' ability to operate and contribute to revenue losses.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Streams, parks, and historic structures are vulnerable to flooding. *Impacts:* Natural areas like wetlands and streams are at risk of habitat destruction. Flooding can contribute to an increase in mosquito populations. Cultural resources, such as parks and public spaces, can become unusable, and parks may be damaged beyond repair.
	Critical Facilities and Infrastructure	*Vulnerability:* Sewer and water systems, transportation networks, and the prison facility are vulnerable to flooding. *Impacts:* Sewer and water systems may be overwhelmed. The prison may be impacted. Roadways may be washed out or blocked by debris, which may disrupt emergency services or isolate communities.
	Community Activities	*Vulnerability*: Outdoor events and recreation are vulnerable to flooding. *Impacts:* Events may be postponed until waters recede, or they may be canceled. Flooding can cause damage to parks and gathering areas.
Landslide/ Slope Failure	People	*Vulnerability:* Homes along the northern and eastern sides of the city are built in the foothills and could be damaged or destroyed by landslides. *Impacts:* Loss of homes would temporarily displace residents. In the case of a fast-moving slope failure, it could cause injury or death.
	Structures	*Vulnerability:* Residences and other structures along the benches/slopes on the northern and eastern borders of the city are vulnerable to landslides. *Impacts:* Earth movement can cause extensive damage to structures.
	Economic Assets	*Vulnerability:* Businesses near slopes are vulnerable to landslides. *Impacts:* Businesses may experience a loss of property and disruption to their operations. Businesses not directly on slopes may experience indirect effects if major transportation routes are blocked or damaged.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Vegetation and wildlife, soil and water resources, and historic and cultural sites are vulnerable to landslides. *Impacts:* • Vegetation: Forests and other plant life can be affected as landslides may uproot trees and destabilize habitats. • Wildlife habitats: Landslides may displace or harm species that depend on specific habitats. • Soil and water resources: Landslides can lead to soil erosion, affecting agricultural lands and water quality in streams and rivers.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		• Landmarks and historic sites: Landslides pose a significant threat to historic sites, causing structural damage and risking the loss of unique cultural heritage. They can block access, negatively impacting tourism and local economies and creating safety hazards that may lead to site closures. The financial burden of repairs can compete with other community needs, and alterations to the landscape can diminish a site's historical significance. Sites such as Red Butte Gardens, This is the Place State Park, Hogle Zoo, Memory Grove, the Natural History Museum, and other resources near the foothills may be vulnerable to landslides.
	Critical Facilities and Infrastructure	*Vulnerability:* Transportation routes and refineries are vulnerable to landslides. *Impacts:* Emigration Canyon Road, I-80, I-15, Victory Road/Beck Street, and smaller neighborhood roads could be damaged or blocked. The University of Utah, Huntsman Cancer, and Primary Children's hospitals may be at risk of damage or limited access if roadways are blocked by landslides.
	Community Activities	*Vulnerability:* The city is situated against a backdrop of steep, mountainous terrain composed of sedimentary rocks that can be prone to erosion and instability. Heavy rainfall or rapid snowmelt can saturate the soil, increasing the likelihood of landslides, especially in areas where vegetation has been removed or where construction has altered the natural landscape. Urban development and infrastructure projects often disturb the natural slope stability, leading to increased runoff and weakened soil structures. In addition, seismic activity in the region poses an added threat, as earthquakes can trigger landslides. *Impacts:* Community events and activities may be disrupted by landslides.
Radon	People	*Vulnerability:* A range of 5% to 50% of homes tested in Salt Lake City have dangerous levels of radon gas. According to UtahRadon.org, an average of 40% of homes have dangerous levels. *Impacts:* Radon causes lung cancer. All people can be exposed either at work or home. There is a lack of widespread testing in homes and businesses.
	Structures	*Vulnerability:* Radon can enter buildings, especially those with basements or crawl spaces. Geological formations in the area can contribute to higher radon levels, and older homes often lack modern radon-resistant features. In addition, the climate can create pressure differences that allow radon to infiltrate buildings, while poor ventilation can lead to elevated indoor levels. *Impacts:* The cost of remediation may discourage people from taking mitigation action.
	Economic Assets	*Vulnerability:* Businesses and personal or household budgets are vulnerable to the effects of radon. *Impacts:* The costs of remediation and healthcare for long-term side effects can be significant.
	Natural, Historic, and	*Vulnerability:* Historic and other older structures are vulnerable to radon.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
	Cultural Resources	*Impacts:* These are vulnerable to radon due to geological factors, outdated construction methods, and environmental conditions. The area's uranium-rich geology produces radon gas, which can seep into older buildings constructed with local materials that lack modern mitigation techniques. Poor ventilation in many historic structures allows radon to accumulate, particularly in tightly sealed environments, during colder months. In addition, the region's topography can trap radon, increasing risks for nearby properties.
	Critical Facilities and Infrastructure	*Vulnerability:* Radon can enter hospitals, police and fire stations, schools, and other city facilities. *Impacts:* Employees and other occupants may be exposed to radon. The region has uranium-rich rocks, especially in the Wasatch Range, which produce radon gas that can seep into buildings through cracks and gaps. Certain soil types have high levels of uranium, contributing to indoor radon accumulation, particularly in poorly ventilated older structures. In addition, Salt Lake City's elevation can affect how radon escapes from the ground, while construction activities might disturb soil and release trapped gas.
	Community Activities	*Vulnerability:* Community activities have limited vulnerability to radon exposure.
Heavy Rain	People	*Vulnerability:* Areas of the city where storm drains cannot keep up with heavy rain events (such as the Ballpark area) and the unsheltered population along the river are vulnerable to heavy rain. *Impacts:* People can be injured by flash flooding following heavy rain. Others may be displaced. Floodwaters can spread disease.
	Structures	*Vulnerability:* Structures in low-lying areas or near flood hazard zones are vulnerable are vulnerable to heavy rain. *Impacts:* Basement flooding is a concern for residential homes. People may not have flood insurance to make repairs.
	Economic Assets	*Vulnerability:* Businesses in low-lying or flood-prone areas are vulnerable to heavy rain. *Impacts:* Local businesses may need to reduce operations or close due to the heavy rain or road closures.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Vegetation in parks and open spaces is vulnerable to heavy rain. *Impacts:* Local vegetation could be inundated, impacting plant growth. Heavy rain can contribute to soil erosion.
	Critical Facilities and Infrastructure	*Vulnerability:* Emergency response services are vulnerable to heavy rain. *Impacts:* Disruption to essential services and potential access issues for police and fire response due to road closures or travel delays.
	Community Activities	*Vulnerability:* Outdoor events and recreation are vulnerable to heavy rain. *Impacts:* Activities may be canceled or postponed due to heavy rain.
High Wind	People	*Vulnerability:* The entire city is vulnerable to high winds. *Impacts:* People can be injured by blowing debris or falling tree limbs.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
	Structures	*Vulnerability:* Structures throughout the city are vulnerable to high winds. Mobile homes are at higher risk. *Impacts:* High wind can cause structural damage across the board, including damage to landscaping damage and personal property, such as broken windows and roof damage. Homes and businesses can be damaged by fallen trees. Four mobile home parks in western Salt Lake City are at heightened risk due to their inability to withstand high winds.
	Economic Assets	*Vulnerability:* All businesses are vulnerable to high winds. *Impacts:* High winds can damage structures and inventory, or disrupt power and communication infrastructure necessary for businesses to operate. Debris may block roads, and employees may be unable to get to work.
	Natural, Historic, and Cultural Resources	*Vulnerability:* The city's location in a valley, surrounded by mountains, can create funneling effects that intensify wind gusts. Trees, vegetation, and historic and cultural sites are vulnerable to high winds. *Impacts:* High winds can lead to potential damage to trees and vegetation, disrupting ecosystems and altering landscapes. Historic buildings and cultural sites may suffer structural strain, as high winds can accelerate wear and tear on aging materials, such as wood and masonry. In addition, debris carried by strong winds can pose risks to both natural areas and human-made structures, leading to erosion or even the destruction of significant historical artifacts. Salt Lake City has many mature trees that can be uprooted by high winds. These trees can contribute to damage in parks and open spaces, as well as cause structural damage.
	Critical Facilities and Infrastructure	*Vulnerability:* Power, communication, and transportation infrastructure are all vulnerable to high winds. All critical facilities are at risk if these lifelines are disrupted. *Impacts:* Utility infrastructure, such as power lines and communications towers, can be damaged by high winds and are vulnerable to service outages. Power and communication outages can disrupt emergency response and medical care. Falling tree branches and other debris can block access to properties and may block roadways. Power is essential for life-sustaining equipment at assisted living and other medical care facilities.
	Community Activities	*Vulnerability:* The area's geography, located at the foot of the Wasatch Mountains, creates a channeling effect that can exacerbate wind speeds. In addition, many outdoor events and gatherings may be set up in open spaces, making them susceptible to sudden gusts. *Impacts:* Structures commonly used in festivals and public events, such as tents, canopies, and stages, have limited resistance to high winds, leading to safety concerns and potential damage. Furthermore, local foliage, including trees and shrubs, may not provide sufficient windbreaks, resulting in an increased risk of debris being blown around, thus posing hazards to participants.
Lightning	People	*Vulnerability:* Salt Lake City experiences summer thunderstorms, which can produce significant lightning activity. Lightning can occur anywhere in Salt Lake City, and all residents are potentially

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		vulnerable to injury from lightning. The area's geographical features, including the presence of mountains and open plains, can create conditions conducive to lightning strikes. In addition, outdoor recreational activities are popular in this area, and many residents and visitors may spend time in exposed locations, such as parks, hiking trails, or golf courses, during thunderstorms. *Impacts:* A lightning strike can cause serious injury or death to people in close proximity to the strike. People outdoors in open areas may struggle to find shelter quickly, particularly in fast-moving thunderstorms
	Structures	*Vulnerability:* Structures anywhere in Salt Lake City are vulnerable. *Impacts:* Fire is a possibility if structures are struck by lightning. Salt Lake City has many taller buildings that may be more vulnerable to lightning strikes if not properly grounded or equipped with proper lightning protection systems. Electrical surges may disrupt power, internet, and communication systems within homes and businesses.
	Economic Assets	*Vulnerability:* Salt Lake City has many major businesses that are vulnerable to losses from power and communication disruptions caused by lightning. *Impacts:* First, the city's geography and climate create conditions conducive to thunderstorms, particularly during summer. This increases the risk of lightning strikes that can damage infrastructure, such as power lines, communication systems, and buildings. In addition, the concentration of economic activities in urban areas makes them more susceptible to disruption from such natural events. Industries reliant on technology and continuous operations, such as data centers and manufacturing plants, may face significant financial losses from equipment damage or business interruptions.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Parks, cultural sites, and historic sites are vulnerable to lightning. *Impacts:* There is a risk of wildfire from lightning in foothills and City Creek Canyon. Salt Lake City has multiple parks and open spaces with mature trees and monuments that can attract lightning due to their height and thus may be damaged.
	Critical Facilities and Infrastructure	*Vulnerability:* Power and communication infrastructure and emergency response systems are vulnerable. *Impacts:* Power lines and substations are susceptible, and lightning strikes can lead to power outages. Power outages can disrupt essential functions of emergency facilities, hospitals, and schools. Lightning strikes could impact communications within buildings and affect emergency responders.
	Community Activities	*Vulnerability:* Outdoor recreation sites such as Memory Grove, Hogle Zoo, Sugar House Park, Liberty Park, and Red Butte Garden, golf courses such as Bonneville and Glendale, as well as numerous smaller parks, are exposed to lightning *Impacts:* Lightning can lead to the cancellation of community events.
Severe Winter Weather	People	*Vulnerability:* All of Salt Lake City is potentially vulnerable to severe winter weather. The eastern benches often see higher snow accumulations and residents there may have a higher risk.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		Impacts: The unsheltered population is vulnerable to exposure or hypothermia. Individuals may be stranded away from home or in their vehicles. Medical issues from shoveling heavy snow are possible, particularly for the elderly. People may underestimate the potential danger of winter weather warnings. People are at risk of injuries from slips and falls.
	Structures	*Vulnerability:* Older homes and structures throughout Salt Lake City are vulnerable to severe winter weather. *Impacts:* Heavy snow loads on roofs can cause damage. Older homes in Salt Lake City might have weakened roofs or inadequate insulation, making them susceptible to snow loads and ice dams.
	Economic Assets	*Vulnerability:* Businesses throughout Salt Lake City are vulnerable to severe winter weather. *Impacts:* Businesses can experience significant losses from decreased customer traffic and delayed shipments. Transportation and logistics companies, such as the Inland Port, are particularly vulnerable, as snow can hinder vehicle movement, leading to delivery delays. Construction projects may face delays and increased costs.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Ecosystems, wildlife habitats, and historic and cultural sites are vulnerable to severe winter weather. *Impacts:* The area's unique topography, characterized by its mountains and valleys, can lead to intense snowfall and create development patterns that concentrate snow accumulation in certain areas. This accumulation can damage delicate ecosystems, disrupt wildlife habitats, and lead to soil erosion as the snow melts. Historic structures and cultural sites, many of which are older and may not be equipped to handle severe weather, can suffer damage from heavy snow loads that may compromise roofs and other structural elements. In addition, the weight of accumulated snow can cause falling branches and trees, posing risks to both natural landscapes and human-made structures. Salt Lake City has 230 sites on the National Register of Historic Places. Culturally significant artifacts and sites can be affected by harsh winter conditions, as prolonged exposure to moisture and freezing temperatures can lead to deterioration.
	Critical Facilities and Infrastructure	*Vulnerability:* Power infrastructure and transportation networks are vulnerable to severe winter weather. *Impacts:* An increase in traffic accidents can strain emergency services. Additionally, communication issues, loss of power from falling trees and snow loads, increased demand for snow removal, and increased demand on drainage systems during snowmelt are possible. I-15 and I-80, as well as other major routes like State Street, Redwood Road, and Highway 201, may experience delays or closures during winter storms. FrontRunner, Trax, and other transit systems may also be delayed.
	Community Activities	*Vulnerability:* Activities and events throughout the city and region are vulnerable to disruption from severe winter weather. *Impacts:* Significant winter snowfall can create hazardous conditions, disrupt transportation, and lead to cancellations of outdoor events, affecting local businesses and community engagement. Snow can

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		cause power outages, which can complicate indoor gatherings. Many residents may prioritize safety, resulting in lower attendance at events. In addition, infrastructure challenges such as snow removal hinder mobility, making it difficult for community members to participate.
Tornado	People	*Vulnerability:* Tornadoes are uncommon in Utah, but they have occurred in Salt Lake City. The entire city is potentially vulnerable to tornadoes, and all populations are potentially at risk. *Impacts:* People are at risk of injury or death if a tornado occurs. The region's unique geography can foster severe weather, while a lack of public awareness and preparedness leaves residents ill-equipped to respond. Unlike tornado-prone areas, there is no established response culture, leading to delays in seeking shelter. In addition, urban infrastructure poses risks because flying debris can endanger lives. Limited access to timely weather alerts also hinders effective communication, making it essential for residents to stay informed and proactive about safety measures.
	Structures	*Vulnerability:* All structures, particularly older buildings and mobile homes, are vulnerable to tornadoes. *Impacts:* The region's sudden temperature shifts and unique geography can contribute to the formation of tornadoes, while many buildings may not be designed to withstand such extreme weather events. Older constructions, in particular, might lack modern reinforcements and building codes that enhance storm resistance. In addition, large trees and open spaces can increase wind speed and debris hazards, making the impact of tornadoes even more severe for nearby structures. Four mobile home parks in western Salt Lake City are at heightened risk due to their inability to withstand high winds.
	Economic Assets	*Vulnerability:* All businesses are vulnerable to tornadoes. *Impacts:* Several economic assets are vulnerable to tornadoes, including commercial buildings, industrial facilities, and critical infrastructure, such as power lines and transportation networks. These assets are at risk due to their construction materials and designs, which may not be fortified against high winds. In addition, densely populated areas can lead to significant damage and economic disruption if a tornado strikes, impacting local businesses and essential services. The region's relatively low experience with tornadoes may mean that preparation and response measures are not as robust as those in more tornado-prone areas.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Parks, mature trees, historic sites, and cultural resources are vulnerable to tornadoes. *Impacts:* Natural resources, like trees in local parks, may be uprooted or damaged, disrupting local ecosystems. Historic sites, such as the Salt Lake City and County Building and the Utah State Capitol, are at risk due to their age and structural integrity, which may not withstand strong winds. Cultural resources, including festivals and community gatherings held outdoors, could be disrupted, posing risks to public safety. The vulnerability of these resources is primarily due to their physical location and construction if they lack the reinforcement needed to endure severe tornado conditions.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
	Critical Facilities and Infrastructure	*Vulnerability:* Critical facilities and infrastructure that are vulnerable to tornadoes include hospitals, schools, power plants, and communication centers. *Impacts:* These structures may be compromised due to their large flat roofs that can easily be uplifted by high winds and their proximity to densely populated areas, which increases the risk of damage and casualties. In addition, utility lines and transport networks, such as highways, can become disconnected or obstructed, hindering emergency response efforts.
	Community Activities	*Vulnerability:* Community activities like outdoor concerts, sports games, and festivals are vulnerable to tornadoes due to their large crowds and open locations. *Impacts:* Tornadoes can develop quickly, leaving little time for attendees to find shelter. In addition, local infrastructure, such as schools and parks, may lack adequate tornado shelters or emergency plans.
Wildfire	People	*Vulnerability:* Wildfire risk is moderate to high in the Wasatch foothills along the northern and eastern areas of the city. Open space in the western area of the city toward Great Salt Lake is also vulnerable. *Impacts:* Wildfire can cause injury or death for those unable to reach safety from flames. Residents may be temporarily displaced due to evacuations or displaced long term if homes are destroyed. Residents near the wildland–urban interface (WUI), individuals with physical disabilities or health issues who may struggle to evacuate, and low-income families lacking resources for fire safety measures may be vulnerable. Older adults might have reduced mobility, making them more dependent on others for assistance. People with respiratory conditions may experience negative impacts from poor air quality due to wildfire smoke.
	Structures	*Vulnerability:* All structures near the WUI are vulnerable to wildfires. *Impacts:* Property loss, especially residences made of wood or in heavily vegetated areas, may be vulnerable. Properties near the WUI are at higher risk due to surrounding flammable vegetation. Inadequate defensible space, such as insufficient clearing of dry grass and shrubs, increases susceptibility. Roofs made of combustible materials and buildings that lack fire-resistant features are particularly at risk during wildfire events.
	Economic Assets	*Vulnerability:* All businesses are vulnerable to wildfires, including the cost to government agencies. *Impacts:* Commercial assets, such as retail centers close to forested regions, can suffer damage from flames and smoke, affecting the local economy. Vital infrastructure, such as power lines and water pipelines, can be disrupted, causing further economic repercussions. The cost of firefighting efforts and its impact on government agencies' total budgets can be significant.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Vegetation and wildfire habitats, watershed, recreation sites, and the Hogle Zoo are vulnerable to wildfires. *Impacts:* Natural resources like forests are at risk because dry vegetation and accumulated brush can ignite easily. Vegetation and habitat in the burn scar area may take a long time to recover. These

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		areas may be unusable for recreation, such as hiking, for a long time. Retardant drops can impact the watershed. The increasing frequency of drought and extreme heat, exacerbated by climate change, heightens these vulnerabilities.
	Critical Facilities and Infrastructure	*Vulnerability:* Water treatment plants in the WUI, utilities, communication towers, watershed, and the prison are vulnerable to wildfires. *Impacts:* Water treatment facilities can be damaged by fire, and water quality in the city's watershed can be impacted. Utilities like power lines and gas pipelines also are at risk, as sparks or falling trees can ignite fires.
	Community Activities	*Vulnerability:* Outdoor recreation is vulnerable to wildfires. *Impacts:* Community activities like hiking, camping, and outdoor events are vulnerable to wildfires due to the city's proximity to natural landscapes. High summer temperatures, low humidity, and invasive plants, such as cheatgrass, increase fire risks. Activities involving campfires or barbecuing can spark fires, and urban infrastructure, such as power lines, can ignite surrounding vegetation.
Dam Failure	People	*Vulnerability:* As shown in the Dam Failure inundation area maps, several large areas in Salt Lake City are potentially vulnerable to dam failure. Six high hazard dams and three significant hazard dams are within the city limits, and three more high hazard dams outside the city have the potential to cause damage within the city. Much of the city east of the Jordan River, west of Foothill Boulevard, and south of 600 South is within a potential inundation zone. High hazard dams in the city include the following: Rotary Glen, Salt Lake County Federal Heights (#1a), Salt Lake County Shriners #12, Salt Lake County Chandler Drive #13, Ensign Downs Db, and Salt Lake County Sugarhouse; high hazard dams outside the city are Little Dell, Mountain Dell, and Red Butte. *Impacts:* Residents in low-lying areas downstream, the elderly, children, and those with mobility issues may struggle to evacuate quickly. Communities with limited resources, particularly low-income neighborhoods, often lack adequate support and awareness of dam-related risks. Individuals may be injured if caught in fast-moving water or may be displaced if their homes are damaged by flooding.
	Structures	*Vulnerability:* Structures vulnerable to dam failure include residential neighborhoods, commercial buildings, and other structures in dam inundation boundaries or downslope of dams. *Impacts:* Structures downstream of a dam can suffer extensive damage from flooding following a dam failure. Damage is often worst close to the dam site because of the volume and velocity of water released. Seismic activity in the region also poses a risk, as earthquakes could compromise dam integrity, leading to severe consequences for nearby communities.
	Economic Assets	*Vulnerability:* Businesses in inundation areas are vulnerable to dam failure. *Impacts:* Several economic assets are vulnerable to dam failure, especially those near water bodies. Residential areas may experience devastating flooding, leading to displacement and

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		significant economic loss. Commercial properties can face damage and business interruptions. The vulnerability arises from their geographical location, the potential for rapid water flow during a dam breach, and the interconnectedness of local infrastructure.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Waterways and riparian habitats are vulnerable to dam failure. Historic and cultural sites are also at risk from flooding. *Impacts:* The Jordan River, creeks, and surrounding wetlands could experience significant flooding, disrupting ecosystems and water quality. Historic sites in downtown and nearby heritage landmarks may suffer extensive damage, threatening their cultural significance. The risks arise from the proximity of these resources to dam infrastructure, inadequate flood defenses, and the potential for rapid water release, which could overwhelm protections and lead to serious consequences for the environment and community heritage.
	Critical Facilities and Infrastructure	*Vulnerability:* One emergency operations center (EOC), 4 fire stations, 2 hospitals, and 24 schools are vulnerable to dam failure due to their location within dam inundation boundaries in Salt Lake City. Big Cottonwood and Little Cottonwood Water Treatment Plants are vulnerable to dam failure in those canyons, although they are outside the city boundaries and are operated by Salt Lake City Public Utilities. *Impacts:* Public safety facilities, such as police and fire stations, may become inaccessible during flooding, complicating emergency response efforts. This poses risks to residential and commercial zones and disrupts critical services. Dam failure could damage transportation infrastructure, such as highways and bridges. I-15, I-80, and numerous arterial roads and transit lines in Salt Lake City are vulnerable to flooding or other damage from a dam failure. Urban development in flood-prone areas further increases these vulnerabilities, leading to significant potential harm during an incident.
	Community Activities	*Vulnerability:* Recreation and community events are vulnerable to dam failure. *Impacts:* Community activities vulnerable to dam failure include recreational activities like boating, fishing, and hiking near reservoirs and rivers. Residential areas downstream are at risk of flooding, impacting homeowners and emergency services. The city's water supply and agricultural activities that rely on controlled water release can be disrupted. These vulnerabilities stem from urban development in flood-prone areas, aging infrastructure, and potential climate changes affecting water levels and dam safety.
Civil Disturbance	People	Bodily harm to people.
	Structures	Damage to structures, inability to access structures, government buildings are often the target, fire.
	Economic Assets	Cost of response, business closure, looting of businesses.
	Natural, Historic, and	Cultural resources have become the target of protest.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
	Cultural Resources	
	Critical Facilities and Infrastructure	The City Public Safety Building has been the target, shutting down dispatch and the Capitol.
	Community Activities	Postponed until disturbance is over.
Cyberattack	People	Inability to access digital information.
	Structures	Threats to buildings that are on a network.
	Economic Assets	Loss of data, hardware, cost of response (ransom).
	Natural, Historic, and Cultural Resources	Misinformation.
	Critical Facilities and Infrastructure	Communications issues, inability to operate water treatment plants and wastewater.
	Community Activities	Community activities like local government services, online event ticketing, and educational institutions are particularly vulnerable to cyberattacks. Outdated software and insufficient cybersecurity measures in government and nonprofit organizations can lead to data breaches and fraud. In addition, remote learning platforms can be targets for phishing attacks due to weak security protocols. Overall, limited resources and increasing reliance on digital systems contribute to these vulnerabilities.
Hazardous Materials Incident (Transporta-tion & Fixed Facility)	People	Health concerns, shelter in place, relocation, sheltering.
	Structures	Contamination, decontamination, destruction of structures.
	Economic Assets	Impact on food supplies.
	Natural, Historic, and Cultural Resources	Impact on watershed and air quality.
	Critical Facilities and Infrastructure	Impact on transportation.
	Community Activities	Cancellation of events.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
Public Health Epidemic/ Pandemic	People	Fear/panic. Several groups are particularly vulnerable during public health epidemics and pandemics. Individuals with pre-existing health conditions, such as asthma or diabetes, and older adults with weakened immune systems face higher risks of severe illness. Low-income individuals and those without health insurance often lack access to healthcare and vaccinations, increasing their vulnerability. In addition, marginalized communities may experience language barriers and distrust in the healthcare system, further hindering their ability to seek assistance. Socioeconomic status, health conditions, and access to care significantly affect these populations during health crises.
	Structures	The blessed tents now on the shelf. Several structures are vulnerable to epidemics and pandemics. Public transportation hubs, such as the TRAX light rail and bus stations, pose high risks due to proximity among individuals. Densely populated areas, such as apartment buildings and low-income housing, often face overcrowding and limited health resources, exacerbating the spread of illness. Healthcare facilities can become overwhelmed during outbreaks if not adequately staffed. Schools and universities also gather many people, facilitating rapid disease transmission.
	Economic Assets	Lack of toilet paper, lack of resources due to fear-purchasing, supply chain interruption. Key economic assets are vulnerable to public health epidemics and pandemics include tourism, hospitality, and retail. These sectors rely heavily on human interaction and can suffer from decreased consumer confidence, leading to lower foot traffic in shops and restaurants. Healthcare facilities, while critical during a crisis, may become overwhelmed, impacting their economic contributions. In addition, local events that draw large crowds are at risk of cancelation or postponement. This reliance on a service-oriented economy can lead to job losses and reduced working hours, amplifying the broader economic impact on the community.
	Natural, Historic, and Cultural Resources	Natural spaces like parks may see reduced access due to health guidelines, impacting community well-being. Historic sites, such as the Salt Lake Temple and local museums, rely on visitor interactions; closures during epidemics can hinder preservation efforts and financial support. Cultural resources such as festivals and community events may be canceled, disrupting social cohesion.
	Critical Facilities and Infrastructure	Increased demand on hospitals, decreased use of mass transit (trains, busses, planes).
	Community Activities	Cancellation of events and social distance. Large gatherings at sporting events, concerts, and festivals are particularly vulnerable to public health epidemics due to crowded conditions, facilitating disease transmission. Other at-risk areas include community centers hosting group classes and public transportation, which can become crowded during peak hours. Food

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		festivals and farmers' markets also pose risks, as they involve shared food handling.
Terrorism	People	Fear, loss of life, mis/disinformation, targeting of specific populations/phobias, not just a foreign issue. Minority religious or ethnic communities often face higher risks of prejudice. Individuals involved in social justice movements or expressing controversial political views also can be targeted. In addition, large public gatherings create opportunities for potential attacks, increasing attendees' vulnerability. Overall, visibility, beliefs, and social engagement contribute to the risks faced by these groups.
	Structures	Could be the target of terrorism. Several structures are vulnerable to terrorism due to their symbolic significance and high accessibility. The Utah State Capitol and the Conference Center of the Church of Jesus Christ of Latter-day Saints are prime targets, representing governance and faith and often hosting large gatherings. In addition, transportation hubs such as Salt Lake City International Airport have high foot traffic, increasing the potential for significant casualties. This combination of visibility, public access, and the potential for mass impact contributes to their vulnerability.
	Economic Assets	Commerce shut down.
	Natural, Historic, and Cultural Resources	Could be the target. Key sites, such as the Salt Lake Temple and the Utah State Capitol, are significant due to their architectural and cultural importance, making them potential targets, especially given their visibility and accessibility to large crowds. Natural resources like the Great Salt Lake carry risks, as attacks could disrupt local ecology and community life. Events such as the Sundance Film Festival attract significant audiences, presenting opportunities for disruption.
	Critical Facilities and Infrastructure	It could be the target, which would impact the entire population. Critical facilities vulnerable to terrorism include government buildings, transportation hubs like the airport and TRAX light rail, and large public venues such as the Salt Palace Convention Center. Their high profile and accessibility make them attractive targets. In addition, utility infrastructures, such as water treatment plants and power grids, are at risk, as disruptions can have widespread impacts.
	Community Activities	Cancellation of events. Large public gatherings, such as festivals, parades, and sporting events, attract crowds and media attention. Places of worship and cultural events may be targets due to their ideological significance. Their vulnerability stems from their open nature, high emotional impact, and often limited security measures. Public transit hubs and tourist attractions also are at risk due to concentrated crowds and unpredictable movement, making effective monitoring challenging.

DRAFT

Jurisdiction-Specific Changes in Vulnerability

Hazard events can impact communities, infrastructures, and ecosystems. The severity of these impacts can be influenced by climate change, population patterns, and land use developments. Understanding these factors is crucial for Salt Lake City to develop a resilient community and minimize the impacts of hazards. Table 13 displays the unique changes within the community and the related effects on each identified hazard affecting Salt Lake City.

DRAFT

Table 13: Jurisdiction-Specific Changes in Vulnerability in Salt Lake City

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
Avalanche	Higher temperatures can lead to more rain, destabilizing snowpack and increasing the risk of wet avalanches. In addition, changes in snowfall can cause denser snow layering on slopes, making them more prone to sliding.	Avalanches can influence population patterns by deterring people from moving to or remaining in high-risk areas, leading to decreased density in these locations. The threat of avalanches prompts many to seek safer environments in urban or lower-risk regions. In addition, when avalanches occur, they can disrupt infrastructure, causing residents to relocate.	Areas at high risk may face restrictions on new construction and require costly safety measures, which can deter development and shift growth to safer locations. Increased awareness of avalanche hazards may lead local governments to implement stricter zoning laws, affecting recreational and tourism opportunities in mountainous regions.	Decreased
Drought	Climate change affects drought incidents by altering precipitation patterns and increasing temperatures. Warmer weather can lead to longer dry periods and more severe droughts, while changes in rainfall can reduce snowpack in nearby mountains, crucial for summer water supply. Higher temperatures also increase evaporation rates, further straining local water resources.	Drought can significantly influence population patterns by impacting economic opportunities and the quality of life. Water scarcity often leads to reduced agricultural productivity, prompting residents to migrate to areas with more stable job prospects. Increased water costs can make living less affordable, driving some residents away. Conversely, efforts to address drought, such as sustainable development or improved water management, may attract newcomers, resulting in changes in the community's demographic composition over time.	Drought can significantly impact land use and development by reducing water availability, leading to shifts in agricultural practices. Farmers may switch to drought-resistant crops or repurpose land for more profitable ventures, prompting urban development as people seek water-secure areas. This increased demand may drive local governments to adjust zoning laws and promote sustainable practices in new projects. As a result, prolonged drought conditions can reshape the area's landscape and influence future development trends.	Increased
Earthquake	Rising temperatures can lead to glacial melting, which affects pressure on tectonic plates and	Earthquakes can significantly alter population patterns by prompting residents to leave for	Earthquakes can alter land use and development by leading to changes in zoning and building	Stayed the same

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	may trigger seismic activity through isostatic rebound. In addition, increased rainfall and flooding can erode soils, weakening structural integrity and heightening vulnerability during earthquakes. Although the direct links between climate change and earthquakes are still under investigation, environmental effects may impact the region's seismic risk.	safer areas after a seismic event. This migration can lead to changes in population density and attract new residents and businesses during the rebuilding process. The perception of the area as a safe place to live may shift, impacting long-term demographics, as some residents return to rebuild while others relocate permanently.	codes. After an earthquake, damaged areas might be rezoned for different uses, and development may accelerate in certain neighborhoods.	
Extreme Heat	Climate change significantly impacts extreme heat by increasing the frequency and intensity of heat waves. Rising global temperatures lead to longer and hotter summers, affecting residents and local infrastructure while heightening health risks, especially for vulnerable populations. Urban heat islands from reduced vegetation and extensive pavement further amplify these effects.	By causing residents to relocate due to damaged homes or safety concerns. Some may move to areas perceived as safer or seek better job opportunities elsewhere. The economic impact and infrastructure damage can also make certain neighborhoods less desirable, leading to shifts in demographics and the socioeconomic landscape as new residents with different backgrounds move in.	Rising temperatures may lead urban planners to adopt heat mitigation strategies, such as increasing green spaces and using reflective materials. Zoning regulations might shift to promote mixed-use developments that enhance walkability and reduce vehicle reliance during peak heat. As concerns about heat-related health risks grow, there may be greater demand for improvements like shaded sidewalks and cooling centers, influencing future development toward resilience and sustainability.	Increased
Extreme Cold	By increasing the intensity of winter storms. Higher atmospheric temperatures allow for more moisture, resulting in heavier snowfall and potentially lower temperatures during these events. In addition, fluctuations in weather patterns may disrupt	By driving some residents to relocate to warmer areas. Harsh winters can hinder economic activities and deter new residents and businesses, influencing housing demand and the attractiveness of certain neighborhoods. This may	Extreme cold can impact land use and development by shifting priorities toward indoor facilities like shopping centers and community spaces, as outdoor activities are curtailed. Developers may focus on energy-efficient designs to cope with	Increased

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	seasonal cycles, leading to unpredictable periods of extreme cold mixed with warmer spells.	disproportionately affect lower-income families, leading to changes in demographics and socioeconomic stratification in the community.	harsh winter conditions, which can lead to increased construction costs and adjusted project timelines.	
Flooding	Higher temperatures increase the frequency and intensity of extreme weather events and alter precipitation patterns. They lead to more intense rainstorms and accelerated snowmelt from nearby mountains, raising water levels in rivers and streams. This combination raises the risk of flooding, especially in areas with inadequate drainage and urban development in flood-prone zones, heightening the potential for damage to homes and infrastructure.	Flooding can significantly alter population patterns by displacing residents from affected areas, leading them to seek shelter elsewhere. This may cause a population decline where flooding occurs, as individuals might hesitate to return due to ongoing risks or property damage. As neighborhoods become less desirable, people may migrate to safer areas, changing demographic trends and putting pressure on housing in those regions. Over time, these shifts can influence urban planning and development, as local governments address flooding risks and changing population needs.	By making some areas unsuitable for construction due to flood risks, planners may prioritize higher ground and impose stricter zoning laws, such as requiring elevated structures. This results in a more resilient urban landscape but may also limit growth and raise property values in safer areas.	Decreased
Landslide/ Slope Failure	Climate change increases the risk of landslides through heavier rainfall and temperature fluctuations. Intense rain saturates soil, destabilizing slopes, while freeze–thaw cycles weaken the ground. Changes in vegetation can also reduce stability, leading to a higher potential for landslides.	Landslides and slope failures can impact population patterns by making some areas unsafe, leading to displacement and lower property values. This prompts residents to move to safer regions, thereby increasing density in more stable areas. Concerns about future landslides may also deter newcomers from	Landslides and slope failures can impact land use and development by rendering certain areas unsafe for construction. This often results in stricter zoning laws, pushing developers to focus on more stable regions. Consequently, property values may decline in affected areas, and infrastructure investments shift to increase	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
		high-risk zones, shaping long-term demographic trends.	safety, ultimately guiding growth toward safer locations.	
Radon	Climate change can affect radon levels by altering soil temperatures and moisture conditions. Higher temperatures may increase radon emissions from the ground, while heavy rainfall can change groundwater and soil saturation, impacting radon migration into buildings.	Radon exposure can influence population patterns as increased health awareness may drive families to move away from areas with high radon levels. This shift could particularly affect vulnerable groups, changing demographics and demand in the housing market. Homes with lower radon levels may become more sought after, and public health campaigns can encourage community action, making previously undesirable areas more attractive once mitigation measures are implemented.	Radon can impact land use and development by necessitating site assessments and mitigation, which can increase costs. Developers might prioritize areas with lower radon risks and adopt designs that reduce gas infiltration. This awareness may prompt stricter building codes and zoning regulations, influencing where new projects are located and shaping community planning.	Decreased
Heavy Rain	Climate change increases the frequency and intensity of heavy rain, as higher temperatures allow the atmosphere to hold more moisture. This leads to stronger storms, flash flooding, and overwhelmed drainage systems.	Heavy rain can shift population patterns by pushing residents out of flood-prone areas and attracting them to safer neighborhoods. Frequent flooding may lead to evacuations and economic disruptions, prompting relocations. Over time, ongoing heavy rains can affect housing demand and community stability, altering the town's population distribution.	Need for adequate stormwater systems in new areas. Heavy rain can impact land use and development by altering zoning regulations to address flood risks. Previously safe areas might be deemed unsuitable for development, pushing growth to higher ground. There may also be a shift toward green infrastructure and improved drainage systems, ultimately transforming the urban landscape to enhance flood resilience.	Increased
High Wind	Climate change affects high winds by altering atmospheric patterns and increasing extreme weather events. Rising	High winds can alter population patterns by making certain areas less desirable. Frequent damage may drive residents to safer	Buildings need to meet building code standards to withstand expected wind events.	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	temperatures may lead to more substantial, unpredictable winds and more frequent thunderstorms, posing risks to infrastructure and air quality.	neighborhoods, deter newcomers, and slow growth in affected regions.	High winds can affect land use and development by necessitating stronger building codes and wind-resistant designs, which may raise construction costs. Areas prone to wind damage might see decreased property values, leading to reduced investment. In addition, high winds can cause erosion and harm vegetation, prompting town planners to prioritize open spaces and green infrastructure, ultimately altering development strategies.	
Lightning	Climate change increases temperatures and alters precipitation, leading to more intense thunderstorms and frequent lightning strikes. Urbanization can enhance this effect, posing risks to public safety and infrastructure.	Lightning can influence population patterns by causing property damage and wildfires, leading some residents to relocate. Areas with higher lightning activity may deter new residents, while safer locations could increase migration as people seek protection from severe weather.	Lightning can impact land use and development by increasing risks that require careful planning. Higher insurance costs may deter developers, while infrastructure must include safety measures, such as lightning rods. As climate change causes more intense storms, urban planners may adapt zoning and building codes to enhance resilience, thereby influencing the town's growth.	Increased
Severe Winter Weather	Climate change impacts heavy snow and blizzards by altering precipitation patterns. Higher temperatures can lead to more rain than snow, affecting snowpack levels—additionally, increased storm intensity results in heavier, more unpredictable snowfall.	Increased population equals an increased number of people needing to get to work and quicker snow removal. Heavy snow or blizzards can impact population patterns by influencing where people live and work. Transportation disruptions may lead residents to seek housing closer to jobs, increasing	Need to maintain the capacity to plow current and future town roads. Heavy snow and blizzards can influence land use and development by necessitating infrastructure improvements, such as enhanced snow removal and drainage. Planners may prioritize areas more affected by snow for	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
		density in some areas while depopulating others. Families might also avoid regions with frequent heavy snowfall, shifting demand to milder areas. Over time, these trends can alter community demographics and economic activity, prompting adjustments in town planning and resource allocation.	development, while frequent blizzards could deter growth in certain neighborhoods, pushing developers to seek safer locations. Over time, these changes can alter population density and reshape the urban landscape.	
Tornado	Climate change may increase the frequency and intensity of tornadoes. Higher temperatures lead to more moisture in the air, creating conditions for severe thunderstorms. Changes in wind patterns and precipitation can also heighten tornado risks, resulting in more destructive storms and greater threats to infrastructure and communities.	Tornadoes can influence population patterns by prompting residents to move to safer areas after damage occurs. This can decrease density in affected neighborhoods while increasing the demand for housing in safer regions. New residents may also move in for recovery opportunities, altering demographics. Over time, repeated tornado threats might push long-term residents to areas with better disaster preparedness, reshaping the town's population distribution.	Tornadoes can significantly alter land use and development by leading to stricter construction codes and zoning laws for resilience. Communities may invest in tornado shelters, relocate critical facilities away from high-risk areas, and create open spaces for emergency response, all while promoting economic development through sustainable practices.	Increased
Wildfire	By raising temperatures and creating drier conditions, prolonged droughts lead to more dry vegetation, which serves as fuel for fires. Erratic seasons extend the growing period, while more lightning strikes can ignite wildfires. These factors heighten the	Displaced individuals often seek safer areas, shifting demographics, while declining property values might deter newcomers. Conversely, some may be drawn to rebuilding efforts, impacting long-term growth and community dynamics.	Recovery efforts often focus on resilient infrastructure and green spaces, leading to stricter building codes and encouraging development in safer areas. As wildfires increase with climate change, adapting land use is vital for community resilience.	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	threat to ecosystems and community safety.			
Dam Failure	Climate change raises the risk of dam failure by causing heavier rainfall and rapid snowmelt. These changes can overwhelm dams and compromise their integrity, highlighting the need for urgent safety assessments and upgrades to protect communities downstream.	Dam failure tornadoes can impact population patterns by displacing residents and altering demographics. Evacuations can lead to an influx in safer areas, while destruction may deter new residents and contribute to population decline. Fear of future disasters may also prompt remaining individuals to relocate, changing the community's composition and affecting population density and economic activity.	Dam failure can reshape land use and development by making areas prone to flooding unsuitable for growth. This may lead planners to focus on safer regions and implement stricter zoning laws to enhance resilience. The emphasis on sustainable practices and flood mitigation can ultimately transform the urban landscape, prioritizing disaster preparedness in future developments.	Increased
Civil Disturbance	Climate change can increase civil disturbances by intensifying environmental stresses and social tensions. Rising temperatures may lead to droughts, wildfires, and poor air quality, particularly affecting vulnerable communities. Resource scarcity, especially water, can spark conflicts and protests. In addition, an influx of migrants from harder-hit areas may strain local resources, further escalating tensions. This cycle of unrest is driven by the impacts of climate change on the environment and community dynamics.	By encouraging residents to move for safety, leading to outflows and new arrivals. These events can reveal social issues, impacting community dynamics, employment, and property values, ultimately reshaping demographics, and social cohesion.	By shifting community priorities toward safety and stability. Developers may hesitate to invest in troubled areas, leading to a focus on public spaces and community centers. Residents might also push for zoning changes favoring low-density housing and community-oriented efforts, prompting a reevaluation of land use strategies.	Increased
Cyberattack	Possible attack on the industry, which is seen as producing	Cyberattacks can change population patterns by eroding	Cyberattacks can impact land use and development by undermining	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	large amounts of greenhouse gases and burning fossil fuels. Climate change can heighten cyberattack risk by increasing vulnerabilities during extreme weather. Disruptions like power outages offer cybercriminals opportunities, but focusing on emergency responses can weaken cybersecurity measures. As organizations adopt new technologies to cope with climate impacts, they may unintentionally introduce additional vulnerabilities.	trust in essential services. Compromised systems may cause residents to leave due to safety concerns, while high-profile incidents can deter businesses, leading to job losses. This perception of vulnerability may also make the town less appealing to newcomers, resulting in demographic shifts and affecting local development.	confidence in public infrastructure. If essential systems are compromised, investors may be discouraged, slowing economic activity. Local governments might also redirect funds to increase cybersecurity rather than new infrastructure, altering development timelines and urban planning priorities. This can significantly reshape the town's growth and land use.	
Hazardous Materials Incident (Transportation & Fixed Facility)	Climate change elevates the risk of hazardous materials incidents by increasing extreme weather events like heavy rain and wildfires. These events can breach storage tanks and heighten material volatility. Vulnerable infrastructure can lead to more spills or accidents, while climate shifts may also introduce new challenges for managing hazardous substances and public health.	By causing evacuations and temporary declines in density. In the long run, unsafe areas may deter new residents, affecting growth and diversity. In addition, negative perceptions can lower property values and economic prospects, leading families to relocate, which impacts local demographics.	Contaminated areas may be designated as hazardous sites, limiting their residential or commercial use and decreasing property values. This can drive developers to seek safer locations, altering growth patterns. Over time, such incidents may lead to new zoning regulations focused on public safety and environmental protection.	Increased
Public Health Epidemic/ Pandemic	By increasing the spread of vector-borne diseases and raising the risk of waterborne illnesses due to flooding or drought. Worsening air quality can also exacerbate respiratory conditions like asthma,	By prompting migration for safety and better healthcare. Vulnerable groups may move to areas with improved services, while economic instability can drive people to seek new employment opportunities. In addition, restrictions like quarantine	By increasing the demand for healthcare facilities like hospitals and clinics. Communities may prioritize green spaces for well-being, leading to adjustments in zoning regulations and potentially fostering higher-density housing	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	especially in vulnerable populations.	measures can limit movement and social interactions, reshaping the community's demographics and impacting local economies.	near essential services for better access during health crises.	
Terrorism	Terroristic activity is sometimes centered around climate change. Climate change impacts terrorism incidents by creating conditions of resource scarcity and social unrest. Increased competition for essential resources, such as water, can fuel tensions, making communities more vulnerable to extremist ideologies. Extreme weather events may disrupt social order and infrastructure, offering terrorist groups opportunities to exploit crises. In addition, climate-driven population displacement can heighten tensions in receiving areas, raising the risk of domestic terrorism. Law enforcement's focus on climate-related challenges can also limit its capacity to address terrorism threats. Ultimately, while climate change may not directly cause terrorism, its effects can create an environment conducive to extremist activities.	Terrorism incidents can alter population patterns by instilling fear and prompting residents to relocate to perceived safer areas, resulting in demographic shifts and potential declines in property values. Some neighborhoods may see an outflow of residents, while others could experience an influx of people seeking refuge from violence. In addition, increased security measures may deter businesses and residents from certain locations, leading to long-term changes in population density and urban development patterns.	Terrorism incidents can lead to significant changes in land use and development by shifting perceptions of safety. Following an attack, areas deemed high risk may see a decline in investment as businesses and residents seek safer locations. This could prompt urban planners to focus on enhancing security features in public and commercial spaces, potentially revising zoning regulations to create buffer zones around critical infrastructure. In addition, fear of future attacks may drive suburbanization, creating more security-conscious communities.	Increased

DRAFT

Additional Public Involvement

Public involvement in Salt Lake City is fostered through various avenues that engage the community and enhance hazard awareness. Community newsletters provide essential information on safety protocols, updates on local events, and resources for residents. Hazard awareness campaigns regularly educate the public about risks and preparedness strategies. In addition, the city invites residents to participate in public meetings and events, ensuring that diverse perspectives are heard and incorporated into planning efforts. Organizations representing underserved and vulnerable populations play a crucial role in advocating for equitable access to resources and information. Furthermore, social media platforms serve as a dynamic tool for circulating notifications and fostering dialogue, allowing residents to stay informed and connected with critical community safety initiatives. The city provided several opportunities for public participation. Figure 1 and Figure 2 display examples of public outreach.

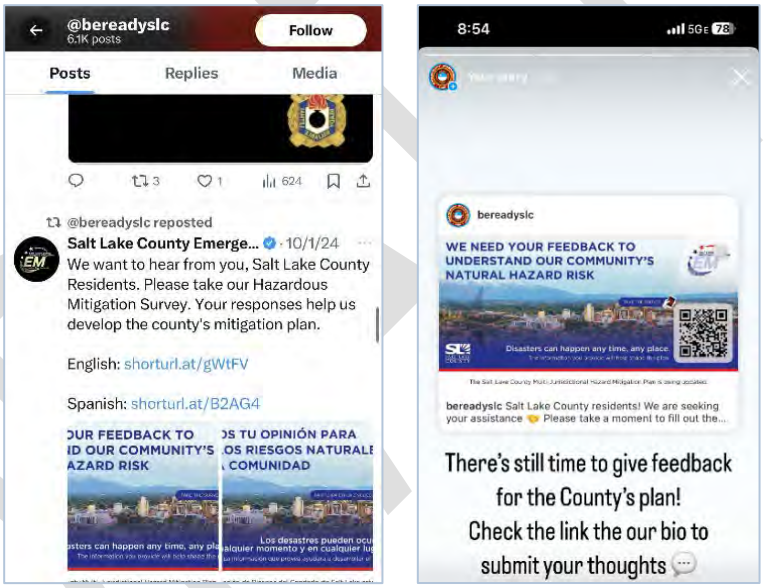

Figure 1: Salt Lake City/BeReadySLC Social Media Post for the Hazard Mitigation Survey (*left*) and Second Post for the Hazard Mitigation Survey (*right*)

Figure 2: Salt Lake City Newsletter Announcement of the Public Survey

Plan Integration

Incorporating the underlying principles of the Hazard Mitigation Plan and its recommendations into other plans is a highly effective and low-cost way to expand their influence. All plan participants will use existing methods and programs to implement hazard mitigation actions where possible. As previously stated, mitigation is most successful when it is incorporated into the day-to-day functions and priorities of government and public service. This plan builds on the momentum developed through previous and related planning efforts and mitigation programs, and it recommends implementing actions where possible through these other program mechanisms. These existing mechanisms include the following:

- Regularity Capabilities
- Administrative Capabilities
- Fiscal Capabilities

Respective planning stakeholders will conduct implementation and incorporation into existing planning mechanisms and will be done through the routine actions of:

- Monitoring other planning/program agendas
- Attending other planning/program meetings
- Participating in other planning processes; and
- Monitoring community budget meetings for other community program opportunities.

DRAFT

The successful implementation of this plan will require constant and vigilant review of existing plans and programs for coordination and multi-objective opportunities that promote a safe, sustainable community. Regular efforts should be made to monitor the progress of mitigation actions implemented through other planning mechanisms. Where appropriate, priority actions should be incorporated into planning updates. Table 14 lists existing planning mechanisms in which the Hazard Mitigation Plan has been integrated.

Table 15 lists the opportunities for integrating elements of this plan into other plans. Some areas of the city have neighborhood-specific plans, including Sugarhouse, City Creek, and Capitol Hill, and they might benefit from including mitigation information from this plan.

Table 14: Integration of Previous Plans by Salt Lake City

Plan	Description
Comprehensive Emergency Management Plan	Framework for the city's disaster response
2025–2029 Consolidated Plan	Roadmap for how the city will allocate fundings for grant programs

Table 15: Opportunities for Integration with Future Plans of Salt Lake City

Plan	Description
General Plan	Overview of the city's long-term goals and initiatives
Open Space Plan	Goals and initiatives to protect public green spaces
Community Preservation Plan	Overview of citywide community preservation efforts
Strategic Plan	Guiding document for how leaders envision the city over the next few years
Urban Forest Action Plan	Strategies related to forest and open space preservation/management
Major Streets Plan	Projects and other infrastructure improvements
Pedestrian and Bicycle Plan	Addressing transportation initiatives
Transit Plan	Transit-oriented goals
Transportation Plan	Planned improvement projects and overall transportation goals for the city
Housing SLC: 2023–2027	Housing goals
Community Wildfire Protection Plan	Describes vulnerabilities and potential actions to reduce wildfire risk.
Stormwater Management Plan	Overview of stormwater management practices
Water Shortage Contingency Plan	Framework for responding to reduced water
Water Conservation Plan	Provides information on the current and future water supply along with water conservation goals
Street Lightning Master Plan	Review of lightning concerns and priorities
Thriving in Place Plan	Addresses the causes, extent, and impacts of displacement in the city

Plan	Description
Salt Lake City Fire Strategic Plan	Strategies and goals that guide the fire department over time
Public Safety Plan	Addresses public safety concerns and provides recommendations
Public Lands Master Plan	Overview of public land initiatives and goals
Cemetery Master Plan	Guides preservation, access, and financial goals
Parks and Recreation Master Plan	Includes information about the park system and needs
Foothills System Master Plan	Provides information on environmental regulation and overall trail system goals
Integrated Pest Management Plan	Management of invasive species and other noxious weeds in the city
Climate and Air Quality Plan	Addresses sustainability initiatives
Impact Fee Facilities Plan	Identify capital improvement projects and funding

Capability Assessment

Local mitigation capabilities are existing authorities, policies, programs, and resources that reduce hazard impacts or could help carry out hazard mitigation activities.

Planning and Regulatory Capabilities

Local mitigation capabilities are existing authorities, policies, programs, and resources that reduce hazard impacts or could help carry out hazard mitigation activities.

Table 16: Assessment of the Planning Capabilities of Salt Lake City

Plan	Does it address hazards? (Y/N)	How can it be used to implement mitigation actions?	When was the last update? When is the next update?
General Plan	Y	Can guide mitigation actions and identify responsible departments or agencies	Yearly
Capital Improvement Plan	Y	Can provide information on funding sources	Multi-year
Climate Change Adaptation Plan	Y	Can guide mitigation actions to be sustainable and actionable over time	Ongoing
Community Wildfire Protection Plan	Y	Community education and outreach, collaboration with local partners (Forest Service, Bureau of Land Management), and direct action through fuel reduction projects and evacuation route signage	Ongoing

DRAFT

Plan	Does it address hazards? (Y/N)	How can it be used to implement mitigation actions?	When was the last update? When is the next update?
Economic Development Plan	Y	Can provide information on funding sources	Yearly
Land Use Plan	Y	Can guide mitigation actions related to open space and development	Yearly
Local Emergency Operations Plan	Y	Provides a framework for response and recovery, which could inform mitigation actions	Yearly
Stormwater Management Plan	Y	Can inform flood or heavy rain mitigation actions	Biyearly
Transportation Plan	Y	Identifies transit problems and areas of concern to guide mitigation actions	Yearly
Substantial Damage Plan	Y	Can provide information on responsible departments or agencies	Yearly
Other? (Describe)			

Table 17: Assessment of the Regulations and Ordinances of Salt Lake City

Regulation/ Ordinance	Does it effectively reduce hazard impacts?	Is it adequately administered and enforced?	When was the last update? When is the next update?
Building Code	Y; Salt Lake City has codes adopted by the state with amendments including the following: • The International Building Code, as promulgated by Title 15A of the Utah State Code (currently IBC 2021) • The International Residential Code, as promulgated by Title 15A of the Utah State Code • The International Fire Code • International Existing Building Code • International Energy Conservation Code • International Fuel Gas Code • National Electrical Code	Y	8/22, Updated Yearly

Regulation/ Ordinance	Does it effectively reduce hazard impacts?	Is it adequately administered and enforced?	When was the last update? When is the next update?
	• The International Mechanical Code • The International Plumbing Code • The International Swimming Pool and Spa Code • Rule R156-56 of the Utah Administrative Code • ICC/MBI 1205-2021 Standard for Off-Site Construction: Inspection and Regulatory Compliance, or its successor • 1997 Uniform Code for the Abatement of Dangerous Buildings. (Ord. 91-24, 2024: Prior code § 5-1-2)		
Flood Insurance Rate Maps (FIRMs)	Y	Y	Last Updated: FIRMs are provided by FEMA. The most recent updates were released in 2016. Next Update: FEMA periodically reviews and updates FIRMs. FEMA determines the schedule for the next update, and it has not been specified.
Floodplain Ordinance	Y	Y	Last Updated**:** Chapter 18.68 of the Salt Lake City Code, which outlines regulations for floodplain hazard protection, was last amended in 2016. Next Update: There are no publicly announced plans for immediate updates. However, the city periodically reviews ordinances to ensure compliance with federal and state regulations.
Subdivision Ordinance	Y	Y	Last Updated: Title 20 of the Salt Lake City Code encompasses the city's subdivision regulations. The most recent amendments were made in 2018.

DRAFT

Regulation/ Ordinance	Does it effectively reduce hazard impacts?	Is it adequately administered and enforced?	When was the last update? When is the next update?
			Next Update: Updates are conducted as needed to address emerging development trends and legal requirements. No specific timeline for the next revision has been announced.
Zoning Ordinance	Y	Y	Last Updated: Title 21A of the Salt Lake City Code contains the zoning ordinances. The city is currently proposing to update its zoning ordinance and zoning map by consolidating up to 27 existing commercial, form-based, and mixed-use zoning districts into six new mixed-use districts. This effort seeks to streamline zoning regulations, clarify language, and integrate missing design standards. Next Update: The proposed zoning consolidation is under review, and public engagement opportunities are available. The timeline for adoption will depend on the review process and public feedback.
Natural Hazard-Specific Ordinance (Stormwater, Steep Slope, Wildfire)	Y	Y	Stormwater management: The Stormwater Control Ordinance, detailed in Division III, Chapter 17.75 of the city code, addresses stormwater discharge and design requirements. **Municode Library** Steep slopes: Regulations concerning development on steep slopes are included in the Foothills and Canyons Overlay Zone (FCOZ), Chapter 19.72 of the Salt Lake County Code. **Municode Library** Wildfire mitigation: The city has established a Citizen Wildfire Mitigation Permit Program, allowing residents to engage in wildfire hazard

DRAFT

Regulation/ Ordinance	Does it effectively reduce hazard impacts?	Is it adequately administered and enforced?	When was the last update? When is the next update?
			reduction activities on adjacent public lands.
Acquisition of Land for Open Space and Public Recreation Use	Y	Y	Last Updated: Salt Lake City actively acquires land for open space and recreational purposes, guided by the Open Space Lands Program. The purpose of the Open Space District is to preserve and enhance public and private open spaces, as stated in Section 21A.32.100 of the city code. **CodeLibrary** Next Update: The city continually assesses opportunities for land acquisition to expand open spaces and recreational areas. Related ordinances are updated as new projects and funding become available.
Prohibition of Building in At-Risk Areas	Y	Y	Last Updated: The city enforces restrictions on development in areas prone to natural hazards, such as floodplains and steep slopes, through specific ordinances and overlay zones. For example, the FCOZ includes provisions to limit disturbance in sensitive areas. **Municode Library** Next Update: Revisions to these regulations are made to address evolving environmental conditions and incorporate best practices in hazard mitigation.
Other? (Describe)	Upsizing sewer lines, retrofit projects for unreinforced masonry buildings		

Administrative and Technical Capabilities

Administrative and technical capabilities include staff and their skills. They also include tools that can help carry out mitigation actions.

DRAFT

Table 18: Assessment of the Administrative Capabilities of Salt Lake City

Administrative Capability	In Place? (Y/N)	Is staffing adequate?	Are staff trained on hazards and mitigation?	Is coordination between agencies and staff effective?
Chief Building Official	Y	Y	Y	Y
Civil Engineer	Y	Y	Y	Y
Community Planner	Y	Y	Y	Y
Emergency Manager	Y	Y	Y – Ongoing progress	Y
Floodplain Administrator	Y	Y	Y	Y
Geographic Information System (GIS) Coordinator	Y	Y	Y	Y
Planning Commission	Y	Y	Y	Y
Fire Safe Council	Y	Y	Y	Y
CERT (Community Emergency Response Team)	Y	N – working toward that goal	Y – In a response component	Y
Active VOAD (Voluntary Agencies Active in Disasters)	Y	Y	Y – Some groups are	Y
Other? (Please describe.)				

Table 19: Assessment of the Technical Capabilities of Salt Lake City

Technical Capability	In Place? (Y/N)	Has it been used to assess/mitigate risk in the past?	How can it be used to assess/mitigate risk in the future?
Mitigation Grant Writing	Y	Housing stability resources for those experiencing homelessness or crisis	Mitigation grant writing is a powerful tool for assessing and mitigating risks by securing funding for targeted projects that enhance community resilience. It facilitates comprehensive risk assessments, supports infrastructure hardening, funds natural hazard defenses, and enables investments in monitoring and early warning systems. Grants also promote public education, sustainable development, and policy improvements, fostering long-term resilience. By addressing emerging challenges like climate adaptation and sustainable growth, communities can proactively reduce vulnerabilities and strengthen preparedness. In addition, the grant process encourages data collection and performance tracking, ensuring

DRAFT

Technical Capability	In Place? (Y/N)	Has it been used to assess/mitigate risk in the past?	How can it be used to assess/mitigate risk in the future?
			that continuous improvement and effective risk management for the future.
Hazard Data and Information	Y	Used to identify areas of concern or priority areas for mitigation projects	Hazard data and information are essential for assessing and mitigating future risks by providing a foundation for informed decision-making. This capability enables communities to identify vulnerabilities, prioritize resources, and model potential hazard scenarios. It supports proactive measures like updating building codes, refining zoning regulations, and planning infrastructure improvements. Access to accurate, real-time data enhances early warning systems, emergency response, and public education efforts. By continuously collecting and analyzing hazard information, communities can adapt to evolving risks, improve resilience, and effectively reduce the impact of future disasters.
GIS	Y	Map overlays with information from flood plains to individual URM units across the city.	Map overlays with information from flood plains to individual Unreinforced Masonry (URM) units across the city.
Mutual Aid Agreements	Y	Agreements in place when an incident occurs, like the Sandhurst Fire	Y
Other? (Please describe.)			

Financial Capabilities

Financial capabilities are the resources to fund mitigation actions. Talking about funding and financial capabilities is important to determine what kinds of projects are feasible, given their cost. Mitigation actions like outreach programs are lower cost and often use staff time and existing budgets. Other actions, such as earthquake retrofits, could require substantial funding from local, state, and federal partners. Partnerships, including those willing to donate land, supplies, in-kind matches, and cash, can be included.

DRAFT

Table 20: Assessment of the Financial Capabilities of Salt Lake City

Funding Resource	In Place? (Y/N)	Has it been used in the past and for what types of activities?	Could it be used to fund future mitigation actions?	Can it be used as the local cost match for a federal grant?
Capital Improvement Project Funding	Y	Infrastructure improvements	Y	Y
General Funds	Y	Operational costs, infrastructure improvements, pay increases for public safety professionals	Y	Y
Hazard Mitigation Grant Program (HMGP/404)	Y	Has not been used yet	Y	N
Building Resilient Infrastructure & Communities (BRIC)	Y	Retrofit the water treatment plant	Y	N
Flood Mitigation Assistance (FMA)	Y	Has not been used yet	Y	N
Public Assistance Mitigation (PA Mitigation/406)	Y	Has not been used yet	Y	N

		staffing, family support services,		
Private Sector or Nonprofit Programs	Y	Shelter operations, trails maintenance	Y	N
Other?				

Education and Outreach Capabilities

Education and outreach capabilities are programs and methods that could communicate about and encourage risk reduction. A participant or a community-based partner may run these programs. Partners, especially those who work with underserved communities, can help identify additional education and outreach capabilities.

Table 21: Assessment of the Education and Outreach Capabilities of Salt Lake City

Opportunities to Expand and/or Improve Capabilities

Actions that can expand and improve existing authorities, plans, policies, and resources for mitigation include budgeting for mitigation actions, passing policies and procedures for mitigation actions, adopting and implementing stricter mitigation regulations, approving mitigation updates, and making additions to existing plans as new needs are recognized. Table 22 lists the opportunities for Salt Lake City.

Table 22: Opportunities to Expand and/or Improve the Capabilities of Salt Lake City

Capability	Opportunity to Expand and/or Improve
Planning and Regulation	The community aims to develop a new Community Wildfire Protection Plan (CWPP) to replace the outdated version. In addition, it seeks to reassess the zoning and planned uses for River Street due to its history of repeated flooding and associated asset losses.
Administrative and Technical	**Current Capacity:** • The **Building Official** is overwhelmed and lacks adequate support staff. • The **Floodplain Manager** would benefit from additional training in floodplain management, including determinations of substantial damage. • The community's **GIS system** relies on outdated data, limiting its utility in planning and hazard analysis. **Opportunities for Improvement:** • **Staffing Needs:** Hire additional staff to support the Building Official, with cross-training in floodplain management to increase capacity. • **Training:** Implement specialized training programs for best practices in floodplain management, hazard mitigation, and zoning. • **GIS Modernization:** Update GIS data to include recent floodplain maps, wildfire risk assessments, and infrastructure inventories to inform decision-making. • **Zoning Review:** Partner with planning experts to revise zoning regulations for River Street and similar areas prone to flooding.
Financial	**Current Capacity:** • Local nonprofits have expressed interest in collaborating on mitigation initiatives and providing volunteer support. **Opportunities for Improvement:** • **Grant Utilization:** Hire grant-writing staff to help the Emergency Manager apply for BRIC and similar programs, leveraging federal funds for mitigation. • **Nonprofit Partnerships:** Engage local nonprofits to provide volunteer labor or in-kind contributions to meet local grant cost-match requirements. • **Local Funding Mechanisms:** Consider establishing special purpose taxes or stormwater utility fees to generate dedicated funding for hazard mitigation projects. • **Private Sector Collaboration:** Partner with local businesses to co-fund projects that enhance resilience in economic development zones like River Street.
Education and Outreach	Education and outreach to vulnerable populations can be expanded. We are working on translating our messages into languages common among our native Spanish speakers and recently arrived populations.

DRAFT

Mitigation Strategy

Mitigation strategies provide proactive measures that are designed to minimize the impacts of hazards on Salt Lake City. Table 23 shows mitigation action alternatives, and Table 24 shows the status of previous mitigation activities. Table 25 is the 2025 mitigation action plan for Salt Lake City.

Table 23: Mitigation Action Alternatives for Salt Lake City

Action	Type of Action	Selected for inclusion in the plan?	If not selected, why not?
Review wildland evacuation zones and make changes if needed. Create additional zones within the city's boundary to respond to all-hazards.		Yes	
Complete fuels mitigation in the wildland–urban interface areas.		Yes	

In reviewing the previous mitigation actions, SLC Public Lands reviewers indicated that fuel mitigation is an ongoing process in the wildland–urban interface (WUI) area. They have documented the actions that have been taken for these locations. However, they indicated that even if fuels have been mitigated in these areas once, that would not be enough to consider the project complete, so such mitigation should be included in the next plan cycle.

Table 24: Status of Prior Mitigation Actions of Salt Lake City[5]

Action	Hazard(s)	Agency Lead	Support Agency(ies)	Status Update
Seismic retrofitting of URM buildings (public, residential, multi-family, and business).	Earthquake	SLC EM	SLC Building Services, SLC FD, UDEM, SLCo EM	Ongoing project.
Conduct 1200 West sewer trunk rehabilitation.	Earthquake, Extreme Cold, Extreme Heat, Flooding (Urban/Flash Flooding), Severe Thunderstorm, Severe Winter Weather	SLCDPU	SLC Engineering, water districts, SLCo Flood Control	Completed.
Conduct the 2300 E-Wilmington Ave–	Flooding (Urban/Flash	SLCDPU	SLC Engineering, water districts,	Ongoing – Planning phase to start

[5] FFSL = Division of Forestry, Fire, and State Lands, NFPA = National Fire Protection Association, SCADA = Supervisory Control and Data Acquisition, SLC = Salt Lake City, SLCDPU = Salt Lake City Department of Public Utilities, SLC EM = Salt Lake City Emergency Management, SLC FD = Salt Lake City Fire Department, SLCo = Salt Lake County, SLCo EM = Salt Lake County Emergency Management, SLC PD = Salt Lake City Police Department, UDEM = Utah Division of Emergency Management, UFA = Unified Fire Authority, URM = unreinforced masonry, USFS = United States Forest Service, WUI = Wildland-Urban Interface.

Action	Hazard(s)	Agency Lead	Support Agency(ies)	Status Update
Yuma St upsizing project.	Flooding), Severe Thunderstorm		SLCo Flood Control	construction in 2026.
Conduct 2100 South capacity upgrades.	Flooding (Urban/Flash Flooding), Severe Thunderstorm	SLCDPU	SLC Engineering, water districts, SLCo Flood Control	Completed.
Conduct critical facility sewer rehab and reliability project.	Earthquake, Extreme Cold, Extreme Heat, Flooding (Urban/Flash Flooding), Severe Thunderstorm, Severe Winter Weather	SLCDPU	SLC Engineering, water districts, SLCo Flood Control	Completed.
Conduct South Temple capacity upgrades.	Flooding (Urban/Flash Flooding), Severe Thunderstorm	SLCDPU	SLC Engineering, water districts, SLCo Flood Control	Ongoing – Starting construction in January 2025.
Upgrade the SLCDPU Admin & Operations Center.	All hazards	SLCDPU	SLC Engineering, SLC Building, SLC EM, SLCo EM, SLC Public Services, SLC PD	Ongoing – In planning phase but 10 years from start of construction.
Conduct SCADA communications and security improvements.	All hazards	SLCDPU	SLC Engineering, SLC FD, SLC PD, SLC EM	Incomplete
Procure and stage items needed for the back-up emergency response equipment staging.	All hazards	SLCDPU	SLC EM, SLC FD, SLC PD, SLCo EM, SLCo Public Works, SLCo Flood Control, water districts	Ongoing – Secured and filled sandbags during 2023 spring runoff. Ongoing as more equipment is expected to be needed.
Mitigate fuels along the east side of East Capitol Blvd to create defensible space.	Wildland Fire	SLC FD	SLC Parks, SLCo EM, UFA, FFSL, SLC EM	Ongoing – Area between Ottinger Hall and Memorial House cleared out in 2022 and trimmed up by Parks Department and volunteers late 2023.
Mitigate fuels along the north side of Northmont Way to create defensible space.	Wildland Fire	SLC FD	SLC Urban Forestry, SLCo EM, UFA, FFSL, SLC EM	Complete – Mitigated 06/10/2024.

DRAFT

Action	Hazard(s)	Agency Lead	Support Agency(ies)	Status Update
Mitigate fuels in home ignition zones on East Tomahawk Dr., Chandler Dr, and Kristianna Circle.	Wildland Fire	SLC FD	UFA, SLCo EM, FFSL, SLC EM	Ongoing – Private residence.
Mow annual rye 25 ft. on either side of the Bonneville Shoreline Trail east of the University of Utah.	Wildland Fire	SLC FD	UFA, University of Utah, FFSL, SLCo EM, SLC EM	Ongoing – University of Utah property.
Mow annual rye and mitigate around the shed north of Rotary Glen on This is the State Park.	Wildland Fire	SLC FD	SLC EM, SLCo EM, UFA, FFSL	Ongoing with Utah State Parks.
Mitigate fuels for ingress/egress along Red Butte Canyon access road.	Wildland Fire	SLC FD	SLC EM, SLCo EM, UFA, FFSL, SLCDPU	Ongoing with SLCDPU.
Mitigate fuels at the mouth of Emigration Canyon under the high-rise buildings.	Wildland Fire	SLC FD	SLC EM, SLCo EM, UFA, FFSL	Incomplete.
Mitigate fuels along the east side of Devonshire Road.	Wildland Fire	SLC FD	SLC Urban Forestry, SLC EM, SLCo EM, UFA, FFSL	Complete: Mitigated 06/10/2024.
Mitigate fuels for defensible space around the City Creek water treatment plant.	Wildland Fire	SLC FD	SLC EM, SLCo EM, UFA, FFSL, SLCDPU	Ongoing with SLCDPU. Area currently under construction for plant upgrades.
Mitigate fuels for ingress/egress along City Creek Canyon access road up to the water treatment plant.	Wildland Fire	SLC FD	SLC EM, SLCo EM, UFA, FFSL	Not completed.
Mitigate fuels and develop maintenance plan for FS lands in Red Butte Canyon outside RNA.	Wildland Fire	SLC FD	SLC EM, SLCo EM, UFA, FFSL	Ongoing with USFS.
Conduct Firewise native seeding for the following open space properties: Popperton, Chandler, and Morris Meadows.	Wildland Fire	SLC FD	SLC EM, SLCo EM, UFA, FFSL	Not completed.

DRAFT

Action	Hazard(s)	Agency Lead	Support Agency(ies)	Status Update
Work on passing a local ordinance to allow homeowners to obtain a permit to conduct mitigation efforts on City property abutting their residential property.	Wildland Fire	SLC FD	SLC EM, SLCo EM, UFA, FFSL, SLC Planning, SLC Urban Forestry	Not completed.
Work with the State Department of Natural Resources to establish NFPA Firewise communities in WUI areas (which carry independent mitigation requirements).	Wildland Fire	SLC FD and FFSL	SLC EM, SLCo EM, UFA	Ongoing – Greater Avenues Community Council is a Firewise community.
Work with homeowners to help them identify risks, such as deteriorating power poles and work with them in finding solutions.	Wildland Fire	SLC EM	SLC FD, SLCo EM, UFA, FFSL	Ongoing – defensible space assessment portal is active and SLC FD is assisting residents with assessments. Multiple completed.
Acquire commercial grade chipper and dump trailer.	All hazards	SLC EM and SLC FD	SLCo EM, UFA, FFSL	Ongoing – SLC Urban Forestry conducts chipper days with the community. UFA completes mitigation projects in Emigration Canyon.

DRAFT

Table 25: 2025 Mitigation Action Plan for Salt Lake City[6]

#	Action	Hazard(s)	Lead Agency	Potential Partners	Benefits (Losses Avoided)	Cost Estimate	Funding Source(s)	Time-frame	Priority	Comments
1	Seismic retrofitting of unreinforced masonry (URM) buildings (public, residential, multi-family, and business).	Earthquake	SLC EM	SLC Building, SLC Planning, SLC FD, SLCo EM	Reduction in the number of injuries and deaths after an earthquake	High	BRIC grant, HMGP grant, SLC general funds, capital improvement funds, Fix the Bricks grant	Long-term	High	The scope includes promoting, enticing, or facilitating the retrofit or rehabilitation of URM buildings that are highly susceptible to severe damage or collapse and/or otherwise threaten the public during ground shake and extreme forces.
2	Conduct the 2300 E-Wilmington Ave.–Yuma St. upsizing project.	Flooding (Urban/Flash Flooding), Severe Thunderstorm	SLCDPU	SLCo Flood Control, SLCo Public Works, SLC Engineering, SLCo EM	High (public health, loss avoidance, flooding protection)	High	SLC general funds, capital improvement funds, BRIC grant, HGMP grant, CDBG grant	Long-term	High	Scope includes the upsizing of the 2300 E-Wilmington Ave-Yuma St. sewer mains for capacity.
3	Upgrade the capacity of 2100 South sewer main.	Flooding (Urban/Flash Flooding), Severe Thunderstorm	SLCDPU	SLCo Flood Control, SLCo Public Works, SLC Engineering, SLCo EM	High (public health, loss avoidance, flooding protection)	High	SLC general funds, capital improvement funds, BRIC grant, HGMP grant, CDBG grant	Long-term	High	Scope includes the upsizing of the 2100 S sewer main for capacity.
4	Conduct South Temple sewer main capacity upgrades.	Flooding (Urban/Flash Flooding), Severe Thunderstorm	SLCDPU	SLCo Flood Control, SLCo Public Works, SLC Engineering, SLCo EM	High (public health, loss avoidance, flooding protection	High	HMGP grant, BRIC grant, capital improvement funds, SLC general funds	Long-term	High	Scope includes the upsizing of the south temple sewer main for capacity.
5	Upgrade the SLCDPU Administrations & Operations Center.	Avalanche, Civil Disturbance, Dam Failure, Drought, Earthquake, Extreme Cold, Extreme Heat, Flooding, Hazardous Materials Incident, Heavy Rain, High Wind, Landslide/Slope Failure, Lightning, Public Health Epidemic/Pandemic, Radon, Severe Winter Weather, Terrorism, Tornado, Wildfire	SLC EM	SLC Engineering, SLC Building, SLCo EM, SLC Public Services, SLC PD	High (ensure functionality of emergency response and support)	High	SLC general funds, capital improvement funds, SHSP grant	Long-term	High	Scope includes replacing the SLCDPU Administration and Operations Facility and constructing an integrated Dispatch/SCADA/Emergency Response Center.
6	Improve Supervisory Control Data Acquisition (SCADA) communications and security.	Avalanche, Civil Disturbance, Dam Failure, Drought, Earthquake, Extreme Cold, Extreme Heat, Flooding, Hazardous Materials Incident, Heavy Rain, High Wind, Landslide/Slope Failure, Lightning, Public Health Epidemic/Pandemic,	SLCDPU	SLC Engineering, SLC Building, SLC EM, SLCo EM, SLC Public Services, SLC PD, SIAC	High (operational emergency response and response prioritization.)	Medium	SHSP grant, capital improvement funds, SLC general funds	Short-term	High	The scope includes planning and building SCADA infrastructure to promote web-based alarms, monitoring capabilities, and communications. Work to include SCADA communications planning, cybersecurity assessment, and security recommendations. Planning recommendations would consist of

[6] BRIC = Building Resilient Infrastructure and Communities, CDBG = Community Development Block Grant, CWDG = Community Wildfire Defense Grant, CWPP = Community Wildfire Protection Plan, FFSL = Division of Forestry, Fire, and State Lands, FMA = Flood Mitigation Assistance, HDPE = High-density polyethylene, HHPD = High Hazard Potential Dam, HMGP = Hazard Mitigation Grant Program, IT = Information Technology, MSD = Municipal Services District, NWS = National Weather Service, SCADA = Supervisory Control and Data Acquisition, SHSP = State Homeland Security Program, SIAC = Statewide Information and Analysis Center, SLC = Salt Lake City, SLCDPU = Salt Lake City Department of Public Utilities, SLC EM = Salt Lake City Emergency Management, SLC FD = Salt Lake City Fire Department, SLCo = Salt Lake County, SLCo EM = Salt Lake County Emergency Management, SLC PD = Salt Lake City Police Department, UDEM = Utah Division of Emergency Management, UDNR = Utah Department of Natural Resources, UFA = Unified Fire Authority, UGRC = Utah Geospatial Resource Center, UGS = Utah Geological Survey, URM = unreinforced masonry, USFS = United States Forest Service, WUI = Wildland-Urban Interface, WUIPPM = Wildland Urban Interface Prevention, Preparedness, and Mitigation Fund.

THIS PAGE INTENTIONALLY LEFT BLANK

DRAFT

Mitigation Success Story

Salt Lake City Department of Public Utilities (SLCDPU) is rehabilitating the Emigration Creek stormwater culvert beneath 1700 South. The culvert and stormwater infrastructure had fallen into disrepair, and a 2023 flooding event exacerbated poor conditions and expedited the project timeline. Unnecessary erosion was occurring along the banks of Emigration Creek and could lead to stormwater contamination. The project goals included the following:

- Slip-lining the existing 60” diameter culvert with a durable-material pipe to extend longevity
- Extending the existing culvert approximately 50 feet downstream and realigning it with the centerline of Emigration Creek to better direct flows away from embankments
- Adding an outlet erosion control structure to dissipate creek flow energy and mitigate the risk of further embankment erosion
- Revegetating and grading existing embankment landscaping
- Using trenchless technology to rehabilitate the existing pipe to minimize the impact on the natural environment

Construction began in October 2024 and was scheduled for completion in the spring of 2025.

Salt Lake Community College Annex

To participate in this multi-jurisdictional hazard mitigation plan (MJHMP) update for Salt Lake County (SLCo), the executive cabinet of the Salt Lake Community College (SLCC) promulgated this plan, a copy of which is maintained at the college administrative offices.

Planning Process Contact Information

Table 1 provides information on the point of contact during the updating of the MJHMP.

Jurisdiction Profile

Date of Founding

1948

Location and Description

Salt Lake Community College is Utah's largest college, with the most diverse student body. The institution serves over 50,000 students across nine campuses and offers online classes. The locations are indicated with red tabs in Figure 1.

DRAFT

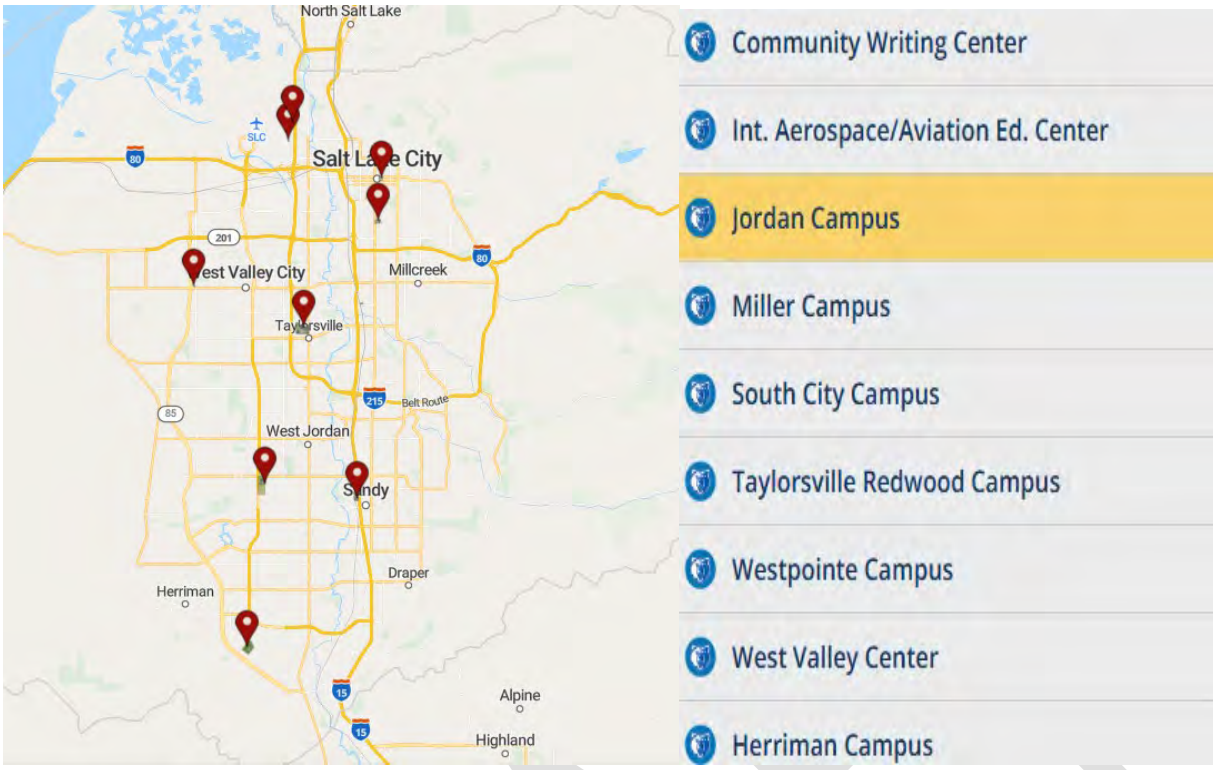

Figure 1: Locations of Salt Lake Community College Campuses[1]

Population and Demographics

SLCC has 50,000 students, including 6,854 full-time students, 29,924 part-time students, and 2,000 technical college students across all campuses.[2] The student population is diverse, with 47% of students being first-generation, 24% identifying as Latino, and 33% identifying as students of color.[3]

Brief History

SLCC has a rich history that dates to its founding in 1948. Established initially as the Salt Lake Area Vocational School, it aimed to provide vocational training to meet the needs of the local workforce. By 1967, the institution had evolved from a vocational school to a community college and opening its doors to a wider array of academic programs to serve both recent high school graduates and adult learners.

In 1978, the name was officially changed to Salt Lake Community College, reflecting its broader mission. Over the decades, SLCC has expanded significantly in terms of programs and facilities to accommodate the growing population of students in SLCo and beyond. The college now offers a variety of associate degrees, certificates, and transfer programs, with multiple campuses and centers throughout the area.

[1] Salt Lake Community College, "Campus Locations." https://map.concept3d.com/?id=726#!ct/11618?s/.
[2] Ibid.
[3] Ibid.

SLCC has also been recognized for its commitment to access and affordability, serving as an important educational resource in the community. Through its various initiatives and partnerships, it continues to adapt to the evolving educational landscape, helping students achieve their academic and career goals.[4]

Climate

SLCo, where SLCC is located, experiences a semi-arid climate characterized by hot, dry summers and cold, snowy winters. The region typically has four seasons, with average summer temperatures reaching the 80s to 90s°F (27–37°C). In comparison, winter temperatures can drop to the 20s to 30s°F (-6 to 4°C). Precipitation is relatively low, with most of it occurring during the spring and early summer months. Snowfall is common in winter, contributing to the area's overall water supply. The surrounding mountains can influence weather patterns, leading to occasional heavy snowfall in the winter months. The climate impacts various aspects of campus life, including potential outdoor activities and commuting conditions.

Public Services

SLCC offers many public services to support student success and enhance the college experience. These include academic advising, where students receive guidance on course selection and degree planning, and financial aid resources to help manage educational costs. Tutoring centers provide additional academic support, while career services help students prepare for the workforce through job placement and internship opportunities. Health and wellness services ensure that students have access to mental and physical health resources, and disability services help create an inclusive environment for all students. In addition, the college libraries offer valuable resources for research and study, and various student organizations foster engagement and leadership.

Governing Body

SLCC's governing body is its Board of Trustees, which is responsible for overseeing the college's administration, setting policies, and ensuring that the institution fulfills its mission to provide quality education and services to students. In addition, SLCC is part of the Utah System of Higher Education, which offers further governance and support at the state level.

Development Trends

A new campus opened in the city of Herriman in 2023. At this shared campus, students have an opportunity to earn an associate degree from SLCC and continue their studies to earn a bachelor's degree from the University of Utah.

Various development trends reflect the institution's commitment to enhancing the learning experience and fostering community engagement. One notable trend is the increasing incorporation of technology into classrooms, propelled by the rapid advancement in digital tools and online learning platforms. In addition, sustainability is strongly emphasized, as seen in the construction of green buildings and the integration of

[4] Utah History Encyclopedia, "Salt Lake Community College." https://www.uen.org/utah_history_encyclopedia/s/SALT_LAKE_COMMUNITY_COLLEGE.shtml.

eco-friendly practices across campuses. Furthermore, SLCC has been actively expanding its outreach programs to serve diverse populations better, ensuring that educational opportunities are accessible to all. These initiatives aim to improve student success rates and adapt to the evolving needs of the community in an ever-changing educational landscape.

Jurisdiction-Specific Hazards and Risk

The Calculated Priority Risk Index (CPRI) is a comprehensive assessment tool for evaluating and prioritizing risks in a given context. It considers various factors, such as probability, impact, and urgency, to determine the level of risk associated with events or situations. The results for each hazard, including its risk factor (RF) value, are shown in Table 3. The results are based on the criteria in Table 4 and the equation that follows it. The CPRI helps organizations and individuals make informed decisions about risk management and mitigation strategies. It provides a systematic approach to identifying and addressing potential issues, allowing for a more efficient allocation of resources and proactive risk prevention. With the CPRI, stakeholders can prioritize their focus on the most critical risks, leading to more effective risk management and, ultimately, better outcomes.

Table 3: Calculated Priority Risk Index Values for Salt Lake Community College

Type of Hazard Event	Probability of Future Events	Spatial Extent	Severity of Life/ Property Impact	Warning Time	Duration	Response Capacity	Risk Factor Value
Avalanche	0	0	0	0	0	0	0
Drought	3	4	2	1	4	2	2.6
Earthquake	3	4	4	4	4	3	3.6
Extreme Heat	3	4	3	1	4	2	2.9

Public Health Epidemic/ Pandemic	3	4	3	1	4	1	2.8
Terrorism	2	1	3	4	2	1	2.3

Table 4: Criteria for the Calculated Priority Risk Index

Risk Index Factor	Degree of Risk Level		Criteria	Factor Weight for Degree of Risk Level
Probability of Future Events	1	Unlikely	Less than 1 percent probability of occurrence in the next year or a recurrence interval of greater than every 100 years.	30%
	2	Occasional	1 to 10 percent probability of occurrence in the next year or a recurrence interval of 11 to 100 years.	
	3	Likely	11 to 90 percent probability of occurrence in the next year or a recurrence interval of 1 to 10 years.	
	4	Highly Likely	91 to 100 percent probability of occurrence in the next year or a recurrence interval of less than 1 year.	
Spatial Extent	1	Limited	Less than 10% of the planning area could be impacted.	10%
	2	Small	10%–25% of the planning area could be impacted	
	3	Significant	25%–50% of the planning area could be impacted.	
	4	Extensive	50%–100% of the planning area could be impacted.	
Severity of Life/Property Impact	1	Negligible	Less than 5% of the affected area's critical and non-critical facilities and structures are damaged/destroyed. Only minor property damage and minimal disruption of life. Temporary shutdown of critical facilities.	30%
	2	Limited	More than 5% and less than 25% percent of property in the affected area is damaged/destroyed. Complete shutdown of critical facilities for more than one day but less than one week.	

DRAFT

Risk Index Factor	Degree of Risk Level		Criteria	Factor Weight for Degree of Risk Level
	3	Critical	More than 25% and less than 50% of property in the affected area was damaged/destroyed. Complete shutdown of critical facilities for over a week but less than one month.	
	4	Catastrophic	Over 50% of critical and non-critical facilities and infrastructures in the affected area are damaged/destroyed. Complete shutdown of critical facilities for more than one month.	
Warning Time	1	Self-defined	More than 24 hours	10%
	2	Self-defined	12 to 24 hours.	
	3	Self-defined	6 to 12 hours.	
	4	Self-defined	Less than 6 hours.	
Duration	1	Brief	Up to 6 hours.	10%
	2	Intermediate	Up to one day.	
	3	Extended	Up to one week.	
	4	Prolonged	More than one week.	
Response Capacity	1	High	Significant resources and capability to respond to this kind of event; staff are trained, experienced, and ready.	10%
	2	Medium	Some resources and capability to respond to this kind of staff; some staff may be trained, experienced, and ready while others may need additional support.	
	3	Low	Limited resources and capability to respond to this kind of event; additional staff or staff training needed.	
	4	None	No resources and capability to respond this kind of event; additional outside support would be required.	

RISK FACTOR (RF) EQUATION

RF Value = [(Probability x 0.30) + (Spatial Extent x 0.10) + (Severity of Life/Property Impact x 0.30) + (Warning Time x 0.10) + (Duration x 0.10) + (Response Capacity x 0.10)]

Hazards with an RF value greater than or equal to 2.5 are considered high risk. Those with RF values of 2.0 to 2.4 are considered moderate risk hazards, and those with an RF value less than 2.0 are considered low risk. The highest possible RF value is 4.

DRAFT

Because SLCC has facilities at nine locations around the county, there is some variability in the level of risk from different hazards at each location. Weather hazards such as extreme heat, extreme cold, heavy rain, high wind, lightning, tornado, and severe winter weather are considered equally likely to affect any location. Drought risk is also likely to be similar at all campuses. None is in a Special Flood Hazard Area. Table 5 lists details of the specific campuses.

Table 5: Characteristics and Hazard Considerations at Salt Lake Community College Campuses

Campus	Estimated Maximum Headcount	Estimated Building Value	Unique Hazard Considerations
Airport	81	N/A	Proximity to interstate and airport may increase risk of hazardous materials incidents.
Herriman	N/A	N/A	Proximity to potential wildfire area.
Jordan	777	$50,511,000	Proximity to dam inundation boundary. Proximity to Bangerter Highway may increase risk of hazardous materials transportation incidents.
Miller	166	$58,298,000	Proximity to Interstate and rail traffic may increase risk of hazardous materials incidents.
South City	811	$115,247,000	In potential dam inundation area.
Taylorsville/ Redwood	2,449	$240,897,000	Moderate liquefaction potential, proximity to earthquake faults may increase risk.
West Valley	83	N/A	Proximity to earthquake faults may increase risk.
Westpointe	130	$50,000,000	Proximity to interstate and airport may increase risk of hazardous materials incidents.
Writing Center	N/A	N/A	Proximity to earthquake faults may increase risk.

Hazard Event History

Examining hazard event histories provides valuable insights to inform decision-making and help prioritize resources for risk prevention and response efforts. SLCC has faced several natural hazard events that have impacted its campuses over the years. Notably, on March 18, 2020, a magnitude 5.7 earthquake struck near Salt Lake City, causing minor structural damage and disruptions on the campus. This seismic activity served as a reminder of the region's vulnerability to such events. Table 6 lists the hazard events impacting SLCC since the 2019 plan update, by location and data, as recorded in the Storm Events Database from the National Centers for Environmental Information. It is noteworthy that no hazard events were found for the Sandy, West Jordan, or West Valley campuses.

DRAFT

Table 6: History of Hazard Events in Salt Lake Community College by Campus[5]

Location	Date	Event Type	Deaths	Injuries	Property Damage	Crop Damage
Herriman	05/16/2021	Hail	0	0	$0	$0
Herriman	07/22/2021	Thunderstorm wind	0	0	$0	$0
Herriman	07/03/2023	Thunderstorm wind	0	0	$1,000	$0
Herriman	08/02/2023	Thunderstorm wind	0	0	$0	$0

National Flood Insurance Program Summary

SLCC and its campuses do not participate in the National Flood Insurance Program.

Jurisdiction-Specific Vulnerabilities and Impacts

Table 8 provides information on the vulnerable assets in SLCC, including its critical facilities, highlighting the college's vulnerability to identified hazards. It also describes the potential impacts on the community arising from those vulnerabilities. By understanding the risks associated with these assets, local authorities can develop proactive strategies to mitigate vulnerabilities and ensure the safety and functionality of these important assets during hazard events. These data are invaluable for decision-making and prioritizing resources for emergency response and preparedness efforts, ultimately contributing to more effective risk management and greater resilience in the community.

Table 8: Jurisdiction-Specific Vulnerabilities and Impacts of Salt Lake Community College

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
Avalanche	People	*Vulnerability:* Students and faculty at campuses are not directly vulnerable to avalanches. *Impacts:* Students and faculty may be affected by avalanches away from campus. Those engaged in outdoor activities, such as skiing and hiking, are most vulnerable to avalanches. Inexperienced individuals, especially newcomers unfamiliar with the local terrain, face higher risks. Commuters during winter storms may also encounter hazardous conditions, increasing their vulnerability. This combination of inexperience and severe winter weather may contribute to the risks faced by these individuals.

[6] FEMA, "Disaster Declarations for States and Counties." https://www.fema.gov/data-visualization/disaster-declarations-states-and-counties.

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
	Structures	*Vulnerability:* No Salt Lake Community College (SLCC) structures are vulnerable to avalanches.
	Economic Assets	*Vulnerability:* SLCC's economic assets are not directly vulnerable to avalanches. *Impacts:* SLCC may be indirectly affected by economic disruptions caused by avalanches. Community economic assets like buildings, roads, and outdoor facilities are vulnerable to avalanches. Damage to infrastructure can lead to costly repairs. Transportation access for students and staff may be affected. Emergency response resources may be strained. Local businesses relying on student populations may face decreased activity due to these events.
	Natural, Historic, and Cultural Resources	*Vulnerability:* There is no direct vulnerability to SLCC's natural, historic, and cultural resources from avalanches. *Impacts:* There may be indirect impacts on the community.
	Critical Facilities and Infrastructure	*Vulnerability:* Utility and transportation networks are vulnerable to avalanches. *Impacts:* Avalanches could cause damage to transportation or utility/power networks, potentially disrupting functions at SLCC campuses.
	Campus Activities	*Vulnerability:* Student activities, particularly off-campus, are vulnerable to avalanches. *Impacts:* Off-campus activities that are vulnerable to avalanches include hiking clubs and winter sports events. Participants face risks when venturing into avalanche-prone areas, especially during heavy snowfall. The unpredictability of avalanches and limited safety awareness among community members increase this vulnerability, particularly for events held in high-risk zones or adverse weather.
Drought	People	*Vulnerability:* All students and staff are vulnerable to drought, which can lead to lack of drinking/culinary water and poor air quality. *Impacts:* Droughts can reduce water supplies and water is a critical resource for everyday use, including drinking, cooking, and cleaning. Water may be unavailable, its usage may be restricted, or its costs may increase. Faculty involved in environmental research may face setbacks in their projects. This vulnerability stems from reliance on water availability and rising expenses during droughts.
	Structures	*Vulnerability:* SLCC buildings and landscaping are vulnerable to drought. *Impacts:* Due to their need for water, structures like sports fields and gardens are vulnerable to drought. Older buildings may waste water because of inefficient plumbing, and traditional landscaping can lead to excessive consumption. Adopting sustainable water management strategies is essential to addressing these issues. Soil may contract due to decreased soil moisture, which could damage structural foundations or building walls.
	Economic Assets	*Vulnerability:* Economic assets are vulnerable to increased costs associated with drought. *Impacts:* Maintaining campus landscaping has become costlier and more challenging. Prolonged dry conditions can decrease enrollment,

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		impacting local businesses that serve students. Economic assets like agricultural programs are vulnerable to droughts due to their reliance on water for irrigation. The connection between these assets and environmental conditions highlights the need for sustainable practices and water conservation efforts. Funding for sustainability initiatives may be redirected to address immediate water concerns, hindering long-term projects.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Landscaping is vulnerable to drought, and other relevance to SLCC is minimal. *Impacts:* Landscaping and green spaces rely on consistent watering, making them prone to deterioration during dry periods. Historic structures may weaken due to fluctuating moisture levels, while cultural events focused on environmental stewardship could be disrupted. This vulnerability stems from limited water availability and the rising frequency of droughts, threatening the sustainability of these important assets.
	Critical Facilities and Infrastructure	*Vulnerability:* Water supply systems are vulnerable to drought. *Impacts:* Drought could affect water supply and delivery systems throughout the region. This may limit the availability of water to SLCC for irrigation and other purposes. Irrigation can strain water resources, impacting food safety and laboratory operations if shortages occur. This vulnerability arises from increasing water demand and competition for limited local supplies during drought.
	Campus Activities	*Vulnerability:* Activities at SLCC campuses, such as agricultural programs, landscaping, and recreational sports, are vulnerable to drought. *Impacts:* Agricultural programs need consistent water for crops, while landscaping relies on irrigation, both of which are strained in dry conditions. Recreational sports face participation challenges and facility issues during droughts, putting these activities at risk due to their dependence on limited water resources.
Earthquake	People	*Vulnerability:* All students and staff are vulnerable to earthquakes. *Impacts:* Injuries from falling objects or building collapse are possible. Classes may be canceled. Students may be displaced from homes following an earthquake and unable to attend class. Groups vulnerable to earthquakes include students unfamiliar with the campus and emergency procedures, individuals with disabilities facing evacuation challenges, and faculty managing large crowds. Transient populations, such as international students, may lack awareness of local seismic risks.
	Structures	*Vulnerability:* All SLCC buildings and facilities are vulnerable to damage and disruptions caused by earthquakes. The South City campus has been identified as needing seismic updates due to the historic nature of its buildings. *Impacts:* There is a potential for SLCC buildings to collapse or sustain damage during an earthquake. Such events would disrupt classes, likely causing them to be canceled. Older buildings lacking modern seismic reinforcements are particularly vulnerable to earthquakes. Structures like large lecture halls and gyms, which may have weak foundations or unbraced walls, are at a heightened risk of damage.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		High occupancy in these areas increases the potential for injury during seismic events, highlighting the need for retrofitting structures and improving safety measures.
	Economic Assets	*Vulnerability:* Agency budgets are vulnerable due to the high costs associated with repairing buildings and replacing instructional material. *Impacts:* SLCC campuses face earthquake vulnerability regarding key economic assets, such as classrooms, labs, and libraries. Damage to these structures can lead to costly repairs and the loss of educational resources. In addition, technology infrastructure may be disrupted, impacting student learning. Perceptions of safety could deter enrollment, ultimately affecting the college's financial stability.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Landscaping, art, and library collections are vulnerable to seismic events. *Impacts:* Mature trees and landscaping can be damaged during an earthquake. In addition, unsecured cultural resources, such as library collections and art installations, face risks during seismic events, compounded by the age of buildings and insufficient retrofitting for safety.
	Critical Facilities and Infrastructure	*Vulnerability:* Utility systems such as water, power, communication, as well as transportation systems, are vulnerable to earthquakes. *Impacts:* Compromised essential systems, such as electrical and plumbing systems, can limit the ability of campus facilities to remain operational following an earthquake. Damage to major roads and transit systems, such as Trax, will likely make travel to and from campus difficult.
	Campus Activities	*Vulnerability:* Education and community activities at SLCC are vulnerable to earthquakes. *Impacts:* Daily classes may be canceled. Large lectures, events, and other campus activities at SLCC are vulnerable to earthquakes due to high attendance in confined spaces, which complicates evacuations. The risk of structural damage and falling objects can lead to injuries. Many individuals may lack preparedness and awareness, thus increasing their vulnerability during earthquakes.
Extreme Heat	People	*Vulnerability:* Students and staff are vulnerable to the effects of extreme heat, which can affect the entire region. Individuals with underlying health issues, such as respiratory or cardiovascular conditions, are vulnerable to additional health complications. *Impacts:* Extreme heat can lead to heat-related illnesses such as heat exhaustion, heat stroke, and dehydration. Those who lack adequate air conditioning, shade, and hydration are particularly at risk. Attendees at outdoor events are also at risk. Groups vulnerable to extreme heat include students in older homes without air conditioning. International students may struggle with coping strategies, while outdoor workers and students without shade or hydration face higher risks. These factors underscore the need for better support during heat waves.
	Structures	*Vulnerability:* SLCC heating, ventilation, and air conditioning (HVAC) and power systems are vulnerable to the effects of extreme heat.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		Impacts: Structures at SLCC are vulnerable to extreme heat, especially those with large glass windows and poor insulation, which can create uncomfortable temperatures. Older buildings lacking modern climate control and those without shade in open areas absorb excess heat. Dark roofing materials also contribute to heat retention, posing health risks to students and staff during heat waves. Increased heat can strain cooling systems and may lead to outages.
	Economic Assets	*Vulnerability:* Economic assets are vulnerable to increased costs associated with extreme heat. *Impacts:* Extreme heat poses risks to economic assets at SLCC campuses. Buildings with cooling systems face higher energy costs, while outdoor facilities, such as sports fields, may become unusable. In addition, extreme heat can deter potential students from attending, impacting enrollment and local economies. Faculty and staff may experience decreased productivity and absenteeism due to heat-related health issues. These challenges underscore the need for strategic planning to safeguard campus assets.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Air and water quality may be reduced due to extreme heat. *Impacts:* Landscaping and trees may become stress-damaged, while historic structures can deteriorate without modern climate control. Extreme heat can contribute to an increase in evaporation rates, reducing water availability for agriculture, recreation, and culinary use. It can also exacerbate the effects of drought and increase wildfire risk. Additionally, extreme heat can increase ozone levels, which can impact respiratory health.
	Critical Facilities and Infrastructure	*Vulnerability:* Power and transportation systems are vulnerable to extreme heat. *Impacts:* Extreme heat can increase demand for power resources and has contributed to widespread power outages. Heat can cause roads to buckle and may cause road closures for emergency repairs, which may disrupt transportation to and from schools. Extreme heat can also raise the risk of wildfires as vegetation dries out, allowing fires to ignite and spread more rapidly. Furthermore, extreme heat can exacerbate drought conditions. The increased demand on healthcare services may strain resources.
	Campus Activities	*Vulnerability:* Sports, recreation, and outdoor activities at SLCC are vulnerable to extreme heat. *Impacts:* During outdoor sports, games, and events, exposure to high temperatures increases the risk of heat-related illnesses, especially at midday. Some events may be canceled, limiting student engagement. Classes in non-air-conditioned spaces also contribute to vulnerability. Proper planning is essential to ensure participant safety during extreme heat.
Extreme Cold	People	*Vulnerability:* Students and staff are vulnerable to extreme cold, which can affect all campuses. Vulnerable groups include those who rely on public transportation, individuals with pre-existing health conditions such as respiratory issues, and those with inadequate shelter. *Impacts:* Students and staff could be exposed to cold-related health impacts, particularly if structures have inadequate heating systems or

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		power is disrupted. International students from warmer climates may struggle to adapt to harsh winters. These factors increase the vulnerability of these populations on campus during severe cold weather.
	Structures	*Vulnerability:* Increased demands on HVAC equipment and older buildings at SLCC are vulnerable to extreme cold due to poor insulation, single-pane windows, and outdated heating systems. *Impacts:* Extreme cold can lead to higher energy costs and discomfort for occupants. Possible delays or cancellation of classes may occur. Extreme cold could freeze water pipes, which can burst and cause water damage. Buildings with inadequate weatherproofing allow cold air to enter, while facilities providing services like childcare and health services face increased risks that can affect students and staff during harsh weather.
	Economic Assets	*Vulnerability:* Economic assets are vulnerable to increased costs due to extreme cold. *Impacts:* Increased heat costs and possible emergency repairs to HVAC systems are costly and impact program budgets. Campuses might close temporarily if they are unable to heat buildings. Heating systems, plumbing, and roofing are at risk, as are laboratory and classroom equipment in buildings without proper insulation. Freeze–thaw cycles can damage outdoor structures and landscaping, affecting campus appearance. In addition, class disruptions and reduced attendance during severe weather impact funding and enrollment, emphasizing the need for protective measures.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Landscaping is vulnerable to extreme cold and frost. *Impacts:* Frost can damage trees and vegetation, harming local ecosystems. Historic buildings may deteriorate from freeze–thaw cycles due to inadequate insulation, while cultural resources, such as art installations and outdoor spaces, can become inaccessible in harsh winter conditions. These issues arise from outdated infrastructure and the need for ongoing maintenance to protect these valuable resources.
	Critical Facilities and Infrastructure	*Vulnerability:* Water, power, and transportation systems are vulnerable to disruptions caused by extreme cold. *Impacts:* Classes may not be able to stay in session if power, communication, or heating system outages occur, or due to water damage from burst pipes. Transportation may be disrupted due to icy conditions, affecting commutes and emergency services.
	Campus Activities	*Vulnerability:* Campus events are vulnerable to extreme cold conditions. *Impacts:* Outdoor sports and social events are vulnerable to extreme cold. Harsh temperatures can deter participation and create safety hazards for commuting students. In addition, outdoor facilities may become unusable, limiting student engagement during winter weather.
Flooding and Heavy Rain	People	*Vulnerability:* Students and staff in flood-prone areas are vulnerable. Vulnerable populations include students in low-lying housing, those with disabilities, and individuals without reliable transportation. *Impacts:* Heavy rain or rapid snowmelt can lead to flooding, particularly if drainage systems are overwhelmed. This could affect

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		campus accessibility, disrupt classes, damage facilities, and risk the safety of students and staff. Residents near the campus may be at risk during floods, while those with mobility issues may find evacuation challenging. In addition, reliance on public transit can hinder escape during emergencies, increasing the risk to these groups.
	Structures	*Vulnerability:* Buildings, equipment, and infrastructure in low-lying locations near waterways are at increased risk of flooding. No SLCC facilities were identified within Flood Insurance Rate Map flood zones, but these facilities may be affected by localized flooding following heavy rain. *Impacts:* Buildings and other structures can be damaged by floodwaters. Valuable resources in classrooms and labs could be damaged, while access to transportation could be disrupted, leading to financial losses. The college's dependence on state funding and tuition makes it sensitive to such disruptions, underscoring the need for adequate flood prevention measures.
	Economic Assets	*Vulnerability:* The costs of flood damage to SLCC assets are a concern. *Impacts:* Water damage to structures or open spaces could require costly repairs. Electrical and HVAC systems could be damaged, leading to repair costs. IT equipment and data centers might sustain costly water damage. Flooding may disrupt classes and affect student enrollment, impacting the college's financial stability.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Floodwaters can damage campus open spaces, landscaping, and fields. *Impacts:* Landscaping may be damaged, and areas of school grounds may become inaccessible. Cultural resources, including art and archives, are also at risk of water damage. Inadequate drainage systems and aging infrastructure might not effectively handle severe weather.
	Critical Facilities and Infrastructure	*Vulnerability:* Community lifelines, such as power, communication, and transportation systems, could be disrupted. *Impacts:* Essential utilities in lower areas may be impacted, disrupting campus operations. Power outages, broken water mains, and sewage system failures could make schools unsafe for operation. Flooded roads and bridges can block bus routes, making it challenging for students and staff to commute.
	Campus Activities	*Vulnerability:* Education routines and campus events are vulnerable to flooding. *Impacts:* Outdoor events like sports practices and concerts are particularly vulnerable to flooding. Facilities, dining areas, and libraries located in low-lying areas may be at risk. Flooding can disrupt classes and pose safety hazards, especially for students commuting during bad weather. Combining these factors heightens the risk of significant disruptions from flooding events.
Landslide/ Slope Failure	People	*Vulnerability:* There is minimal vulnerability for SLCC students and staff. *Impacts:* No campuses were identified in high landslide susceptibility areas. Students, staff, and visitors may be vulnerable to the impacts of

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		landslides in other community areas. Students and staff may be displaced from their homes or may face transportation difficulties if landslides occur elsewhere in the community.
	Structures	*Vulnerability:* There is minimal potential for landslides to affect SLCC structures.
	Economic Assets	*Vulnerability:* There is minimal potential for landslides to affect SLCC economic assets.
	Natural, Historic, and Cultural Resources	*Vulnerability:* SLCC assets have minimal vulnerability to landslides.
	Critical Facilities and Infrastructure	*Vulnerability:* Transportation networks and utility systems are vulnerable to landslides. *Impacts:* Landslides elsewhere in the community could affect utility systems, such as power, water, or communication, which could disrupt campus functions. Students and staff may be unable to travel to or from campus if roads or transit systems are damaged.
	Campus Activities	*Vulnerability:* There is minimal risk to SLCC campuses from landslides.
Radon	People	*Vulnerability:* All students and staff are vulnerable to radon exposure. High radon levels have been detected in homes throughout the county and may be present in college structures. Impacts. Long-term radon exposure is the second leading cause of lung cancer. Certain groups at SLCC campuses are especially vulnerable to radon exposure, particularly students and staff who spend long hours in basements or ground-level classrooms where radon can accumulate. Individuals with pre-existing health conditions, such as respiratory issues, are at increased risk. In addition, those unaware of radon risks, such as new students and faculty, may unknowingly expose themselves to this hazardous gas. Promoting education and awareness is essential for reducing these vulnerabilities.
	Structures	*Vulnerability:* All structures may contain radon. *Impacts:* Radon is primarily a health risk, but the condition of structures can contribute to the accumulation of radon gas. Basements and older buildings are vulnerable to the accumulation of radon. Basements can allow radon gas from the soil to seep in, while buildings with foundation cracks and poor ventilation can trap the gas indoors. Ground-floor classrooms and offices may be at risk if they are located in areas with high radon production.
	Economic Assets	*Vulnerability:* Indirect costs related to radon exposure are a concern. *Impacts:* Radon exposure threatens SLCC's economic assets by increasing remediation costs and potentially deterring students and staff, which can reduce enrollment and revenue. Health issues arising from radon can lead to absenteeism and higher healthcare expenses, further straining the college's financial resources and stability.
	Natural, Historic, and	N/A – Radon is primarily a health risk.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
	Cultural Resources	
	Critical Facilities and Infrastructure	N/A – Radon is primarily a health risk.
	Campus Activities	N/A – Radon is primarily a health risk and not expected to disrupt activities.
High Wind	People	*Vulnerability:* All students and staff are vulnerable to high winds, which can occur over a large area and may affect multiple campuses. The Herriman campus is particularly vulnerable to high winds. *Impacts:* Students or staff could be injured by blowing debris or falling tree limbs. Classes may be canceled. Similarly, those with mobility challenges—such as individuals using wheelchairs or those who might have difficulty navigating uneven surfaces—can find it particularly difficult to seek shelter or respond to sudden gusts. In addition, maintenance staff and outdoor workers may be exposed to the elements without adequate protection, heightening their risk during severe weather conditions. Understanding these vulnerabilities is crucial for developing effective safety strategies on campus during high wind events.
	Structures	*Vulnerability:* All campus facilities are vulnerable to high winds, with the Herriman campus facing a higher risk. *Impacts:* High winds can damage roofs, fencing, and break windows. The Herriman campus had an entrance vestibule that needed replacing due to the impacts of high wind. Buildings with large, flat roofs and/or exposed façades, such as gymnasiums and auditoriums, tend to catch wind more quickly, leading to increased pressure and potential structural failure. In addition, older buildings might not meet current wind resistance standards, making them more susceptible to damage during severe weather events. The arrangement of trees and landscaping can also impact wind flow, potentially directing turbulent winds toward specific structures and further increasing risk. Understanding these vulnerabilities is crucial for ensuring the safety and integrity of the college's infrastructure during high wind scenarios.
	Economic Assets	*Vulnerability:* Economic assets are vulnerable to costs associated with high wind damage. *Impacts:* Physical damage to structures and contents can have significant budget impacts. Outdoor facilities, such as picnic areas, sports equipment, and temporary structures, like tents, are at risk due to their lightweight construction and exposure to the elements. Mature trees and landscaping elements can be damaged by strong gusts, leading to potential property damage and increased maintenance costs. Signage that is not firmly anchored or designed to withstand severe weather can be dislodged or destroyed, creating safety hazards and requiring costly replacement.
	Natural, Historic, and Cultural Resources	Vulnerabilities: Mature trees and landscaping are vulnerable to high winds. *Impacts:* High winds can uproot plants and cause substantial damage to the campus environment. Additionally, cultural resources, such as

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		outdoor art installations, can be compromised, leading to physical loss and cultural degradation.
	Critical Facilities and Infrastructure	*Vulnerability:* Utility systems and transportation networks are vulnerable to high winds. *Impacts:* Damaged power lines and communication equipment may interrupt emergency communications and both in-person and online learning. School buses may be delayed due to fallen debris or road closures. Transportation disruptions can make it difficult for students or staff to travel to class. Classes may be canceled or moved online, impacting the academic calendar.
	Campus Activities	*Vulnerability:* Activities, such as outdoor concerts, sporting events, and fairs, are vulnerable to high winds. *Impacts:* Outdoor events may be delayed or canceled. These events often feature large tents, stages, and equipment that strong gusts can easily affect. The expansive fields and courtyards on campus expose participants to unpredictable wind patterns that can create hazardous conditions. In addition, loose items, such as banners, stands, and personal belongings, can become projectiles in high winds, further jeopardizing the safety of students and staff.
Lightning	People	*Vulnerability:* Lightning can occur anywhere in the region, so all students and staff are vulnerable. *Impacts:* Students or staff can be injured or killed by lightning, particularly during outdoor events. Students engaging in outdoor activities, such as participating in sports or attending events on the lawn, are at greater risk due to their exposure to open areas. Maintenance and facilities staff working outdoors during inclement weather may face increased vulnerability. Other risk factors include a lack of knowledge about severe weather safety and the tendency to underestimate the dangers of lightning.
	Structures	*Vulnerability:* All SLCC facilities are vulnerable to lightning damage. Impacts. Lightning strikes can cause fires, structural damage, or power surges that damage electrical systems. Buildings, such as the administration and gymnasium facilities, are prime targets as they naturally occupy a higher position on the landscape, making them more susceptible to electrical discharge during storms. In addition, structures with metal components, such as steel framing or roofing, conduct electricity more efficiently, increasing the risk of damage during lightning events. Furthermore, geographic features surrounding the campuses, including open areas and limited tree cover, may provide little natural protection against lightning.
	Economic Assets	*Vulnerability:* Structures, computers, and electronic equipment are vulnerable to lightning. *Impacts:* Several economic assets are particularly vulnerable to lightning strikes due to their structural and electrical characteristics. Key assets include outdoor recreational facilities, such as sports fields and amphitheaters, which may lack sufficient grounding systems. In addition, buildings with extensive metal frameworks or those housing sensitive electronic equipment, such as computer labs and libraries, are at risk because lightning can induce powerful surges that can damage electronic circuits and disrupt operations. Vulnerability is

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		exacerbated when these assets are situated in open areas or near tall structures that attract lightning.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Natural resources, such as mature trees and expansive green spaces, are vulnerable to lightning. *Impacts:* Trees can be severely damaged when struck, leading to the loss of biodiversity and altering campus ecosystems. Historic structures, particularly those with tall steeples or conductive metals, may suffer damage from direct hits, resulting in costly repairs and a loss of historical integrity. Cultural resources, including art installations and outdoor sculptures, are at risk, as a lightning strike's extreme heat and energy can damage them. Factors contributing to this vulnerability include the topography of the campuses, which may increase lightning strike frequency in certain areas, and the presence of aging infrastructure, which may lack modern lightning protection systems.
	Critical Facilities and Infrastructure	*Vulnerability:* Power and communication systems are vulnerable to lightning. *Impacts:* Power and communication outages can affect operations for campuses. Such outages may lead campuses to close temporarily.
	Campus Activities	*Vulnerability:* Campus activities are vulnerable to lightning. *Impacts:* Activities, such as outdoor sports, open-air events, and students congregating in unprotected areas like fields or parking lots, are at risk during thunderstorms. The vulnerability lies in the lack of immediate shelter and the tendency for individuals to ignore storm warnings or underestimate the severity of approaching storms. Athletic events, where large groups gather, can attract lightning due to their open settings and the potential for players to remain on the field, even as weather conditions deteriorate. Events may be delayed or canceled.
Severe Winter Weather	People	*Vulnerability:* All students and staff are vulnerable to severe winter weather, which occurs over large areas and could affect all campuses. *Impacts:* Travel to and from campuses may be disrupted. Students who rely on public transportation may face significant difficulties, as delays or cancellations can hinder their ability to reach campus or home safely. Pedestrians are at risk to injury from slips or falls. In addition, individuals with disabilities might have trouble navigating slick or obstructed pathways, making it crucial for the college to maintain accessible routes. Faculty and staff with longer commutes can also be at risk, especially if they are unaware of worsening weather conditions. Furthermore, those experiencing financial hardships may lack the resources to protect themselves from severe winter weather, such as winter gear or reliable vehicles.
	Structures	*Vulnerability:* Minimal damage is expected to SLCC from severe winter weather. *Impacts:* Flat-roofed buildings are prone to snow accumulation and, in rare cases, may risk roof collapse if not cleared. Roof design, material quality, and the age of a building are key factors in how well a structure can withstand heavy snowfall.
	Economic Assets	*Vulnerability:* Economic assets are vulnerable to increased costs associated with severe winter weather.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		Impacts: There is an increased need for facilities/maintenance staff to clear parking lots and sidewalks. Buildings and walkways can suffer from snow accumulation and ice, leading to potential damage and costly repairs. Additionally, there may be increased heating or power costs.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Landscaping and outdoor equipment are vulnerable to severe winter weather. *Impacts:* Among the natural resources, mature trees, particularly those not adapted to heavy snow loads, can suffer from branch breakage or toppling under the weight of accumulated snow. This affects the trees themselves and the habitats and ecosystems they support. In addition, cultural resources, such as public art installations and outdoor classrooms, can be at risk; heavy snow can obscure visibility and limit public access, undermining their educational and aesthetic value.
	Critical Facilities and Infrastructure	*Vulnerability:* Utility networks and roads are vulnerable to damage or outages caused by severe winter weather. *Impacts:* Power lines and communications systems may be disrupted by heavy accumulation of snow or ice, leading to outages. Snow covered roads may inhibit access to campus. Classes may be delayed or canceled.
	Campus Activities	*Vulnerability:* Campus functions and activities are vulnerable to disruptions from severe winter weather. *Impacts:* Activities, such as sports practices, outdoor club meetings, and commencement ceremonies, are at risk due to icy conditions and reduced visibility, which can create unsafe environments for participants and attendees. In addition, logistical operations, such as transportation services for students and staff, may be severely disrupted, leading to challenges in maintaining schedules and ensuring safety. Facilities that are not adequately winterized, such as tents or open-air venues, can also be affected by accumulating snow, raising concerns about structural integrity and accessibility.
Tornado	People	*Vulnerability:* Students and staff are vulnerable to tornadoes, which are rare but could occur anywhere in the county and affect any campus. *Impacts:* Flying debris or collapsed structures could lead to injuries or fatalities. Students engaged in outdoor activities and those unfamiliar with emergency procedures on campus may be at risk. Individuals with mobility challenges could find it difficult to reach safe shelters quickly during a tornado warning. Faculty and staff occupied with their responsibilities may overlook emergency alerts or fail to act promptly. New students or visitors unaware of the campus layout might struggle to navigate to safe areas. As tornadoes can develop rapidly, a lack of preparedness and understanding of available resources adds to the vulnerability of these groups during severe weather events.
	Structures	*Vulnerability:* All SLCC facilities are vulnerable to tornadoes. *Impacts:* Tornadoes can damage or destroy campus buildings. Roofs can be torn off, windows shattered, and buildings leveled. Buildings with large, open spaces—such as gyms and auditoriums—are particularly vulnerable, as their expansive roofs can easily collapse under the pressure of tornado winds. Similarly, older structures that

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		may lack modern engineering standards are at greater risk due to potential weaknesses in their designs or materials.
	Economic Assets	*Vulnerability:* College structures and equipment are vulnerable to costs associated with tornado damage. *Impacts:* Rebuilding or repairing damaged property and equipment can be costly and may affect college budgets. Buildings, especially older structures that might not be built to modern safety standards, are particularly vulnerable, as intense winds and debris can compromise their integrity. Equipment and technology assets, such as computer labs and specialized learning tools, may be damaged or rendered inoperable during a tornado event. In addition, landscaping and outdoor facilities, such as sports fields and recreational areas, can sustain severe damage, impacting student activities and community engagement.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Mature trees and landscaped areas are vulnerable to tornadoes. *Impacts:* Trees and landscaping may experience extensive damage during tornadoes. In addition, cultural resources, including art installations and monuments, can be destroyed or displaced during tornadoes, adversely affecting the community's cultural heritage.
	Critical Facilities and Infrastructure	*Vulnerability:* Utility networks and transportation access are vulnerable to outages and disruptions caused by tornadoes. *Impacts:* Damage to electrical grids, water systems, and communication systems can occur, leading to utility outages. Campuses may close due to these outages. Debris can block roads and hinder transportation to and from school.
	Campus Activities	*Vulnerability:* Outdoor activities, such as sporting events or concerts, are vulnerable to disruptions caused by tornadoes. *Impacts:* Attendees at campus events may be exposed to the elements and at risk during a tornado. Furthermore, indoor activities in large, open spaces, such as lectures in auditoriums or gymnasiums, can present dangers if proper safety protocols are not in place. Outdoor recreation areas, such as sports fields, may be damaged or littered with debris, making them unsafe or temporarily unusable. Events and activities held at the college may be delayed or canceled.
Wildfire	People	*Vulnerability:* The risk to students and staff from wildfires is moderate. *Impacts:* Campuses are unlikely to be directly impacted by wildfire; however, students and staff may be affected by wildfires elsewhere in the region. Students living on campus or in nearby residential areas may not have easy access to transportation in an emergency. Faculty and staff, especially those with impaired mobility, could face challenges evacuating quickly. Low-income community members might lack the resources to prepare their homes or have limited access to information about wildfires and safety protocols. Those with limited English proficiency may struggle to receive critical alerts during wildfire events, increasing their vulnerability. Smoke and poor air quality from wildfires can affect the whole region. Smoke can cause respiratory issues, particularly for those with pre-existing conditions like asthma.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
	Structures	*Vulnerability:* No college facilities were identified in high wildfire risk areas. *Impacts:* Students or staff with homes near the wildland-urban interface (WUI) area may be affected, and class attendance may be disrupted.
	Economic Assets	*Vulnerability:* SLCC has minimal vulnerability to direct economic impacts from wildfires. *Impacts:* There may be some indirect impacts from the community. Local businesses may be closed, and government resources might be strained. Economic losses might impact class participation or enrollment.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Watershed and air quality are at risk from wildfires. *Impacts:* Smoke pollution can linger for weeks, affecting air quality. Burned landscapes can threaten the contamination of water sources, impacting both natural and cultural resources.
	Critical Facilities and Infrastructure	*Vulnerability:* Utility systems and emergency response capabilities are vulnerable to disruption by wildfires. *Impacts:* Wildfires can cause power outages and disrupt essential services. Classes may be canceled if power, water, or communication systems are disrupted. Evacuations or road closures could impact transportation to and from campuses. Resources devoted to fire response may strain other emergency response capabilities in the community.
	Campus Activities	*Vulnerability:* Campus activities are vulnerable to disruption from wildfires and poor air quality. *Impacts:* Activities, such as outdoor sports practices and large lawn gatherings, may be postponed or canceled due to poor air quality. Maintenance work involving equipment like lawnmowers can generate sparks or heat that may ignite dry vegetation. Such activities should be done with caution in hot, windy conditions.
Dam Failure	People	*Vulnerability:* Students and staff may be vulnerable to injury or other effects resulting from dam failure at the Jordan campus and South City campus. *Impacts:* Two SLCC campuses are within dam failure inundation boundaries. Dam failures can occur suddenly, and those downstream may have little warning. Swift-moving water can cause injury to individuals who do not reach safe areas. Environmental contamination from floodwaters might pose health risks, Students, faculty, and staff with limited mobility, new or inexperienced individuals on campus, and those with specific medical needs may be at risk.
	Structures	*Vulnerability:* Buildings that located in dam inundation areas, including Jordan and South City campuses, are vulnerable to damage from dam failure. *Impacts:* Significant structural and content/equipment losses can result from a dam failure. Older structures may lack modern engineering advancements that enhance flood resilience, making them more susceptible to structural damage during a dam failure.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
	Economic Assets	*Vulnerability:* Economic losses may result from damage to facilities and educational materials. *Impacts:* The buildings that house classrooms and administrative offices can sustain severe damage from flooding, leading to costly repairs and prolonged downtime. Furthermore, educational resources, including laboratories and libraries, may be damaged or rendered unusable, jeopardizing the academic experience of students and staff.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Outdoor areas at SLCC are vulnerable to damage from dam failure. *Impacts:* Landscaping and outdoor gathering spots may be damaged or destroyed.
	Critical Facilities and Infrastructure	*Vulnerability:* Utility networks and transportation networks are vulnerable to damage from dam failure. *Impacts:* Power, communication, and transportation systems could be damaged by dam failure. College functionality could be disrupted by power outages, communication network outages, or damage to transportation networks. Classes may be delayed or canceled due to outages. Transportation to or from campuses could be difficult for students and staff.
	Campus Activities	*Vulnerability:* Classes, campus events, and recreational activities are vulnerable to disruption from dam failure. *Impacts:* Outdoor events, sports practices, and recreational gatherings can be particularly vulnerable to dam failures. The proximity of specific campuses to dams and water bodies increases the risk of flooding in the event of a breach.
Civil Disturbance	People	College campuses are common locations for activist activities. Sometimes tensions escalate, and participants at rallies or protests can become more aggressive, leading to civil disturbance. Participants are typically the most vulnerable, but staff, students, and pedestrians on campuses could be harmed. Students from marginalized backgrounds, including those from racial or ethnic minorities, low-income families, or individuals with differing political beliefs, may face heightened risks during times of unrest. Their vulnerability can stem from a lack of resources or support systems, fear of retaliation, or potential misinterpretation of their actions during heightened emotions surrounding protests or rallies. Moreover, individuals who may already be experiencing mental health challenges can find themselves in particularly precarious situations, as civil disturbances can amplify feelings of anxiety and isolation.
	Structures	Large gathering areas, open plazas, and aging infrastructure, such as older lecture halls, are often focal points for student activities and events, making them susceptible to overcrowding and tension during protests or civil unrest. Open spaces can amplify noise and chaos, while older buildings may lack adequate security features like surveillance cameras or controlled access points, further increasing vulnerability. In addition, the proximity of these structures to key administrative offices or outdoor areas can create opportunities for disruption and challenge the ability of campus security to manage large crowds effectively.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
	Economic Assets	Physical infrastructure, such as buildings and equipment, may suffer damage during protests or violent outbursts. In addition, financial assets like tuition revenue can be affected if civil unrest leads to campus closures, disrupting classes and discouraging student enrollment. The presence of students and faculty makes the campus environment particularly susceptible to disturbances, as heightened emotions can escalate quickly in densely populated areas. Finally, institutional reputation is an intangible yet critical asset that can be severely impacted by civil disturbances, influencing future enrollment and community support.
	Natural, Historic, and Cultural Resources	Natural resources, such as gardens, parks, and landscaped areas can be damaged or depleted during unrest, as protesters may disregard property boundaries, leading to soil erosion or loss of flora. Historical buildings and monuments on campus, cherished for their architectural significance and local heritage, face threats from vandalism or destruction, especially in emotionally charged environments. In addition, cultural resources, including art installations and community gathering spaces, may be compromised when crowds become unruly, as these expressions of identity and shared values are often targeted during conflict. The vulnerability of these resources stems not only from their visibility but also from the heightened emotions and tensions that can arise during civil disturbances, creating an environment where respect for these assets may be diminished.
	Critical Facilities and Infrastructure	Administrative buildings, lecture halls, student centers, and recreational facilities are particularly vulnerable to civil disturbances. These areas often attract many individuals, making them prime targets for protests and other forms of civil unrest. The lack of adequate security measures and open-access policies intended to foster community engagement can exacerbate vulnerabilities. High traffic during peak hours can also hinder emergency response efforts, complicating evacuation or containment strategies.
	Campus Activities	Large-scale rallies, protests, and significant social events often attract passionate individuals rallying around specific causes, which can escalate tensions when opposing views are present. In addition, activities involving controversial speakers or politically charged topics tend to incite strong reactions from various groups, heightening the risk of unrest. Factors, such as insufficient security measures, lack of communication among organizers regarding expectations, and the potential for misinformation, can further exacerbate these vulnerabilities.
Cyberattack	People	Students, often new to managing their online security, may lack awareness of phishing schemes or not use strong passwords, making them easy targets. Furthermore, faculty and staff who handle sensitive information may inadvertently expose themselves through unsecured networks or by falling for social engineering tactics. In addition, international students who face language barriers could struggle to identify suspicious online activities or scams, increasing their risk.
	Structures	Vulnerabilities to administrative systems, student information databases, and online learning platforms arise from several factors, such as outdated software, insufficient encryption protocols, and lax access controls that enable unauthorized users to exploit weaknesses

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		in the system. In addition, increasing reliance on remote access tools and unsecured networks can create further entry points for cybercriminals. With a growing number of devices connected to the college's network, the potential for breaches expands, highlighting the need for enhanced cybersecurity measures to safeguard sensitive information and maintain the integrity of academic operations.
	Economic Assets	Sensitive student and employee data, financial records, and research materials are prime targets for malicious actors, as they can lead to identity theft, financial fraud, or ransomware attacks. In addition, the increasing use of online learning platforms and digital communications tools has created multiple entry points for cyber threats. The lack of comprehensive cybersecurity training for staff and students further exacerbates this vulnerability.
	Natural, Historic, and Cultural Resources	Malicious actors seeking to disrupt educational initiatives could target sensitive data on the college's sustainable practices, environmental studies, and conservation projects. In addition, historical archives, digital records of artifacts, and cultural programming resources also might face risks, as breaches could compromise the integrity of these resources and the trust of the community. Factors, such as outdated security protocols, limited cybersecurity training among staff, and the lack of comprehensive disaster recovery plans, contribute to the vulnerability. In addition, cultural organizations managing events may face threats if their systems lack security. Limited resources for smaller organizations further increase this vulnerability.
	Critical Facilities and Infrastructure	Administrative systems, student information databases, and online learning platforms are susceptible due to several factors: the increasing reliance on digital systems for academic operations, software that may lack the latest security updates, and the diverse range of users—from students to faculty—who access these systems, often with varying levels of cybersecurity awareness. In addition, interconnected networks that facilitate communication and resource sharing can create multiple entry points for potential attackers, further exacerbating risk.
	Campus Activities	Activities that involve online registration for events, accessing student information systems, and using campus Wi-Fi networks are prime targets for cybercriminals. Relying on digital platforms for communication and transactions creates opportunities for phishing schemes and data breaches. In addition, the open nature of public Wi-Fi can expose users to eavesdropping and man-in-the-middle attacks, especially when students and staff access sensitive information without adequate cybersecurity measures. The combination of a tech-savvy population and varying levels of cyber awareness among users exacerbates these vulnerabilities.
Hazardous Materials Incident (Transporta-tion & Fixed Facility)	People	Students and staff are vulnerable to hazardous materials incidents at fixed sites or from transportation spills in the vicinity of campuses. There are also small amounts of chemical materials stored on some campuses related to automotive and other classes. Students living on campus might have limited awareness of safety protocols and may lack immediate access to emergency resources. In addition, employees who handle or work near hazardous materials, such as laboratory staff and maintenance workers, may be at greater risk due

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		to prolonged exposure and potential safety lapses. Those with disabilities or medical conditions may face additional challenges during an incident, such as mobility issues that impede evacuation. Moreover, individuals new to the college, including first-year students and staff, may be less familiar with emergency procedures, thus increasing their vulnerability to hazardous situations.
	Structures	Laboratories, for example, are often equipped with various chemicals and materials that, if improperly stored or accidentally mixed, can lead to significant hazards. Maintenance and storage buildings that house cleaning supplies and mechanical fluids are at risk, especially if they lack proper containment measures. Furthermore, older buildings that are not designed with modern safety standards may be more prone to leaks or structural failures. The presence of high-traffic areas near these structures also increases the likelihood of accidental exposure or spills.
	Economic Assets	Physical infrastructure, such as buildings and laboratories, technological equipment for instruction and research, and valuable supplies or materials stored on-site may be vulnerable. This stems from their potential exposure to hazardous chemicals, which can cause structural damage or contamination, rendering them unusable. Furthermore, the presence of students and faculty increases the risk of human exposure to hazardous substances, leading to liability issues and potential loss of income. The interconnectedness of these assets also means that a single incident can have cascading effects, impacting financial stability and resource availability for the college.
	Natural, Historic, and Cultural Resources	Natural resources, such as nearby waterways, which provide habitat for local wildlife, are at risk of contamination from spills or leaks. Historically significant buildings and sites, integral to the community's identity, could suffer damage or degradation, particularly in the event of an emergency response that involves the use of chemicals. In addition, cultural resources, including artifacts and collections housed in campus facilities, may be exposed to harmful substances, compromising their integrity and heritage. The vulnerability of these resources is exacerbated by their location in densely populated areas, where the potential for hazardous incidents is heightened.
	Critical Facilities and Infrastructure	Laboratories, maintenance buildings, and storage facilities for chemicals and equipment may be vulnerable if they are close to areas with high traffic, are near a range of chemicals that might not be adequately contained, and have aging infrastructure that does not comply with the latest safety standards. In addition, the movement of students and personnel in these areas increases the risk of exposure during an incident.
	Campus Activities	Science labs that handle chemicals and biological samples pose significant risks due to the potential for spills or accidental exposure. Maintenance and facilities operations, which often involve cleaning agents and maintenance fluids, can lead to hazardous situations if proper protocols are not strictly followed. Art and photography studios, where solvents and paints are commonly used, also present vulnerabilities, particularly in poorly ventilated areas. The nature of these activities, combined with the presence of students and staff who

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		might not be fully trained in handling hazardous materials, increases the likelihood of incidents occurring.
Public Health Epidemic/ Pandemic	People	Students with pre-existing health conditions, such as asthma or autoimmune diseases, may face heightened risks during outbreaks due to their compromised immune systems. In addition, low-income students often lack access to healthcare resources, making it difficult for them to receive timely vaccinations or treatment. International students can be susceptible due to language barriers and unfamiliarity with local healthcare systems. Lastly, those living in crowded housing or communal settings have a higher risk of rapid disease transmission.
	Structures	Densely populated lecture halls and classrooms can facilitate the rapid spread of pathogens, especially during peak hours for such activity., Communal spaces, such as cafeterias and lounges, pose similar risks, as they involve the sharing of air and surfaces by large groups of people. Furthermore, facilities that lack proper ventilation or are not equipped with advanced filtration systems can exacerbate the transmission of airborne diseases. High-traffic areas, including hallways and entrances, can be hotspots for the spread of viruses, especially if hygiene protocols, such as frequent cleaning and hand sanitation, are not strictly adhered to.
	Economic Assets	One of the most vulnerable assets is the student population, which can experience decreased enrollment due to health concerns or remote learning shifts. In addition, on-campus businesses and services, such as bookstores, dining facilities, and recreational centers, face diminished customer traffic during health crises, adversely impacting revenue. Moreover, the financial stability of SLCC itself can be threatened through reduced state funding and tuition revenues, as public health priorities may redirect resources away from educational institutions. Lastly, infrastructure investments, especially those accommodating large gatherings or in-person events, are at risk due to health regulations and social distancing mandates.
	Natural, Historic, and Cultural Resources	Natural resources, such as the local flora and fauna, can be affected by changes in human activity and pollution during outbreaks, potentially leading to biodiversity loss. Historic resources, including buildings and monuments, may suffer neglect and deterioration when public health measures restrict access and maintenance. In addition, cultural resources, such as community events and educational programs, are at risk of discontinuation or significant alteration, which may lead to a loss of shared identity and communal bonds.
	Critical Facilities and Infrastructure	Key facilities, such as student housing, health services, and dining areas present significant challenges due to high population density and close interactions among individuals. Classrooms and laboratories, where large groups gather for instruction, can facilitate the rapid spread of infectious diseases. These vulnerabilities are exacerbated by the mobility of students, staff, and faculty exposed to various environments. Furthermore, inadequate supply chains for essential medical resources and sanitation products can hinder rapid response efforts, further compromising the safety and well-being of the college community during public health crises.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
	Campus Activities	Large gatherings, such as orientation events, athletic competitions, and academic seminars, pose significant risks, as they involve many participants in confined spaces, facilitating the spread of infectious diseases. In addition, routine activities like dining in campus cafeterias, using study lounges, and participating in club meetings, can contribute to transmission, especially if social distancing measures and hygiene protocols are not strictly followed. The interconnectedness of the campus community further amplifies this vulnerability, as students, faculty, and staff frequently transition between different environments, increasing the likelihood of contagion across various settings.
Terrorism	People	Students who belong to minority communities or those who are visibly different in terms of race, religion, or sexual orientation can often be targets due to their perceived differences. In addition, international students might face heightened vulnerability as they navigate a new cultural environment and might not fully understand the subtleties of local social dynamics. Furthermore, individuals who are at risk of social isolation or who struggle with mental health issues may be more susceptible to radicalization or manipulation by extremist groups.
	Structures	Buildings which accommodate large crowds and are often situated in open areas, such as lecture halls and gyms, present easier targets for potential attacks. Facades with large windows can be compromised more quickly, exposing occupants to greater risk. Limited security measures, such as inadequate surveillance systems and a lack of controlled access points, also can contribute to their vulnerability.
	Economic Assets	Educational buildings—high-traffic areas filled with students and staff—present enticing targets for those aiming to disrupt academic pursuits and instill fear. Infrastructure, including dormitories, bookstores, and laboratories, can be compromised due to inadequate security measures or a lack of surveillance systems, making them susceptible to attacks.
	Natural, Historic, and Cultural Resources	SLCC campuses host a variety of natural, historic, and cultural resources that are vulnerable to terrorism. These assets include beautiful green spaces, unique architectural structures, and art collections that reflect the community's diverse history and culture. The vulnerability of these resources stems from their accessibility and visibility; open campuses allow easy entry for individuals with malicious intent. In addition, high foot traffic in communal areas makes them attractive targets for acts of violence or vandalism. Although valued for their heritage, historic buildings may lack modern security measures, making them particularly susceptible. Furthermore, cultural artifacts and events, often celebrated and showcased, can serve as symbols of identity, attracting attention from those seeking to disrupt societal harmony.
	Critical Facilities and Infrastructure	Key areas include student centers, administrative buildings, and large auditoriums, where mass gatherings occur, making them attractive targets. In addition, the open campus layout, with multiple access points and limited security during certain hours, increases vulnerability. The reliance on public transportation for student commuting further heightens risk, as it can be a conduit for potential threats.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		Furthermore, the presence of diverse social groups and activities may inadvertently create tensions that malicious actors could exploit.
	Campus Activities	Events, such as large gatherings, sporting events, or concerts often attract significant attention, creating opportunities for malicious actors to exploit crowded environments. The lack of stringent security measures at many events can further increase vulnerabilities, as attendees may be less aware of their surroundings in high-energy atmospheres. In addition, the diverse student and visitor populations and expansive public spaces can complicate monitoring efforts and make it challenging to identify potential threats before they escalate.

Jurisdiction-Specific Changes in Vulnerability

Hazard events can impact communities, infrastructures, and ecosystems. The severity of these impacts can be influenced by climate change, population patterns, and land use developments. Understanding these factors is crucial for SLCC to develop a resilient community and minimize the impacts of hazards. Table 9 displays the unique changes within SLCC and the related effects on each identified hazard affecting SLCC.

DRAFT

Table 9: Jurisdiction-Specific Changes in Vulnerability for Salt Lake Community College

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
Avalanche	Higher temperatures can lead to more rain, destabilizing snowpack and increasing the risk of wet avalanches. In addition, changes in snowfall can lead to denser snow layering on slopes, making them more prone to sliding.	Avalanches can impact Salt Lake Community College (SLCC) enrollment by causing road closures and safety concerns, which may lead students to stay home or defer their studies. Significant damage to campus facilities could lead to a longer-term decrease in enrollment. Conversely, there could be increased interest in programs related to emergency management and outdoor safety as a community response to avalanche risks.	Development on SLCC campuses has not increased the risk of avalanches.	Increased
Drought	Climate change affects drought incidents by altering precipitation patterns and raising temperatures. Warmer weather can lead to longer dry periods and more severe droughts, while changes in rainfall can reduce snowpack in nearby mountains, crucial for summer water supply. Higher temperatures also increase evaporation rates, further straining local water resources.	Droughts can impact SLCC enrollment by driving families to relocate, which may reduce the local student population. Economic challenges can make tuition less affordable, but some may seek retraining in sustainability programs, potentially increasing enrollment in those areas.	The new campus SLCC campus in Herriman, developed in 2023, adds new water demand on the local water system, increasing the risk of drought.	Increased
Earthquake	Rising temperatures can lead to glacial melting, which affects pressure on tectonic plates and may trigger seismic activity through isostatic rebound. In addition, increased rainfall and	Changes in SLCC enrollment because of earthquakes can be notable. A major quake may disrupt campus facilities, leading to temporary closures and decreased enrollment as students	The new 2023 campus in Herriman adds more SLCC buildings that are exposed to earthquake damage, but these new facilities were also built to current building codes, mitigating some of the risk.	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	flooding can erode soils, weakening structural integrity and heightening earthquake vulnerability. Although the direct links between climate change and earthquakes are still under investigation, the environmental effects may impact the region's seismic risk.	defer or relocate. Conversely, enrollment might increase as individuals seek education to rebuild their lives and careers after a disaster.		
Extreme Heat	Climate change significantly impacts extreme heat by increasing the frequency and intensity of heat waves. Rising global temperatures lead to longer and hotter summers, affecting residents and local infrastructure while heightening health risks, especially for vulnerable populations. Urban heat islands, resulting from reduced vegetation and extensive pavement, amplify these effects.	Extreme heat can impact SLCC enrollment by discouraging students from attending classes because of discomfort or health concerns. These conditions may deter prospective students from enrolling. In addition, extreme heat can affect community events and outreach, influencing the college's engagement with the local population and potentially causing fluctuations in enrollment figures.	The new Herriman campus adds more pavement and buildings, which can trap heat and raise temperatures during extreme heat events.	Increased
Extreme Cold	By increasing the intensity of winter storms. Warmer atmospheric temperatures allow for more moisture, resulting in heavier snowfall and potentially lower temperatures during these events. In addition, fluctuations in weather patterns may disrupt seasonal cycles, leading to unpredictable periods of extreme cold mixed with warmer spells.	Extreme cold weather can negatively affect SLCC enrollment. Harsh winter conditions may lead to transportation issues, health challenges, and increased absenteeism, temporarily decreasing class attendance. This can discourage new students from enrolling and shift demographic trends.	New facilities on the Herriman campus will increase energy usage during extreme cold events, potentially adding stress to the local energy system.	Increased
Flooding	Higher temperatures increase the frequency and intensity of	Flooding can lead to campus closures and class disruptions at	The new Herriman campus does not appreciably increase the risk of	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	extreme weather events and alter precipitation patterns. They can lead to more intense rainstorms and accelerated snowmelt from nearby mountains, raising water levels in rivers and streams. This combination raises the risk of flooding, especially in areas with inadequate drainage and urban development in flood-prone zones, heightening the potential for damage to homes and infrastructure.	SLCC, which may discourage enrollment and cause current students to withdraw if their housing is affected.	flooding. However, new impervious surfaces may slightly increase the risk of pluvial flooding.	
Landslide/ Slope Failure	Climate change increases the risk of landslides through heavier rainfall and temperature fluctuations. Intense rain saturates soil, destabilizing slopes, while freeze–thaw cycles weaken the ground. Changes in vegetation can also reduce stability, leading to a higher potential for landslides.	Landslides can impact SLCC enrollment by disrupting transportation and accessibility. Road closures may lead to temporary reductions in attendance, as safety concerns may prompt students to defer or seek education elsewhere.	Development on SLCC campuses has not increased the risk of landslides.	Increased
Radon	Climate change can affect radon levels by altering soil temperatures and moisture conditions. Higher temperatures may increase radon emissions from the ground, while heavy rainfall can change groundwater and soil saturation, impacting radon migration into buildings.	Rising awareness of radon exposure may deter prospective students from attending SLCC because of health concerns. This could also affect retention rates among current students, influencing overall enrollment trends, as health and safety become priorities for families.	Development on SLCC campuses has not increased the risk of radon exposure.	Increased or stayed the same.
Heavy Rain	Climate change increases the frequency and intensity of heavy rain, as higher temperatures	Heavy rain can impact SLCC's enrollment by deterring students from attending classes because	New impervious surfaces on the Herriman campus may slightly increase the risk of pluvial flooding.	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	allow the atmosphere to hold more moisture. This leads to stronger storms, flash flooding, and overwhelmed drainage systems.	of flooding and unsafe conditions. This may lead to a temporary decline in enrollment, as some students opt for online courses or defer their studies. In addition, adverse weather can affect campus access and infrastructure, further influencing student participation.		
High Wind	Climate change affects high winds by altering atmospheric patterns and increasing extreme weather events. Rising temperatures may lead to more substantial, unpredictable winds and more frequent thunderstorms, posing risks to infrastructure and air quality.	High winds can lead to canceled classes, temporarily reducing attendance. Unsafe conditions may deter new students from enrolling, potentially impacting long-term enrollment patterns.	The new multistory building on the Herriman campus increases the risk of damage from high winds.	Increased
Lightning	Climate change increases temperatures and alters precipitation, leading to more intense thunderstorms and frequent lightning strikes. Urbanization can enhance this effect, posing risks to public safety and infrastructure.	Lightning can impact enrollment by causing campus disruptions during storms, leading to temporary closures and affecting attendance. Safety concerns may deter students from commuting, influencing their decision to enroll.	The new multistory building on the Herriman campus slightly increases the risk of damage from lightning strikes.	Increased
Severe Winter Weather	Climate change impacts heavy snow and blizzards by altering precipitation patterns. Higher temperatures can lead to more rain than snow, affecting snowpack levels. In addition, increased storm intensity results in heavier, more unpredictable snowfall.	Heavy snowfall or blizzards can lower SLCC attendance as safety concerns keep students and faculty home. This may also delay enrollments.	The SLCC Herriman campus moderately increases the risk of severe winter weather damaging facilities and infrastructure. SLCC has increased responsibility to protect the new buildings and students from heavy snow and ice.	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
Tornado	Climate change may increase the frequency and intensity of tornadoes. Higher temperatures lead to more moisture in the air, creating conditions for severe thunderstorms. Wind patterns and precipitation changes can also heighten tornado risks, resulting in more destructive storms and greater threats to infrastructure and communities.	Tornadoes can reduce SLCC enrollment because of student displacement and class disruptions. However, strong support during recovery may attract new students seeking stability. The overall impact depends on the severity of the tornado and the community's response.	The risk of tornadoes is very low in Herriman, the location of SLCC's new development since the previous plan. The new campus does not increase risk.	Same
Wildfire	By raising temperatures and creating drier conditions, climate change contributes to prolonged droughts, leading to more dry vegetation, which serves as fuel for fires. Erratic seasons extend the growing period, while more lightning strikes can ignite wildfires. These factors heighten the threat to ecosystems and community safety.	Wildfires can affect enrollment at SLCC by causing potential students to postpone their education because of safety concerns. Conversely, SLCC may see an influx of students from impacted areas seeking support, altering the demographic composition.	The new Herriman SLCC campus puts new facilities and infrastructure in an area with high risk of wildfire. This increases risk for SLCC.	Increased
Dam Failure	Climate change raises the risk of dam failure by causing heavier rainfall and rapid snowmelt. These changes can overwhelm dams and compromise their integrity, highlighting the need for safety assessments and upgrades to protect communities downstream.	Dam failure near SLCC could reduce enrollment because of safety evacuations and commuting challenges for affected residents. Conversely, the aftermath may boost interest in disaster management and recovery programs, attracting new students.	Development on SLCC campuses has not increased the risk of dam failure.	Increased
Civil Disturbance	Climate change can increase the likelihood of civil disturbances by intensifying environmental stresses and social tensions. Rising temperatures may lead to	Civil disturbances can lead to declining enrollment because of safety concerns among students and potential applicants. Fear of violence and disruptions may	Development on the Herriman SLCC campus has slightly raised the risk of damage due to civil disturbances. The new facilities	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	droughts, wildfires, and poor air quality, particularly affecting vulnerable communities. The scarcity of resources, especially water, can spark conflicts and protests. In addition, an influx of migrants from harder-hit areas may strain local resources, further escalating tensions. The impacts of climate change on the environment and community dynamics drive this cycle of unrest.	cause current students to miss classes and prospective students to seek other options. This can lead to temporary reductions in enrollment and demographic shifts, as individuals affected seek alternative educational opportunities.	could be targeted and need to be protected during a disturbance.	
Cyberattack	Climate change can heighten cyberattack risk by increasing vulnerabilities during extreme weather. Disruptions like power outages offer cybercriminals opportunities, as focusing on emergency responses can weaken cybersecurity measures. Organizations adopting new technologies to cope with climate impacts may unintentionally introduce additional vulnerabilities.	A cyberattack on SLCC could decrease enrollment as potential students may doubt the security of their personal information. Disruptions in services might deter current students from continuing their studies, and temporary closures could harm the institution's reputation, further impacting enrollment and retention rates.	Development on SLCC campuses has not increased the risk of cyberattacks.	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
Hazardous Materials Incident (Transportation & Fixed Facility)	Climate change elevates the risk of hazardous materials incidents by increasing extreme weather events like heavy rain and wildfires. These events can breach storage tanks and heighten material volatility. Vulnerable infrastructure can lead to more spills or accidents, while climate shifts may introduce new challenges for managing hazardous substances and public health.	Hazardous materials incidents at SLCC can lead to decreased enrollment because of safety concerns. Temporary closures and disrupted classes may prompt current students to withdraw, while prospective students might choose safer institutions.	Development on SLCC campuses has not increased the risk of a hazardous materials incident.	Increased
Public Health Epidemic/ Pandemic	Worsening air quality can also exacerbate respiratory conditions like asthma, especially in vulnerable populations, by increasing the spread of vector-borne diseases and raising the risk of waterborne illnesses because of flooding or drought.	Public health crises, like the COVID-19 pandemic, have notably affected SLCC enrollment. There may be declines as prospective students delay education because of health concerns, while some existing students might drop out or take leaves of absence. Conversely, there could be an increase in enrollment in healthcare-related programs in response to public health needs, resulting in a fluctuating enrollment landscape.	Development on SLCC campuses has not increased the risk of a pandemic/epidemic.	Increased
Terrorism	Terroristic activity is sometimes centered around climate change. Climate change impacts terrorism incidents by creating resource scarcity and social unrest. Increased competition for essential resources, such as water, can fuel tensions, making	Terrorism could lead to a decline in enrollment at SLCC because of safety concerns. Potential students might defer their education or choose other institutions perceived as safer. Following any incident, increased	Development on SLCC campuses has not increased the risk of terrorism.	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	communities more vulnerable to extremist ideologies. Extreme weather events may disrupt social order and infrastructure, offering terrorist groups opportunities to exploit crises. In addition, climate-driven population displacement can heighten tensions in receiving areas, raising the risk of domestic terrorism. Law enforcement's focus on climate-related challenges can also limit its capacity to address terrorism threats. Ultimately, while climate change may not directly cause terrorism, its effects can create an environment conducive to extremist activities.	security measures may lead to a temporary drop in enrollment.		

DRAFT

Additional Public Involvement

SLCC engages students in various public involvement activities related to hazard awareness and emergency preparedness. These initiatives include workshops educating students on disaster response and safety protocols, interactive training sessions to develop practical skills, and collaborative events involving community leaders and organizations discussing hazard mitigation strategies. In addition, SLCC provides resources such as informational pamphlets and access to online materials, ensuring students are well-informed about potential hazards and best practices for personal and community safety. Through these efforts, the college fosters a sense of responsibility and preparedness in its student body, empowering them to act effectively in times of crisis.

Plan Integration

Incorporating the underlying principles of the Hazard Mitigation Plan and its recommendations into other plans is a highly effective and low-cost way to expand their influence. All plan participants will use existing methods and programs to implement hazard mitigation actions where possible. As previously stated, mitigation is most successful when it is incorporated into the day-to-day functions and priorities of government and public service. This plan builds on the momentum developed through previous and related planning efforts and mitigation programs, and it recommends implementing actions where possible through these other program mechanisms. These existing mechanisms include the following:

- Regularity Capabilities
- Administrative Capabilities
- Fiscal Capabilities

Respective planning stakeholders will conduct implementation and incorporation into existing planning mechanisms and will be done through the routine actions of:

- Monitoring other planning/program agendas
- Attending other planning/program meetings
- Participating in other planning processes; and
- Monitoring community budget meetings for other community program opportunities.

The successful implementation of this plan will require constant and vigilant review of existing plans and programs for coordination and multi-objective opportunities that promote a safe, sustainable community. Regular efforts should be made to monitor the progress of mitigation actions implemented through other planning mechanisms. Where appropriate, priority actions should be incorporated into planning updates.

Table 10: Integration of Previous Plans by Salt Lake Community College

Plan	Description
None	N/A

DRAFT

Table 11: Opportunities for Integration with Future Plans for Salt Lake Community College

Plan	Description
SLCC Sustainability Plan	Identifies strategies for improving sustainability on campuses through recommendations on water usage, transportation, waste and recycling, future facilities development, energy usage, and sustainable purchasing.
SLCC 2025 Master Plan and Campus Master Plans	Addresses sustainability, infrastructure improvements, student safety, future development.
SLCC Business Continuity Plan	Ensures each department can minimize disruptions caused by various hazards. It identifies areas for training and education regarding hazards.
County and municipal plans	The community college works closely with the emergency managers of each jurisdiction via the monthly county emergency managers' meetings. Because the community college does not have the same long-term planning mechanisms and direct responsibility for management of community lifelines, the college will seek opportunities to collaborate in county and municipal long-term planning initiatives where hazard mitigation planning actions may be integrated.

Capability Assessment

Local mitigation capabilities are existing authorities, policies, programs, and resources that reduce hazard impacts or could help carry out hazard mitigation activities. However, the Community College does not have responsibility for implementing ordinances.

Planning and Regulatory Capabilities

Planning and regulatory capabilities are the plans, policies, codes, and ordinances that prevent and reduce the impacts of hazards.

Table 12: Assessment of the Planning Capabilities of Salt Lake Community College

Plan	Does it address hazards? (Y/N)	How can it be used to implement mitigation actions?	When was the last update? When is the next update?
General Plan	Y – Strategic Plan	N/A	N/A
Capital Improvement Plan	N	N/A	N/A
Climate Change Adaptation Plan	Y – Sustainability Plan	Can be used to inform responsible parties for mitigation actions	2023
Community Wildfire Protection Plan	Y – For cities with campuses	Can inform wildfire mitigation actions	2022
Economic Development Plan	N	N/A	N/A

DRAFT

Plan	Does it address hazards? (Y/N)	How can it be used to implement mitigation actions?	When was the last update? When is the next update?
Land Use Plan	Y	Can be used to inform mitigation actions	2017
Local Emergency Operations Plan	Y – CEMP	Can be used to inform mitigation actions as far as organizational charts and duties	2022
Stormwater Management Plan	Y	Can be used to inform flooding mitigation actions	2022
Transportation Plan	Y	Can be used to inform mitigation actions and identify funding sources	2024
Substantial Damage Plan	N/A	N/A	N/A

Table 13: Assessment of the Regulations and Ordinances of Salt Lake Community College

Regulation/Ordinance	Does it effectively reduce hazard impacts?	Is it adequately administered and enforced?	When was the last update? When is the next update?
Building Code	N	N/A	N/A
Flood Insurance Rate Maps	N/A		
Floodplain Ordinance	N	N/A	N/A
Subdivision Ordinance	N	N/A	N/A
Zoning Ordinance	N	N/A	N/A
Public Health and Safety Program	Y	Y	Reviewed annually
Natural Hazard-Specific Ordinance (Stormwater, Steep Slope, Wildfire)	Y	Y	Reviewed annually
Acquisition of Land for Open Space and Public Recreation Use	N/A	N/A	N/A
Prohibition of Building in At-Risk Areas	N/A	N/A	N/A
Other? (Describe)			

Most of these regulations exist at the town or city level. The college is regulated by the local ordinances for the jurisdiction where each of its campuses are located. The college does include guidance for development in the plans in Table 12.

Administrative and Technical Capabilities

Administrative and technical capabilities include staff and their skills. They also include tools that can help carry out mitigation actions.

Table 14: Assessment of the Administrative Capabilities of Salt Lake Community College

Administrative Capability	In Place? (Y/N)	Is staffing adequate?	Are staff trained on hazards and mitigation?	Is coordination between agencies and staff effective?

DRAFT

Table 15: Assessment of the Technical Capabilities of Salt Lake Community College

Technical Capability	In Place? (Y/N)	How has it been used to assess/mitigate risk in the past?	How can it be used to assess/mitigate risk in the future?
Mitigation Grant Writing	Y – Office of Sponsored Projects	Identification of known risks	Grant funds can be used to mitigate risks
Hazard Data and Information	Y	Used for any construction or maintenance projects to ensure safety standards	Can inform strategies to reduce risk
GIS	Y – Natural Sciences Department	Mapping of at-risk areas	Identification of at-risk areas
Mutual Aid Agreements	Y	Assistance on projects related to hazard mitigation	Established agreements to assist in completing mitigation actions
Other? (Please describe.)			

Financial Capabilities

Financial capabilities are the resources to fund mitigation actions. Talking about funding and financial capabilities is important to determine what kinds of projects are feasible, given their cost. Mitigation actions like outreach programs are lower cost and often use staff time and existing budgets. Other actions, such as earthquake retrofits, could require substantial funding from local, state, and federal partners. Partnerships, including those willing to donate land, supplies, in-kind matches, and cash, can be included.

Table 16: Assessment of the Financial Capabilities of Salt Lake Community College[7]

Funding Resource	In Place? (Y/N)	Has it been used in the past and for what types of activities?	Could it be used to fund future mitigation actions?	Can it be used as the local cost match for a federal grant?

Other? (Please describe.)			

Opportunities to Expand and/or Improve Capabilities

Actions that can expand and improve existing authorities, plans, policies, and resources for mitigation include budgeting for mitigation actions, passing policies and procedures for mitigation actions, adopting and implementing stricter mitigation regulations, approving mitigation updates, and making additions to existing plans as new needs are recognized. Table 18 lists the opportunities for SLCC.

Table 18: Opportunities to Expand and/or Improve the Capabilities of Salt Lake Community College[8]

Capability	Opportunity to Expand and/or Improve
Planning and Regulation	SLCC can expand planning mechanisms such as a Capital Improvement Plan and incorporate hazard mitigation actions. Plan integration increases the likelihood of successful project implementation. SLCC could also benefit from a clear path to integrate with planning mechanisms at the city and county level.
Administrative and Technical	Director and deputy director of emergency management manage emergency planning duties and coordinate within the community college and with county and state EMS. They receive some assistance from college finance staff for EMPG grants but could benefit from additional staff and capabilities. The EM Director is working with facilities staff on topics related to resources and ATC-20 training of staff for logistics and damage assessment. Another opportunity to expand this capability is enhancing communications between campuses. Improved communications between departments will help SLCC leverage all skills and resources available.
Financial	SLCC can apply for grant programs, such as the HMGP (404) as well as other HMA grant programs. These grants, although not previously used, can provide substantial funding for mitigation actions if successfully obtained.

[8] ATC-20 = Postearthquake Safety Evaluation of Buildings, EM = Emergency Management, EMPG = Emergency Management Performance Grants, EMS = Emergency Management Services, HMA = Hazard Mitigation Assistance, HMGP = Hazard Mitigation Grant Program.

Capability	Opportunity to Expand and/or Improve
Education and Outreach	SLCC has the capability to conduct hazard mitigation outreach in-person, through newsletters, news, and awareness campaigns. Adding additional hazard-specific information regarding mitigation can help ensure outreach is informative and specific to the hazards identified in this plan update. The college has been developing the SLCC Mobile App to be a one-stop shop for campus information, including student safety information. This tool could be used to share information regarding hazards.

Mitigation Strategy

Mitigation strategies provide proactive measures that are designed to minimize the impacts of hazards on SLCC. mitigation actions, and Table 20 shows the mitigation actions for 2025.

Table 19 shows the status of previous mitigation actions, and Table 20 shows the mitigation actions for 2025.

Table 19: Status of Prior Mitigation Actions of Salt Lake Community College[9]

Action	Goal/Objective	Hazard(s)	Agency Lead	Time-frame	Status Update
Seismic retrofitting and upgrades of vulnerable buildings and facilities.	Goal 1. Protect the lives, health, and safety of the citizens of Salt Lake County before, during, and after a disaster.	Earthquake	Facilities Services	Long-term	Ongoing
	Goal 2. Protect and eliminate and/or reduce damage and disruptions to critical facilities, structures, and infrastructure during disasters.				Ongoing
Hand sanitizing stations.	Goal 1. Protect the lives, health, and safety of the citizens of Salt Lake County before, during, and after a disaster.	Public Health Epidemic/ Pandemic	Emergency Management and Health Safety	Long-term	Ongoing
Stop the Bleed kits.	Goal 1. Protect the lives, health, and safety of the citizens of Salt Lake County before, during, and after a disaster.	Civil Disturbance Terrorism/ Active Threat	Emergency Management	Long-term	Ongoing
Security hardening assessment and	Goal 1. Protect the lives, health, and safety of the citizens of Salt Lake	Civil Disturbance Terrorism/	Public Safety, Emergency Management	Long-term	Ongoing

Table 20: 2025 Mitigation Action Plan for Salt Lake Community College[10]

#	Action	Year Initiated	Goal/Objective	Hazard(s)	Lead Agency	Potential Partners	Benefits (Losses Avoided)	Cost Estimate	Funding Source(s)	Time-frame	Priority	Comments
1	Retrofit and upgrade buildings and facilities vulnerable to earthquake damage	2019	Goal 1. Protect the lives, health, and safety of the citizens of Salt Lake County before, during, and after a disaster. Goal 2. Protect and eliminate and/or reduce damage and disruptions to critical facilities, structures, and infrastructure during disasters.	Earthquake	SLCC Facilities Services	SLCo EM, local jurisdictions	Example: Retrofits will reduce the likelihood of structural damage from earthquakes. This will reduce the cost of repairs, reduce time that facilities/ equipment may be inoperable, and reduce injuries to building occupants.	High	PDM, HMGP, SLCC capital improvement funds	Long-term	High	
2	Deploy hand sanitizing stations.	2019	Goal 1. Protect the lives, health, and safety of the citizens of Salt Lake County before, during, and after a disaster.	Public Health Epidemic/Pandemic	SLCC Emergency Management	SLCo EM, SLCo Health Department, NGO partners, SLCC Health Safety	Reduced transmission of bacteria or other diseases, increased preventative health measures in public areas on campuses	Low	SLCC general funds	Long-term	Medium	
3	Make Stop the Bleed Kits available.	2019	Goal 1. Protect the lives, health, and safety of the citizens of Salt Lake County before, during, and after a disaster.	Civil Disturbance, Terrorism/ Active Threat	SLCC Emergency management	SLCo EM, SLCo Health Department, NGO partners	Accessible medical equipment in the event of an incident	Low	SLCC general funds	Long-term	High	
4	Assess and harden campus assets that need additional security.	2019	Goal 1. Protect the lives, health, and safety of the citizens of Salt Lake County before, during, and after a disaster. Goal 2. Protect and eliminate and/or reduce damage and disruptions to critical facilities, structures, and infrastructure during disasters.	Civil Disturbance, Terrorism/ Active Threat	SLCC Public Safety	Local law enforcement agencies, SLCC Emergency Management, SLCC Facilities Services	Increased campus security, improved coordination between departments	High	SLCC general funds	Long-term	High	
5	Enhance interoperable communications between campuses. Make investments in key communications infrastructure and equipment to ensure redundant and effective communications.	2019	Goal 3. Enhance and protect the communication and warning/notification systems in the County. Goal 6. Advocate, support, and promote the continued coordination and integration of disaster planning efforts throughout the County.	Dam Failure, Drought, Extreme Cold, Extreme Heat, Earthquake, Flood, Heavy Rain, High Wind, Landslide, Lightning, Public Health Epidemic/Pandemic, Radon, Severe Winter Weather, Tornado, Wildfire, Civil Disturbance, Hazardous Materials	SLCC Public Safety	SLCo EM, local law enforcement agencies	Improved communication between departments	Medium	SLCC general funds	Long-term	High	

[10] The college did not provide any new information, so all previous mitigation actions were incorporated into the 2025 plan. HMGP = Hazard Mitigation Grant Program, NGO = nongovernmental organization, PDM = Pre-Disaster Mitigation, SLCC = Salt Lake Community College, SLCo EM = Salt Lake County Emergency Management.

#	Action	Year Initiated	Goal/Objective	Hazard(s)	Lead Agency	Potential Partners	Benefits (Losses Avoided)	Cost Estimate	Funding Source(s)	Time-frame	Priority	Comments
6	Develop and implement public education programs on disaster awareness. Use SLCC Mobile App, social media, and integrate with ongoing CPR/first aid trainings.	2025	Goal 1. Protect the lives, health, and safety of the citizens of Salt Lake County before, during, and after a disaster.	Dam Failure, Drought, Extreme Cold, Extreme Heat, Earthquake, Flood, Heavy Rain, High Wind, Landslide, Lightning, Public Health Epidemic/Pandemic, Radon, Severe Winter Weather, Tornado, Wildfire, Civil Disturbance, Hazardous Materials, Terrorism	SLCC Public Safety	SLCo EM, City EMS, Utah DEM	Improved education and understanding for the public on local hazards and ways in which they can reduce risks to themselves, their homes, and loved ones.	Low	SLCC general funds	Short term	Medium	Information can be shared via social media, in-person, and flyers. Types of relevant mitigation information include the following: for drought, water conservation techniques and drought-resistant landscaping. For extreme temperatures (heat/cold), information can include how to recognize the warning signs of heat-related illnesses and frostbite, as well as shelter locations. Flooding education might involve teaching students and staff about floodplain maps, evacuation routes, and flood insurance. Landslide awareness can focus on recognizing signs of slope instability and safe building practices. Radon education can include information on testing and mitigation methods to ensure safe indoor air quality. Heavy rain mitigation can involve understanding stormwater management and maintaining clear drainage systems. High wind awareness might focus on securing outdoor objects and reinforcing structures. Lightning safety could be promoted through information on safe indoor sheltering and avoiding open areas. Severe winter weather

DRAFT

#	Action	Year Initiated	Goal/Objective	Hazard(s)	Lead Agency	Potential Partners	Benefits (Losses Avoided)	Cost Estimate	Funding Source(s)	Time-frame	Priority	Comments
												education can emphasize safe driving and weatherizing homes for snow and ice. Tornado info might involve drills on seeking shelter and understanding warning systems. Wildfire education can focus on creating defensible space around buildings and understanding evacuation procedures. Dam failure awareness can include information on downstream hazards and emergency response plans.

Sandy City Annex

To participate in this multi-jurisdictional hazard mitigation plan (MJHMP) update for Salt Lake County (SLCo), the governing body of Sandy City passed a formal resolution, a copy of which is maintained at the local government offices.

Planning Process Contact Information

Table 1 provides information on the point of contact during the updating of the MJHMP.

Table 1: Contact Information for the Sandy City

Name	Contact Information
Michael Bullock	**Phone:** 801-568-7100; **email**: mbullock@sandy.utah.gov
David Larsen	**Phone:** 801-568-2940; **email**: djlarsen@sandy.utah.gov

Sandy City has a fully integrated approach to hazard mitigation planning and program implementation. During the 2024 update process, the MJHMP participation roles in Table 2 were recorded.

Table 2: Participant List for the Sandy City

Kim Bell	Deputy Mayor	Sandy City

Jurisdiction Profile

Date of Incorporation

1893

Location and Description

Sandy City lies at the base of the Wasatch Mountains, approximately 15 miles south of Salt Lake City. The city is approximately 24.2 square miles in area and is approximately 4,450 feet above sea level.

DRAFT

Sandy City boasts several significant attractions, such as the Shops at South Town shopping mall, the Jordan Commons entertainment and dining complex, and the Mountain America Exposition Center. It is also home to the Rio Tinto Stadium which hosts Real Salt Lake and the Utah Royals Football Club.

Population

The 2022 American Community Survey 5-Year Estimate from the U.S. Census Bureau records the population of Sandy City as 91,934 people.

Demographics

Most of the 91,934 people are between the ages of 35 and 44, with a median age of 39; 46,186 are females (50.2%) and 45,748 are males (49.8%). English is the primary language in 86.3% of homes, with 7.3% Spanish and 6.4% other languages.

Brief History

Sandy City has a rich history that dates back to the 1860s and 1870s, when early settlers began moving into the area due to the availability of land in the southern end of the Salt Lake Valley. The city was officially founded in 1871 and incorporated in 1893. Sandy City was initially a small rural community focused on farming, business, and family life. Over time, it evolved into a rural Utah town while continuing to grow. Today, it is known for its scenic surroundings, outdoor recreational opportunities, and a variety of attractions.

Climate

Sandy City has a humid continental climate (Dsa Köppen classification) characterized by hot, dry summers and cold, snowy winters with significant temperature variations throughout the year. Average high temperatures are approximately 95°F in the summer and approximately 22°F in the winter. Rain each year is approximately 20.1 inches, and snowfall averages 61.2 inches.

Public Services

Sandy City has the “Be Ready Sandy Program” that is the connection between Sandy City and its residents and businesses on issues regarding emergency preparedness. Other services offered by the city include animal services, city recorder services, community development services, community events services, finance & purchasing, fire department services, human resources, justice court, parks and recreation, police services, public utilities services, and public works services.

Governing Body

The governing body of Sandy City is a Mayor–Council form of government with an elected seven-member city council and an elected Mayor. Four members of the council represent the municipal districts, and the other three are elected at-large.

DRAFT

Development Trends

Current development trends are aimed at not increasing the risk to hazards. One trend is that multi-family buildings are being built. Sandy City is Utah's sixth-largest city. Sandy experienced tremendous growth in both land area and population during the past thirty years. The annexation of previously unincorporated land has resulted in growth from 6.6 square miles in 1970 to nearly 23 square miles today. Annexations combined with new construction resulted in population growth from 6,438 to 87,461 in that same time period. Many of the new homes built during the 1970s and the 1980s were bought by young families, which resulted in one of the lowest median ages in the nation. In recent years, the population has aged, as many of the children in young families have grown and left home. This demographic shift has had an effect on the city budget in such areas as declining participation in recreation programs and a reduced rate of growth in both sales tax revenue and state road funds, which are based partially on population.

Commercial growth, however, continues along the I-15 corridor. It continues to fuel a strong economy and tax base and provide job opportunities for residents. The I-15 corridor and Trax light rail line on the west side of the city provide both access to downtown Salt Lake City and the opportunity to be a commercial center for the south end of the valley. To address the growing needs of Sandy City and to accommodate regional growth, a vision for the creation of a city center has been developed, called the Cairns District. The Cairns Master Plan is a culmination of more than six years of planning to reimagine the future of Sandy's downtown area (a printer-friendly version is available). Design guidelines for the area are currently being developed based on the goals and policies outlined in this plan.

Jurisdiction-Specific Hazards and Risk

The Calculated Priority Risk Index (CPRI) is a comprehensive assessment tool for evaluating and prioritizing risks in a given context. It considers various factors, such as probability, impact, and urgency, to determine the level of risk associated with events or situations. The results for each hazard, including its risk factor (RF) value, are shown in Table 3. The results are based on the criteria in Table 4 and the equation that follows it. The CPRI helps organizations and individuals make informed decisions about risk management and mitigation strategies. It provides a systematic approach to identifying and addressing potential issues, allowing for a more efficient allocation of resources and proactive risk prevention. With the CPRI, stakeholders can prioritize their focus on the most critical risks, leading to more effective risk management and, ultimately, better outcomes.

Table 3: Calculated Priority Risk Index Values for Sandy City

Type of Hazard Event	Probability of Future Events	Spatial Extent	Severity of Life/ Property Impact	Warning Time	Duration	Response Capacity	Risk Factor Value
Avalanche	1	1	1	4	1	3	1.5
Drought	4	4	2	1	4	1	2.8
Earthquake	3	4	4	4	4	3	3.6
Extreme Heat	4	4	3	1	3	1	3

DRAFT

Type of Hazard Event	Probability of Future Events	Spatial Extent	Severity of Life/ Property Impact	Warning Time	Duration	Response Capacity	Risk Factor Value
Extreme Cold	3	4	2	1	3	1	2.4
Flooding	3	3	2	1	4	1	2.4
Landslide/ Slope Failure	2	1	2	4	1	2	2
Radon	4	4	2	1	4	2	2.9
Heavy Rain	4	3	2	3	1	1	2.6
High Wind	4	3	3	3	2	1	3
Lightning	4	2	2	4	1	1	2.6
Severe Winter Weather	2	4	3	2	3	1	2.5
Tornado	2	2	3	4	1	2	2.4
Wildfire	4	3	3	4	4	1	3.3
Dam Failure	2	2	3	2	2	3	2.4
Civil Disturbance	2	2	2	4	2	1	2.1
Cyberattack	2	1	4	4	4	2	2.9
Hazardous Materials Incident (Transportation & Fixed Facility)	1	1	2	4	3	2	1.9
Public Health Epidemic/ Pandemic	1	4	4	1	4	1	2.5
Terrorism	2	1	3	4	2	1	2.3

Table 4: Criteria for the Calculated Priority Risk Index

Risk Index Factor	Degree of Risk Level		Criteria	Factor Weight for Degree of Risk Level
Probability of Future Events	1	Unlikely	Less than 1 percent probability of occurrence in the next year or a recurrence interval of greater than every 100 years.	30%
	2	Occasional	1 to 10 percent probability of occurrence in the next year or a recurrence interval of 11 to 100 years.	
	3	Likely	11 to 90 percent probability of occurrence in the next year or a recurrence interval of 1 to 10 years.	

DRAFT

Risk Index Factor	Degree of Risk Level		Criteria	Factor Weight for Degree of Risk Level
	4	Highly Likely	91 to 100 percent probability of occurrence in the next year or a recurrence interval of less than 1 year.	
Spatial Extent	1	Limited	Less than 10% of the planning area could be impacted.	10%
	2	Small	10%–25% of the planning area could be impacted	
	3	Significant	25%–50% of the planning area could be impacted.	
	4	Extensive	50%–100% of the planning area could be impacted.	
Severity of Life/Property Impact	1	Negligible	Less than 5% of the affected area's critical and non-critical facilities and structures are damaged/destroyed. Only minor property damage and minimal disruption of life. Temporary shutdown of critical facilities.	30%
	2	Limited	More than 5% and less than 25% percent of property in the affected area is damaged/destroyed. Complete shutdown of critical facilities for more than one day but less than one week.	
	3	Critical	More than 25% and less than 50% of property in the affected area was damaged/destroyed. Complete shutdown of critical facilities for over a week but less than one month.	
	4	Catastrophic	Over 50% of critical and non-critical facilities and infrastructures in the affected area are damaged/destroyed. Complete shutdown of critical facilities for more than one month.	
Warning Time	1	Self-defined	More than 24 hours	10%
	2	Self-defined	12 to 24 hours.	
	3	Self-defined	6 to 12 hours.	
	4	Self-defined	Less than 6 hours.	
Duration	1	Brief	Up to 6 hours.	10%
	2	Intermediate	Up to one day.	
	3	Extended	Up to one week.	
	4	Prolonged	More than one week.	
Response Capacity	1	High	Significant resources and capability to respond to this kind of event; staff are trained, experienced, and ready.	10%
	2	Medium	Some resources and capability to respond to this kind of staff; some staff may be trained,	

DRAFT

Risk Index Factor	Degree of Risk Level		Criteria	Factor Weight for Degree of Risk Level
			experienced, and ready while others may need additional support.	
	3	Low	Limited resources and capability to respond to this kind of event; additional staff or staff training needed.	
	4	None	No resources and capability to respond this kind of event; additional outside support would be required.	

RISK FACTOR (RF) EQUATION

RF Value = [(Probability x 0.30) + (Spatial Extent x 0.10) + (Severity of Life/Property Impact x 0.30) + (Warning Time x 0.10) + (Duration x 0.10) + (Response Capacity x 0.10)]

Hazards with an RF value greater than or equal to 2.5 are considered high risk. Those with RF values of 2.0 to 2.4 are considered moderate risk hazards, and those with an RF value less than 2.0 are considered low risk. The highest possible RF value is 4.

Hazard Event History

Examining hazard event histories provides valuable insights to inform decision-making and help prioritize resources for risk prevention and response efforts. Table 5 lists the hazard events impacting Sandy City since the 2019 plan update, as recorded in the Storm Events Database from the National Centers for Environmental Information.

Table 5: History of Hazard Events in Sandy City

Type of Hazard Event	FEMA Disaster #	Date(s)	Damage or Impacts	Description
Avalanche		N/A	N/A	Has not occurred but there is risk in the mountains close to unincorporated Salt Lake County
Drought		Summers of 2020–2024	The state has been in a drought period over the last few years.	The statewide drought has impacted tourism and local vegetation. Reduced tourism revenue and reduced vegetation.
Earthquake	DR-4548	05/18/2020	Infrastructure/ building damage	Salt Lake Valley earthquake caused damage across the valley.

DRAFT

Type of Hazard Event	FEMA Disaster #	Date(s)	Damage or Impacts	Description
Extreme Heat		Summers from 2020-present	The statewide drought has contributed to this.	Local temperatures have increased in the summer. Cooling centers have been opened by the county.
Extreme Cold		Code Blue Days in the winter (2020-present)	Some cooler temperatures in the winter contribute to Code Blue days. The county has experienced some.	Shelters expand their capacity on Code Blue days.
Flooding		Spring 2023	Basement flooding, debris in streets	Risk of flooding following record snowpack in winter 2022/2023. Sandbags were available.
Landslide/ Slope Failure		N/A	N/A	N/A
Radon		Ongoing risk	54% of Sandy households are at or above WHO's mitigation threshold.	Increased concern with climate change.
Heavy Rain		Spring 2023	Increased snowpack melting and rain caused some flooding.	Some debris in roads, basement flooding
High Wind	DR-4578	09/07/2020	Some wind damage and power outages	Debris in roads
Lightning		N/A	N/A	N/A
Severe Winter Weather		December 2021/January 2022	Lengthy impacts on roadways that were not major thoroughfares.	Several feet of snow came down in one week. Side roads and cul-de-sacs were not cleared for several days.
Tornado		N/A	N/A	Salt Lake City tornado in 1999 impacted road access.
Wildfire		Multiple over the years	Wildlife, vegetation, minor private property damage	Multiple small wildfires have occurred in the city every year.
Dam Failure		N/A	N/A	There are multiple high and significant hazard dams in the city.
Civil Disturbance		N/A	N/A	N/A
Cyberattack		N/A	N/A	N/A
Hazardous Materials Incident (Transportation & Fixed Facility)		November 2023 and October 2019	Hazmat fire and beer truck crash	Businesses were evacuated, a supply plant was damaged, and additional fire support was needed.

DRAFT

Type of Hazard Event	FEMA Disaster #	Date(s)	Damage or Impacts	Description
				Hazmat team completed cleanup after a semi-truck carrying beer crashed into a church parking lot.
Public Health Epidemic/ Pandemic	DR-4525 for COVID-19	February 2020 and January 2020	Minor impacts on residents and drinking water. COVID-19 relief funds were provided to assist residents and local businesses.	Incident in which too much fluoride was released into the water systems. The Emergency Operations Center was activated. The whole world was impacted by the COVID-19 pandemic, which affected city revenue and public health.
Terrorism		N/A	N/A	N/A

National Flood Insurance Program Summary

Sandy City participates in the National Flood Insurance Program (NFIP). Table 6 displays statistics related to the NFIP. Sandy City does not participate in the Community Rating System (CRS).

Table 6: National Flood Insurance Program Status for Sandy City[1]

Initial FHBM Identified	Initial FIRM Identified	Current Effective Map Date	Adopted Date	Date Joined NFIP	Tribal
07/26/1974	12/18/1985	11/19/2021	2021	12/18/1985	No

Table 7: National Flood Insurance Program Overview for Sandy City

Community ID	Number of Losses	Total Net Payment	Active Policies	Total Coverage
490106	9	$41,053.73	45	$14,722,000

Sandy City has designated the Public Utilities Director as the Floodplain Administrator. Public Utilities helps address local flood issues across the city due to rainstorms, snowmelt, or groundwater. The current Floodplain Overlay Zone Ordinance is dated 2/5/2025. The current effective Flood Insurance Rate Mape (FIRM) is dated 11/19/2021. The city, through the Public Utilities Department, issues Floodplain Development Permits for construction in the Special Flood Hazard Area (SFHA). Substantial damage/substantial improvement determinations are made through the building permit application process. The Floodplain Administrator utilizes the guidance provided in the Federal Emergency Management Agency's (FEMA) Substantial Improvement/Substantial Damage Desk Reference to make determinations. Structures that meet these definitions are required to come into compliance with current codes and standards.

[1] FIRM = Flood Insurance Rate Map, FHBM = Flood Hazard Boundary Map

Jurisdiction-Specific Vulnerabilities and Impacts

Table 8 provides information on the vulnerable assets in Sandy City, including its critical facilities, highlighting the city's vulnerability to identified hazards. It also describes the potential impacts to the community arising from those vulnerabilities. Impacts are the consequences or effects of each hazard on the assets. By understanding the risks associated with these assets, local authorities can develop proactive strategies to mitigate vulnerabilities and ensure the safety and functionality of these important assets during hazard events. These data are invaluable for decision-making and prioritizing resources for emergency response and preparedness efforts, ultimately contributing to more effective risk management and greater resilience in the community.

Vulnerable assets in Sandy: All 91,934 residents can be vulnerable to hazards, including particularly vulnerable populations such as the elderly, children, people with disabilities, and low-income residents. Seven percent of Sandy City's population under age 65 has a disability. Critical facilities include 5 fire stations, 1 police station, 2 hospitals, 31 schools, and 1 EOC. Community centers include Sandy Amphitheater, America First Field, Dimple Dell Regional Park, Dimple Dell Recreation Center, Quail Hollow Park, Lone Peak Park, Hidden Valley Golf Club, and multiple trailheads. Economic centers are near primary roads such as I-15 interchanges, along State Street, and along 9000/9400 South. Sandy Historic District includes over 300 structures located between State Street and 700 East, and between 9000 South and Pioneer Avenue.

Table 8: Jurisdiction-Specific Vulnerabilities and Impacts in Sandy City

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
Avalanche	People	*Vulnerability:* Backcountry enthusiasts are vulnerable to avalanches, with limited risk to residences on the East Bench slopes. *Impacts:* Avalanches can lead to injuries or fatalities. Although an avalanche is unlikely in the city, those who venture into the backcountry may be at risk. Skiers, snowboarders, and snowshoers who venture into backcountry areas are at higher risk because they may not be familiar with avalanche terrain or conditions. Their activities often take them into areas prone to avalanches. Inexperienced individuals: People without adequate training or knowledge about snow safety and avalanche risk are particularly vulnerable. A lack of awareness about signs of instability in the snowpack or how to respond in an avalanche situation can increase risk. Tourists and non-locals: Visitors who are unfamiliar with the local geography and snow conditions might not recognize potential hazards. They might not know the terrain features that can influence avalanche risk. Professionals in high-risk areas: Workers such as mountain guides and construction crews operating in mountainous regions may be at risk, especially during avalanche control work or if they are required to traverse unstable areas as part of their job.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		Groups without proper gear: Those without appropriate safety equipment (like avalanche beacons, probes, and shovels) are at greater risk because they may not be able to respond effectively to an avalanche event. Individuals ignoring warnings: People who do not heed avalanche warnings or neglect to check avalanche forecasts before going into the backcountry may place themselves in harm's way.
	Structures	*Vulnerability:* Homes and businesses on the high East Bench of Sandy and water facilities may be damaged by avalanche. *Impacts:* Their roofs may not be designed to withstand the weight of accumulated snow, increasing the likelihood of structural failure.
	Economic Assets	*Vulnerability:* Winter sports-related business are vulnerable to avalanches. *Impacts:* Shutdown of nearby commercial skiing areas can cause major loss of revenue and taxes to the city. Businesses could suffer structural damage or total loss. Road closures and necessary repairs can be expensive.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Forests, trails, wildlife habitats, and watershed areas are vulnerable. *Impacts:* Avalanche can uproot trees, strip slopes of vegetation, and lead to erosion. There are several popular trailheads and hiking trails along the East Bench that could be damaged or where people could encounter harm from avalanche.
	Critical Facilities and Infrastructure	*Vulnerability:* Power lines, gas lines, water supply, and transportation systems can be damaged. *Impacts:* Utilities can be damaged, and outages could affect other facilities, homes, and businesses. Roads and highways: Avalanches can heavily affect transportation infrastructure, leading to blockages and the potential for damage to vehicles and road surfaces. Little Cottonwood Canyon Road/Highway 210 and Wasatch Boulevard could be blocked by avalanches or may be backed up during road closures for avalanche mitigation in the canyon.
	Community Activities	*Vulnerability:* Recreation opportunities are vulnerable to avalanches. *Impacts:* Winter hiking and activities on the mountain benches could cause loss of life and difficulty locating missing persons. Summer recreation areas can also be damaged by avalanche.
Drought	People	*Vulnerability:* All of Sandy City is vulnerable to drought. *Impacts:* Possible lack of culinary water to all populations. Elderly, young, and homeless individuals are particularly vulnerable and might not be able to obtain water for hydration. Residents may face restrictions or increased costs for water. Air and water quality are also vulnerable.
	Structures	*Vulnerability:* All structures are vulnerable. *Impacts:* Structures may need to switch to water-wise landscaping. There may be increased water and utility costs, especially if drought is coupled with extreme heat. Severe, prolonged drought can contribute to changes in soil conditions that may result in cracks in foundations or walls.

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
	Economic Assets	*Vulnerability:* Businesses, particularly those that depend heavily on water, are vulnerable. *Impacts:* Increased water costs. Businesses providing water recreation and outdoor landscaping will be unable to continue normal operations.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Vegetation, parks, and open spaces are vulnerable to drought. *Impacts:* Much of Sandy's East Bench is in the wildlife–urban interface (WUI), and homes are at risk. Parks, golf courses, and urban forests may suffer from drought conditions, making the city less green and increasing heat levels. Dimple Dell Regional Park and other outdoor recreation areas, such as parks and golf courses, may experience deterioration in the health of vegetation and their aesthetic appeal during drought. Drought increases wildfire risk, which poses a risk to homes and structures in the WUI areas.
	Critical Facilities and Infrastructure	*Vulnerability:* Water systems are vulnerable to drought. *Impacts:* Water supply systems are susceptible to drought and may struggle to deliver adequate water supply to the community. There may be a lack of water in the drinking water supply and secondary water for irrigation.
	Community Activities	*Vulnerability:* Community events and recreation are vulnerable to drought. *Impacts:* Recreational spaces such as parks, golf courses, pools, and other open spaces may be vulnerable to poor vegetation health and reduced appeal during drought. The city may struggle with maintenance and increased costs for landscaping and pools. Outdoor recreation or community events may be moved to other locations, especially if local vegetation dies off or invasive species arise.
Earthquake	People	*Vulnerability:* All people in the Salt Lake Valley would be affected, especially those with access and functional needs. *Impacts:* Over 90,000 people in Sandy are vulnerable. People may be injured or killed and may be displaced from their homes. Power outages are a concern for those who have medical equipment or are at critical facilities. Disruption to utilities and infrastructure will disrupt daily life for all residents.
	Structures	*Vulnerability:* All structures in the city are vulnerable. *Impacts:* Catastrophic damage to homes and buildings is likely.
	Economic Assets	*Vulnerability:* All businesses are vulnerable to the impacts of an earthquake. *Impacts:* A complete shutdown of economic activities in Sandy and throughout Salt Lake County could occur.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Sandy Historic District and other historic structures are vulnerable to earthquakes. *Impacts:* Older structures are more likely to experience damage from an earthquake due to the lack of seismic building codes when they were built.
	Critical Facilities and Infrastructure	*Vulnerability:* All critical facilities and infrastructure are potentially vulnerable to earthquakes.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		Impacts: Critical structures for supplies of clean water, power, communication, and natural gas, as well as roadways in and out of Salt Lake Valley, will be affected. Damage to I-15, State Street, 9000/9400 South, and Trax trail lines may occur. Hospitals may be affected, particularly Alta View Hospital (AVH), which is located on the East Bench of Sandy City. Fire and police facilities could be damaged, and emergency response could be delayed.
	Community Activities	*Vulnerability:* All community events are vulnerable to disruption by earthquakes. *Impacts:* Community activities will be stopped. There may be an activation of community emergency volunteers and the Community Emergency Response Team. Evacuations may occur, and there may be a need for FEMA resources.
Extreme Heat	People	*Vulnerability:* All residents are vulnerable, with increased risk for the elderly, young, and those experiencing homelessness. *Impacts:* Extreme heat can lead to severe heat-related illnesses such as dehydration, heat exhaustion, and heat stroke, which can be fatal.
	Structures	*Vulnerability:* All structures are vulnerable to damage from extreme heat. *Impacts:* Prolonged heat exposure can weaken building materials, causing cracks in concrete, warping of wood, and deterioration of roofing materials.
	Economic Assets	*Vulnerability:* All businesses are vulnerable to the impacts of extreme heat. *Impacts:* Businesses may face increased energy costs and reduced worker productivity due to heat-related stress.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Vegetation and parks are vulnerable to extreme heat. Impact: Extreme heat can dry out vegetation, increasing wildfire risks that can destroy forests, parks, and historic sites. Outdoor events and supporting activities may need to be postponed or canceled due to heat risks.
	Critical Facilities and Infrastructure	*Vulnerability:* Power infrastructure, transportation, and water systems are vulnerable to extreme heat. *Impacts:* Increased use of air conditioning can overload the power grid. Extreme heat can also cause roads to soften, crack, and buckle, creating transportation hazards. Prolonged extreme heat can also increase water demand while leading water reservoirs to evaporate faster, putting pressure on water systems.
	Community Activities	*Vulnerability:* Summer public events are vulnerable to extreme heat. *Impacts:* Multiple large city events, including July 4th celebrations and the Balloon Festival, could lead to medical emergencies for attendees due to heat exposure.
Extreme Cold	People	*Vulnerability:* All Sandy residents are vulnerable, with some demographics are at higher risk. *Impacts:* Extreme cold can cause illnesses such as hypothermia or frostbite. There is a heightened risk for the elderly, the young, and those experiencing homelessness. Approximately 6.5% of residents

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		are under age 5, and 14.9% are over age 65 in Sandy and are vulnerable. The number of unhoused persons is unknown.
	Structures	*Vulnerability:* All structures are vulnerable to damage from extreme cold. *Impacts:* Water can freeze, expand, and burst pipes. Heavy snow accumulation can also collapse roofs, especially on older/weaker structures. Freeze–thaw cycles can also weaken building foundations and cause cracks in roads, bridges, and sidewalks.
	Economic Assets	*Vulnerability:* Extreme cold can lead to increased heating costs. *Impacts:* Outdoor winter businesses and recreation, such as skiing, could be affected or closed down due to unsafe outdoor temperatures, causing a loss of revenue for industry businesses. There is also a high cost of road salt for city and county road maintenance.
	Natural, Historic, and Cultural Resources	*Vulnerability:* The historic district and wildlife are vulnerable to extreme cold. *Impacts:* Historic homes may be less efficient at maintaining a warm interior and may be at increased risk for broken pipes. Extreme cold can harm local wildlife by reducing food sources.
	Critical Facilities and Infrastructure	*Vulnerability:* Critical facilities, transportation networks, and power systems are vulnerable to extreme cold. *Impacts:* The operations of fire and police stations or hospitals could be disrupted by power failures or water line breaks. Increased demand for electricity and natural gas for heating can overload systems and lead to outages. Transportation can also be disrupted due to secondary hazards, leading to closures, accidents, and delays. Colder temperatures can also freeze water infrastructure, leading to supply disruptions and costly repairs.
	Community Activities	*Vulnerability:* Commuting, roadway safety, and community events are vulnerable to extreme cold. *Impacts:* Extreme cold can cause schools and offices to close or delay their start. Extreme cold can also reduce participation in outdoor sports, events, and activities.
Flooding	People	*Vulnerability:* Population in 1% and 0.2% chance annual flood zones is vulnerable to flooding, including areas near Jordan River, Dry Creek, Little Cottonwood Creek, Rocky Mouth, and Big and Little Willow Creeks. *Impacts:* The population on the East Bench at canyon mouths, along creeks, and homes in the valley where water will accumulate is at risk. People can be injured or killed by fast-moving floodwaters. Residents can be displaced due to evacuations or flood damage to homes.
	Structures	*Vulnerability:* Any structure along natural waterways and in low-level flood planes at the base of the Wasatch Mountains is vulnerable to flooding. *Impacts:* Water can cause significant structural damage.
	Economic Assets	*Vulnerability:* Businesses near waterways are vulnerable to flooding. *Impacts:* Flooding can cause damage to structures, resulting in increased insurance claims.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
	Natural, Historic, and Cultural Resources	*Vulnerability:* Rivers and creeks are vulnerable to flooding. *Impacts:* During high runoff, severe erosion along creeks can occur.
	Critical Facilities and Infrastructure	*Vulnerability:* No critical facilities were identified in SFHAs. However, water distribution systems at the base on the East Bench and major roadways, such as 2000 East and 1300 East that cross flood areas are vulnerable. *Impacts:* Water treatment facility in Little Cottonwood Canyon could be damaged. Floodwaters could block, damage, or wash out major roads.
	Community Activities	*Vulnerability:* Recreation and community events are vulnerable to flooding. *Impacts:* Areas of hiking and recreation in the flood zones would have to be shut down, and security would need to be enforced due to the danger. Commuting would be difficult because of poor road conditions.
Landslide/ Slope Failure	People	*Vulnerability:* People residing on the East Bench and along the entire Dimple Dell Gully on both the North and South slopes could be affected by landslides. *Impacts:* People could be injured if caught in a fast-moving landslide. If homes are impacted, residents would be displaced.
	Structures	*Vulnerability:* Structures in the same area as described in the People section are vulnerable to landslides. *Impacts:* Many large homes built on the East Slope and on the edges of the gully are at risk of damage from slope failure. Residences or other structures can be damaged or destroyed by a landslide.
	Economic Assets	*Vulnerability:* Businesses in landslide-susceptible areas are vulnerable to impacts. *Impacts:* Large insurance claims may arise due to structure or home damage. If roads are damaged, costly repairs could be required. Disruptions to transportation networks could affect nearby businesses.
	Natural, Historic, and Cultural Resources	*Vulnerability:* The natural landscape and outdoor recreation areas are vulnerable to landslides. *Impacts:* Landslides can cause damage to wildlife refuge areas and established hiking/recreation areas.
	Critical Facilities and Infrastructure	*Vulnerability:* Water treatment/storage areas on the upper East Bench may be affected by landslides. *Impacts:* Landslides could disrupt water delivery to communities.
	Community Activities	*Vulnerability:* Outdoor recreation in affected areas is vulnerable to landslides. *Impacts:* Trailheads and trails could be damaged or become inaccessible for use.
Radon	People	*Vulnerability:* UtahRadon.org reports that 54% of homes in Sandy test with dangers levels of radon, and residents are vulnerable. Test results aggregated by zip code indicate vulnerability may be higher in the northeast area of Sandy.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		Impacts: Radon is the second leading cause of lung cancer after smoking. Certain populations, such as children, the elderly, and those with respiratory conditions, are more vulnerable.
	Structures	*Vulnerability:* Although radon does not directly damage structures, some buildings may be more likely to accumulate radon gas, increasing exposure to occupants. *Impacts:* Radon enters buildings and homes through cracks in foundations, basements, and crawl spaces. Many homes would need proper mitigation to reduce radon levels.
	Economic Assets	*Vulnerability:* Medical businesses and household budgets are vulnerable to the impacts of radon exposure. *Impacts:* Long-term exposure can lead to increased medical expenses for lung cancer treatment and respiratory issues.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Older structures may lack modern radon-resistant designs, making mitigation more difficult and expensive. *Impacts:* Residents in historic homes may have higher exposure to radon, and more homes may require mitigation.
	Critical Facilities and Infrastructure	*Vulnerability:* City facilities are vulnerable to radon accumulation. *Impacts:* Employees and patrons in critical facilities may be vulnerable if radon levels accumulate to high levels. Radon can dissolve into groundwater, potentially affecting well water sources.
	Community Activities	*Vulnerability:* Indoor community events are vulnerable to radon exposure. *Impacts:* Some venues could be avoided, especially in buildings with high radon levels. Mitigation measures may be needed for those who are immunocompromised.
Heavy Rain	People	*Vulnerability:* Residents along waterways on the East Bench and floodplain areas on the west side of the city are vulnerable to heavy rain impacts. *Impacts:* Heavy rain could cause flash flooding along roadways and low-lying areas if drainage systems are overwhelmed. People near drainage systems and waterways may be at risk of injury or drowning during flash flooding. Residents may be displaced if homes are flooded. Flash flooding places those traveling on roadways in danger, particularly if they choose to drive through floodwaters. Vehicles can be carried away in floodwaters, and occupants may be injured or killed.
	Structures	*Vulnerability:* Homes and business along Little Cottonwood Creek, Dry Creek, and Big and Little Willow Creeks are vulnerable to flooding. *Impacts:* Structures may encounter flooding from large amounts of stormwater runoff. Water can cause severe damage to buildings and their contents.
	Economic Assets	*Vulnerability:* Businesses in low-lying areas are vulnerable to flooding. *Impacts:* Flooding or water damage may close businesses, leading to financial losses. Outdoor construction projects may be delayed due to heavy rain.
	Natural, Historic, and	*Vulnerability:* Waterway ecosystems are vulnerable to heavy rain impacts.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
	Cultural Resources	*Impacts:* Increased soil erosion can harm these ecosystems.
	Critical Facilities and Infrastructure	*Vulnerability:* Roads, emergency response, and stormwater systems are vulnerable to heavy rain impacts. *Impacts:* Roads can become dangerous or unpassable due to standing water, creating a public safety issue. There could be disruption to essential services and potential access issues for police and fire response. Heavy rain could overwhelm drainage systems. Roads could be inundated or washed out. Roads along waterways, particularly on the East Bench, could be affected, including Little Cottonwood Canyon Road and Wasatch Boulevard.
	Community Activities	*Vulnerability:* Trails and community events are vulnerable to heavy rain impacts. *Impacts:* The public might avoid outdoor hiking areas due to flash flood dangers. Commuting during heavy rain is dangerous due to road conditions. Outdoor activities may be canceled or delayed.
High Wind	People	*Vulnerability:* Any resident or visitor in the area is vulnerable. *Impacts:* Public safety is a concern. Blowing debris or falling limbs can cause injury or death. Those with access and functional needs may need assistance with evacuating or obtaining additional resources, especially if the power goes out.
	Structures	*Vulnerability:* High-profile buildings along the I-15 corridor, homes, and businesses are vulnerable to high wind. *Impacts:* High winds can damage houses and commercial buildings. Flying debris can shatter windows. Sheds, fences, and older homes are more vulnerable to wind damage.
	Economic Assets	*Vulnerability:* Businesses in high profile buildings are vulnerable to high wind. *Impacts:* Most of the retail and office space in the city is in and around the high-profile buildings, which are susceptible to damage from high winds. This could cause temporary or moderate shutdowns of activities. It also creates a large draw on insurance claims in the city.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Trees are vulnerable to high wind. *Impacts:* Sandy City has a large number of large trees, creating a hazard of downed trees. This situation can contribute to injuries and structure damage and also requires major debris cleanup resources.
	Critical Facilities and Infrastructure	*Vulnerability:* City Hall and other city facilities, as well as power infrastructure, are vulnerable to high wind. *Impacts:* City Hall sits in the middle of the susceptible areas. Wind damage to power lines and IT network lines can lead to power outages, which can disrupt emergency response and government operations.
	Community Activities	*Vulnerability:* Public events are vulnerable to high wind. *Impacts:* Community events and activities may be postponed or canceled due to high wind conditions.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
Lightning	People	*Vulnerability:* Lightning can occur anywhere in the city. All residents are vulnerable, but those working or engaging in recreational activities outdoors are at increased risk. *Impacts:* Areas where people may be at higher risk of lightning strike include flat or exposed ground such as parks or golf courses. Locations such as hiking trails, Dimple Dell Park, and city parks are also vulnerable. Direct lightning strikes on people can cause severe burns, cardiac arrest, or neurological damage. Strikes hitting trees, metal structures, or ground currents can also injure people.
	Structures	*Vulnerability:* Tall buildings along the I-15 corridor are vulnerable to lightning strikes. *Impacts:* Lightning strikes can ignite house fires. Barns, sheds, and outdoor storage buildings are also vulnerable.
	Economic Assets	*Vulnerability:* All businesses are vulnerable to lightning strikes. *Impacts:* Lightning can disrupt power and telecommunications systems. Business disruptions resulting from lightning strikes can lead to business closures or financial losses.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Lightning increases the risk of wildfire in WUI. *Impacts*: Trees and vegetation could be damaged or destroyed by lightning or fire.
	Critical Facilities and Infrastructure	*Vulnerability:* Power, cell towers, and other internet/communications infrastructure are vulnerable to lightning strikes. *Impacts:* These systems can be damaged by lightning strikes, which can delay emergency services and cause disruptions throughout the community.
	Community Activities	*Vulnerability:* Outdoor recreation is vulnerable to lightning strikes. *Impacts:* Outdoor events may be delayed or canceled, especially if lightning is likely to occur in certain areas.
Severe Winter Weather	People	*Vulnerability:* All Sandy residents are potentially vulnerable to severe winter weather such as heavy snow. East Bench is at a higher elevation and often sees higher snow accumulation, and residents in this area are at higher risk. *Impacts:* Public safety is a concern due to traffic accidents from the heavy snow. People can be injured in car accidents while driving in severe winter weather conditions or may be stuck in vehicles or away from home. People are at risk of injuries from slips and falls due to slick conditions. Older residents or people with disabilities may be particularly vulnerable to injury. People who rely on home health or other home delivery services may be at risk due to travel delays. The unsheltered population is vulnerable to exposure or hypothermia.
	Structures	*Vulnerability:* Severe winter weather could affect structures anywhere in Sandy, but the higher elevations along the East Bench tend to receive higher snow accumulation. *Impacts:* Flat-roofed buildings in older neighborhoods may be damaged by heavy snow loads. Heavy snow loads can cause roofs to collapse, especially for older buildings, barns, or poorly maintained structures. Prolonged freezing temperatures can cause pipes to burst,

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		leading to water damage. Freeze–thaw cycles can crack foundations, driveways, and roads.
	Economic Assets	*Vulnerability:* Businesses throughout Sandy are vulnerable to severe winter weather. *Impacts:* Telecommunications and power infrastructure can be affected, leading to shutdowns of commerce due to travel restrictions. There are high costs for snow removal and salt for city/county operations. Severe winter weather may shut down businesses and schools. The retail and tourism industries may see fewer customers during extreme winter weather. There will also be an increased demand for heating and electricity, raising energy costs for homes and businesses. Severe winter weather can also delay or halt deliveries, affecting grocery stores, fuel, and other essential goods.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Parks and trees are vulnerable to severe winter weather. *Impacts:* Downed trees or broken branches can occur due to heavy snow load, causing damage to parks and trails.
	Critical Facilities and Infrastructure	*Vulnerability:* Roads, power, communication, and emergency response systems are vulnerable to severe winter weather. *Impacts:* Heavy snow creates road and travel dangers. This hinders commuters, reduces the ability of emergency vehicles to respond in the city, and increases call for rates about traffic-related incidents. Roads might be impassable due to snowdrifts or accidents. Major roads such as I-15, State Street, 9000/9400 South, and Wasatch Boulevard, as well as numerous smaller routes may be inaccessible or may experience severe delays. Buses, trains such as Trax, and flights may be delayed or canceled. Emergency services may be delayed due to road conditions. Heavy snow also increases the risk of damage to critical infrastructure, including power and telecommunications equipment. Downed power/telecommunications lines can impair emergency response. Heavy snow can weigh down power lines, causing widespread outages and leaving homes without power.
	Community Activities	*Vulnerability:* Disruptions to daily activities such as commuting, school, and recreation are possible during severe winter weather. *Impacts:* Severe winter weather creates roadway danger for commuting and traveling. These conditions may force schools to close. Outdoor activities such as skiing and snowshoeing may be too hazardous. Recreational facilities and city parks may close. Homeless shelters and warming centers may see increased demand as people seek protection from the extreme cold. Variable conditions contribute to avalanche risk.
Tornado	People	*Vulnerability:* All people in the path of a tornado are vulnerable, particularly those in buildings with large glass windows. *Impacts*: Similar to downslope and other high wind events, residents are at risk of injury or death from flying debris and collapsing buildings, especially those in mobile homes or weak structures. Individuals without access to basements or similar storm shelters are more vulnerable to injury. Older residents and those with limited mobility or other disabilities are also vulnerable. Outdoor workers or others without shelter are at high risk of injury.

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
	Structures	*Vulnerability:* Glass buildings and small RV/trailer park areas are vulnerable to tornado damage. Sandy City has three mobile/manufactured home communities that are at risk: Sandy Mobile Home Park, Sandee Village Mobile Home Park, Crescentwood Village Manufactured Home Community. *Impacts:* High winds can rip roofs off houses, shatter windows, and collapse walls. Tornadoes can flatten shopping centers, businesses, and restaurants, leading to long-term closures. Mobile homes and other structures that are not firmly anchored are at extreme risk.
	Economic Assets	*Vulnerability:* Businesses in the path of a tornado are vulnerable. *Impacts:* Damage to businesses can lead to closures, layoffs, and financial losses. Industries such as retail, hospitality, and manufacturing may be disrupted for weeks or months.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Trees, parks, and vegetation are vulnerable to tornado damage. *Impacts:* There is potential for wildfires sparked by downed power lines. Tornadoes can uproot trees, destroy parks, and damage local ecosystems.
	Critical Facilities and Infrastructure	*Vulnerability:* Power, communication networks, roads, and critical facilities are vulnerable to tornado damage. *Impacts:* Tornadoes can knock down power lines and damage substations, leaving residents and businesses without power for days or weeks depending on the severity of damage. Highways like I-15 could be blocked by debris. Traffic signals and streetlights may be damaged, as well as schools, public facilities, and communication infrastructure.
	Community Activities	*Vulnerability:* Schools, public facilities, and transportation are vulnerable to disruptions caused by tornadoes. *Impacts:* Evacuation routes and emergency access may be limited along the path of damage. Schools and public facilities may close temporarily for repairs.
Wildfire	People	*Vulnerability:* People residing along the WUI, the East Bench, and Dimple Dell Park are vulnerable to wildfires. *Impacts:* Residents may be evacuated or permanently displaced from homes by wildfire. Wildfire can kill those unable to evacuate quickly.
	Structures	*Vulnerability:* Homes, garages, sheds, and Salt Lake County Park buildings are vulnerable to wildfire damage. *Impacts:* Wildfires can burn entire neighborhoods, especially those within the WUI. Homes without defensible space are more vulnerable.
	Economic Assets	*Vulnerability:* Business operations are vulnerable to disruptions and losses caused by wildfires. *Impacts:* Power and telecommunications poles can be damaged by wildfires. Stores, restaurants, and offices may be forced to shut down due to fire damage, evacuations, or power outages.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Large areas of designated protected wildlife areas in Dimple Dell and the Wasatch Front are vulnerable to wildfires. Drought and extreme heat can increase the risk of wildfires.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		Impacts: Wildfire can burn thousands of acres of forests, grasslands, and habitats, displacing wildlife. The loss of vegetation can lead to erosion, landslides, and long-term environmental damage.
	Critical Facilities and Infrastructure	*Vulnerability:* Many power and telecommunications infrastructures are vulnerable to wildfires, especially along and in WUI areas. Road networks and water supply systems are also vulnerable. *Impacts:* Fire can damage electrical grids, transformers, and transmission lines. Roads may be closed due to flames, smoke, or fallen trees. If the water supply systems are damaged, firefighting efforts become more difficult. Emergency services and hospitals may be overwhelmed.
	Community Activities	*Vulnerability:* Community activities, recreation, work, school. *Impacts:* Possibility of extensive private property loss, power outages, life safety issues in outdoor recreation areas. Community events/activities may be canceled or postponed. Schools may close due to damage. Workplaces may remain closed for days or weeks due to evacuation and/or damage.
Dam Failure	People	*Vulnerability:* Any individuals in or around the base of the Bells Canyon watershed or within the White Pine, Red Pine, Alta Canyon, or Flat Iron Mesa dam inundation boundaries are vulnerable to dam failure. *Impacts:* Those downstream could be injured or displaced due to dam failure.
	Structures	*Vulnerability:* Homes, schools, and water storage facilities are vulnerable to damage or destruction from dam failure. *Impacts:* Large amounts of water from the Bell Canyon reservoir could cause major damage to homes and roadways located directly below.
	Economic Assets	*Vulnerability:* Businesses located in the dam inundation zone are vulnerable to dam failure. *Impacts:* Businesses could be damaged or disrupted due to interruptions in power, communications, or transportation systems. Water storage, telecommunications towers, roads, and/or public buildings such as schools may require costly repairs.
	Natural, Historic, and Cultural Resources	*Vulnerability:* High-volume recreational trails along the dam and below the site of rupture are vulnerable to dam failure. *Impacts:* The Bell Canyon Reservoir holds a substantial amount of water high above the heavily populated East Bench. There is also a large amount of outdoor recreation at the base of the reservoir. The inundation area of this reservoir is not included in the mapped dam failure inundation areas. Large amounts of water could cause significant damage and possible life safety risks to residents in the downslope area of Wasatch Boulevard and Dimple Dell Gully. Trails and trailheads could be damaged or washed out and become unusable.
	Critical Facilities and Infrastructure	*Vulnerability:* One fire station, two schools, major roads, and utilities are vulnerable to dam failure. *Impacts:* One fire station and one school are within the Flat Iron Mesa inundation boundary, and one school in the Alta Canyon inundation area could be damaged by a failure.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		Homes and schools in the flood path have limited immediate evacuation routes. Flooding could damage electrical grids, substations, and transformers, leading to power outages. Gas lines could be damaged, increasing the risk of fires and explosions. Roads could become impassable, and emergency services may struggle to reach people due to these conditions and may become overwhelmed.
	Community Activities	*Vulnerability:* Life safety in schools, homes, and recreation areas. *Impacts:* People could be injured, property damaged, and community activities disrupted or canceled.
Civil Disturbance	People	City employees and business district employees/visitors. If demonstrations escalate, people could suffer injuries from physical altercations, tear gas, and projectiles.
	Structures	Sandy City Hall, local businesses, Hale Center Theater, Mountain America Administration Building, multiple high-rise high-density housing buildings. Sandy City Amphitheater and Mountain America Exposition Center could be targeted for graffiti, broken windows, arson, or other damage.
	Economic Assets	City Hall, Mountain America Credit Union (MACU) Administration, the Amphitheater and AVH are all in critical and busy commuting areas. Mountain America Expo are at risk within Sandy City. Civil unrest can force store closures, reducing revenue. Tourists and shoppers may avoid certain areas affecting local businesses and restaurants. Businesses may struggle with costly repairs.
	Natural, Historic, and Cultural Resources	The Hale Center Theater is in the middle of the high-target area. Demonstrations in parks or streets may result in environmental damage.
	Critical Facilities and Infrastructure	The Emergency Operations Center, City Hall, and Sandy Police Department headquarters are places where people could protest. Protestors may block access to roads delaying emergency response.
	Community Activities	Area of high traffic. America First Field is in the area. Community events and activities may be postponed or canceled
Cyberattack	People	Government and banking buildings. MACU headquarters is near City Hall and is a major target in the city. Cyberattacks could interrupt government work, public safety, and critical infrastructure operation. A data breach could result in cybercriminals stealing personal information, tax documents, and other critical records.
	Structures	IT communication systems, IT storage, Businesses, government buildings, and public spaces could be targeted for graffiti, broken windows, arson, or other damage.
	Economic Assets	All city systems and transactions, EMS/Police data, banking data could be impacted. Cyberattacks can disrupt financial systems, causing delays in payroll and payment processing, licensing and permitting, as well as other essential services and record management.
	Natural, Historic, and	A cyberattack on Sandy City's water supply or power grid could disrupt irrigation systems impacting parks and other natural areas.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
	Cultural Resources	
	Critical Facilities and Infrastructure	Sandy City's data system at City Hall and at remote locations/ departments around the city that could be impacted by a cyberattack. A cyberattack on Rocky Mountain Power our Enbridge gas could lead to power outages, gas shortages, and water system failures. A breach at Intermountain Healthcare could compromise patient records, delay medical treatment, and disrupt emergency services. Attacks on 911 dispatch systems could day emergency response times.
	Community Activities	Sandy Amphitheater connected to Sandy Network could cause a shutdown. Cyberattacks can disrupt school and education, delay government services, and spread misinformation which can lead to public distrust
Hazardous Materials Incident (Transporta-tion & Fixed Facility)	People	Traffic on I-15, America First Field next to BD Medical, Trax on 9000 S 150 E. Exposure to toxic chemicals, fumes, or radiation can cause burns, respiratory issues, poisoning, and long-term diseases (cancer or organ damage). Immediate health effects that could occur include nausea, dizziness, difficulty breathing, and skin irritation. Residents and businesses near the spill or explosion site may need to evacuate and people may need to temporarily shelter somewhere.
	Structures	BD Medical, Steris, I-15, America First Field, Trax, Mountain America Exposition Center are vulnerable to this hazard. hazardous materials explosion at a gas station, industrial site, or along a transportation route could destroy nearby homes, businesses, and other critical infrastructure.
	Economic Assets	Major shutdown of largest transportation route in Utah. Businesses within hazard zones may be forced to close for weeks or months for cleanup. Road closures due to a spill on I-15 or nearby railways could delay supply chain and daily commute. Government agencies and businesses may face millions of dollars in cleanup expenses and legal claims from affected residents.
	Natural, Historic, and Cultural Resources	BD Medical next to America First Field could create a very large mass casualty event during a sporting event at the stadium. Chemicals could seep into groundwater, rivers, and wetland areas impacting Sandy City's water supply and local ecosystems.
	Critical Facilities and Infrastructure	I-15, Trax could be impacted by a hazardous materials incident. Firefighters, police, and local hospitals could be overwhelmed, delaying response times for other emergencies as well. Powerlines could be damaged causing power outages, if a train derailment or truck accident involved hazardous chemicals transportation roads could be closed.
	Community Activities	Sporting events with large amounts of people could be targets for a planned incident or casualties of an accidental incident. Community events and activities may be postponed or canceled due to air quality concerns or evacuation orders.
Public Health Epidemic/ Pandemic	People	All citizens, but especially the elderly, the young and high-risk populations. Fear of infection could cause panic, distrust, and social unrest. Isolation from quarantines, lockdowns, and social distancing can lead to depression, anxiety, and stress.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
	Structures	Assisted living and senior living, commercial areas around South Towne Mall. Public buildings, public transportation systems, and shared public spaces may require frequent cleanings and modifications to prevent the spread of disease.
	Economic Assets	High use of EMS, shutdown of commercial districts, shutdown of sporting events. Retail stores, restaurants, and small businesses may suffer from reduced foot traffic, workforce shortages, or mandatory shutdowns. Increased demand for hospital care, medications, and vaccines could become costly.
	Natural, Historic, and Cultural Resources	Parks and natural hiking trails and events may close or limit access to prevent gatherings and disease spread.
	Critical Facilities and Infrastructure	Overload of medical resources including EMS, AVH, and freestanding clinics. Hospitals and urgent care clinics may become overwhelmed, leading to long waiting times and shortages of medical staff. Fewer people may use public transportation systems, if utility workers and emergency service providers get sick, critical services may slow down leading to increased response times.
	Community Activities	Cancelation of all events in the city. Large gatherings like sports games, religious services, and community events may be canceled or restricted. Schools and workplaces may implement virtual classes and remote work.
Terrorism	People	Key targets include America First Field, Mountain America Exposition Center, BD Medical, and Steris. A terrorist attack in a public area (such as a shopping center, school, or public event) could result in mass casualties and injuries.
	Structures	Key targets include America First Field, Mountain America Exposition Center, BD Medical, and Steris. A terrorist attack could damage businesses, schools, government buildings, transportation hubs, and other public facilities.
	Economic Assets	Target areas of commerce and large gatherings. Attacks on business, districts, bans, or commercial centers could result in closures and loss of revenue. Tourism and local businesses may suffer if people avoid public places out of fear. Businesses, schools, and government/public buildings may need to invest in security upgrades increasing operational costs. Property and business owners may have higher insurance premiums and expensive rebuilding costs after an attack.
	Natural, Historic, and Cultural Resources	Mountain America Exposition Center and Hale Center Theater gather large amounts of people in a small area. If an attack targeted churches or monuments, it would be devastating for the community. A biological, chemical, or radiological attack could cause environmental damage.
	Critical Facilities and Infrastructure	Physical attacks on substations, transformers, water treatment facilities, could cause long-term power outages and water shortages. Disruptions in communication systems could delay emergency response efforts. A terrorist attack on a major highway like I-15 or public transit could shut down travel and delay supply chain. Hospitals

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		and ERs can become overwhelmed delaying care for other medical emergencies that do not just stop.
	Community Activities	Any mass gathering event. Schools, shopping centers, and office buildings may close temporarily or indefinitely after an attack. Large community gatherings and events may be postponed or canceled due to safety concerns.

Jurisdiction-Specific Changes in Vulnerability

Hazard events can impact communities, infrastructures, and ecosystems. The severity of these impacts can be influenced by climate change, population patterns, and land use developments. Understanding these factors is crucial for Sandy City to develop a resilient community and minimize the impacts of hazards. Table 9 displays the unique changes within the community and the related effects on each identified hazard affecting Sandy City.

DRAFT

Table 9: Jurisdiction-Specific Changes in Vulnerability in Sandy City

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
Avalanche	Changes in extreme weather have had major impacts on snow levels across the Wasatch Front.	Population growth and a drive to experience the outdoors puts more individuals in the elements and potential path of natural disasters in the wildland–urban interface (WUI).	More and more homes are being built on the eastern border of Sandy, bordering the wilderness areas of the Wasatch Front Mountains, exposing them to avalanche risk.	Increased
Drought	Hotter and longer summers are reducing the buildup of snowpack in the Wasatch Front.	Population growth in Salt Lake Valley on top of drier and longer summers is creating an increased risk of drought.	New commercial developments, particularly in the Cairns development area, increase the water demand in Sandy and increase risk for drought.	Increased
Earthquake	N/A, Climate does not affect earthquake risk.	High-density housing and homes in areas with limited access might require more urban search and rescue efforts.	New high-density housing with limited access and egress on the East Bench near an active fault line increases earthquake risk in Sandy.	Increased
Extreme Heat	Climate change has increased the number of days at or above 100°F over the past few years.	An aging population and a large number of senior living areas could lead to increased life safety risk from sustained extreme heat. An increase in the homeless population also represents an increased risk of life safety from exposure.	Densifying developments, such as the Union Heights Community Development Project Area, can trap heat and increase the risk of extreme heat.	Increased
Extreme Cold	Similar to extreme heat, there have been sustained extreme cold spells in the area.	An aging population and a large number of senior living areas could lead to increased life safety risk from sustained extreme cold. An increase in the homeless population also represents an increased risk of life safety from exposure.	Increased growth of commercial and residential developments in Sandy increases energy demand during extreme cold events, stressing the electrical grid	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
			and increasing the risk of harm.	
Flooding	Larger snowpacks in the winter and fast melting in the spring increase the levels in the reservoir.	Those with access and functional needs are at risk, especially if they need to be evacuated or seek shelter.	More homes have been built in the flood path below the reservoir, increasing the risk of flood damage.	Increased
Landslide/Slope Failure	Fast water runoff can cause instability to ground	Those with access and functional needs are at risk. Fatalities or injuries are a concern.	Homes have been built on slopes throughout the city, putting them at risk of landslides.	Stayed the same
Radon	Air, soil, and water quality concerns	Increased rates of lung cancer are likely if radon levels cannot be reduced.	Development in Sandy has not increased radon risk.	Stayed the same
Heavy Rain	Changing weather has been more extreme over the past few seasons.	Access and functional needs are a concern, especially for evacuations or any type of transport.	Increased impervious surfaces due to development across Midvale could contribute to ponding and other pluvial flooding.	Increased
High Wind	Changing weather has been more extreme over the past few seasons.	High wind can cause injuries and fatalities, which is a concern at schools. EMS response may be delayed if responders are overwhelmed.	Building has continued in high wind areas, and insurance may be dropped for certain areas.	Increased
Lightning	Increased in severe weather	First responders could become overwhelmed, especially if an event is on a hiking trail requiring additional resources.	Widespread development in Sandy puts more structures and people at risk of lightning strikes.	Increased
Severe Winter Weather	The last El Niño weather pattern brought heavy snow to the Salt Lake Valley. Per the National Weather Service, El Niño years bring roughly triple the days of snow. This trend may	The population growth across Salt Lake Valley has increased road traffic in every city. This can put great burdens on systems during heavy snow periods. A rise in the elderly also increases 911 calls,	N/A – Land use is not currently affecting the risk from heavy snow.	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	increase the odds of heavy snow and blizzards in the coming years.	especially if supplies and heating are cut off.		
Tornado	Weather is becoming more extreme and unpredictable. This increases the chance of a tornado in the area.	People may move to areas not affected by tornadoes. Tornado safety may become more prominent in schools.	Increased development puts more structures at risk from tornados.	Stayed the same
Wildfire	Weather changes have created hotter and drier summers and falls, extending and increasing the risk of wildfires in the area.	Population growth and a drive to experience the outdoors put more individuals in the elements and potential paths of natural disasters in the WUI.	More and more homes are being built on the border of wilderness areas, exposing them to the dangers of natural disasters in the WUI.	Increased
Dam Failure	Higher amounts of snowpack on the Wasatch Front create high amounts of runoff during the increasingly warm early spring creating higher water levels and runoff into the reservoir.	Busier trail hiking paths create life safety risk increase.	New development has not increased the risk of dam failure.	Increased
Civil Disturbance	Conversations surrounding climate change could cause a civil disturbance or increase the likelihood of them occurring in the city.	Increased social media use has led to an increase in civil disturbances. Bad actors may become inspired by others.	Development in Sandy has not increased the risk of civil disturbance.	Stayed the same
Cyberattack	Bad actors can hack into critical infrastructure systems, impacting public health.	The rise in social media and digital platforms places the city at risk.	Cyberattacks could pose a threat to the physical security of buildings, impacting revenue and public access.	Stayed the same
Hazardous Materials Incident (Transportation & Fixed Facility)	Conversations surrounding climate change could pose a threat if there are bad actors. In addition,	More people live in the area, leading to increased likelihood of traffic accidents with semi-trucks carrying hazardous chemicals.	Development in Sandy has not increased hazardous material risk.	Stayed the same

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	increased fossil fuel use and population changes can impact resource needs. Air, water, and soil quality is a concern.			
Public Health Epidemic/ Pandemic	Air, water, and soil quality issues if it is coupled with drought or extreme heat/cold	Spread from person to person in high-density housing could increase the rate of infection.	Development in Sandy has not increased epidemic/pandemic risk.	Stayed the same
Terrorism	Conversations surrounding climate change could trigger bad actors.	Increased social media use could cause panic. Misinformation is a concern.	Development in Sandy has not increased terrorism risk.	Stayed the same

DRAFT

Additional Public Involvement

Sandy City provided several opportunities for public participation. Figure 1 shows examples of public outreach.

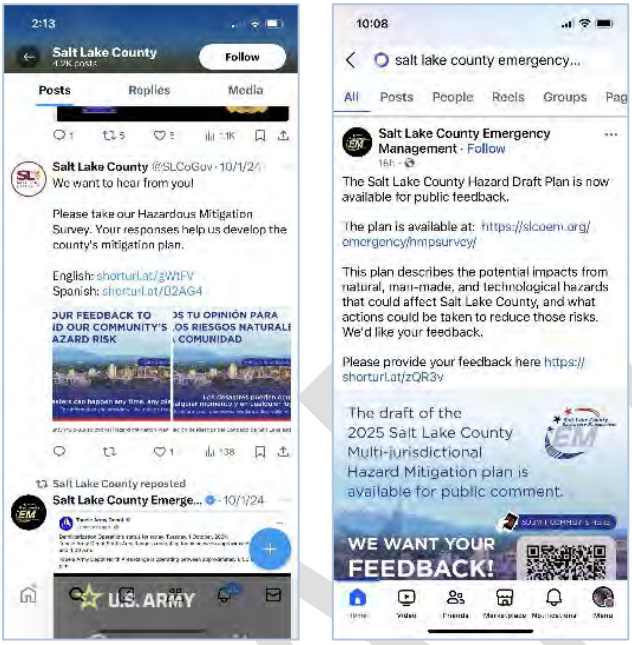

Figure 1: Social Media Posts for the Hazard Mitigation Plan (*left*) and Draft Plan Review (*right*)

Plan Integration

Incorporating the underlying principles of the Hazard Mitigation Plan and its recommendations into other plans is a highly effective and low-cost way to expand their influence. All plan participants will use existing methods and programs to implement hazard mitigation actions where possible. As previously stated, mitigation is most successful when it is incorporated into the day-to-day functions and priorities of government and public service. This plan builds on the momentum developed through previous and related planning efforts and mitigation programs, and it recommends implementing actions where possible through these other program mechanisms. These existing mechanisms include the following:

- Regularity Capabilities
- Administrative Capabilities
- Fiscal Capabilities

Respective planning stakeholders will conduct implementation and incorporation into existing planning mechanisms and will be done through the routine actions of:

- Monitoring other planning/program agendas
- Attending other planning/program meetings

DRAFT

- Participating in other planning processes; and
- Monitoring community budget meetings for other community program opportunities.

The successful implementation of this plan will require constant and vigilant review of existing plans and programs for coordination and multi-objective opportunities that promote a safe, sustainable community. Regular efforts should be made to monitor the progress of mitigation actions implemented through other planning mechanisms. Where appropriate, priority actions should be incorporated into planning updates. Table 11 lists the opportunities for integrating elements of this plan into other plans.

Table 10 lists existing planning mechanisms in which the Hazard Mitigation Plan has been integrated. Table 11 lists the opportunities for integrating elements of this plan into other plans.

Table 10: Integration of Previous Plans by Sandy City

Plan	Description
None	N/A

Table 11: Opportunities for Integration with Future Plans of Sandy City

Plan	Description
Trails and Open Lands Plan	The city recently updated the open lands and trails plan. This included many individuals in the city to ensure that the plan was relevant and updated for our current situation.
Community Wildfire Preparedness Plan (CWPP)	The Fire Department is currently updating the CWPP. This includes hazard assessments and identifying critical wildland–urban interface areas in the city. It also identifies critical exposure areas and evacuation routes in the event of an emergency.
General Plan	City's long-term goals and initiatives
Stormwater Management Plan	Stormwater infrastructure maintenance
Cemetery Master Plan	Recommended improvements and functionality
Active Transportation Plan	Review of any human-powered transportation for the city
Neighborhood Preservation and Maintenance Plan	Protection of health, safety, and welfare of Sandy City residents
Master Transportation Plan	Overview of transportation goals and ways to improve accessibility
Water Conservation Plan	Water-saving measures
Energy Action Plan	Energy goals and initiatives
Area Master Plans	Additional plans for areas with special consideration: Bell Canyon, Cairns, Hidden Valley Park, 90th S Gateway, Historic Sandy, Sandy City Downtown, Sandy Corners, South Towne Promenade Urban Streetscape

DRAFT

Capability Assessment

Local mitigation capabilities are existing authorities, policies, programs, and resources that reduce hazard impacts or could help carry out hazard mitigation activities.

Planning and Regulatory Capabilities

Planning and regulatory capabilities are the plans, policies, codes, and ordinances that prevent and reduce the impacts of hazards.

Table 12: Assessment of the Planning Capabilities of Sandy City

Plan	Does it address hazards? (Y/N)	How can it be used to implement mitigation actions?	When was the last update? When is the next update?
General Plan	Y	This plan identifies funding sources and provides general direction and guidance for the future of the city.	Yearly
Capital Improvement Plan	Y	This plan can identify vulnerable areas, such as buildings that are not up to code or that need renovation for natural disasters. This would help identify target hazards in the city.	Yearly
Climate Change Adaptation Plan	N – Water Conservation Plan	Can implement water-saving measures into drought, extreme heat, or wildfire mitigation actions	Annually
Community Wildfire Protection Plan	Y	This plan is updated every 5 years and reflects current evacuation routes, identifies target hazards, and identifies the department response model.	2019; currently undergoing update
Economic Development Plan	Y	Provide information on funding sources	Annually
Land Use Plan	Y	Incorporate information on land use and development into mitigation actions	Annually
Local Emergency Operations Plan	Y	The city provides Emergency Operations Center (EOC) training throughout the year. This includes activation of the EOC, running full scale exercises, and Incident Command System training. Information can be incorporated into mitigation actions and identify responsible departments	This is a continual process.
Stormwater Management Plan	Y	This plan identifies who is notified when a violation occurs. Can incorporate this information into responsible departments for mitigation actions	This plan is updated yearly

DRAFT

Plan	Does it address hazards? (Y/N)	How can it be used to implement mitigation actions?	When was the last update? When is the next update?
Transportation Plan	Y	Identifies critical infrastructure and planning for evacuation routes during a natural disaster. Also provides a temporary traffic control plan.	Every 10 years – most recently updated in 2019
Substantial Damage Plan	N/A	N/A	N/A
Other? (Describe)			

Table 13: Assessment of the Regulations and Ordinances of Sandy City

Regulation/Ordinance	Does it effectively reduce hazard impacts?	Is it adequately administered and enforced?	When was the last update? When is the next update?
Building Code	Y; Sandy City has adopted IBC 2021 with amendments specifically requiring the use of ignition-resistant materials in the WUI.	Y	Yearly
Flood Insurance Rate Maps	Y	Y	2022
Floodplain Ordinance	Y	Y	2022
Subdivision Ordinance	Y	Y	2022
Zoning Ordinance	Y	Y	As needed
Natural Hazard-Specific Ordinance (Stormwater, Steep Slope, Wildfire)	Y	Y	2022
Acquisition of Land for Open Space and Public Recreation Use	N/A	N/A	N/A
Prohibition of Building in At-Risk Areas	N/A	N/A	N/A
Other? (Describe)			

Administrative and Technical Capabilities

Administrative and technical capabilities include staff and their skills. They also include tools that can help carry out mitigation actions.

Table 14: Assessment of the Administrative Capabilities of Sandy City

Administrative Capability	In Place? (Y/N)	Is staffing adequate?	Are staff trained on hazards and mitigation?	Is coordination between agencies and staff effective?
Chief Building Official	Y	Y	Y	Y

DRAFT

Administrative Capability	In Place? (Y/N)	Is staffing adequate?	Are staff trained on hazards and mitigation?	Is coordination between agencies and staff effective?
Civil Engineer	Y	Y	Y	Y
Community Planner	Y	Y	Y	Y
Emergency Manager	Y	N	Y	Y
Floodplain Administrator	Y	Y	Y	Y
Geographic Information System (GIS) Coordinator	Y	Y	Y	Y
Planning Commission	Y	Y	Y	Y
Fire Safe Council	Y	Y	Y	Y
CERT (Community Emergency Response Team)	Y	Y	Y	Y
Active VOAD (Voluntary Agencies Active in Disasters)	Y	Y	Y	Y
Other? (Please describe.)				

Table 15: Assessment of the Technical Capabilities of Sandy City

Technical Capability	In Place? (Y/N)	How has it been used to assess/mitigate risk in the past?	How can it be used to assess/mitigate risk in the future?
Mitigation Grant Writing	Y	Used to fund infrastructure improvements	Can be used to fund mitigation actions
Hazard Data and Information	Y	Used to identify areas of concern related to flooding and wildfire	Can be used to submit with grant applications or show the need for mitigation actions
GIS	Y	Used to map vulnerable area and identify safety zones/ evacuation routes	Ensure that updates are an ongoing process, keep the public informed and aware of current data that is available.
Mutual Aid Agreements	Y	Aid is provided or received to enhance emergency response capabilities.	Continue to work on these aid agreements, ensure that multi-jurisdictional training is taking place with all stakeholders involved.
Other? (Please describe.)			

DRAFT

Financial Capabilities

Financial capabilities are the resources to fund mitigation actions. Talking about funding and financial capabilities is important to determine what kinds of projects are feasible, given their cost. Mitigation actions like outreach programs are lower cost and often use staff time and existing budgets. Other actions, such as earthquake retrofits, could require substantial funding from local, state, and federal partners. Partnerships, including those willing to donate land, supplies, in-kind matches, and cash, can be included.

Table 16: Assessment of the Financial Capabilities of Sandy City

Funding Resource	In Place? (Y/N)	Has it been used in the past and for what types of activities?	Could it be used to fund future mitigation actions?	Can it be used as the local cost match for a federal grant?

Other?				

Education and Outreach Capabilities

Education and outreach capabilities are programs and methods that could communicate about and encourage risk reduction. These programs may be run by a participant or a community-based partner. Partners, especially those who work with underserved communities, can help identify additional education and outreach capabilities.

Table 17: Assessment of the Education and Outreach Capabilities of Sandy City

Opportunities to Expand and/or Improve Capabilities

Actions that can expand and improve existing authorities, plans, policies, and resources for mitigation include budgeting for mitigation actions, passing policies and procedures for mitigation actions, adopting and implementing stricter mitigation regulations, approving mitigation updates, and making additions to existing plans as new needs are recognized. Table 18 lists the opportunities for Sandy City.

Table 18: Opportunities to Expand and/or Improve the Capabilities of Sandy City

Capability	Opportunity to Expand and/or Improve
Planning and Regulation	The Fire Department is currently updating the Community Wildfire Protection Plan (CWPP) for the city. This includes identifying and updating the target hazards in the wildland-urban interface (WUI) and identifying evacuation routes and safety zones. The city is expanding its efforts to collaborate with neighboring departments and other stakeholders to ensure that all parties involved have input on the CWPP.
Administrative and Technical	Currently all departments are facing staffing and budget shortages. The workloads continue to increase, and personnel are being stretched thinner and thinner. The city can explore options to expand and cross-train staff. Additional MOUs or partnerships could also be expanded.
Financial	The community has taken advantage of many grant funding opportunities to expand services and hire and retain personnel. However, the city has not yet applied for federal mitigation grants such as the Hazard Mitigation Grant Program (HMGP/404), Flood Mitigation Assistance (FMA), and Public Assistance Mitigation (PA Mitigation/406). Applying for these types of funding sources would expand the city's ability to finance mitigation projects.
Education and Outreach	The city is taking advantage of many social media outlets to ensure that citizens are provided pertinent information. There are also department-specific outreach programs that are designed to target specific information and provide training and outreach opportunities for the public.

DRAFT

Capability	Opportunity to Expand and/or Improve
	The city can expand this capability by identifying opportunities to educate the public on emergency hazards and hazard-specific mitigation measures including green infrastructure. The city continues to seek and develop programs to enhance its efforts to ensure the community is receiving information and education on different city programs and events and it continues to have a large social media presence and provide as much outreach to the community as possible.

Mitigation Strategy

Mitigation strategies provide proactive measures that are designed to minimize the impacts of hazards on Sandy City. Table 19 shows mitigation action alternatives, and Table 20 shows the status of previous mitigation activities. Table 21 is the 2025 mitigation action plan for Sandy City.

Table 19: Mitigation Action Alternatives for Sandy City

Action	Type of Action	Selected for inclusion in the plan?	If not selected, why not?
Create all-hazards evacuation zones for the city	Local plans and regulations	No	Response rather than mitigation

to protect their structures from wildfire damage. Post such information on the city's website.			City EM, FFSL, Sandy City GIS	
Maintain a wildland fire response unit.	Wildfire	Sandy City Fire	Sandy City EM, FFSL, UFA, SLCo EM	Complete.
Prohibit the use of fireworks in high-risk areas.	Wildfire	Sandy City Fire	Sandy City EM, FFSL, UFA, SLCo EM	Ongoing.
Training for firefighters in wildland firefighting.	Wildfire	Sandy City Fire	Sandy City EM, FFSL, UFA, SLCo EM	Ongoing.

Mitigation Success Story

Sandy City, in collaboration Bowen Collins & Associates (BC&A), completed the design, environmental permitting, and construction management of 1,200 linear feet of the Dry Creek channel realignment near the Sandy City South Town Mall. This project was undertaken to accommodate future development, provide public open space, mitigate 100-year flood concerns, and connect Monroe Street from 10200 South to 10600 South and I-15. BC&A completed environmental compliance, including an extensive Individual Permit with the US Army Corps of Engineers, Salt Lake County Flood Control permitting, and a State of Utah Stream Alteration permit. The project goals were to enhance riparian habitat, develop a pedestrian trail that connects Dimple Dell to the Jordan River Parkway Trail, provide a pedestrian bridge over Dry Creek, and create a park for leisure and recreational use.

Brad Klavano	City Engineer	South Jordan
Raymond Garrison	Public Works Director	South Jordan
Jason Rasmussen	Assistant City Manager	South Jordan

Jurisdiction Profile

Date of Incorporation

The area was first settled in 1859 and officially incorporated in 1935.

Location and Description

South Jordan occupies 25.8 square miles in the southwestern portion of Salt Lake County. This includes approximately 3.5 square miles recently annexed from Kennecott. The city is located between the cities of West Jordan to the north, Sandy to the East, Draper to the southeast, Riverton to the south, Herriman to the southwest. The Oquirrh Mountains lie to the west. Significant geographic features include the Jordan

River near the city's eastern boundary, which flows from south to north through the city. The elevation of South Jordan ranges from approximately 4,300 feet near the Jordan River and rises gently to about 5,200 feet at the city's western boundary on the slopes of the Oquirrh Mountains. The entire area was once covered by Lake Bonneville, so the area is relatively flat and the soils are primarily old lakebed sediments. One notable exception is an old sandbar that creates a bluff-like topography just west of the Bangerter Highway. The city of South Jordan is centrally located between Provo and Ogden in the Wasatch Front Region. It extends westward from I-15 to State Road U-111, between 9400 South and 11800 South. It is easily accessible by road, within minutes of the Salt Lake International Airport, and is intersected by a rail line. Freeway ramps off I-15 are located at 10600 South and 11400 South. The valley's light rail system (TRAX) has two stations in the western portion of the city. The commuter rail line connecting Ogden and Provo also has a station in South Jordan.

Population

The 2022 American Community Survey 5-Year Estimate from the U.S. Census Bureau records the population of the city of South Jordan in 2024 as 86,719, up from 77,954 in 2020, reflecting an 11.24% increase.[1]

Demographics

The city of South Jordan is a growing community characterized by its relatively high median household income of approximately $119,822, which indicates a prosperous population. The city has a poverty rate of about 2.6%, suggesting that most residents enjoy a stable economic situation. In addition, the demographic profile reflects a youthful population, with a median age of around 35 years for males and 34 years for females. This combination of economic stability and a younger demographic points to a vibrant community that is likely to continue growing and evolving in the coming years.[2]

Brief History

The city of South Jordan was settled in 1859 by Alexander and Catherine Lince Beckstead. Like many of the first settlers in the Salt Lake Valley, their first home was a cave dug out of the riverbank. These first homes were "a good-sized room" (14 ft. sq.), with large sun-dried adobe bricks on the front wall. Large logs covered with plants, willows, mud, and dirt formed the roof.

Climate

The hottest month in the city of South Jordan is July, with an average high temperature of around 91°F, while the coldest month is January, with an average low temperature of 23°F. On average, South Jordan receives 13 inches of rain and 13 inches of snow yearly, as seen in Figure 1 and Figure 2.[3]

Figure 2: Average Monthly Snowfall in the City of South Jordan [5]

Public Services

Though residential development in the Salt Lake Valley has mushroomed, the city of South Jordan is committed to preserving its natural beauty. Along the banks of the Jordan River, the city of South Jordan is cooperating with other government, nonprofit, and private groups to set aside a significant area for the South Jordan Riverway Wildlife Enhancement project.

Governing Body

The city of South Jordan is led by a Mayor and a five-member City Council. It also has a City Manager. The Mayor and Council Members have four-year terms, with staggered elections (the Mayor and two members in one election; the other three members in the other). The mayor and council set city policy, and the City Manager is responsible for the day-to-day operations.

Development Trends

Since 1960, the city's population has doubled or nearly doubled every 10 years. The city is experiencing tremendous population and commercial growth, which are projected to continue. The city of South Jordan has evolved from a community known for its agricultural land use to one that is primarily residential. Nearly two-thirds of the city's total acreage is residential or is planned to be. The agricultural feel still

[5] Ibid.

exists through larger parcels that continue to be farmed and areas of exceptionally low-density residential. The city of South Jordan has experienced significant growth across various sectors since the previous hazard mitigation plan. The surge in residential development is evident with the construction of single-family homes and townhomes. Complementing this residential boom, commercial growth has flourished, increasing retail, dining, and office space, especially in the evolving South Jordan Town Center. The city has committed to infrastructure improvements to support this expanding population, focusing on road expansions, enhanced public transit, and upgraded utilities. In addition, the city prioritizes parks and recreational spaces, resulting in new parks and trail systems that enhance community well-being.

Jurisdiction-Specific Hazards and Risk

The Calculated Priority Risk Index (CPRI) is a comprehensive assessment tool for evaluating and prioritizing risks in a given context. It considers various factors, such as probability, impact, and urgency, to determine the level of risk associated with events or situations. The results for each hazard, including its risk factor (RF) value, are shown in Table 3. The results are based on the criteria in Table 4 and the equation that follows it. The CPRI helps organizations and individuals make informed decisions about risk management and mitigation strategies. It provides a systematic approach to identifying and addressing potential issues, allowing for a more efficient allocation of resources and proactive risk prevention. With the CPRI, stakeholders can prioritize their focus on the most critical risks, leading to more effective risk management and, ultimately, better outcomes.

Table 3: Calculated Priority Risk Index Values for the City of South Jordan

Type of Hazard Event	Probability of Future Events	Spatial Extent	Severity of Life/ Property Impact	Warning Time	Duration	Response Capacity	Risk Factor Value
Avalanche	1	1	1	1	1	2	1.1
Drought	2	1	1	1	1	1	1.3
Earthquake	2	4	4	4	4	2	3.2
Extreme Heat	2	2	1	1	1	1	1.4
Extreme Cold	2	2	1	1	1	1	1.4
Flooding	1	2	1	1	1	1	1.1
Landslide/ Slope Failure	1	1	1	1	1	2	1.1
Radon	2	1	1	1	1	2	1.4
Heavy Rain	2	2	1	2	1	1	1.5
High Wind	2	2	1	2	1	1	1.5
Lightning	2	2	1	2	1	1	1.5
Severe Winter Weather	2	2	1	1	1	1	1.4
Tornado	1	1	1	1	1	2	1.1
Wildfire	2	2	1	2	1	2	1.6

Type of Hazard Event	Probability of Future Events	Spatial Extent	Severity of Life/ Property Impact	Warning Time	Duration	Response Capacity	Risk Factor Value
Dam Failure	1	2	1	1	1	1	1.1
Civil Disturbance	1	2	1	2	1	2	1.3
Cyberattack	2	2	1	2	1	2	1.6
Hazardous Materials Incident (Transportation & Fixed Facility)	2	2	1	2	1	1	1.5
Public Health Epidemic/ Pandemic	2	2	1	1	1	1	1.4
Terrorism	1	1	1	2	1	1	1.1

Table 4: Criteria for the Calculated Priority Risk Index

Risk Index Factor	Degree of Risk Level		Criteria	Factor Weight for Degree of Risk Level
Probability of Future Events	1	Unlikely	Less than 1 percent probability of occurrence in the next year or a recurrence interval of greater than every 100 years.	30%
	2	Occasional	1 to 10 percent probability of occurrence in the next year or a recurrence interval of 11 to 100 years.	
	3	Likely	11 to 90 percent probability of occurrence in the next year or a recurrence interval of 1 to 10 years.	
	4	Highly Likely	91 to 100 percent probability of occurrence in the next year or a recurrence interval of less than 1 year.	
Spatial Extent	1	Limited	Less than 10% of the planning area could be impacted.	10%
	2	Small	10%–25% of the planning area could be impacted	
	3	Significant	25%–50% of the planning area could be impacted.	
	4	Extensive	50%–100% of the planning area could be impacted.	
Severity of Life/Property Impact	1	Negligible	Less than 5% of the affected area's critical and non-critical facilities and structures are damaged/ destroyed. Only minor property damage and minimal disruption of life. Temporary shutdown of critical facilities.	30%

Risk Index Factor	Degree of Risk Level		Criteria	Factor Weight for Degree of Risk Level
	2	Limited	More than 5% and less than 25% percent of property in the affected area is damaged/ destroyed. Complete shutdown of critical facilities for more than one day but less than one week.	
	3	Critical	More than 25% and less than 50% of property in the affected area was damaged/destroyed. Complete shutdown of critical facilities for over a week but less than one month.	
	4	Catastrophic	Over 50% of critical and non-critical facilities and infrastructures in the affected area are damaged/ destroyed. Complete shutdown of critical facilities for more than one month.	
Warning Time	1	Self-defined	More than 24 hours	10%
	2	Self-defined	12 to 24 hours.	
	3	Self-defined	6 to 12 hours.	
	4	Self-defined	Less than 6 hours.	
Duration	1	Brief	Up to 6 hours.	10%
	2	Intermediate	Up to one day.	
	3	Extended	Up to one week.	
	4	Prolonged	More than one week.	
Response Capacity	1	High	Significant resources and capability to respond to this kind of event; staff are trained, experienced, and ready.	10%
	2	Medium	Some resources and capability to respond to this kind of staff; some staff may be trained, experienced, and ready while others may need additional support.	
	3	Low	Limited resources and capability to respond to this kind of event; additional staff or staff training needed.	
	4	None	No resources and capability to respond this kind of event; additional outside support would be required.	

RISK FACTOR (RF) EQUATION

RF Value = [(Probability x 0.30) + (Spatial Extent x 0.10) + (Severity of Life/Property Impact x 0.30) + (Warning Time x 0.10) + (Duration x 0.10) + (Response Capacity x 0.10)]

DRAFT

Hazards with an RF value greater than or equal to 2.5 are considered high risk. Those with RF values of 2.0 to 2.4 are considered moderate risk hazards, and those with an RF value less than 2.0 are considered low risk. The highest possible RF value is 4.

Hazard Event History

Examining hazard event histories provides valuable insights to inform decision-making and help prioritize resources for risk prevention and response efforts. According to the National Centers for Environmental Information, no natural hazard events occurred explicitly in South Jordan between 2019 and 2024.[6] However, since the previous plan update, several changes have occurred for all of Salt Lake County, and they are listed in Table 5.[7] Events in the City of South Jordan are listed in Table 6.

Table 5: History of Hazard Events in Salt Lake County

Date	Event Type	Disaster Number	Deaths	Injuries	Property Damage	Crop Damage
08/14/2021	Fire (Parleys Canyon Fire)	5408	N/A	N/A	N/A	N/A
01/12/2021	Severe storm (straight-line winds)	4578	N/A	N/A	N/A	N/A
07/09/2020	Earthquake	4548	N/A	N/A	N/A	N/A
04/04/2020	Biological (COVID-19)	4525	N/A	N/A	N/A	N/A
03/13/2020	Biological (COVID-19)	3478	N/A	N/A	N/A	N/A

Table 6: History of Hazard Events in the City of South Jordan

Type of Hazard Event	FEMA Disaster #	Date(s)	Damage or Impacts	Description
Avalanche		N/A		
Drought		Multiple		Statewide drought conditions
Earthquake		2020	Residents felt shaking and may have been affected by power outages.	A 5.7 magnitude earthquake struck near the city of Magna on March 18, 2020. Sandy, along with the rest of the Salt Lake Valley, experienced strong shaking. Some areas of the county experienced

[6] Center for Environmental Information, "Storm Events Database." https://www.ncdc.noaa.gov/stormevents/listevents.jsp?eventType=ALL&beginDate_mm=01&beginDate_dd=01&beginDate_yyyy=2019&endDate_mm=12&endDate_dd=30&endDate_yyyy=2024&county=SALT%2BLAKE%3A35&hailfilter=0.00&tornfilter=0&windfilter=000&sort=DT&submitbutton=Search&statefips=49%2CUTAH.

[7] FEMA, "Disaster Declarations for States and Counties." https://www.fema.gov/data-visualization/disaster-declarations-states-and-counties.

Type of Hazard Event	FEMA Disaster #	Date(s)	Damage or Impacts	Description
				minor property damage and temporary power outages.
Extreme Heat			Extreme heat can cause heat-related illness, contribute to road damage, and increase power demands.	
Extreme Cold			2022: 5 people experiencing homelessness died from cold-related exposure in Salt Lake City, but this threat could impact nearby jurisdictions such as South Jordan.	
Flooding		Sept. 14-16, 2013	Flooding at an apartment complex near 6000 West and 11600 South, displaced the residents of more than 18 units.	Heavy rain triggered flooding in Herriman, South Jordan, and West Jordan.
		June 6, 2015		Severe weather and flooding in the south end of the valley, primarily South Jordan, Riverton, and Herriman.
		Aug. 18, 2021	Streams and ponds were above peak flow level and flood rim level.	Heavy rain caused flooding of Midas Creek and 1300 West
Landslide/ Slope Failure				
Radon			Up to 50% of homes, tested in Riverton have elevated radon levels.	Radon exists in the city.
Heavy Rain		See Flooding		
High Wind		September 8, 2020	Large trees and debris caused significant damage to vehicles and homes and had a major impact on traffic and powerlines. This resulted in a state declaration of emergency for Salt Lake County.	The city of South Jordan provided assistance for debris collection caused by windstorm.
		March 2, 2024	Required clean-up/removal.	Extreme high winds caused an inundation of tumbleweeds west of the city, including Daybreak.

DRAFT

Type of Hazard Event	FEMA Disaster #	Date(s)	Damage or Impacts	Description
Lightning				
Severe Winter Weather		1/24/2013	Hundreds of accidents along the Wasatch Front including three cars colliding with Utah Highway Patrol Vehicles. Hundreds of hospital visits for ice-related injuries (primarily falls) and one reported death.	A rare freezing rain event impacted the Wasatch front.
Tornado				
Wildfire		April 2020	12 Acres in Anderson Wetland burned; mitigation and restoration project followed	12 Acres of wetland east of the Jordan River between 10800 South and 11200 South burned. The fire was started by resident burning weeds along fence line.
		May 2012		Cotton from cottonwood tree burned along Glenmoore golf course. Started by a resident lighting large cotton ball
Dam Failure				
Civil Disturbance		05/29/2020	A Salt Lake City (SLC) police cruiser was overturned and set ablaze. A South Jordan vehicle was damaged. Some officers were injured.	George Floyd protest in SLC turned violent, with riots and civil unrest. South Jordan PD responded with riot gear to assist.
Cyberattack				
Hazardous Materials Incident (Transportation & Fixed Facility)		1. 09/02/2021 2. July 2020 3. October 2021 4. June 2021	1. Local HazMat Event. No significant damage or injury 2. Explosive material, Triacetone Triperoxide (TATp) was discovered at a local residence. 3. Incident involving explosive material. 4. Demolished and burned-out basement.	1. Hydrochloric acid spill in generator enclosure. 2. Residential neighborhood evacuated; mitigated the hazard and later demolished the residential structure.

DRAFT

Type of Hazard Event	FEMA Disaster #	Date(s)	Damage or Impacts	Description
Public Health Epidemic/ Pandemic	DR-4525-UT			COVID-19 pandemic. Business closures, economic losses, school disruptions.
Terrorism				

National Flood Insurance Program Summary

The city of South Jordan participates in the National Flood Insurance Program (NFIP). Table 7 displays statistics related to the NFIP. The city of South Jordan participates in the Community Rating System (CRS).

Table 7: National Flood Insurance Program Status for the City of South Jordan[8]

Init FHBM Identified	Init FIRM Identified	Current Effective Map Date	Adopted Date	Date Joined NFIP	Tribal
7/26/74	9/12/78	9/25/09	2009	12/18/85	No

Table 8: National Flood Insurance Policies for the City of South Jordan

Community ID	Number of Losses	Total Net Payment	Active Policies	Total Coverage
490106	9	$41,053.73	45	$14,722,000

The city of South Jordan has designated the engineering director, city engineer, or designee as the Floodplain Administrator. The city's Flood Hazard Management ordinance was adopted on 8/18/2009. The current effective FIRM is dated 9/25/2009. The city requires development permits in the special flood hazard area. The Building Department issues permits, with the Floodplain Administrator being responsible for reviewing the permits to ensure alignment with the current floodplain code. A substantial damage determination would be made by the Floodplain Administrator through the permitting process. Structures that are damaged or improved more than 50% of the market value before the damage occurred would be considered substantially damaged/substantially improved.

Jurisdiction-Specific Vulnerabilities and Impacts

Table 9 provides information on the vulnerable assets in the city of South Jordan, including its critical facilities, highlighting the city's vulnerability to identified hazards. It also describes the potential impacts to the community arising from those vulnerabilities. Impacts are the consequences or effects of each hazard on the assets. By understanding the risks associated with these assets, local authorities can develop proactive strategies to mitigate vulnerabilities and ensure the safety and functionality of these important

[8] FIRM = Flood Insurance Rate Map, FHBM = Flood Hazard Boundary Map

assets during hazard events. These data are invaluable for decision-making and prioritizing resources for emergency response and preparedness efforts, ultimately contributing to more effective risk management and greater resilience in the community.

Vulnerable assets in South Jordan include 86,719 residents, 3 fire stations, 1 EOC, 1 police station, and 19 schools. Major transportation routes include I-15 along the east border, 10600 South, 11400 South, Redwood Road, Bangerter Highway, and Mountain View Corridor. Key recreational facilities include South Jordan Recreation Center, South Jordan City Park, East River Front and West River Front Parks, Jordan River Parkway, Mulligans Golf, Glenmore Golf, Bingham Creek Regional Park and many other neighborhood parks. The future Salt Lake Bees' Ballpark will be in South Jordan. Bingham Creek, Midas Creek, the Jordan River, canals, and Oquirrh Lake are important water resources.

Table 9: Jurisdiction-Specific Vulnerabilities and Impacts in the City of South Jordan

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
Avalanche	People	*Vulnerability:* Avalanche risk is primarily limited to mountains. South Jordan is located in the valley and does not have terrain or snow accumulations that pose a risk within the city. Individuals vulnerable to avalanches primarily include outdoor enthusiasts like skiers and hikers who may lack proper avalanche knowledge and safety precautions or do not monitor avalanche forecasts.
	Structures	No structures in South Jordan are considered to be at risk from avalanches.
	Economic Assets	Economic risk in South Jordan from avalanche is minimal. Avalanche in neighboring jurisdictions that rely on tourism-related businesses such as ski-resorts may have indirect effects.
	Natural, Historic, and Cultural Resources	Risk to natural, historic, and cultural resources from avalanches is minimal in South Jordan.
	Critical Facilities and Infrastructure	No critical facilities in South Jordan are vulnerable to avalanches. South Jordan residents may experience indirect disruptions if transportation routes near the canyons are closed or damaged by an avalanche.
	Community Activities	Avalanche is unlikely to directly affect activities within South Jordan. Residents may venture into backcountry areas in other cities or unincorporated parts of the county. Activities like skiing, snowboarding, and snowmobiling are vulnerable to avalanches due to heavy snowfall and participants' lack of safety knowledge. Variable temperatures affect snow stability. Backcountry hiking and community events in winter sports areas also increase the risk.
Drought	People	*Vulnerability:* All residents in South Jordan are vulnerable to drought. *Impacts:* Drought can limit water supply for drinking, cooking, cleaning and other household uses. Drought can lead to decreased water quantity and quality and increased incidence of illness and/or disease. Drought also affects air quality.
	Structures	*Vulnerability:* All structures could be affected by drought. This includes lack of water for future development and landscaping.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		Impacts: Drought can restrict growth and future development. Foundations can crack due to drying and contracting soil, leading to potential issues like uneven floors, misaligned doors and windows, and damage to sewer pipes.
	Economic Assets	*Vulnerability:* Businesses and household budgets are vulnerable to the effects of drought. *Impacts:* Prolonged drought may lead to water restrictions or increased costs for culinary water and irrigation water for landscaping. Reduced precipitation limits water availability and crop yields.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Parks, golf courses, and urban forests are vulnerable to drought conditions. *Impacts:* Drought can weaken trees, making them more susceptible to pests and disease. Reduced water availability for irrigation may affect parks and recreational facilities, leading to degraded landscapes and limited public use.
	Critical Facilities and Infrastructure	*Vulnerability:* Water supply systems, agriculture, and emergency services are susceptible to drought. *Impacts:* Fire stations and emergency services may face challenges in suppressing wildfires, which can be exacerbated by dry conditions. Drought reduces water availability for firefighting efforts. Public health facilities face water quality challenges that affect drinking water and sanitation. Hospitals and clinics may experience increased strain during droughts due to health complications arising from water scarcity, a decline in water quality and sanitation, and heat-related illnesses and the spread of vector-borne diseases.
	Community Activities	*Vulnerability:* Parks, recreation spaces, and open spaces are vulnerable to drought. *Impacts:* Recreational spaces struggle with maintenance, and households may encounter restrictions and costs for landscaping and pools. Jordan River Parkway and River Front Park, South Jordan City Park, Oquirrh Lake, Mulligans Golf, and other outdoor recreation areas such as parks and golf courses may experience deterioration in the health of vegetation and aesthetic appeal during drought. This may lead to decreased attendance at outdoor events.
Earthquake	People	*Vulnerability:* All of South Jordan's 86,719 residents are vulnerable to earthquakes. *Impacts:* People may be injured or killed by falling objects or collapsed structures. Others may be displaced from their homes. Those living in older buildings not up to seismic standards, families with young children, the elderly, and individuals with disabilities who may struggle to evacuate are vulnerable. Residents near fault lines and those in densely populated areas are also at higher risk. In addition, individuals lacking resources for disaster preparedness, such as emergency supplies and evacuation information, may find it difficult to respond effectively during an earthquake, thus increasing their vulnerability.
	Structures	*Vulnerability:* All structures in South Jordan are vulnerable to earthquakes.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		Impacts: Damage to homes and businesses is likely. There is an area of high liquefaction potential near the eastern border of the city, near the Jordan River, which adds to vulnerability of structures in that area. Older buildings not built according to modern seismic codes, unreinforced masonry, and homes with inadequate foundations may be vulnerable. Many lack the retrofitting needed to withstand earthquakes, and those built on unstable soil or near fault lines are at higher risk. Large commercial buildings without flexible designs can sustain severe damage. Overall, outdated construction practices and poor site selection contribute to their vulnerability.
	Economic Assets	*Vulnerability:* All businesses in South Jordan are vulnerable to earthquakes. *Impacts:* Commerce may shut down for a period of time, and some businesses may close permanently. The local economy, reliant on retail and services, could face significant disruptions during seismic events. In addition, certain soil types can amplify ground shaking, increasing the risk of damage to these assets. Many businesses located between the Jordan River and I-15 are in areas of moderate to high liquefaction potential and may have a higher vulnerability to damage.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Older structures are vulnerable to earthquakes. *Impacts:* Natural resources like geological formations and local ecosystems can be disrupted, leading to habitat loss. Historic structures and landmarks often lack modern seismic retrofitting, making them susceptible to damage. Cultural resources, including community centers, may also be at risk due to their architectural styles or inadequate building codes, compromising their integrity and the heritage they represent.
	Critical Facilities and Infrastructure	*Vulnerability:* All critical facilities and infrastructure systems are vulnerable to earthquakes. *Impacts:* Schools, healthcare clinics, and emergency services buildings are all vulnerable to earthquakes, particularly those that are older and constructed to lower standards. Bridges and overpasses that lack modern engineering safeguards are also at risk. In addition, water supply systems, communication systems, and power distribution are susceptible to disruption from ground shaking. Widespread outages of these community lifelines are likely. The absence of retrofitting in older structures increases these vulnerabilities. Major transportation routes that could be damaged include I-15, Redwood Road, Bangerter Highway, Mountain View Corridor, 11400 South, and South Jordan Parkway, as well as numerous other local roads. Impassable roads disrupt the delivery of goods and materials and inhibit emergency response.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
	Community Activities	*Vulnerability:* Community events are vulnerable to disruption from earthquakes. *Impacts:* Many day-to-day activities will be canceled following a strong earthquake. Recovery efforts may disrupt education, recreation, business, government services, and social activities for an extended period. Public gatherings, school events, and large festivals are vulnerable to earthquakes due to the area's geological conditions and urban infrastructure. Vulnerability stems from factors such as buildings' age and structural integrity, inadequate emergency preparedness, and high population density, which can lead to increased risks and casualties during an earthquake.
Extreme Heat	People	*Vulnerability:* All South Jordan residents are vulnerable to extreme heat. Some individuals may have more severe risk, such as people over 65, children, outdoor workers, and the homeless. *Impacts:* Extreme heat can lead to heat-related illness such as dehydration, heat exhaustion and heat stroke. Vulnerable populations during extreme heat include adults over 65, individuals with pre-existing health conditions, and young children, as they struggle to regulate body temperature. Socioeconomically disadvantaged individuals may lack access to cooling resources, while outdoor workers are at higher risk of heat-related illnesses due to physical labor without adequate hydration and rest. Extreme heat can hinder students' learning.
	Structures	*Vulnerability:* Extreme heat can be detrimental to homes, businesses, industries, and city-owned buildings. *Impacts:* Residential buildings with inadequate insulation and ventilation and commercial buildings lacking reflective roofing and proper shading may be vulnerable. Materials like metal and glass can amplify heat retention, while areas with limited green space typically experience higher temperatures.
	Economic Assets	*Vulnerability:* Businesses are vulnerable to the effects of extreme heat. *Impacts:* Construction or other outdoor occupations may lose productivity during extreme heat. Businesses may struggle to absorb the increased energy costs for air conditioning. Agricultural operations can have reduced yields and higher water demand due to heat stress. The outdoor recreation industry may see decreased participation during heat waves, affecting local businesses that rely on visitors. In addition, the energy infrastructure could face strain from increased cooling demands, leading to outages.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Parks and recreation areas are vulnerable to extreme heat. *Impacts:* Local plant species and wildlife habitats can suffer from extreme heat conditions, leading to reduced biodiversity. Historic buildings may degrade due to high temperatures, causing materials to deteriorate and paint to peel. In addition, parks and recreational areas may experience overuse as residents seek relief from the heat, which can lead to degradation.
	Critical Facilities and Infrastructure	*Vulnerability:* Health clinics, city facilities, and transportation are vulnerable to extreme heat.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		Impacts: Healthcare facilities may experience increased demand because of heat-related medical issues, while schools can suffer from the strain on cooling resources. Residents may depend on city facilities as cooling stations. Transportation systems are at risk of damage, such as buckling roads and warped train tracks. Power grids may be strained by higher demands for electricity for cooling, leading to potential outages. Power outages could disrupt services at all other critical facilities, including fire and police stations.
	Community Activities	*Vulnerability:* Public events are vulnerable to extreme heat. *Impacts:* Activities like outdoor sports, fairs, and agricultural practices are vulnerable to extreme heat. These events can pose risks, particularly for participants such as youth athletes and elderly residents who may suffer from heat-related illnesses. In addition, high temperatures can stress crops. Extreme heat may affect the turnout at or ability of staff to work the city's local events such as Summerfest.
Extreme Cold	People	*Vulnerability:* All of South Jordan's 86,719 residents are potentially vulnerable to extreme cold. *Impacts:* Extreme cold can lead to severe health impacts, including frostbite and hypothermia. Increased heating costs for homes and buildings are expected. The elderly face increased risks due to health issues and mobility challenges, while children may be susceptible if they lack proper winter clothing. Approximately 6.7% of residents are under age 5 and 13.1% over age 65. Individuals experiencing homelessness or financial hardship often lack access to heated shelters and resources for protection against the cold. It is unknown how many people may be unhoused in South Jordan. Those with pre-existing health conditions may experience worsening symptoms at low temperatures.
	Structures	*Vulnerability:* Residential homes, commercial buildings, and unheated spaces like sheds may be vulnerable. *Impacts:* Homes with poor insulation or inadequately sealed windows and doors are prone to significant heat loss. Older homes and mobile homes may be more vulnerable. Older buildings lacking modern energy efficiency standards may also suffer from freezing pipes and structural damage. Commercial and industrial buildings used for storage or manufacturing that are not properly insulated can be at risk, especially if they are not occupied regularly and the heating is inconsistent.
	Economic Assets	*Vulnerability:* All businesses in the area are vulnerable to extreme cold. *Impacts:* Increased heating costs for all businesses. Agriculture, infrastructure, and energy-related businesses may be at risk. Agricultural operations, such as greenhouses and livestock farms, may experience crop and livestock losses. Icy roads can disrupt transportation networks, affecting logistics and supply chains and the delivery of materials. Power lines risk outages from ice accumulation, which could disrupt operations for all local businesses. Energy-intensive facilities may face higher operational costs due to increased heating needs. Retail and hospitality businesses may have reduced traffic. Cold weather can halt construction or manufacturing projects.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
	Natural, Historic, and Cultural Resources	*Vulnerability:* Trees, vegetation, and parks are vulnerable to extreme cold. *Impacts:* Due to prolonged cold, local vegetation and wildlife habitats may suffer from plant stress and reduced food availability. This could affect areas along the Jordan River and undeveloped areas in the western part of the city. Historic structures, especially those not built for severe weather, can deteriorate from below-freezing temperatures and ice. Culturally significant sites, including monuments and public art, may also be damaged, while infrastructure such as water pipes and roadways may be compromised during extreme cold events, leading to service disruptions and safety hazards.
	Critical Facilities and Infrastructure	*Vulnerability:* Critical facilities, transportation networks, and power systems are vulnerable. *Impacts:* Operations of fire and police stations or hospitals could be disrupted by power failures or water line breaks. Transportation issues may occur on primary routes such as I-15, Bangerter Highway, Mountain View Corridor, and other roads. Access to essential services could be disrupted. Water treatment plants can face frozen pipes and equipment failures. Icy conditions may increase accident risks on transportation infrastructure, and power generation facilities may struggle to meet heating demands. Residential and commercial buildings lacking proper insulation are also at risk of heating system failures, endangering occupants.
	Community Activities	*Vulnerability:* Public events are vulnerable to extreme cold. *Impacts:* Schools and offices may delay opening or remain closed. Extreme cold can reduce participation in outdoor sports/events and other activities. It can also cause schools and offices to close or delay their start. Youth sports, festivals, and outdoor markets are vulnerable to extreme cold. Harsh temperatures can deter participation and reduce community engagement. At-risk groups, such as the elderly and young children, face health risks like frostbite and hypothermia, further limiting outdoor involvement. In addition, poorly insulated buildings or inadequate heating in community centers can make gatherings uncomfortable.
Flooding (and Heavy Rain)	People	*Vulnerability:* Residents near the Jordan River and other Special Flood Hazard Zones are particularly vulnerable to flooding. *Impacts:* Flooding primarily affects residents in low-lying areas near rivers and streams, especially during heavy rainfall or snowmelt. Individuals without reliable transportation may struggle to evacuate quickly, while low-income families often lack resources for flood-prevention measures. The elderly and those with disabilities may face mobility challenges, increasing their risk during emergencies. Overall, factors such as geographic location, economic status, and physical ability contribute to the community's varying levels of vulnerability to flooding.
	Structures	*Vulnerability:* Structures vulnerable to flooding primarily include those in low-lying areas or near the Jordan River and creeks. *Impacts:* Residential properties in flood plains and commercial buildings without proper drainage systems or flood-resistant designs face significant risks during heavy rain or snowmelt. Older structures

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		may be more susceptible due to outdated construction standards. Overall, a combination of location and construction features contributes to their vulnerability to flooding.
	Economic Assets	*Vulnerability:* Commercial properties and residential developments are vulnerable to flooding. *Impacts:* Businesses, especially retail centers and warehouses near rivers or low-lying areas, are at high risk during heavy rainfall. Structures and inventory can be damaged by flooding, causing lost revenue. Residential developments in flood-prone zones also can suffer damage, impacting property values. Public infrastructure, such as roads and utilities, may experience disruptions, leading to costly repairs. Agricultural land can be affected by excess water, reducing crop yields.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Jordan River, parks, and open spaces are vulnerable to flooding. *Impacts:* Natural areas like wetlands and streams are at risk of habitat destruction, while historic sites and landmarks may sustain structural damage. Cultural resources, such as parks and public spaces, can become unusable, affecting community events. Factors contributing to their vulnerability include inadequate flood management, urban development that alters water flow, and the increasing frequency of extreme weather events due to climate change.
	Critical Facilities and Infrastructure	*Vulnerability:* No critical facilities were identified within SFHAs, but transportation and utility networks are vulnerable to flooding. *Impacts:* Flooding can disrupt emergency services, require schools to evacuate, block transportation routes, and isolate communities. In addition, inadequate drainage systems and urban development encroaching on floodplains increase these risks.
	Community Activities	*Vulnerability:* Public events and recreational activities are vulnerable to flooding. *Impacts:* Due to the area's geography and infrastructure, outdoor events, sports, and farmers' markets are vulnerable to flooding. Parks and open spaces can quickly become inundated during heavy rainfall or rapid snowmelt. Residential neighborhoods near rivers, roads, and bridges are at risk of flash floods, which can disrupt transportation and emergency services.
Landslide/ Slope Failure	People	*Vulnerability:* Landslides are primarily a risk near steep or unstable slopes. The topography in South Jordan is relatively flat, and landslide risk to people and structures is minimal. *Impacts:* Residents who commute to neighboring cities could potentially be affected if transportation routes closer to the mountains are blocked by landslides. Small, localized slope failures may occur in areas with human-made slopes, such as along freeway overpasses and underpasses or other developments, or due to erosion along stream banks. The landslide susceptibility map in Volume 1 shows some areas of risk along the Jordan River.
	Structures	*Vulnerability:* Risk to structures in South Jordan is minimal due to relatively few steep slopes within the city.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		Impacts: Heavy rainfall, ground shaking from an earthquake, or loose soil may contribute to small, localized slope failures near the Jordan River. Homes, commercial buildings, roads, and bridges on or near these slopes may be vulnerable. In addition, inadequate construction practices and a lack of erosion control measures can increase the risk of slope failures, particularly for properties not designed with their environmental context in mind.
	Economic Assets	*Vulnerability:* Economic vulnerability from landslides in South Jordan is low due to the relatively low risk of landslide occurrence. *Impacts:* Infrastructure like roads and bridges, and utility services like water and power lines, may be vulnerable to damage or disruption from slope failure, which could contribute to economic losses for nearby businesses. These assets are at risk due to heavy rainfall, earthquake-induced landslides, and development practices that may destabilize slopes.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Landslides pose a low risk in South Jordan. *Impacts:* Natural resources along creeks and the Jordan River could see minor disruptions to vegetation and wildlife habitat if slopes along the banks fail. No risks to historic and cultural resources from landslides were identified.
	Critical Facilities and Infrastructure	*Vulnerability:* Roadways and essential services like water supply and power lines may be at risk, but likelihood in South Jordan is low. *Impacts:* Heavy rain, earthquake, or destabilization of slopes during development may contribute to small slope failures that may lead to disruptions in infrastructure in the immediate vicinity. South Jordan Parkway and 11400 South could be affected if a landslide occurred near the Jordan River corridor.
	Community Activities	Landslides pose a minimal risk to community activities in South Jordan.
Radon	People	*Vulnerability:* Sixty-two percent of homes tested in South Jordan have dangerous levels of radon. *Impacts:* Occupants in homes with elevated radon levels are at higher risk of lung cancer. Homeowners in older buildings in areas with high radon potential are most at risk. Families with young children or elderly members are especially at risk due to their increased sensitivity to health impacts.
	Structures	*Vulnerability:* Structures with concrete slabs or basements are particularly vulnerable to radon exposure, as radon can seep in from the soil. *Impacts:* Although radon does not directly impact structures, the condition of structures contributes to radon levels that pose a risk to occupants. Homes in areas with high uranium content are at greater risk, especially older houses with inadequate ventilation. Cracks in floors and walls can allow radon to enter.
	Economic Assets	*Vulnerability:* Home values are vulnerable to radon exposure. *Impacts:* Residential properties, commercial buildings, and rental units are vulnerable to radon. Structures built on radon-prone soil and older buildings lacking modern building standards face higher risks. Residential and commercial properties in South Salt Lake may

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		experience lower market value and increased maintenance costs due to radon remediation needs. The presence of radon can lead to health issues, decrease property values, and complicate real estate transactions.
	Natural, Historic, and Cultural Resources	*Vulnerability:* There is minimal risk to these resources from radon. *Impacts:* Natural resources, such as underground water sources and soil, can accumulate radon, particularly in areas with granite or uranium deposits. Historic structures made from stone or concrete with high uranium content may trap radon indoors, exposing occupants to health risks. Cultural resources, such as museums built with similar materials, also face threats from radon, potentially endangering both the preservation of artifacts and the health of visitors and staff.
	Critical Facilities and Infrastructure	*Vulnerability:* Public buildings are vulnerable to radon exposure. *Impacts:* City facilities can accumulate radon, possibly at similar levels to homes and other structures, and employees or other occupants could be vulnerable. Schools in high-radon areas pose risks for children if they do not have proper ventilation. Healthcare facilities are also at risk, affecting both patients and staff. Inadequate construction practices and a lack of awareness about radon risks often heighten vulnerability.
	Community Activities	*Vulnerability:* Limited vulnerability to public events *Impacts:* Radon is a long-term exposure risk and hasn't typically affected day-to-day activities.
High Wind	People	*Vulnerability:* All residents of South Jordan are potentially vulnerable to high wind, which can affect the entire city. *Impacts:* Wind can cause injury or death from blowing debris or falling tree limbs. The elderly may face mobility challenges that hinder their ability to seek shelter, while children might not fully grasp the dangers of severe weather. Individuals with disabilities or health issues may struggle to react quickly or seek shelter. Those living in mobile homes or poorly constructed houses are at greater risk of damage and are more vulnerable to injury. People who work outdoors may be exposed during sudden wind events. Unhoused populations are particularly vulnerable.
	Structures	*Vulnerability:* Structures throughout South Jordan are potentially at risk to damage from high wind. *Impacts:* Damage to personal property or businesses such as broken windows and roof damage are likely. Single-story homes, commercial buildings, and agricultural facilities like barns may be at risk. Residential homes with large flat roofs or lightweight materials may struggle to withstand strong winds, while commercial buildings with extensive glass can suffer from breakage and structural damage. Structures can also be damaged by trees uprooted by high wind. Carports, sheds, fences, and accessory structures are easily damaged by high winds and can contribute to blowing debris. Agricultural structures often lack proper reinforcement, making them prone to collapse. The vulnerability of these buildings is heightened in open areas with no landscaping or natural windbreaks, which can help dissipate wind energy.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
	Economic Assets	*Vulnerability:* Commercial buildings, such as retail stores, are vulnerable to high wind. *Impacts:* Businesses might have large signs and awnings that can be damaged, leading to business interruptions. Residential properties, particularly older homes, can suffer roof and window damage, contributing to economic slowdown in the community. Debris can block roads, and people may be unable to get to work, while cleanup can be costly. Agricultural assets such as greenhouses and livestock facilities face risks from wind destruction. Infrastructure, including power lines and roads, can be compromised, resulting in outages and disruptions. The vulnerability of these assets is largely due to construction quality, location, and the presence of loose materials that can become projectiles.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Trees and parks are vulnerable to high wind. *Impacts:* Natural resources like mature trees and agricultural lands are vulnerable to high winds, which can cause uprooting and wind erosion. Historic structures also may be at risk if their materials are not resilient, potentially leading to damage or collapse. Cultural resources, such as outdoor art installations and community spaces, can be disrupted or damaged by strong winds. These vulnerabilities are primarily due to the structural integrity of the resources and their exposure to the elements.
	Critical Facilities and Infrastructure	*Vulnerability:* Critical facilities in South Jordan, including police or fire stations, schools, and healthcare facilities are vulnerable to damage from high wind. *Impacts:* Residential buildings, especially those with older construction methods, and commercial structures lacking proper design for severe weather may be vulnerable. Utility infrastructure, such as power lines and communications towers, also is at risk, potentially leading to outages. Bridges and overpasses may be compromised, and falling branches from nearby trees can pose hazards to property and access routes.
	Community Activities	*Vulnerability:* Public events, sports, and recreation, such as Summerfest, are vulnerable to high wind. *Impacts:* Outdoor events like festivals and sporting activities may involve injury from falling debris and damaged structures. Farmers' markets and open-air concerts can also face challenges, with tents being uprooted. In addition, recreational activities in parks—such as picnics and playground use—become unsafe during high winds. The vulnerability of these activities stems from their outdoor settings, where structures and unattached items can easily be compromised, leading to safety risks and disruptions. Decreased attendance at outdoor events may affect Jordan River Parkway and River Front Park, South Jordan City Park, Oquirrh Lake, Mulligans Golf, and other outdoor recreation areas.
Lightning	People	*Vulnerability:* South Jordan experiences storms that can produce significant lightning activity. Lightning can occur anywhere in South Jordan, and all residents are potentially vulnerable to injury from lightning.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		Impacts: Athletes participating in outdoor sports, golfers, and other outdoor enthusiasts are at risk due to their exposure in open areas and may struggle to find shelter quickly. In addition, young children and the elderly are more vulnerable, as they may not be aware of the dangers of lightning or may be slower to seek protection. Those lacking access to warning systems or education on lightning safety are at further risk during severe weather.
	Structures	*Vulnerability:* All structures are vulnerable to lightning. *Impacts:* Fire or electrical damage is a possibility if structures are struck by lightning. Due to their height and exposure, tall buildings, communications towers, and open-frame agricultural barns are particularly vulnerable to lightning strikes. Those with metallic components or inadequate grounding systems face increased risk because metal conducts electricity. In addition, residential homes near tall trees may be at risk if the trees are struck by lightning and energy is transferred to the structure.
	Economic Assets	*Vulnerability:* Businesses in South Jordan are vulnerable to losses from power and communication disruptions caused by lightning. *Impacts:* Local businesses may experience lost revenue if there is a prolonged power outage due to a lightning event. Tall structures like communications towers and power lines are at high risk, as are agricultural buildings, such as barns and silos, which can suffer damage to stored crops and livestock. Commercial buildings with metal roofing or equipment may face electrical surges, disrupting operations. In addition, outdoor recreational areas that attract crowds are at risk during thunderstorms, posing dangers to infrastructure and public safety.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Parks and trees are vulnerable to lightning. *Impacts:* Mature trees in parks can attract lightning due to their height, while historic buildings made of wood or flammable materials are at risk of igniting. Cultural resources, such as monuments and outdoor sculptures, can also be damaged by lightning. The risk increases in areas with frequent thunderstorms and dry conditions.
	Critical Facilities and Infrastructure	*Vulnerability:* Communications towers and power distribution systems are vulnerable. Facilities such as emergency response facilities, schools, and healthcare facilities may also be at risk if they do not have proper lightning protection systems. *Impacts:* Communications towers attract lightning due to their height and metal structure. Power lines and substations are also susceptible, potentially causing power outages. Emergency services could be disrupted during power outages.
	Community Activities	*Vulnerability:* Sports practices, concerts, picnics, and festivals are particularly vulnerable to lightning strikes. *Impacts:* Community events may be delayed or canceled, which could affect Jordan River Parkway, River Front Park, South Jordan City Park, Oquirrh Lake, Mulligans Golf, and other outdoor recreation areas. Participants in these events often find themselves in open areas without adequate shelter and may be unprepared for sudden weather changes, leading to dangerous situations. Water-related

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		activities, such as boating and fishing, also increase risk due to water's conductivity.
Severe Winter Weather	People	*Vulnerability:* All South Jordan residents are potentially vulnerable to severe winter weather. The elderly, young, disabled, and unhoused populations are particularly vulnerable. *Impacts:* Snowy and icy conditions can lead to injuries from slips and falls. Older residents may experience cardiac problems from shoveling heavy snow. Elderly individuals may also struggle with mobility and health issues, while young children lack the awareness needed to navigate severe weather safely. People with disabilities often depend on assistance that might not be available during storms. In addition, those without reliable transportation can become stranded. Low-income families in inadequate housing may lack resources for heating and snow removal. Unsheltered people and outdoor workers are vulnerable to exposure and hypothermia.
	Structures	*Vulnerability:* Heavy snow load can cause damage to homes with weak roofs. *Impacts:* Older homes in South Jordan might have weakened roofs or inadequate insulation, making them susceptible to snow load and ice dams. Flat-roofed buildings are prone to snow accumulation, risking roof collapse if not cleared. Commercial buildings with large open spaces may face risks if their roofs do not meet snow load requirements. Temporary structures, like tents, are especially vulnerable, as they are not designed to handle heavy snow. Roof design, material quality, and the age of the building are key factors in determining how well a structure can withstand heavy snowfall.
	Economic Assets	*Vulnerability:* Businesses in South Jordan can experience losses from decreased customer traffic. *Impacts:* Snow can hinder vehicle movement and cause delivery delays. Retail businesses can experience significant losses from decreased customer traffic and delayed shipments. Construction projects may face delays and increased costs. Transportation and logistics companies are particularly vulnerable, as snow can hinder vehicle movement, leading to delivery delays. In addition, public services may struggle to maintain continuity during severe weather events.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Trees and parks are vulnerable to severe winter weather. *Impacts:* Local vegetation can be impacted by heavy snow or a blizzard. Trees and branches can break under heavy snow. Cultural resources, including public art and community spaces, face access issues.
	Critical Facilities and Infrastructure	*Vulnerability:* All critical facilities in South Jordan are vulnerable to severe winter weather including transportation, utilities, and communication. *Impacts:* Transportation networks like roads and bridges can become impassable, hindering emergency responses. Slick conditions may increase vehicle collisions, which further disrupt traffic flow. I-15, South Jordan Parkway, 11400 South, Bangerter Highway, Mountain View Corridor, and numerous local roads are likely to be affected by heavy snow and other severe winter weather. Trax and other transit systems

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		may be delayed. There may be an increased demand for response and medical care if there are many traffic accidents. Utilities such as power and water supply systems are at risk of disruptions from downed lines. Power outages can disrupt government operations, healthcare facilities, and emergency response. Communications infrastructure can be damaged, impeding signals. Roofs on public buildings, including schools and hospitals, may collapse from the weight of excessive snow. These vulnerabilities stem from reliance on systems that may not be equipped to handle extreme winter weather.
	Community Activities	*Vulnerability:* Public events are vulnerable to severe winter weather. *Impacts:* Outdoor events, public transportation, and community gatherings may be at risk. Severe weather can lead to low attendance, travel delays, and access issues for essential services, such as emergency response and healthcare. Severe winter weather may force schools to close. In addition, warming centers may see increased demand during extreme cold and severe winter weather conditions.
Tornado	People	*Vulnerability:* Tornadoes are rare in South Jordan but could potentially occur anywhere in the city. If a tornado were to occur, all residents would be vulnerable. *Impacts:* Serious injury can result from blowing debris, uprooted trees, and structural collapse. Individuals living in mobile homes face higher risks, as these structures can be easily damaged. Those with limited mobility, such as the elderly and people with disabilities, may struggle to reach safety quickly. Families with young children might have difficulty ensuring everyone's safety during a warning. In addition, residents unfamiliar with tornado preparedness or without timely weather alerts are at greater risk. Those in lower socioeconomic conditions often live in areas less equipped for disaster response.
	Structures	*Vulnerability:* All homes and businesses in South Jordan could sustain heavy damage from a tornado. *Impacts:* Tornadoes can cause extensive damage, including roofs torn from homes, broken windows, and walls that are damaged or compromised. Single-story homes and those with flat roofs often lack the support needed to withstand high winds. Mobile homes are particularly at risk due to their light weight and insecure foundations. Older commercial buildings that do not meet modern codes may also be weak, and large-span structures, such as warehouses, can have roofs easily lifted by tornado winds. Overall, inadequate materials, poor design, and age increase the risk of damage from tornadoes.
	Economic Assets	*Vulnerability:* Businesses throughout South Jordan could sustain damage and have operations interrupted. *Impacts:* Tornadoes can damage retail businesses, hotels, restaurants, and industrial sites and cause operational downtime or closures. Damage to power or communication systems can cause temporary business closures, which may lead to lost wages or layoffs, lost revenue, and interruption of supply chains. Roads could be blocked by debris, disrupting transportation access to businesses. Larger commercial spaces may be at risk due to their size and

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		materials. Roads and bridges can be compromised, disrupting transportation and service access.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Parks and open spaces are vulnerable to tornadoes. *Impacts:* South Jordan's parks and open spaces could be severely damaged by tornadoes. Natural resources like forests and wetlands can be severely damaged, disrupting ecosystems. Historic structures may suffer damage because their age and construction methods might make them less able to withstand high winds. Cultural resources, including monuments and parks that are vital to community heritage, also may be at risk.
	Critical Facilities and Infrastructure	*Vulnerability:* Fire and police stations, city facilities, healthcare clinics, and utility systems are vulnerable to tornadoes. Any above-ground facilities in the path of the tornado could be affected. *Impacts:* Public safety buildings, schools, or other civic facilities may need emergency inspections or repairs. Utilities like water treatment plants, communication facilities, and power stations are also at risk, as damage to these facilities can disrupt essential services. In addition, any structures not built to modern codes might lack the reinforcements necessary to endure severe weather, increasing vulnerability for the facilities and surrounding communities. Major transportation routes, such as I-15, Bangerter Highway, Mountain View Corridor, and other arterial roads, may be blocked by debris.
	Community Activities	*Vulnerability:* Public events are vulnerable to tornadoes. *Impacts:* Outdoor festivals, sports events, and markets are vulnerable to tornadoes due to their open spaces and limited options for shelter. Temporary structures, such as tents, can be easily damaged by high winds, and patrons may be unable to find shelter. Events may be postponed or canceled, reducing opportunities for social engagement and community support. Schools and recreational facilities with large glass windows or weak roofs also face significant risks.
Wildfire	People	*Vulnerability:* Wildfire risk in South Jordan is highest in the western part of the city, where development is less dense and homes are closer to the foothills of the Oquirrh Mountains. Open spaces, such as near the Jordan River, also have wildfire risk. *Impacts:* Residents may be temporarily evacuated due to wildfires in the vicinity or homes may be permanently lost to fire. Residents near the wildland–urban interface (WUI), individuals with physical disabilities or health issues who may struggle to evacuate, and low-income families lacking resources for fire safety measures may be vulnerable. Older adults might have reduced mobility, making them more dependent on others for assistance. All residents in South Jordan are vulnerable to the effects of poor air quality from a wildfire anywhere in the vicinity. Individuals with underlying respiratory or cardiac conditions may be particularly vulnerable to wildfire smoke.
	Structures	*Vulnerability:* Residential homes and other structures in higher wildfire potential areas near foothills or the Jordan River, especially those made of wood or other flammable materials, may be vulnerable. *Impacts:* Properties near the WUI are at higher risk due to surrounding flammable vegetation. Inadequate defensible space, such as insufficient clearing of dry grass and shrubs, increases susceptibility.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		Roofs made of combustible materials and buildings that lack fire-resistant features are particularly at risk during wildfire events.
	Economic Assets	*Vulnerability:* Risk to economic assets is relatively low in South Jordan due to small areas exposed to wildfire. *Impacts:* Commercial assets, such as retail centers close to undeveloped regions, can suffer damage from flames and smoke, affecting the local economy. Vital infrastructure, such as power lines and water pipelines, can be disrupted, causing further economic repercussions. These vulnerabilities are heightened by dry conditions and high winds, which can facilitate the spread of fires.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Air quality and natural habitats are vulnerable. *Impacts:* Natural resources like forests and grasslands are at risk because dry vegetation and accumulated brush can easily ignite. Historic sites made of wood and cultural landmarks can also be affected, particularly when located near wildland areas. The increasing frequency of drought and extreme heat, exacerbated by climate change, heightens these vulnerabilities. In addition, urban development encroaching on wildland areas increases the risk.
	Critical Facilities and Infrastructure	*Vulnerability:* No critical facilities in South Jordan are at direct risk of wildfire, but utility systems may be vulnerable. *Impacts:* Utilities like power lines and gas pipelines may be at risk, as sparks or falling trees can ignite fires. If the water supply systems are damaged, firefighting efforts could become more difficult. Emergency services may be overwhelmed if assisting neighboring jurisdictions.
	Community Activities	*Vulnerability:* Outdoor public events and recreational activities are susceptible to disruption due to wildfire conditions. *Impacts:* Recreational activities and outdoor events like festivals and sports, especially during hot, windy conditions, may be at risk and may be cancelled due to wildfire smoke. Recreational activities along the Jordan River also pose risks from open flames or sparks. High summer temperatures, low humidity, and invasive plants, such as cheatgrass, increase fire risks. In addition, landscaping with dry grasses and shrubs increases susceptibility during fire season, putting local infrastructure, such as schools and neighborhoods, at risk.
Dam Failure	People	*Vulnerability:* South Jordan residents are vulnerable to dam failure of Kennecott Mine Bingham Creek Dam and Oquirrh Lake Dam. Vulnerable areas are along Bingham Creek and in areas downslope of the Daybreak Community. The Jordan River area is vulnerable to dam failure from the Jordan Valley Water Reservoirs. *Impacts:* Dam failure can cause swift moving floodwaters downstream that can cause injury. Individuals living near dams, particularly in low-lying areas, are most vulnerable to dam failure and potential flooding. Damage to homes may lead to residents being displaced. Families with young children, the elderly, and low-income residents may struggle to evacuate quickly, while individuals with disabilities may face significant barriers during emergencies.
	Structures	*Vulnerability:* Structures in the areas mentioned above are at risk of flooding from dam failure. Residential homes downstream or in low-lying areas, bridges, and roadways near rivers may be vulnerable.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		Impacts: Outdated dam infrastructure, insufficient spillway capacity, and a lack of warning systems can worsen the vulnerability to dam failure and threaten lives and property.
	Economic Assets	*Vulnerability:* Businesses are vulnerable to disruption from dam failure. *Impacts:* Roads, bridges, and utilities could suffer catastrophic damage, disrupting transport and services. Residential and commercial properties downstream face significant flood risks, leading to property damage and economic loss. Agricultural assets, including farmland and livestock, can be severely affected, especially if irrigation systems are compromised. In addition, businesses that rely on water, such as manufacturing plants, may experience operational disruptions. The proximity of these assets to failure zones and their dependence on a stable water supply highlight their vulnerability in the event of a dam failure.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Parks are vulnerable to dam failure. *Impacts:* Natural resources like local waterways and wetlands could suffer habitat loss, while historically significant sites, including old irrigation systems, are at risk of flooding and deterioration. Cultural resources, such as community centers and parks, may also face damage, affecting local gatherings. Welby Park, Glenmore Golf Course, and the Jordan River Parkway and Riverfront Park are vulnerable.
	Critical Facilities and Infrastructure	*Vulnerability:* Water and transportation networks are vulnerable. No critical facilities are located within dam inundation areas in South Jordan. *Impacts:* South Jordan is served by the Jordan Valley Water Conservancy District (JFWCD) and the water supply to the city could be affected by a failure of the JFWCD reservoir. Mountain View Corridor, Bangerter Highway, and 11400 South could be damaged or blocked due to dam failure. Emergency response could be affected by road closures.
	Community Activities	*Vulnerability:* Public events and recreation are vulnerable to dam failure. *Impacts:* Recreational pursuits downstream may be at risk. These activities are vulnerable to sudden flooding from a dam breach. Activities or events at Welby Park, Glenmore Golf Course, and the Jordan River Parkway and Riverfront Park may also be vulnerable.
Civil Disturbance	People	Low-income individuals may lack the resources for safety, while the elderly or disabled may struggle to navigate emergencies. Young people, particularly teenagers, may be drawn into unrest, influenced by social dynamics. In addition, marginalized individuals may feel targeted or compelled to participate. A lack of community cohesion and trust in authorities can further heighten tensions.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
	Structures	Government buildings, commercial properties, and infrastructure, such as bridges and transportation hubs may be vulnerable. Government buildings may be targeted for their symbolic authority, while retail stores can attract crowds during protests. Residential neighborhoods also can be affected, especially in areas with heightened tensions. The vulnerability of these structures stems from their visibility and importance to the community, combined with factors such as location and ongoing social issues.
	Economic Assets	Retail establishments, especially shopping centers, are at risk as they often become focal points for protests. Transportation systems can be disrupted by blockades, hindering access to services. Financial institutions may face vandalism or theft, while critical service providers, such as hospitals, could experience strain during unrest. Several economic assets are vulnerable to civil disturbances, primarily due to their visibility and reliance on foot traffic.
	Natural, Historic, and Cultural Resources	Parks and open spaces may suffer from vandalism or destruction during uncontrolled events. Historic sites can become targets, as they symbolize authority or cultural significance. Cultural resources such as community centers and places of worship may also be affected, as they play a vital role in community identity. Their vulnerability lies in the potential for damage during protests.
	Critical Facilities and Infrastructure	Governmental buildings, schools, and healthcare facilities may be at risk, since they often symbolize authority and serve as community hubs, making them targets during unrest. Utility infrastructure, such as water and power facilities, is also at risk of disruption. Its visibility and essential services contribute to its vulnerability during civil disturbances.
	Community Activities	Public demonstrations, parades, and local government meetings are particularly vulnerable to civil disturbances. These events often attract large crowds and can become tense, especially around contentious social or political issues. Factors such as the local demographic, economic conditions, and recent events can heighten these vulnerabilities, making it easier for conflicts to arise during passionate public gatherings.
Cyberattack	People	Older adults often lack familiarity with technology and online security, making them easy targets for phishing scams. Individuals engaging in online banking or shopping without strong security measures also face heightened risks. Families with children may be less vigilant about internet safety, allowing cybercriminals to exploit personal information. In addition, small business owners without robust cybersecurity practices are prime targets for attacks that can disrupt operations.
	Structures	Critical infrastructure, such as power plants, water treatment facilities, and transportation systems, often lack robust cybersecurity measures. Commercial businesses, especially financial institutions and healthcare providers, are also at risk due to weaker data protection and employee training. Educational institutions may be vulnerable because of limited funding for cybersecurity and outdated software. Obsolete technology and insufficient training enhance the susceptibility of these structures to cyber threats.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
	Economic Assets	Financial institutions, such as banks and credit unions, are at risk of data theft and service disruption. Small and medium-sized businesses often lack robust cybersecurity measures, making them attractive targets. In addition, local government agencies and critical infrastructure, such as water treatment facilities, might have outdated security protocols, posing threats to public safety. The rise of remote work further exacerbates vulnerabilities, as employees accessing networks from home can unintentionally expose systems to risks. Overall, the combination of outdated technology and insufficient cybersecurity practices increases the vulnerability of an area's economic assets.
	Natural, Historic, and Cultural Resources	Natural resources like water management systems and wildlife databases can be compromised, disrupting ecosystems. Historic sites and museums that digitize collections are at risk of losing valuable artifacts and data. In addition, cultural organizations managing events may face threats if their systems lack adequate security. The limited resources of smaller organizations further increase this vulnerability
	Critical Facilities and Infrastructure	Energy and utility services, such as electricity and water systems, which often rely on outdated technology, may be vulnerable. Transportation infrastructure, such as traffic management and public transit, is also at risk due to networked systems. Healthcare facilities that use electronic records and connected medical devices face vulnerabilities that can compromise patient safety.
	Community Activities	Online registration for events, local government services, and educational programs that rely on digital tools may be targeted due to inadequate security measures, outdated software, and insufficient staff training.
Hazardous Materials Incident (Transporta-tion & Fixed Facility)	People	Individuals with pre-existing health conditions, such as respiratory issues, and the elderly are at higher risk due to their compromised health. Children are also more susceptible. Those living near industrial areas or transport routes for hazardous materials face increased exposure risk, while low-income families may lack resources and information to effectively prepare for incidents.
	Structures	Industrial facilities, such as manufacturing plants and warehouses, often store hazardous chemicals which may leak. Residential buildings, schools, and hospitals are also at risk, particularly if located along transportation routes for hazardous materials. Older buildings may lack modern safety features, increasing their vulnerability.
	Economic Assets	Industrial facilities, transportation infrastructure, and nearby commercial properties may be affected. Industrial facilities handling chemicals are at risk of spills or leaks, while roads and railways used for transporting hazardous materials can lead to accidents and contamination. In addition, nearby commercial and residential areas face potential health risks and economic losses.
	Natural, Historic, and Cultural Resources	Waterways and habitats are vulnerable to hazardous materials incidents, which can disrupt ecosystems. Historic sites and structures may suffer damage from toxic exposure, leading to degradation over time. In addition, cultural landmarks risk losing their significance due to contamination events. The proximity of these resources to industrial areas or transport routes exacerbates their risk.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
	Critical Facilities and Infrastructure	Chemical manufacturing plants, waste treatment facilities, and transportation networks, such as highways and railroads may be at risk. Their vulnerability stems from factors such as proximity to residential areas, aging infrastructure, and inadequate safety measures. Natural hazards, such as flooding and earthquakes, can further increase risks by damaging containment systems.
	Community Activities	Local markets, school events, and outdoor gatherings are vulnerable to hazardous materials incidents if they are near industrial zones and transport corridors. This risk is heightened by inadequate emergency preparedness, lack of public awareness, and the potential for spills during transport. Large crowds at events can complicate evacuation efforts, increasing the risks for participants and nearby residents.
Public Health Epidemic/ Pandemic	People	Individuals with pre-existing health conditions like asthma and heart disease and adults over 65 may be vulnerable. Low-income families may struggle to access healthcare and vaccinations, increasing their risk. Marginalized communities with limited access to information and those living in high-density conditions also are at greater risk due to the rapid spread of diseases and the challenges in implementing preventive measures.
	Structures	Several structures are vulnerable to public health epidemics or pandemics, particularly due to their ability to facilitate the spread of disease. High-density residential areas, such as apartment complexes, are at risk, as close living quarters can lead to faster transmission. Public gathering spaces, such as schools and community centers, also pose significant threats because large groups are in confined spaces. Healthcare facilities can become hotspots for infections if infection control measures are insufficient. In addition, workplaces with high foot traffic, such as retail stores, contribute to vulnerability.
	Economic Assets	Small businesses in retail, hospitality, and food service are particularly vulnerable to public health epidemics or pandemics. These sectors face risks from fluctuating consumer demand and potential operational restrictions. The tourism industry is also affected, as travelers may avoid high-risk areas. Healthcare facilities can become overwhelmed, straining resources and impacting operations. In addition, local supply chains may experience disruptions, leading to shortages and inflation. Overall, the direct effects of illness, along with prolonged shutdowns and consumer hesitance, leave these economic assets exposed to significant downturns.
	Natural, Historic, and Cultural Resources	Natural resources like wildlife and ecosystems can be disrupted by increased human activity, raising the risk of zoonotic diseases. Historic sites may deteriorate due to reduced visitor access and funding, while cultural resources, such as community events, face cancelations, impacting social connections.
	Critical Facilities and Infrastructure	Public health epidemic or pandemic incidents can affect healthcare facilities, nursing homes, public transportation systems, schools, and food supply chains. Hospitals and clinics may become overwhelmed with patients, while vulnerable populations in nursing homes are at higher risk. Public transportation can facilitate the spread of disease, and schools gather large groups, thereby increasing transmission potential. These facilities often lack adequate resources, including

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		medical supplies and testing capabilities, making them more susceptible to the impacts of a health crisis.
	Community Activities	Large gatherings like festivals and sporting events can facilitate the rapid spread of diseases due to close contact. Public transportation is also at risk, as it serves many people in confined spaces. Schools and childcare facilities are particularly susceptible, given that children can easily transmit infections. In addition, food-related events, such as farmers' markets, can pose risks if hygiene practices are not followed. The interconnectedness of community members and varying adherence to health guidelines further exacerbate these vulnerabilities.
Terrorism	People	Young children and newcomers may lack awareness of potential threats, while the elderly and individuals with disabilities may struggle to respond quickly in emergencies. Marginalized communities often face bias, making them more susceptible to targeting. In addition, those with lower socioeconomic status may lack access to security measures and emergency preparedness resources.
	Structures	Government buildings, transportation hubs, commercial centers, and public spaces are particularly vulnerable to terrorism incidents. Government buildings are symbolic targets, while transportation hubs and commercial centers are attractive due to their potential for high casualties and crowd presence. Public spaces are also at risk due to their open nature and lack of security. Their vulnerability is heightened by inadequate security measures, high occupancy rates, and their locations in densely populated areas, which can amplify the impact of incidents.
	Economic Assets	Infrastructure, commercial establishments, and community facilities may be vulnerable. Critical infrastructure, such as transportation networks and power grids, could disrupt the economy if targeted. Commercial establishments, especially those with high foot traffic, and community facilities like schools and hospitals are also at risk, as they can provoke widespread concern and disruption. Their accessibility and interconnectivity increase vulnerability, meaning that damage to one asset can have a broader economic impact and hinder recovery efforts.
	Natural, Historic, and Cultural Resources	Natural resources like water supplies and parks could be targeted for their significance to the community. Historic sites and cultural resources, such as museums or community centers, are also at risk due to their accessibility and importance to local identity. Their vulnerability is often heightened by inadequate security measures.
	Critical Facilities and Infrastructure	Public transportation systems, healthcare facilities, schools, and utility services like water and power plants may be affected. Their vulnerability arises from high accessibility and the potential impact of an attack, as crowded transportation and public spaces can lead to mass casualties and panic. Attacking utility services could disrupt the town's essential functions, creating chaos.
	Community Activities	Festivals, parades, and sporting events are particularly vulnerable to terrorism incidents. These events attract large crowds, making it easier for perpetrators to inflict harm and instill fear. In addition, community centers and places of worship serve as social hubs, increasing their

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		risk. Factors such as limited security measures and open access to public spaces, contribute to this vulnerability.

Jurisdiction-Specific Changes in Vulnerability

Hazard events can impact communities, infrastructures, and ecosystems. The severity of these impacts can be influenced by climate change, population patterns, and land use developments. Understanding changes in these factors is crucial for the city of South Jordan as it works to develop a resilient community and minimize the impacts of hazards. Table 10 displays the unique changes within the community and the related effects on each identified hazard affecting the city of South Jordan.

DRAFT

Table 10: Jurisdiction-Specific Changes in Vulnerability in the City of South Jordan

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
Avalanche	Higher temperatures can lead to more rain, destabilizing snowpack and increasing the risk of wet avalanches. In addition, changes in snowfall can cause denser snow layering on slopes, making them more prone to sliding.	Avalanches can influence population patterns by deterring people from moving to or remaining in high-risk areas, leading to decreased density in these locations. The threat of avalanches prompts many to seek safer environments in urban or lower-risk regions. In addition, when avalanches occur, they can disrupt infrastructure, causing residents to relocate.	Developments like the Bacchus Highway Center that are on the far western border of South Jordan, close to the slopes of Bingham Canyon Mine, are at a slight risk for avalanche.	Decreased
Drought	Climate change affects drought incidents by altering precipitation patterns and increasing temperatures. Warmer weather can lead to longer dry periods and more severe droughts, while changes in rainfall can reduce snowpack in nearby mountains, crucial for summer water supply. Higher temperatures also increase evaporation rates, further straining local water resources.	Drought can significantly influence population patterns by impacting economic opportunities and the quality of life. Water scarcity often leads to reduced agricultural productivity, prompting residents to migrate to areas with more stable job prospects. Increased water costs can make living less affordable, driving some residents away. Conversely, efforts to address drought, such as sustainable development or improved water management, may attract newcomers, resulting in changes in the community's demographic composition over time.	Increasing population and development will continue to put a strain on South Jordan's water sources and increase drought risk.	Increased
Earthquake	Rising temperatures can lead to glacial melting, which affects pressure on tectonic plates and may trigger seismic activity	Earthquakes can significantly alter population patterns by prompting residents to leave for safer areas after a seismic event.	New developments like Daybreak and South Jordan Towne Center expose new structures to ground shaking	Stayed the same

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	through isostatic rebound. In addition, increased rainfall and flooding can erode soils, weakening structural integrity and heightening vulnerability during earthquakes. Although the direct links between climate change and earthquakes are still under investigation, environmental effects may impact the region's seismic risk.	This migration can lead to changes in population density and attract new residents and businesses during the rebuilding process. The perception of the area as a safe place to live may shift, impacting long-term demographics, as some residents return to rebuild while others relocate permanently.	from nearby faults. These structures are built according to modern building code standards, thus mitigating some of the risk from earthquakes.	
Extreme Heat	Climate change significantly impacts extreme heat by increasing the frequency and intensity of heat waves. Rising global temperatures lead to longer and hotter summers, affecting residents and local infrastructure while heightening health risks, especially for vulnerable populations. Urban heat islands resulting from reduced vegetation and extensive pavement further amplify these effects.	Extreme heat can cause residents to relocate due to damaged homes or safety concerns. Some may move to areas perceived as safer or seek better job opportunities elsewhere. The economic impact and infrastructure damage can also make certain neighborhoods less desirable, leading to shifts in demographics and the socioeconomic landscape as new residents with different backgrounds move in.	Increased development and density can raise temperatures in South Jordan during extreme heat events.	Increased
Extreme Cold	Climate change can increase the intensity of winter storms. Higher atmospheric temperatures allow for more moisture, resulting in heavier snowfall and potentially lower temperatures during these events. In addition, fluctuations in weather patterns may disrupt seasonal cycles, leading to unpredictable periods of	Extreme cold can drive some residents to relocate to warmer areas. Harsh winters can hinder economic activities and deter new residents and businesses, influencing housing demand and the attractiveness of certain neighborhoods. This may disproportionately affect lower-income families, leading to changes in demographics and	Increased growth of commercial and residential developments in South Jordan increases energy demand during extreme cold events, stressing the electrical grid and increasing the risk of extreme cold events.	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	extreme cold mixed with warmer spells.	socioeconomic stratification in the community.		
Flooding	Higher temperatures increase the frequency and intensity of extreme weather events and alter precipitation patterns. They lead to more intense rainstorms and accelerated snowmelt from nearby mountains, raising water levels in rivers and streams. This combination raises the risk of flooding, especially in areas with inadequate drainage and urban development in flood-prone zones, heightening the potential for damage to homes and infrastructure.	Flooding can significantly alter population patterns by displacing residents from affected areas, leading them to seek shelter elsewhere. This may cause a population decline where flooding occurs, as individuals might hesitate to return due to ongoing risks or property damage. As neighborhoods become less desirable, people may migrate to safer areas, changing demographic trends and putting pressure on housing in those regions. Over time, these shifts can influence urban planning and development, as local governments address flooding risks and changing population needs.	No developments in South Jordan have been placed in the special flood hazard area. Increased impervious surfaces due to development across South Jordan could contribute to ponding and other pluvial flooding.	Decreased
Landslide/ Slope Failure	Climate change increases the risk of landslides through heavier rainfall and temperature fluctuations. Intense rain saturates soil, destabilizing slopes, while freeze–thaw cycles weaken the ground. Changes in vegetation can also reduce stability, leading to a higher potential for landslides.	Landslides and slope failures can impact population patterns by making some areas unsafe, leading to displacement and lower property values. This prompts residents to move to safer regions, thereby increasing density in more stable areas. Concerns about future landslides may also deter newcomers from high-risk zones, shaping long-term demographic trends.	Developments like the Bacchus Highway Center in western South Jordan near the Bingham Canyon Mine are susceptible to landslides.	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
Radon	Climate change can affect radon levels by altering soil temperatures and moisture conditions. Higher temperatures may increase radon emissions from the ground, while heavy rainfall can change groundwater and soil saturation, impacting radon migration into buildings.	Radon exposure can influence population patterns as increased health awareness may drive families to move away from areas with high radon levels. This shift could particularly affect vulnerable groups, changing demographics and demand in the housing market. Homes with lower radon levels may become more sought after, and public health campaigns can encourage community action, making previously undesirable areas more attractive once mitigation measures are implemented.	The development in South Jordan has not increased radon risk.	Stayed the same
Heavy Rain	Climate change increases the frequency and intensity of heavy rain, as higher temperatures allow the atmosphere to hold more moisture. This leads to stronger storms, flash flooding, and overwhelmed drainage systems.	Heavy rain can shift population patterns by pushing residents out of flood-prone areas and attracting them to safer neighborhoods. Frequent flooding may lead to evacuations and economic disruptions, prompting relocations. Over time, ongoing heavy rains can affect housing demand and community stability, altering the town's population distribution.	Increased impervious surfaces due to development across South Jordan could contribute to ponding and other pluvial flooding.	Increased
High Wind	Climate change affects high winds by altering atmospheric patterns and increasing extreme weather events. Rising temperatures may lead to more substantial, unpredictable winds and more frequent	High winds can alter population patterns by making certain areas less desirable. Frequent damage may drive residents to safer neighborhoods, deter newcomers, and slow growth in affected regions.	New development across South Jordan, especially in multistory buildings, brings additional risk for damage from high winds.	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	thunderstorms, posing risks to infrastructure and air quality.			
Lightning	Climate change increases temperatures and alters precipitation, leading to more intense thunderstorms and frequent lightning strikes. Urbanization can enhance this effect, posing risks to public safety and infrastructure.	Lightning can influence population patterns by causing property damage and wildfires, leading some residents to relocate. Areas with higher lightning activity may deter new residents, while safer locations could increase migration as people seek protection from severe weather.	New, large-scale development exposes more structures to lightning strikes, slightly increasing risk for South Jordan.	Increased
Severe Winter Weather	Climate change impacts heavy snow and blizzards by altering precipitation patterns. Higher temperatures can lead to more rain than snow, affecting snowpack levels—additionally, increased storm intensity results in heavier and more unpredictable snowfall.	An increased population means an increased number of people needing to get to work and quicker snow removal. Heavy snow or blizzards can impact population patterns by influencing where people live and work. Transportation disruptions may lead residents to seek housing closer to jobs, increasing density in some areas while depopulating others. Families might also avoid regions with frequent heavy snowfall, shifting demand to milder areas. Over time, these trends can alter community demographics and economic activity, prompting adjustments in town planning and resource allocation.	With large development increases in South Jordan, the risk of damage and increased responsibility from severe winter storms has gone up. With new subdivisions, the city is responsible for plowing, rescues, and evacuations during heavy snow events.	Increased
Tornado	Climate change may increase the frequency and intensity of tornadoes. Higher temperatures lead to more moisture in the air,	Tornadoes can influence population patterns by prompting residents to move to safer areas after damage occurs. This can	New, large-scale development exposes more structures to tornadoes, slightly increasing risk for South Jordan.	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	creating conditions for severe thunderstorms. Changes in wind patterns and precipitation can also heighten tornado risks, resulting in more destructive storms and greater threats to infrastructure and communities.	decrease density in affected neighborhoods while increasing the demand for housing in safer regions. New residents may also move in for recovery opportunities, altering demographics. Over time, repeated tornado threats might push long-term residents to areas with better disaster preparedness, reshaping the town's population distribution.		
Wildfire	By raising temperatures and creating drier conditions, prolonged droughts lead to more dry vegetation, which serves as fuel for fires. Erratic seasons extend the growing period, while more lightning strikes can ignite wildfires. These factors heighten the threat to ecosystems and community safety.	Displaced individuals often seek safer areas, shifting demographic trends, while declining property values might deter newcomers. Conversely, some may be drawn to rebuilding efforts, impacting long-term growth and community dynamics.	Development, especially in the western side of South Jordan, is close to high-risk wildfire areas. These neighborhoods, like the Bacchus Highway Center, are at heightened risk of wildfire damage.	Increased
Dam Failure	Climate change raises the risk of dam failure by causing heavier rainfall and rapid snowmelt. These changes can overwhelm dams and compromise their integrity, highlighting the need for urgent safety assessments and upgrades to protect communities downstream.	Dam failure can impact population patterns by displacing residents and altering demographics. Evacuations can lead to an influx of people in safer areas, while destruction may deter new residents and contribute to population decline. Fear of future disasters may also prompt remaining individuals to relocate, changing the community's composition and	Development in South Jordan has not increased dam failure risk.	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
		affecting population density and economic activity.		
Civil Disturbance	Climate change can increase civil disturbances by intensifying environmental stresses and social tensions. Rising temperatures may lead to droughts, wildfires, and poor air quality, particularly affecting vulnerable communities. Resource scarcity, especially water, can spark conflicts and protests. In addition, an influx of migrants from harder-hit areas may strain local resources, further escalating tensions. This cycle of unrest is driven by the impacts of climate change on the environment and community dynamics.	By encouraging residents to move for safety, leading to outflows and new arrivals. These events can reveal social issues, impacting community dynamics, employment, and property values, ultimately reshaping demographics and social cohesion.	Development in South Jordan has not increased civil disturbance risk.	Increased
Cyberattack	Possible attack on the industry, which is seen as producing large amounts of greenhouse gases and burning fossil fuels. Climate change can heighten cyberattack risk by increasing vulnerabilities during extreme weather. Disruptions like power outages offer cybercriminals opportunities, because focusing on emergency responses can weaken cybersecurity measures. As organizations adopt new technologies to cope with climate impacts, they may	Cyberattacks can change population patterns by eroding trust in essential services. Compromised systems may cause residents to leave due to safety concerns, while high-profile incidents can deter businesses, leading to job losses. This perception of vulnerability may also make the town less appealing to newcomers, resulting in demographic shifts and affecting local development.	Development in South Jordan has not increased cyberattack risk.	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	unintentionally introduce additional vulnerabilities.			
Hazardous Materials Incident (Transportation & Fixed Facility)	Climate change elevates the risk of hazardous materials incidents by increasing extreme weather events like heavy rain and wildfires. These events can breach storage tanks and heighten material volatility. Vulnerable infrastructure can lead to more spills or accidents, while climate shifts may also introduce new challenges for managing hazardous substances and public health.	Hazardous materials incidents can cause evacuations and temporary declines in density. In the long run, unsafe areas may deter new residents, affecting growth and diversity. In addition, negative perceptions can lower property values and economic prospects, leading families to relocate, which impacts local demographics.	Development in South Jordan has not increased hazardous material risk.	Increased
Public Health Epidemic/ Pandemic	By increasing the spread of vector-borne diseases and raising the risk of waterborne illnesses due to flooding or drought. Worsening air quality can also exacerbate respiratory conditions like asthma, especially in vulnerable populations.	By prompting migration for safety and better healthcare. Vulnerable groups may move to areas with improved services, while economic instability can drive people to seek new employment opportunities. In addition, restrictions like quarantine measures can limit movement and social interactions, reshaping the community's demographics and impacting local economies.	Development in South Jordan has not increased epidemic/pandemic risk.	Increased
Terrorism	Terroristic activity is sometimes centered around climate change. Climate change impacts terrorism incidents by creating conditions of resource scarcity and social unrest. Increased competition for essential resources, such as water, can	Terrorism incidents can alter population patterns by instilling fear and prompting residents to relocate to perceived safer areas, resulting in demographic shifts and potential declines in property values. Some neighborhoods may see an outflow of residents, while others could experience an	Development in South Jordan has not increased terrorism risk.	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	fuel tensions, making communities more vulnerable to extremist ideologies. Extreme weather events may disrupt social order and infrastructure, offering terrorist groups opportunities to exploit crises. In addition, climate-driven population displacement can heighten tensions in receiving areas, raising the risk of domestic terrorism. The focus of law enforcement on climate-related challenges can also limit its capacity to address terrorism threats. Ultimately, while climate change may not directly cause terrorism, its effects can create an environment conducive to extremist activities.	influx of people seeking refuge from violence. In addition, increased security measures may deter businesses and residents from certain locations, leading to long-term changes in population density and urban development patterns.		

DRAFT

Additional Public Involvement

Public involvement in the city of South Jordan reflects a strong commitment to community engagement and safety awareness, particularly regarding hazards like extreme weather. The city actively disseminates information through various channels to keep residents informed and prepared. One key initiative is the distribution of community newsletters, which provide updates on local events, safety tips, and information about upcoming hazard awareness campaigns. These newsletters are essential for educating the public about potential hazards and the steps they can take to mitigate risks.

The city of South Jordan also organizes school programs that teach students about emergency preparedness and hazard awareness. These programs foster a safety culture from a young age, ensuring that future generations can handle extreme weather events and other emergencies. Severe Weather Week is another vital aspect of public involvement. This annual event typically includes workshops, demonstrations, and informational sessions highlighting the importance of preparedness. It engages the community in discussions about extreme cold and other weather-related hazards, encouraging proactive measures.

Public meetings and events are regularly held to facilitate direct engagement between city officials and residents. These forums allow community members to voice their concerns, ask questions, and discuss local safety initiatives. The availability of hard copy notices ensures that information reaches all residents, including those who might not have internet access. The city also collaborates with various organizations that advocate for and represent underserved and vulnerable communities. These partnerships ensure that safety information is effectively communicated to all residents, particularly those facing additional challenges during extreme weather events.

Social media are critical in the city of South Jordan's public involvement strategy. The city uses platforms like Facebook and X to share real-time updates, safety information, and alerts about severe weather. This instant communication channel lets residents stay informed and engaged with their community. The city of South Jordan's public involvement initiatives demonstrate a comprehensive approach to community safety and education. The city effectively promotes awareness and preparedness for extreme cold and other hazards by leveraging multiple communication channels and fostering partnerships.

Plan Integration

Incorporating the underlying principles of the Hazard Mitigation Plan and its recommendations into other plans is a highly effective and low-cost way to expand their influence. All plan participants will use existing methods and programs to implement hazard mitigation actions where possible. As previously stated, mitigation is most successful when it is incorporated into the day-to-day functions and priorities of government and public service. This plan builds on the momentum developed through previous and related planning efforts and mitigation programs, and it recommends implementing actions where possible through these other program mechanisms. These existing mechanisms include the following:

DRAFT

- Regularity Capabilities
- Administrative Capabilities
- Fiscal Capabilities

Respective planning stakeholders will conduct implementation and incorporation into existing planning mechanisms and will be done through the routine actions of:

- Monitoring other planning/program agendas
- Attending other planning/program meetings
- Participating in other planning processes; and
- Monitoring community budget meetings for other community program opportunities.

The successful implementation of this plan will require constant and vigilant review of existing plans and programs for coordination and multi-objective opportunities that promote a safe, sustainable community. Regular efforts should be made to monitor the progress of mitigation actions implemented through other planning mechanisms. Where appropriate, priority actions should be incorporated into planning updates. Table 11 lists existing planning mechanisms in which the Hazard Mitigation Plan has been integrated. Table 12 lists the opportunities for integrating elements of this plan into other plans. Aligning the hazard mitigation with these plans can create a more sustainable, resilient, and adaptive urban environment that reduces risk, protects citizens, and ensures that growth happens in a way that minimizes exposure to hazards.

Table 11: Integration of Previous Plans by the City of South Jordan

Plan	Description
Development standards and specifications via municipal code	Many of the required mitigation strategies and efforts have been adopted in the development approval process.

Table 12: Opportunities for Integration with Future Plans of the City of South Jordan

Plan	Description
Community Wildfire Protection Plan	Identifies risks to the community from wildfire and potential actions to reduce risk.
Comprehensive Emergency Management Plan	Establishes the city framework for mitigation, preparedness, response, and recovery.
City Master Plan	Integrating a hazard mitigation plan (HMP) with a city master plan creates an opportunity to enhance resilience to natural and human-caused disasters while aligning long-term development goals with risk reduction strategies.
General Plan	Align city goals with risk reduction strategies.
Storm Drain Mater Plan	Align storm water goals with risk reduction strategies.
Water Shortage Master Plan	Align water storage goals with risk reduction strategies.
Economic Strategic Plan	Align economic development with risk reduction strategies.

Plan	Description
Transportation Master Plan	Align transportation development with risk reduction strategies
Open Space Master Plan	Align planning for open space with risk reduction strategies

Capability Assessment

Local mitigation capabilities are existing authorities, policies, programs, and resources that reduce hazard impacts or could help carry out hazard mitigation activities.

Planning and Regulatory Capabilities

Planning and regulatory capabilities are the plans, policies, codes, and ordinances that prevent and reduce the impacts of hazards.

Table 13: Assessment of the Planning Capabilities of the City of South Jordan

Plan	Does it address hazards? (Y/N)	How can it be used to implement mitigation actions?	When was the last update? When is the next update?
General Plan	Y	All plans, codes, ordinances, standards, and specifications have been written and developed to provide mitigation action at all levels. This includes underground utility requirements, bridge/culvert design, detention/retention facilities, hydrodynamic separators installed, and seismic standards on buildings.	Annual

Financial Capabilities

Financial capabilities are the resources to fund mitigation actions. Talking about funding and financial capabilities is important to determine what kinds of projects are feasible, given their cost. Mitigation actions like outreach programs are lower cost and often use staff time and existing budgets. Other actions, such as earthquake retrofits, could require substantial funding from local, state, and federal partners. Partnerships, including those willing to donate land, supplies, in-kind matches, and cash, can be included.

Table 17: Assessment of the Financial Capabilities of the City of South Jordan

Opportunities to Expand and/or Improve Capabilities

Actions that can expand and improve existing authorities, plans, policies, and resources for mitigation include budgeting for mitigation actions, passing policies and procedures for mitigation actions, adopting and implementing stricter mitigation regulations, approving mitigation updates, and making additions to existing plans as new needs are recognized. Table 19 lists the opportunities for the city of South Jordan.

Table 19: Opportunities to Expand and/or Improve the Capabilities of the City of South Jordan

Capability	Opportunity to Expand and/or Improve
Planning and Regulation	The city can develop a new five-year Water Conservation Plan to address drought and update the city's Stormwater Master Plan to address flooding through the identification of specific mitigation projects.
Administrative and Technical	The city can expand partnerships for mitigation implementation, particularly with local water districts.
Financial	Pursuing new hazard mitigation funding, such as pre-disaster grants like the Flood Mitigation Assistance (FMA) grant program, can help expand current mitigation funding capabilities.
Education and Outreach	Additional targeted outreach, including efforts directed at vulnerable populations like people with disabilities and backcountry users at risk of avalanches, can help expand current education and outreach capabilities.

Mitigation Strategy

Mitigation strategies provide proactive measures that are designed to minimize the impacts of hazards on the city of South Jordan. Table 20 shows mitigation action alternatives, and Table 21 is the 2025 mitigation action plan for the city of South Jordan.

Table 20: Mitigation Action Alternatives for the City of South Jordan

Action	Type of Action	Selected for inclusion in the plan?	If not selected, why not?
Underground Powerlines	Local plans and regulations	Yes	
Seismic Valves on Gas Meter	Structure and infrastructure projects	Yes	
Hydrodynamic Separator on Storm Water	Structure and infrastructure projects	Yes	
Retention and Detention capability	Structure and infrastructure projects	Yes	
Water System Fire Flow capacity increase	Structure and infrastructure projects	Yes	

DRAFT

Table 21: Status of Prior Mitigation Actions of the City of South Jordan[10]

Action	Year Initiated	Hazard(s)	Agency Lead	Benefits	Cost	Funding Source(s)	Priority	Timeframe	Comments	Status Update
Establish notification capabilities and procedures for emergency personnel	2009	All hazards	South Jordan	High	Medium	Local, state and federal grants	High	Ongoing	South Jordan continues to work on notification tools and procedures to be in harmony with changing technology and equipment	Ongoing
Establish a coordinating group to address long-term communication needs and implementation strategies	2009	All hazards	South Jordan	Medium	Low	Local	Low	Ongoing	No formal coordinating group exists yet, but South Jordan engages in discussions with other jurisdictions and the county regarding this issue	Ongoing
Implement improvements to address hazards identified in assessment	2009	All hazards	South Jordan	High	High	HMA, federal, and state	High	Ongoing	South Jordan is identifying options and opportunities to address issues identified during the risk assessments in 2013 and 2019	Ongoing
Provide education regarding all natural hazards through live trainings and web-based, print, and broadcast media	2009	All hazards	South Jordan	High	Low	Local funds	High	Ongoing	South Jordan Emergency Management continues to provide several public education classes for groups to discuss the hazards in the community and what residents can do to be prepared	Ongoing
Develop education programs to target specific groups including homeowners, developers, schools and people with special needs	2009	All hazards	South Jordan	High	Low	Local funds	High	Ongoing	South Jordan's education programs are customizable for all kinds of groups and available to all members of the community	Ongoing
Coordinate with existing public education programs, such as the American Red Cross, Utah Living with Fire, be Ready Utah, the National Weather Service, etc.	2009	All hazards	South Jordan	High	Low	Local funds	High	Ongoing	South Jordan has worked with Be Ready Utah and other programs to make presentations in South Jordan and will continue to invite them to events and other activities in the community	Ongoing
Coordinate with water districts to plan for, develop and/or expand secondary water	2009	Drought	South Jordan	Medium	High	County and state funds	Medium	Ongoing	South Jordan continues to encourage the development of secondary water, where feasible. Several areas have been added to the secondary water system in the last 5 years.	Ongoing
Encourage Communities to actively participate in NFIP	2009	Flooding	South Jordan	High	Low	Local	High	Ongoing	South Jordan actively participates in the NFIP	Ongoing
Determine potential flood impacts and identify areas in need of additional flood control structures	2009	Flooding	South Jordan	High	High	Federal, county, and state funds	High	Ongoing	The City Engineer and Public Works Director regularly review the impact of development and the need for flood control infrastructure and make recommendations as needed	Ongoing
Address identified problems through construction of debris basins, flood retention ponds, energy dissipaters or other flood control structures	2009	Flooding	South Jordan	High	High	Federal, county, and state funds	High	Ongoing	The City Engineer and Public Works Director oversee the construction of flood control structures Example: Significant construction efforts were completed on Midas Creek including upsizing culverts, channel stabilization, etc.	Ongoing
Establish maintenance and repair programs to remove debris, improve resistance and otherwise maintain effectiveness of stormwater and flood control systems	2009	Flooding	South Jordan	High	High	Federal, county, and state funds	High	Ongoing	The Stormwater Division of the Public Works Department continues to maintain and repair all drainage systems in the city	Ongoing
Modify structures as needed to address deficiencies	2009	Flooding	South Jordan	High	High	Federal, county, and state funds	High	Ongoing	The City Engineering Division in cooperation with the Public Works Department make repairs as needed to deficient structures	Ongoing

[10] HMA = Hazard Mitigation Assistance,

Action	Year Initiated	Hazard(s)	Agency Lead	Benefits	Cost	Funding Source(s)	Priority	Timeframe	Comments	Status Update
Assist NWS in making other agencies and departments aware of available resources	2009	Severe Weather	South Jordan	Medium	Low	Local	Low	Ongoing	South Jordan supports the NWS efforts for education and outreach and makes internal departments aware of NWS resources	Ongoing
Assist Forest Service Utah Avalanche Forecast Center and other organizations in promoting avalanche hazard awareness for backcountry users	2009	Severe Weather	South Jordan	Medium	Low	Local	Medium	Ongoing	South Jordan supports the efforts for education and outreach	Ongoing
Maintain community participation in the National Flood Insurance Program. **Flooding risks exist in the community from a variety of sources, including; riverine flooding, infrastructure failures (canal breech, dam failure, water main rupture), and groundwater sources. Areas near the Jordan River are in a mostly undeveloped state.**	2014	Flooding	Development Services	High	Low <$5,000	General Fund	High	Ongoing	Participation in the National Flood Insurance requires the city to maintain and enforce a flood damage prevention ordinance and other regulatory authorities to minimize the effects of flooding on structures in the community. Enforcement of the ordinance will reduce the number of structures at risk of damage from flooding	Ongoing
Distribution of flood hazard and flood preparedness/ response information, such as the "Flooding: What you should Know when Living in Utah" brochure which the city partnered in developing in 2014, or similar types of information. Post such information on the city's website.	2014	Flooding	Administrative Services – Emergency Management, Information Technology	Medium	Low <$5,000	General Fund	Medium	Ongoing	Dissemination of information raises public awareness, resulting in a more knowledgeable community that is prepared for potential threats. It also helps build community support for other hazard mitigation efforts, such as strong building codes and enforcement of existing codes, such as the flood damage prevention ordinance.	Ongoing
Update of the city's Stormwater Master Plan to include specific flood mitigation projects in flood-prone areas of the city.	2014	Flooding	Public Works, Development Services	Medium	High – $50,000–$100,000	General Fund, Enterprise Funds	Medium	Ongoing	Once updated, the Stormwater Master Plan will identify specific infrastructure needs that will help reduce the potential for flooding. The plan will be used to determine priority-based needs throughout the city. Funding for specific projects may come from various sources and will appear as part of the capital improvement plan.	Ongoing
Install automatic gas shut off fixtures on any City-owned buildings or structures with gas service/meter that do not have one currently. **Train staff to check the meter immediately following an earthquake event and shut off service if necessary**	2014	Earthquake	Administrative Services – Facilities Division	Medium	Medium – $50,000–$100,000	General Fund, grants	Medium	Ongoing	Automatic shut off valves will stop the flow of gas after a significant event if there is damage to the system. This could save the structure from potential fire or a hazardous materials incident.	Ongoing
Distribution of earthquake hazard preparedness/response information. Post such information on City's website	2014	Earthquake	Administrative Services – Emergency Management, Information Technology	Medium	Low <$5,000	General Fund	Medium	Ongoing	Dissemination of information raises public awareness, resulting in a more knowledgeable community that is prepared for potential threats. It also helps build community support for other hazard mitigation efforts, such as strong building codes and enforcement of existing codes, such as the flood damage prevention ordinance.	Ongoing
Support of community education programs that raise awareness and provide information to property owners on how to protect their structures from wildfire damage. Post such information on the city's website.	2014	Wildland Fire	Administrative Services – Emergency Management, Fire Department, Information Technology	Medium	Low < $5,000	General Fund, grants	Medium	Ongoing	Raised awareness of people who may determine to live in areas that are at risk of wildland fire.	Ongoing

DRAFT

Action	Year Initiated	Hazard(s)	Agency Lead	Benefits	Cost	Funding Source(s)	Priority	Timeframe	Comments	Status Update
Maintain a wildland fire response unit.	2014	Wildland Fire	Fire Department	High	High – $100,000	General Fund, grants	High	Ongoing	Provides the city with an initial response unit and the ability to support neighboring jurisdictions with their response efforts.	Ongoing
Prohibit the use of fireworks in high-risk areas.	2014	Wildland Fire	Fire Department	Low	Minimal	General Fund, grants	Low	Ongoing	Fireworks restrictions in high-risk areas help reduce the potential for ignition sources and the need for additional response units.	Ongoing
Training for firefighters in wildland firefighting.	2014	Wildland Fire	Fire Department	High	Medium – $50,000	General Fund, grants	High	Ongoing	Continue providing training to firefighters in wildland fire so there are better able to assist if needed.	Ongoing
Maintain automatic/mutual aid agreements and assist neighboring jurisdictions as requested.	2014	Wildland Fire	Fire Department	Medium	Low – Minimal	General Fund, grants	Medium	Ongoing	Having automatic and mutual aid agreements will help the community be more prepared with access to resources when needed. It will also make it easier to assist neighboring jurisdictions if requested	Ongoing
Rebate program to promote water conservation	2014	Drought	Public Works	Low	Low	Local	Low	Ongoing	The city offers rebates to persons who upgrade their existing infrastructure with new devices that use less water. This includes fixing leaking toilets and upgrading to low flow, installing smart irrigation systems, planting drought tolerant plants, etc. The results of these efforts should reduce the consumption of water by users in the community.	Ongoing
Development of a 5-year Water Conservation Plan	2014	Drought	Public Works	Medium	Low	Local	Low	Ongoing	Unknown	Ongoing
Offer Annual Sprinkler Maintenance Workshops to promote efficient and effective watering of landscapes.	2014	Drought	Public Works	Low	Low	Local	Low	Ongoing	Public education on maintaining and operating a sprinkler system will help conserve water by avoiding waste from leaks and/or ineffective systems and practices.	Ongoing
Promoting "Water Week" with elementary students to promote best management practices for water conservation.	2014	Drought	Public Works	Medium	Low	Local	Medium	Ongoing	Teaching elementary students about water conservation will help promote best management practices in residents' homes and share information about how individuals can make a difference in conserving water.	Ongoing
Provide real-time water use data to customers	2014	Drought	Public Works	Medium	Medium	Local	Medium	Ongoing	Water users can monitor their use of water resources in real time to help them make decisions about their water use practices.	Ongoing
Development of a Pandemic Response & Recovery Plan	2014	Pandemic	Administrative Services – Emergency management, Fire Department – EMS	Low	Medium	General Fund, grants	Low	Ongoing	Having a response and recovery plan will help the city to be more prepared, identify potential protocols for response and implement strategies that prioritize public safety and help reduce the economic impacts on the city from the potential effects of a pandemic crisis.	Ongoing
Engage in the process to become a "Storm Ready Community" with the National Weather Service.	2014	Severe Weather	Administrative Services – Emergency Management, Public Works	Medium	Medium $25,000-$50,000	General Fund, grants	Medium	Ongoing	Participation in the "Storm Ready Community" will help raise awareness of the dangers of severe weather and provide tools to the community to aid in preparing for and responding to severe weather events.	Ongoing

DRAFT

Action	Year Initiated	Hazard(s)	Agency Lead	Benefits	Cost	Funding Source(s)	Priority	Timeframe	Comments	Status Update
Promote public education in the community regarding severe weather. Post such information on the city's website.	2014	Severe Weather	Administrative Services – Emergency Management, Information Technology	Medium	Low < $5,000	General Fund, grants	Medium	Ongoing	Dissemination of information raises public awareness, resulting in a more knowledgeable community that is prepared for potential threats. It also helps build community support for other hazard mitigation efforts, such as strong building codes and enforcement of existing codes.	Ongoing
Support of community education programs that raise awareness and provide information to property owners on the dangers and risks of avalanches. Post such information on the city's website, including links to the Utah Avalanche Center.	2014	Avalanche	Administrative Services – Emergency Management, Information Technology	Medium	Low < $5,000	General Fund, grants	Medium	Ongoing	Raised awareness of people who may desire to participate in activities that are at risk of avalanche.	Ongoing
Creation of a radon hazard map showing potential areas of the community that may be affected by radon.	2014	Radon	Administrative Services – Emergency Management, Information Technology, Development Services	High	Low < $5,000	General Fund	High	Ongoing	A map showing the extent of the hazard will be useful in helping residents determine if they should consider testing for radon and/or engaging in their own efforts to mitigate radon in their structures. The map will also help raise awareness of the issue in the community.	Ongoing
Distribution of information on Radon. Post such information on the city's website.	2014	Radon	Administrative Services – Emergency Management, Information Technology	High	Low < $5,000	General Fund	Medium	Ongoing	Dissemination of information raises public awareness, resulting in a more knowledgeable community that is prepared for potential threats. It also helps build community support for other hazard mitigation efforts, such as strong building codes and enforcement of existing codes, such as the flood damage prevention ordinance.	Ongoing
Development of a Communications Response Team and Emergency Communications Plan	2014	All hazards	Administrative Services, Police Department, Fire Department, Public Works	Medium	Medium >$50,000	General Fund, grants	Medium	Ongoing	A communication response team will help ensure that the city can develop and maintain a viable communication system that will enable the city to have communications capabilities after a significant event occurs.	Ongoing
Adoption and Enforcement of Building Codes	2014	All hazards	Development Services	Medium	Medium	General Fund, grants	Medium	Ongoing	Adopting and enforcing appropriate building codes will ensure that new construction projects will benefit from new technologies, construction design, and lessons learned from previous disasters.	Ongoing
Bury powerlines and upgrade key utilities in the older community sections to ensure greater resilience to severe weather.	2019	Severe Weather	Public Works	Medium	High	Local and private funds, HMA grants	Medium	Long-term	Unknown	Ongoing

DRAFT

Table 22: 2025 Mitigation Action Plan for the City of South Jordan[11]

#	Action	Hazard(s)	Lead Agency	Potential Partners	Benefits (Losses Avoided)	Cost Estimate	Funding Source(s)	Timeframe	Priority	Comments
1	Establish notification capabilities and procedures for emergency personnel	Avalanche, Dam Failure, Drought, Earthquake, Extreme Cold, Extreme Heat, Flooding, Heavy Rain, High Wind, Landslide/Slope Failure, Lightning, Public Health Epidemic/Pandemic, Radon, Severe Winter Weather, Tornado, Wildfire, Civil Disturbance, Hazardous Materials, Terrorism	South Jordan Emergency Management	South Jordan Fire, SLCo EM, other local jurisdictions	Improved information sharing and coordination between local agencies/jurisdictions.	Medium	Local General Fund, staff time	Ongoing	High	
2	Establish a coordinating group to address long-term communication needs and implementation strategies	Avalanche, Dam Failure, Drought, Earthquake, Extreme Cold, Extreme Heat, Flooding, Heavy Rain, High Wind, Landslide/Slope Failure, Lightning, Public Health Epidemic/Pandemic, Radon, Severe Winter Weather, Tornado, Wildfire, Civil Disturbance, Hazardous Materials, Terrorism	South Jordan Emergency Management	South Jordan IT, Administrative Services, SLCo EM, local jurisdictions	Identifying and establishing working groups for long-term communication provides value in knowing resources and opportunities that exist.	Low	Local General Fund, staff time	Ongoing	Low	
3	Implement improvements to address hazards identified in the assessment including but not limited to a thorough evaluation of structural vulnerabilities, environmental risks, and emergency preparedness gaps to develop targeted mitigation strategies.	Avalanche, Dam Failure, Drought, Earthquake, Extreme Cold, Extreme Heat, Flooding, Heavy Rain, High Wind, Landslide/Slope Failure, Lightning, Public Health Epidemic/Pandemic, Radon, Severe Winter Weather, Tornado, Wildfire, Civil Disturbance, Hazardous Materials, Terrorism	South Jordan Emergency Management	SLCo EM, local jurisdictions	Increase understanding of community assets at risk from hazards and the potential for mitigation opportunities. Reduce damage to critical infrastructure, residences, and businesses, and prevent personal injuries.	High	HMA, BRIC, PDM, HMGP, federal, and state	Ongoing	High	
4	Provide education regarding all natural hazards through live trainings and web-based, print, and broadcast media	Avalanche, Dam Failure, Drought, Earthquake, Extreme Cold, Extreme Heat, Flooding, Heavy Rain, High Wind, Landslide/Slope Failure, Lightning, Public Health Epidemic/Pandemic, Radon, Severe Winter Weather, Tornado, Wildfire, Civil Disturbance, Hazardous Materials, Terrorism	South Jordan Emergency Management,	South Jordan Fire, SLCo EM, local jurisdictions, State of Utah	Reduce or prevent personal injuries by informing groups of appropriate actions for local hazards.	Low	Local General Fund, staff time	Ongoing	High	
5	Develop education programs to target specific groups, including homeowners, developers, schools, and people with special needs	Avalanche, Dam Failure, Drought, Earthquake, Extreme Cold, Extreme Heat, Flooding, Heavy Rain, High Wind, Landslide/Slope Failure, Lightning, Public Health Epidemic/Pandemic, Radon, Severe Winter Weather, Tornado, Wildfire, Civil Disturbance, Hazardous Materials, Terrorism	South Jordan Fire,	South Jordan Emergency Management, Public Works, Administrative Services, SLCo EM, local surrounding jurisdictions	Reduce or prevent personal injuries by informing groups of appropriate actions for local hazards.	Low	Local General Fund, staff time	Ongoing	High	

[11] BRIC = Building Resilient Infrastructure and Communities, EM = Emergency Management, FMA = Flood Mitigation Assistance, HMA = Hazard Mitigation Assistance, HMGP = Hazard Mitigation Grant Program, NWS = National Weather Service, PDM = Pre-Disaster Mitigation, SLCo EM = Salt Lake County Emergency Management, UAC = Utah Avalanche Center, UDOT = Utah Department of Transportation, UFA = Unified Fire Authority, USFS = United States Forest Service, VOAD = Voluntary Agencies Active in Disasters.

#	Action	Hazard(s)	Lead Agency	Potential Partners	Benefits (Losses Avoided)	Cost Estimate	Funding Source(s)	Timeframe	Priority	Comments
6	Coordinate with existing public education programs, such as the American Red Cross, Utah Living with Fire, Be Ready Utah, and the NWS	Avalanche, Dam Failure, Drought, Earthquake, Extreme Cold, Extreme Heat, Flooding, Heavy Rain, High Wind, Landslide/Slope Failure, Lightning, Public Health Epidemic/Pandemic, Radon, Severe Winter Weather, Tornado, Wildfire, Civil Disturbance, Hazardous Materials, Terrorism	South Jordan Emergency Management	SLCo EM, local VOAD, NWS, State of Utah	Relationship building and public education and outreach with VOAD and other EM partners during blue sky days provides for resources and knowledge needed during a disaster.	Low	Local General Fund, staff time	Ongoing	Medium	
7	Coordinate with water districts to plan for, develop, and/or expand secondary water	Drought	South Jordan Engineering	South Jordan Public Works, SLCo EM, water districts, State of Utah, local jurisdictions	Improved water conservation helps prevent water shortages.	High	Local General Fund, staff time, County and State funds	Ongoing	High	
8	Encourage communities to actively participate in NFIP	Flooding	South Jordan Engineering	South Jordan Emergency Management, SLCo EM, State of Utah, local jurisdictions, water districts	Preparedness campaigns and public education and outreach foster community resilience, readiness, and program opportunity.	Low	Local General Fund, staff time	Ongoing	High	
9	Determine potential flood impacts and identify areas in need of additional flood control structures	Flooding, Dam Failure	South Jordan Engineering	SLCo EM, local jurisdictions, State of Utah	Identifying events and problem areas provides a great opportunity for mitigation measures.	High	Federal, County, and State Funds, FMA, PDM, HMGP	Ongoing	High	
10	Address identified problems through construction of debris basins, flood retention ponds, energy dissipaters, or other flood control structures	Flooding, Dam Failure	South Jordan Engineering	SLCo EM, local jurisdictions, State of Utah	Reduce potential damage caused by flooding.	High	Federal, County, and State Funds, FMA, BRIC, PDM, HMGP	Ongoing	High	
11	Establish maintenance and repair programs to remove debris, improve resistance, and otherwise maintain effectiveness of stormwater and flood control systems	Flooding	South Jordan Public Works	SLCo EM, local jurisdictions, UDOT	Preventative maintenance of infrastructure allows for design functionality.	High	Federal, County, and State Funds, FMA, PDM, HMGP	Ongoing		
12	Modify structures as needed to address deficiencies	Flooding	South Jordan Engineering	South Jordan Public Works, SLCo EM, State of Utah	Structure modification ensures mitigation efforts.	High	Federal, County, and State Funds, BRIC, FMA	Ongoing		
13	Assist NWS in making other agencies and departments aware of available resources	Heavy Rain, High Wind, Lightning, Tornado, Severe Winter Weather, Flooding	South Jordan Emergency Management	SLCo EM, NWS, local jurisdictions	Sharing capabilities provides resource opportunities.	Low	Local General Fund	Ongoing		
14	Bury powerlines and upgrade key utilities in the older sections of the community to ensure	Heavy Rain, High Wind, Lightning, Tornado, Severe Winter Weather, Flooding	South Jordan Engineering and Development	SLCo EM, NWS, UDOT, State of Utah, Private Utility Companies: Rocky	Underground power and utilities help protect from many hazardous elements.	High	Local General Fund, Local Capital Improvement Fund, private	Long-term	Medium	

DRAFT

#	Action	Hazard(s)	Lead Agency	Potential Partners	Benefits (Losses Avoided)	Cost Estimate	Funding Source(s)	Timeframe	Priority	Comments
	greater resilience to severe weather			Mountain Power, Enbridge Gas			funds, HMA grants			
15	Assist the USFS, the Utah Avalanche Forecast Center, and other organizations in promoting avalanche hazard awareness for backcountry users	Heavy Rain, High Wind, Lightning, Tornado, Severe Winter Weather, Flooding	South Jordan Emergency Management	SLCo EM, USFS, UAC, local jurisdictions	Community awareness will benefit people in recreational activities and provide knowledge of the dangers that exist.	Low	Local General Fund, staff time	Ongoing	Medium	
16	Maintain community participation in the NFIP.	Flooding	South Jordan Public Works,	South Jordan Engineering, SLCo EM, SLCo Public Works, local jurisdictions, State of Utah	Ensuring good status in the NFIP allows for citizen participation.	Low	Local General Fund	Ongoing	High	Flooding risks exist in the community from various sources, including riverine flooding, infrastructure failures (canal breech, dam failure, water main rupture), and groundwater sources. Areas near the Jordan River are in a mostly undeveloped state.
17	Distribute flood hazard and flood preparedness/ response information, such as the “Flooding: What You Should Know When Living in Utah” brochure, which the city partnered in developing in 2014, or similar types of information. Post such information on the city’s website.	Flooding	South Jordan Administrative Services	Emergency Management, South Jordan Fire, SLCo EM, State of Utah, local jurisdictions	Public education and outreach is beneficial because it keeps people informed.	Low	Local General Fund	Ongoing	Medium	
18	Update the city’s Stormwater Master Plan to include specific flood mitigation projects in flood-prone areas of the city	Flooding	South Jordan Public Works	South Jordan Engineering, SLCo EM, SLCo Public Works	Updates to the City Stormwater Master Plan provide mitigation projects and strategies for a changing and growing system.	High ($50–100K)	Local Funds (General fund and Enterprise Fund). FMA, HMGP, PDM	Ongoing	Medium	
19	Install automatic gas shutoff fixtures on any city-owned buildings or structures with gas service/meter that do not have one. Train staff to check the meter immediately after an earthquake event and shut off service if necessary.	Earthquake	South Jordan Admin Services – Facilities	SLCo EM, local jurisdictions	Installing and understanding the use of seismic valves helps to reduce the potential for cascading events.	Medium ($50–100K)	Local General Fund, Staff Time, Grants	Ongoing	Medium	
20	Distribute earthquake hazard preparedness/ response information. Post	Earthquake	South Jordan Administrative Services	South Jordan Emergency	Providing literature and information helps to sustain a resilient community.	Low	Local General Fund	Ongoing	Medium

	such information on the city's website			Management, South Jordan IT, SLCo EM						
21	Support community education programs that raise awareness and provide information to property owners on how to protect their structures from wildfire damage. Post such information on the city's website.	Wildfire	South Jordan Fire Department	SLCo EM, UFA	Providing literature and information helps to sustain a resilient community.	High – $100K	Local General Fund, Grants, Community Wildfire Assistance Grant, Fire Prevention and Safety Grant	Ongoing	High	
22	Maintain a wildland fire response unit	Wildfire	South Jordan Fire Department	SLCo EM, UFA	Maintaining a wildfire response unit and the training requirements mandated promotes capability readiness.	High – $100K	Local General Fund, Community Wildfire Assistance Grant, Fire Prevention and Safety Grant	Ongoing	High	
23	Prohibit the use of fireworks in high-risk areas	Wildfire	South Jordan Fire Department	SLCo EM, UFA	Annual firework restriction efforts, including resolution, maps, and ordinances, help to reduce human-caused fire hazards.	Minimal	Local General Fund, Community Wildfire Assistance Grant, Fire Prevention and Safety Grant	Ongoing	Low	
24	Train firefighters in wildland firefighting	Wildfire	South Jordan Fire Department	SLCo EM, UFA	Training and exercising promote capability readiness.	Medium – $50K	Local General Fund, Community Wildfire Assistance Grant, Fire Prevention and Safety Grant	Ongoing	High	
25	Maintain automatic/mutual aid agreements and assist neighboring jurisdictions as requested	Wildfire	South Jordan Fire Department	SLCo EM, UFA	MOUs and Mutual Aid Agreements ensure that all agencies provide assistance as operationally aligned.	Low	Local General Fund, staff time	Ongoing	Medium	
26	Develop a rebate program to promote water conservation	Drought	South Jordan Fire Department	SLCo EM, UFA	Drought conditions and growing communities provide for an opportunity to promote conservation and program rebates.	Low	Local General Fund	Ongoing	Low	
27	Develop a 5-year Water Conservation Plan	Drought	South Jordan Public Works	SLCo EM, water districts	Drought conditions and growing communities provide for an opportunity to promote conservation.	Low	Local General Fund	Ongoing	Low	

DRAFT

#	Action	Hazard(s)	Lead Agency	Potential Partners	Benefits (Losses Avoided)	Cost Estimate	Funding Source(s)	Timeframe	Priority	Comments
28	Offer annual sprinkler maintenance workshops to promote efficient and effective watering of landscapes	Drought	South Jordan Public Works	SLCo EM, water districts	A sprinkler maintenance workshop during a drought ensures efficient water use by optimizing irrigation systems, reducing waste, and promoting sustainable water conservation practices.	Low	Local General Fund	Ongoing	Low	
29	Promote “Water Week” with elementary school students to promote best management practices for water conservation	Drought	South Jordan Public Works	SLCo EM, water districts, Jordan School District	Water Week helps educate students on water conservation, fostering lifelong habits to protect this vital resource.	Low	Local General Fund	Ongoing	Medium	
30	Provide real-time water use data to customers	Drought	South Jordan Public Works	SLCo EM, water districts	Providing real-time water use data helps individuals and communities identify waste, make informed conservation decisions, and respond quickly to leaks or inefficiencies.	Medium	Local General Fund	Ongoing	Medium	
31	Develop a Pandemic Response & Recovery Plan	Public Health Epidemic/Pandemic	South Jordan Administrative Services –	South Jordan Emergency Management, South Jordan Fire/EMS, SLCo EM, SLCo Health Department	Developing a pandemic response and recovery plan ensures preparedness, minimizes disruptions, and enables a swift, coordinated effort to protect public health and economic stability.	Medium	Local General Fund, EMPG	Ongoing	Low	
32	Engage in the process to become a “StormReady Community” with the NWS	Heavy Rain, High Wind, Lightning, Tornado, Severe Winter Weather, Flooding	South Jordan Administrative Services	South Jordan Emergency Management, South Jordan Public Works, SLCo EM, NWS	Engaging in the process of becoming a StormReady community enhances emergency preparedness, improves public safety, and reduces the risks associated with severe weather events.	Medium – $25–50K	Local General Fund,	Ongoing	Medium	
33	Promote public education in the community regarding severe weather. Post such information on the city’s website.	Heavy Rain, High Wind, Lightning, Tornado, Severe Winter Weather, Flooding	South Jordan Administrative Services	South Jordan Emergency Management, IT, SLCo EM, NWS	Promoting public education in community resilience strengthens preparedness, empowers individuals to take proactive measures, and reduces the impact of severe weather events on lives and property.	Low	Local General Fund	Ongoing	Medium	
34	Support community education programs that raise awareness and provide information on the dangers and risks of avalanches. Post such information on the city’s website, including links to the Utah Avalanche Center.	Avalanche	South Jordan Administrative Services	South Jordan Emergency Management, SLCo EM, NWS, U.S. Forest Service, UDOT	Supporting community education programs on avalanche risks helps residents make informed safety decisions, implement protective measures, and reduce loss of life.	Low – under $5K	Local General Fund	Ongoing	Medium

DRAFT

City of South Salt Lake Annex

To participate in this multi-jurisdictional hazard mitigation plan (MJHMP) update for Salt Lake County (SLCo), the governing body of the City of South Salt Lake passed a formal resolution, a copy of which is maintained at the local government offices.

Planning Process Contact Information

Table 1 provides information on the point of contact during the updating of the MJHMP.

Table 1: Contact Information for the City of South Salt Lake

Name	Contact Information
Yasmin Abbyad	**Phone:** 385-395-2563; e**mail:** Yabbyad@sslc.gov

The City of South Salt Lake has a fully integrated approach to hazard mitigation planning and program implementation. During the 2024 update process, the MJHMP participation roles in Table 2 were recorded.

Table 2: Participant List for the City of South Salt Lake

Name	Title	Jurisdiction/Agency
Craig Giles	Public Works Director	City of South Salt Lake
Christopher Merket	Director of Engineering	City of South Salt Lake
Jonathan Weidenhamer	Community & Economic Development Director	City of South Salt Lake
Sharen Hauri	Director of Neighborhoods	City of South Salt Lake
Terry Addison	Fire Chief	City of South Salt Lake
Yasmin Abbyad	Emergency Management Coordinator	City of South Salt Lake
Steve Niedenhauser	Facilities Manager	City of South Salt Lake
Kelli Meranda	Promise South Salt Lake Director	City of South Salt Lake

Contact List

Table 3 lists plan contacts and stakeholders for the City of South Salt Lake update.

Jurisdiction Profile

Date of Incorporation

September 29, 1938

DRAFT

Location and Description

The City of South Salt Lake is located south of Salt Lake City and is bordered by West Valley City, Salt Lake City, Millcreek, and Murray. The City of South Salt Lake has a mixture of residential, commercial, and industrial areas with recent growth in urban development and revitalization. The City of South Salt Lake maintains a suburban atmosphere with access to major transportation routes, such as I-15 and I-80. The city features a range of parks, shopping centers, and community services that attract local businesses and families.

Population

The 2022 American Community Survey 5-Year Estimate from the U.S. Census Bureau records the population of the city of South Salt Lake as 26,122.

Demographics

Most of the 26,122 people are between the ages of 25 and 29, with a median age of 31.3; 13,518 are males (51.7%) and 12,604 are females (48.3%). English is the primary language in 67.5% of homes,, with 22.2% Spanish, 6.6% other Indo-European languages, 2.5% Asian and Pacific Islander languages, and 1.2% other languages.

Brief History

Latter-Day Saints (LDS) pioneers originally settled South Salt Lake in 1847, but it took nearly a century before the area was incorporated. Inspired by New York City, Jesse Fox Jr began to develop the area in 1890. Originally named Central Park, the area eventually merged with Millcreek and Southgate. Vidas Avenue and Beryl Avenue are tributes to Mr. Fox, bearing the names of his two daughters. The Granite School District was formed in 1904, and Granite High School opened in 1906.

The area of South Salt Lake eventually became the LDS Central Park Ward in 1925, reflecting its growing population and business activity. This eventually led to South Salt Lake's incorporation. In 1936, Salt Lake City attempted to annex the area because of its development and proximity, but the proposal failed mainly due to South Salt Lake's lack of a sewer system. Recognizing the urgent need for a sewer system, residents opted to create a township with its own infrastructure. The Town of Central Park was incorporated from this need but it disincorporated the following year. In 1938, community members voted to incorporate the Town of South Salt Lake, changing its name from Central Park.

Climate

The City of South Salt Lake has a semi-arid climate (BSk Köppen classification), which is common for much of the region. This is characterized by hot, dry summers and snowy winters. Summer temperatures range from 80°F to the lower 90s°F with winter temperatures ranging from the 30s°F and 40s°F. Annual rainfall is approximately 20.9 inches, with snowfall between 30 and 40 inches.

DRAFT

Public Services

The Utah Transit Authority (UTA) light rail system has three stations in the City of South Salt Lake as it passes along 200 West. The Blue, Red, and Green lines all enter the city from the north through Central Pointe station. The Green Line funnels west toward West Valley City, while the Blue and Red lines funnel south, stopping at Millcreek station before exiting the city near Meadowbrook station. Besides the light rail system, UTA operates many local bus routes throughout the City of South Salt Lake.

Governing Body

The city of South Salt Lake is governed by a council-mayor form of government, which includes the Mayor and a seven-member city council. The Mayor is not part of the council but is a separate branch of the government. The city also has several boards and commissions that serve as advisory bodies to the Mayor and the city council, including the Civilian Review Board, Planning Commission, and the Redevelopment Agency.

Development Trends

The city is a major business provider in the county, with over 2,000 businesses that bring approximately 40,000 workers to the city each day. Business areas account for approximately two-thirds of the land use in the area of jurisdiction. The municipality is the crossroads for the region's transportation network. The major interstates of I-15 and I-80 intersect within the municipal boundaries. The city's residents are among the highest users of public transportation, thanks to major bus routes, three light rail stations, and three new stops as part of the South Salt Lake/Salt Lake City streetcar. The city is also the center for government, utility, and education. The State of Utah, Salt Lake County, Utah Transit Authority, and Granite School District have offices and key facilities in South Salt Lake which encompasses approximately 21% of the land in South Salt Lake. Due to the city's proximity to Salt Lake City and vast transit networks, the city has seen a substantial increase in homebuilding. Because the city is essentially "built out," there is very little land for new development, and what remains is expensive. For this reason, most development in the city is more of urban nature with small-lot single-family detached homes, townhomes, and multi-family development.

Jurisdiction-Specific Hazards and Risk

The Calculated Priority Risk Index (CPRI) is a comprehensive assessment tool for evaluating and prioritizing risks in a given context. It considers various factors, such as probability, impact, and urgency, to determine the level of risk associated with events or situations. The results for each hazard, including its risk factor (RF) value, are shown in Table 5. The results are based on the criteria in Table 6 and the equation that follows it. The CPRI helps organizations and individuals make informed decisions about risk management and mitigation strategies. It provides a systematic approach to identifying and addressing potential issues, allowing for a more efficient allocation of resources and proactive risk prevention. With the CPRI, stakeholders can prioritize their focus on the most critical risks, leading to more effective risk management and, ultimately, better outcomes.

DRAFT

Table 5: Calculated Priority Risk Index Values for the City of South Salt Lake

Type of Hazard Event	Probability of Future Events	Spatial Extent	Severity of Life/ Property Impact	Warning Time	Duration	Response Capacity	Risk Factor Value
Avalanche	1	1	1	1	1	1	1
Drought	3	4	2	1	4	2	2.6
Earthquake	3	4	4	4	4	3	3.6
Extreme Heat	3	4	3	1	4	2	2.9
Extreme Cold	2	4	2	1	3	1	2.1
Flooding	3	2	2	3	3	3	2.6
Landslide/Slope Failure	1	1	1	1	1	1	1
Radon	2	3	1	1	4	4	2.1
Heavy Rain	3	3	2	3	1	1	2.3
High Wind	2	3	2	1	1	2	1.9
Lightning	3	1	1	1	1	3	1.8
Severe Winter Weather	3	4	2	1	3	2	2.5
Tornado	1	1	3	4	1	1	1.9
Wildfire	2	2	2	2	2	2	2
Dam Failure	2	3	3	4	2	2	2.6
Civil Disturbance	3	1	2	3	4	1	2.4
Cyberattack	3	3	2	4	4	3	2.9
Hazardous Materials Incident (Transportation & Fixed Facility)	4	2	2	4	4	3	3.1
Public Health Epidemic/ Pandemic	2	4	3	1	4	2	2.6
Terrorism	1	3	4	4	3	4	2.9

Table 6: Criteria for the Calculated Priority Risk Index

Risk Index Factor	Degree of Risk Level		Criteria	Factor Weight for Degree of Risk Level
Probability of Future Events	1	Unlikely	Less than 1 percent probability of occurrence in the next year or a recurrence interval of greater than every 100 years.	30%

DRAFT

Risk Index Factor	Degree of Risk Level		Criteria	Factor Weight for Degree of Risk Level
	2	Occasional	1 to 10 percent probability of occurrence in the next year or a recurrence interval of 11 to 100 years.	
	3	Likely	11 to 90 percent probability of occurrence in the next year or a recurrence interval of 1 to 10 years.	
	4	Highly Likely	91 to 100 percent probability of occurrence in the next year or a recurrence interval of less than 1 year.	
Spatial Extent	1	Limited	Less than 10% of the planning area could be impacted.	10%
	2	Small	10%–25% of the planning area could be impacted	
	3	Significant	25%–50% of the planning area could be impacted.	
	4	Extensive	50%–100% of the planning area could be impacted.	
Severity of Life/Property Impact	1	Negligible	Less than 5% of the affected area's critical and non-critical facilities and structures are damaged/ destroyed. Only minor property damage and minimal disruption of life. Temporary shutdown of critical facilities.	30%
	2	Limited	More than 5% and less than 25% percent of property in the affected area is damaged/ destroyed. Complete shutdown of critical facilities for more than one day but less than one week.	
	3	Critical	More than 25% and less than 50% of property in the affected area was damaged/destroyed. Complete shutdown of critical facilities for over a week but less than one month.	
	4	Catastrophic	Over 50% of critical and non-critical facilities and infrastructures in the affected area are damaged/ destroyed. Complete shutdown of critical facilities for more than one month.	
Warning Time	1	Self-defined	More than 24 hours	10%
	2	Self-defined	12 to 24 hours.	
	3	Self-defined	6 to 12 hours.	
	4	Self-defined	Less than 6 hours.	
Duration	1	Brief	Up to 6 hours.	10%
	2	Intermediate	Up to one day.	
	3	Extended	Up to one week.	
	4	Prolonged	More than one week.	
Response Capacity	1	High	Significant resources and capability to respond to this kind of event; staff are trained, experienced, and ready.	10%

DRAFT

Risk Index Factor	Degree of Risk Level		Criteria	Factor Weight for Degree of Risk Level
	2	Medium	Some resources and capability to respond to this kind of staff; some staff may be trained, experienced, and ready while others may need additional support.	
	3	Low	Limited resources and capability to respond to this kind of event; additional staff or staff training needed.	
	4	None	No resources and capability to respond this kind of event; additional outside support would be required.	

RISK FACTOR (RF) EQUATION

RF Value = [(Probability x 0.30) + (Spatial Extent x 0.10) + (Severity of Life/Property Impact x 0.30) + (Warning Time x 0.10) + (Duration x 0.10) + (Response Capacity x 0.10)]

Hazards with an RF value greater than or equal to 2.5 are considered high risk. Those with RF values of 2.0 to 2.4 are considered moderate risk hazards, and those with an RF value less than 2.0 are considered low risk. The highest possible RF value is 4.

Hazard Event History

Examining hazard event histories provides valuable insights to inform decision-making and help prioritize resources for risk prevention and response efforts. Table 7 lists the hazard events impacting the city of South Salt Lake since the 2019 plan update, as recorded in the Storm Events Database from the National Centers for Environmental Information.

Table 7: History of Hazard Events in the City of South Salt Lake

Type of Hazard Event	FEMA Disaster #	Date(s)	Damage or Impacts	Description
Avalanche	N/A	N/A	N/A	Avalanches do not affect SSL.
Drought	N/A	Aug.–Sep. 2024	Drought has not had severe damage or impacts on SSL.	SSL has experienced D0 (abnormally dry) drought conditions during the late Summer of 2024 based on the U.S. Drought Monitor Scale.
Earthquake	2020-02	March 18, 2020	There was no severe damage caused to city building infrastructure. Issues from sewer	A 5.7M earthquake hit Magna Utah, approximately 12.2 miles away from SSL.

DRAFT

Type of Hazard Event	FEMA Disaster #	Date(s)	Damage or Impacts	Description
			laterals were identified by some homeowners.	
Extreme Heat	N/A	Summers, 2020–2024	Extreme heat has damaged infrastructure and people's health.	Extreme heat events have contributed to heat-related illnesses in SSL. Cooling centers were activated and open to the public.
Extreme Cold	N/A	Winter 2023	Extreme cold affects vulnerable groups like the unsheltered.	Extreme cold events happen most winters in SSL. Additional steps with the local PD help get those who are unsheltered to sheltering areas for the night.
Flooding	NA	Aug. 18, 2021	6–8 commercial properties and 12–15 private homes had minor impacts from localized flash flooding.	SSL and the city of Millcreek had approximately 0.8" of rain in about 1 hour that caused the Mill Creek to rise. The culvert at approximately 675 E. 3300 South was inundated, and water flowed down 3300 South, west toward 400 East, and then north back to the creek. This impacted many homes and businesses. The city closed all impacted roads until the event was over.
Landslide/ Slope Failure	NA	Spring 2022	No damage occurred – there was fear of impacts on life and property damage during this time.	After a very heavy snow year, the snow water equivalent in most drainage basins flowing into the Jordan River were 150%–200% of normal. As temperatures began to rise, there was fear of mass flooding along Mill Creek, the Jordan River, and Spring Creek as the snow began to melt. Due to a steady temperature increase, flooding did not occur.
Radon	N/A	N/A	N/A	Radon affects approximately 47% of households in the Salt Lake valley. Around 30% of homes,, in SSL zip codes are over 4 picocuries.
Heavy Rain	N/A	N/A	There have been heavy rains, but no major damage has resulted in the last five years.	
High Wind	N/A	Sep. 7–8, 2020	The city had serious property damage, including downed trees and power lines, damage to homes and	The state of Utah, including SSL, experienced a severe windstorm with wind speeds exceeding 100 mph in some places.

DRAFT

Type of Hazard Event	FEMA Disaster #	Date(s)	Damage or Impacts	Description
			vehicles, destroyed sidewalks, road closures, loss of power, and many other items of property damaged or destroyed.	
Lightning	N/A		There has been some lightning, but no major damage has resulted in the last 5 years.	
Severe Winter Weather	N/A	N/A	There have been heavy snow/blizzard events but no major damage has been associated in the last 5 years.	N/A
Tornado	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Dam Failure	N/A	N/A	N/A	N/A
Civil Disturbance	N/A	N/A	There have been minor civil disturbances, but no major damage has resulted in the last 5 years.	N/A
Cyberattack	N/A	N/A	N/A	N/A
Hazardous Materials Incident (Transporta-tion & Fixed Facility)	N/A	N/A	N/A	N/A
Public Health Epidemic/ Pandemic	N/A	March 15, 2020–Present	There was unknown damage to community members and major economic losses.	SARS-CoV-2 is a strain of coronavirus that causes COVID-19. SARS-CoV-2 was responsible for the pandemic that killed millions and had many medical repercussions that are still being studied. There is no specific data on SSL residents who were affected medically or otherwise.
Terrorism	N/A	N/A	N/A	N/A

National Flood Insurance Program Summary

The City of South Salt Lake participates in the National Flood Insurance Program (NFIP). Table 8 displays statistics related to the NFIP. The city of South Salt Lake does not participate in the Community Rating System (CRS).

DRAFT

Table 8: National Flood Insurance Program Status for the City of South Salt Lake[2]

Initial FHBM Identified	Initial FIRM Identified	Current Effective Map Date	Adopted Date	Date Joined NFIP	Tribal
09/19/1975	12/18/1985	08/02/2012	2012	12/18/1885	No

The city has designated the South Salt Lake City Engineer as the Floodplain Administrator. The current Flood Damage Prevention Ordinance is dated 1/8/2020. The current effective FIRM is from 8/2/2012. The Building Permits Division is responsible for issuing development permits, including in the SFHA. The Building Permits Division coordinates with the Engineering Division, which helps oversee projects. Every permit also requires an inspection. Substantial damage/substantial improvements are identified through the permitting and inspection process. These structures are required to come into compliance with applicable codes.

Jurisdiction-Specific Vulnerabilities and Impacts

Table 9 provides information on the vulnerable assets in the city of South Salt Lake, including its critical facilities, highlighting the city's vulnerability to identified hazards. It also describes the potential impacts to the community arising from those vulnerabilities. Impacts are the consequences or effects of each hazard on the assets. By understanding the risks associated with these assets, local authorities can develop proactive strategies to mitigate vulnerabilities and ensure the safety and functionality of these important assets during hazard events. These data are invaluable for decision-making and prioritizing resources for emergency response and preparedness efforts, ultimately contributing to more effective risk management and greater resilience in the community.

Vulnerable assets in South Salt Lake include 26,122 residents, 17 schools, 3 fire stations, and 3 police stations. No hospitals are located in South Salt Lake but there may be smaller health clinics. Primary transportation routes include I-15, I-80, State Street, Highway 201, 3300 South, 2100 South, FrontRunner, Trax, and Union Pacific Railroad/Roper Train Yard that traverse South Salt Lake. City parks and the Central Golf Course (Golf the Round) and Jordan River Parkway are among the outdoor assets in the community.

Table 9: Jurisdiction-Specific Vulnerabilities and Impacts the City of South Salt Lake

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
Avalanche	People	N/A – avalanches do not affect South Salt Lake (SSL).
Drought	People	*Vulnerability:* All South Salt Lake residents are vulnerable to drought. Certain vulnerable groups may experience more severe effects, including the elderly, low-income households, families with children, and homeless populations.

[2] FIRM = Flood Insurance Rate Map, FHBM = Flood Hazard Boundary Map

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		Impacts: Drought causes water scarcity for household use. It can lead to decreased water quantity and quality and may increase the risk of illness and/or disease. Drought also affects air quality. Vulnerable Populations: • Elderly individuals are more susceptible to heat and potential limitations on water availability, especially during droughts. • Low-income households may struggle with the costs of water conservation measures, such as drought-resistant landscaping, water-efficient appliance upgrades, or paying higher water bills during shortages. • Families with children are particularly affected in neighborhoods lacking access to well-maintained parks or water-based recreational areas. • Homeless populations lack access to clean water, cooling centers, or consistent water supplies for hygiene and drinking. Health Impacts: • There is an increased risk of heat-related illnesses and dehydration due to drought conditions. • Air quality deteriorates as a result of dust and wildfires, which can be worsened by prolonged dry conditions. Action Considered – Partnerships and Collaboration: • Strengthen partnerships with the Jordan Valley Water Conservation District and the Central Valley Water Reclamation Facility to support water conservation programs, provide rebates for efficient water use, and expand community engagement on sustainability initiatives.
	Structures	*Vulnerability:* Residential and commercial properties, as well as public facilities, are vulnerable to drought. *Impacts:* A lack of water can impede future development and landscaping. Residential Properties: • Homes with traditional landscaping and conventional irrigation systems will experience higher water demand. • Older homes with outdated plumbing systems may face more significant challenges in conserving water, which can lead to higher costs and inefficiencies. Commercial Buildings: • Water-reliant businesses, such as laundromats, restaurants, and car washes, may face higher costs or operational limitations due to water scarcity. Public Facilities: • Parks, public pools, and other recreational areas that rely on water may face closures or restricted operations due to reduced well water availability. Agricultural Land: • If agricultural properties are present, they may experience crop losses or reduced yields, impacting the local economy and food supply.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		Action considered – Upgrading Infrastructure: • Invest in smart irrigation systems, leak-detection technology, and infrastructure improvements for both residential and public buildings to increase water efficiency and reduce waste from the well system.
	Economic Assets	*Vulnerability:* Water-intensive businesses and government services are vulnerable to drought conditions. *Impacts:* Water restrictions can lead to economic losses for some businesses. Businesses: • Companies, such as landscaping services, nurseries, and vehicle washing services, could face severe economic strain due to water restrictions from well system limitations. Tourism: • Drought conditions may affect the appeal of local outdoor attractions, thereby reducing tourism and the revenue it generates for local businesses. Utilities and Municipal Services: • Increased demand on the well water supply system may strain municipal budgets and resources as efforts to maintain consistent service levels grow more challenging.
	Natural, Historic, and Cultural Resources	*Vulnerability:* City green spaces and parks are vulnerable to drought conditions. *Impacts:* Drought conditions can lead to the deterioration of natural resources, historic sites, and cultural resources. Natural Resources: • Parks, the Jordan River, and other green spaces dependent on the water table may see a reduction in flora and fauna, impacting biodiversity. • Wetlands, if present, could experience substantial degradation, thus harming wildlife habitats. Historic Sites: • Drought-related damage, such as cracking and deterioration from heat, could threaten historic landmarks and buildings if water becomes limited for essential maintenance. Cultural Resources: • Cultural events that rely on public spaces like parks may be affected by drought conditions, which could limit available venues or resources.
	Critical Facilities and Infrastructure	*Vulnerability:* Water supply systems and emergency response services are vulnerable to drought conditions. *Impacts:* Drought can significantly affect the functionality and efficiency of critical infrastructure. Water Supply: • The well system providing culinary water may come under strain, leading to rationing, use restrictions, or infrastructure challenges.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		• Public irrigation systems, especially for parks and city lands, may become vulnerable as well levels drop, limiting functionality. Stormwater Management Systems: • Extended droughts can lead to soil compaction, which increases the risk of flooding during heavy rains, posing threats to the stormwater management infrastructure. Emergency Services: • Increased fire risks from dry conditions will place additional pressure on fire departments and emergency response teams. • Hospitals and clinics may see a rise in heat-related illness and dehydration cases, impacting the healthcare system.
	Community Activities	*Vulnerability:* Recreation areas and activities are vulnerable to drought conditions. *Impacts:* Drought conditions can significantly impact the usability and enjoyment of community recreational areas. • Sports fields, Golf the Round, and parks may become less usable because water restrictions limit the ability to maintain landscaping. • Outdoor festivals and public gatherings may be canceled or experience decreased attendance due to drought-related fire risks or lack of viable green spaces. Gardening and Landscaping: • Local residents and businesses may transition to xeriscaping or other water-efficient landscaping designs to conserve water. Action Considered – Public Events and Water Use Campaigns: • Community outreach programs will increasingly focus on water conservation to raise awareness about drought-resistant practices and encourage changing behaviors around water use. Community Education and Outreach: • Launch targeted educational campaigns to inform residents and businesses about water-saving practices, available rebates, and the benefits of drought-resistant landscaping.
Earthquake	People	*Vulnerability:* All South Salt Lake residents are vulnerable to earthquakes. Some populations may face unique challenges. SSL has a large daytime population due to commuters. *Impacts:* People may be injured or killed by falling objects or collapsed structures. Many day-to-day activities such as school and work may be disrupted. Some people may be displaced from their homes. • Elderly individuals may be more susceptible to injury during an earthquake and in the immediate aftermath because of limited resources available. • Low-income households may be unable to rebuild their homes if they are damaged. In addition, these individuals is less likely to have earthquake insurance or the ability to retrofit their homes. • Families with children may be separated during and in the aftermath of an earthquake if infrastructure, such as roads and communication lines, is down or damaged. • Unsheltered populations may not have the resources to prepare for a catastrophic disaster, such as a major earthquake.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		Health Impacts*:* • Health impacts may be severe, with many individuals injured if infrastructures such as roads or bridges are unusable. Individuals may be impacted by hazmat spills, and there will likely be limited sheltering options.
	Structures	*Vulnerability:* All structures in South Salt Lake are vulnerable, including homes and businesses. • Older structures and unreinforced masonry homes that were built before 1975 and have not been retrofitted are likely to sustain severe damage. • There is a moderate to high potential for liquefaction in all of SSL that could affect building structures, including residential and commercial properties, as well as city and county owned property. • SSL is adjacent to both the West Valley Zone, including Taylorville's Fault, and the East Bench Fault in the Wasatch Fault Zone. *Impacts:* Shaking from a moderate to strong earthquake can damage walls, chimneys, and foundations. Damage may be extensive, and buildings may become unusable. Businesses may be forced to close, and residents may be displaced.
	Economic Assets	*Vulnerability:* Businesses and commerce are vulnerable to disruption from earthquakes. *Impacts:* The flow of commerce and goods may be severely affected if the Roper Train Yard and/or the intersection of I-15 & I-80 are severely damaged. Many businesses may be slow to reopen in the immediate aftermath of an earthquake. Commerce could be severely interrupted. Businesses will likely lose revenue and workers could be severely impacted by wage loss. Economic loss could be felt across the region. The sales tax base would be impacted by business losses.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Historic structures are highly susceptible to earthquake damage *Impacts:* Historic Scott's School and the South Salt Lake Community Center would likely be severely damaged.
	Critical Facilities and Infrastructure	*Vulnerability:* All city infrastructure—including roads, pipes, water, communications, city buildings, police stations, fire stations, and major highways—may be severely affected. *Impacts:* Fire and police stations, healthcare facilities, schools, and other government buildings may be damaged by earthquakes, and their service may be disrupted. Water supply networks, wastewater systems, power distribution networks, and communication systems are also vulnerable to damage from earthquakes and may be inoperable. Critical facilities and government services may not be able to operate until these systems are restored. Several major transportation routes in South Salt Lake could be damaged. I-15, I-80, rail lines in Roper Train Yard, Trax, FrontRunner, and numerous local roads could be damaged and impassable. Emergency response and delivery of goods and materials may be inhibited, delaying recovery.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
	Community Activities	*Vulnerability:* Day-to-day activities, work, education, and community events may be canceled following an earthquake. *Impacts:* Response and recovery efforts may disrupt activities following an earthquake. A stronger magnitude earthquake will likely result in longer disruptions and cancellations. If an earthquake occurred during events such as the 4th of July Parade and Celebration, Craftoberfest, Mural Fest, or Celebrate SSL, it would lead to major losses and difficulties with evacuation.
Extreme Heat	People	*Vulnerability:* All residents are vulnerable to extreme heat. Socially vulnerable populations, like seniors, individuals with disabilities, lower-income individuals, and those who are unsheltered, can be severely affected by extreme heat. In addition, those who work primarily outdoors or who do not have air conditioning may be greatly affected. *Impacts:* Individuals without access to shade, air conditioning, and water are vulnerable to heat-related illnesses such as heat exhaustion, heat stroke, and dehydration. Vulnerable populations, such as the elderly and young children, may have difficulty regulating their body temperature and may suffer heat-related illness, requiring medical care. Low-income households may not be able to cool their homes.
	Structures	*Vulnerability:* Extreme heat can be detrimental to homes, businesses, industry, and city-owned buildings. *Impacts:* Extreme heat can strain building materials, increase energy consumption, reduce air quality, and create fire hazards. Materials like metal and glass can amplify heat retention, while areas with limited green space typically experience higher temperatures. South Salt Lake may experience urban heat island effects, which exacerbate extreme heat conditions.
	Economic Assets	*Vulnerability:* Businesses are vulnerable to economic losses due to extreme heat. *Impacts:* Investment in the local economy could decrease, especially if local businesses cannot absorb the high energy demands and costs for proper ventilation and air conditioning. Construction or other outdoor occupations may reduce productivity during extreme heat. Additionally, people may not want to go outside or travel if the temperatures are very high, leading to losses in the tourism and recreation industries.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Parks and recreational activities are vulnerable to extreme heat. *Impacts:* Extreme heat will affect leisure activities such as Golf in the Round, and play for children at all city parks including Fitts, Bickley, and Harmony Parks.
	Critical Facilities and Infrastructure	*Vulnerability:* City facilities and transportation systems may be affected by extreme heat. *Impacts:* Extreme heat would have an effect on the city's infrastructure and its ability to respond to some incidents like large fires. Residents may depend on city facilities as cooling stations. Proper ventilation and cooling would pose an issue.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		Roads can buckle due to extreme heat, which may cause significant transportation disruptions on I-15, I-80, or other major roads through South Salt Lake. Rail lines could also be damaged.
	Community Activities	*Vulnerability:* Community events are vulnerable to extreme heat. *Impacts:* Extreme heat may reduce attendance or affect staff availability for local events, such as the 4th of July Parade, Mural Fest, Craftoberfest, and Celebrate SSL.
Extreme Cold	People	*Vulnerability:* All South Salt Lake residents can be exposed to extreme cold. Socially vulnerable populations, such as seniors, individuals with disabilities, lower-income individuals, and those who are unsheltered, can be severely affected by extreme cold. *Impacts:* Below-freezing temperatures occur annually in SSL. They impact the elderly, low-income, and transient populations the most. Individuals exposed to extreme cold can experience life-threatening health effects, including hypothermia and frostbite. Residents may struggle with increased heating costs.
	Structures	*Vulnerability:* Homes, businesses, and water systems are vulnerable to extreme cold. *Impacts:* Pipes and heating systems in buildings or residential properties can be adversely affected by extreme cold. There is the potential for burst pipes, water damage, or power failure.
	Economic Assets	*Vulnerability:* Business disruptions are susceptible to disruptions due to extreme cold. *Impacts:* Businesses may face increased heating costs, and economic assets could suffer if heating is limited or in short supply, which could affect the local energy supply. Extreme cold can cause power disruptions if pipes freeze, potentially preventing locals from visiting businesses.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Local vegetation and wildlife are affected by extreme cold. *Impacts:* Wildlife may change migration patterns, and vegetation may die off due to harsh conditions.
	Critical Facilities and Infrastructure	*Vulnerability:* Critical facilities, including homeless shelters and transportation systems, are vulnerable to extreme cold. *Impacts:* Facilities are at risk of water failure or damage if pipes freeze or if heating is not adequate. Extreme cold, coupled with heavy snow or high winds, can disrupt essential services like police and fire departments. The homeless shelter in South Salt Lake may experience increased demand and exceed capacity, necessitating additional resources, particularly during Code Blue alerts. Extreme cold combined with rain or snow can create icy road conditions, leading to transportation delays.
	Community Activities	*Vulnerability:* Community activities, recreation, and events are vulnerable to extreme cold. *Impacts:* Attendance at community events would be affected if adequate heating cannot be guaranteed. Additionally, transportation to

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		and from community activities would be impacted if public transportation is unable to operate in very low temperatures.
Flooding	People	*Vulnerability:* Residents in flood zones, unsheltered populations, and workers are vulnerable to flooding. A significant proportion of South Salt Lake near Millcreek is in a Special Flood Hazard Area, either a 1% or 0.2% annual chance flood zone. *Impacts:* Residences near Millcreek and Jordan River could be flooded, displacing residents. Those who are displaced or impacted by floodwaters might require rescue operations.
	Structures	*Vulnerability:* Residences and commercial facilities near the creek and/or river may be affected by floodwaters. The area is primarily residential east of State Street and commercial on the west side, so homeowners and renters would be impacted the most. *Impacts:* Flooding can cause extensive damage to structures. The levee along Jordan River is owned and operated by Salt Lake County. Roper Train Yard and the I-80/I-15 intersection could be disrupted by a major flood.
	Economic Assets	*Vulnerability:* Businesses, rail lines, and commerce are vulnerable to flooding. *Impacts:* Roper Train Yard and the Union Pacific Railroad may be affected, with issues such as submerged rail lines disrupting the transportation of goods. Inventory could be damaged.
	Natural, Historic, and Cultural Resources	Vulnerabilities: Tracy Aviary, Scott School, and Fitts Park are vulnerable to flooding. *Impacts:* Cultural sites could be affected by floodwaters and sustain considerable damage.
	Critical Facilities and Infrastructure	Vulnerabilities: Water systems, transportation systems, critical facilities, and emergency response facilities are vulnerable to flooding. *Impacts:* South Salt Lake Public Works and Mount Olympus Sewer District could see a large volume of inflow into their sewer system that could cause significant backups. The pump stations near the Jordan River may be impacted and become fully surcharged. South Salt Lake Public Works has a water well and storage tank located next to the creek that could be impacted by power outages and/or contaminated by floodwaters. First responders may need to rescue people.
	Community Activities	Vulnerabilities: Community events and parks are vulnerable to flooding. *Impacts:* Events may be canceled, and recreation areas closed. Mill Creek, which flows through the South Salt Lake Fitts Park, has multiple events during the year that could be impacted by floodwaters. Jordan River Park Trail could also be impacted.
Landslide/ Slope Failure	People	N/A – landslides do not affect SSL.
Radon	People	*Vulnerability:* All South Salt Lake residents are vulnerable to radon exposure. Results of home radon tests in South Salt Lake show that between 25% and 50% of homes have dangerous levels of radon.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		Residents in older homes or those situated over radon-prone soils are at higher risk. *Impacts:* Long-term radon exposure is the second-leading cause of lung cancer. Children and those smokers are at increased risk of lung cancer in homes where radon is present or has not been tested for.
	Structures	*Vulnerability:* Structures have minimal vulnerability to radon, as it is primarily a health risk. *Impacts:* Although radon doesn't directly impact structures, the condition of structures contributes to radon levels that pose a risk to occupants. Buildings with basements or slab-on-grade foundations are at a higher risk of radon infiltration, especially those with cracks in flooring or foundation walls. Older homes without updated ventilation systems are particularly susceptible in this part of the Salt Lake Valley, where naturally occurring uranium in the underlying geology increases radon presence. Residential and commercial properties are at risk, especially if there is not adequate ventilation or there are cracks in the building foundation for radon to seep through.
	Economic Assets	*Vulnerability:* Real estate and home values are vulnerable to radon issues. *Impacts:* Residential and commercial properties in South Salt Lake may experience lower market value and increased maintenance costs due to radon remediation needs. Real estate transactions can be delayed or disrupted when radon is detected, and rental units may require costly mitigation to meet tenant safety expectations. Radon could affect the city's reputation if mitigation work and public education are not prioritized. The public may choose to recreate or invest in other areas if there are high radon levels in the city.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Historic buildings are vulnerable to radon exposure. *Impacts:* Historical buildings that have not been regularly maintained or inspected are at higher risk.
	Critical Facilities and Infrastructure	*Vulnerability:* Public buildings are vulnerable to radon exposure. *Impacts:* Critical facilities pose an increased health risk if the building foundation has leaks, potentially exposing employees to radon. Schools, daycares, and community centers in South Salt Lake should consider regular testing to protect young children and staff.
	Community Activities	*Vulnerability:* Community activities have limited vulnerability to radon exposure, given that radon primarily poses a long-term health risk rather than an immediate threat to activities. *Impacts:* Radon is a long-term exposure risk and hasn't typically affected day-to-day activities. With increased awareness, indoor community activities may be canceled or have low attendance if the building has high radon levels.
Heavy Rain	People	*Vulnerability:* All of the South Salt Lake population is vulnerable to heavy rain. People near creeks are at higher risk. *Impacts:* Heavy rain can cause flash flooding in low-lying areas and may contribute to flooding in Mill Creek and along the Jordan River. Homeowners living along waterways might be displaced by flooding.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
	Structures	*Vulnerability:* Homes and businesses are vulnerable to heavy rain. Heavy rain events have overwhelmed select areas of the city including Mill Creek at the 700 East culvert. *Impacts:* Homes and businesses along the Mill Creek and the Jordan River might flood.
	Economic Assets	*Vulnerability:* Businesses and inventory are vulnerable to heavy rain. Impact: Businesses situated along waterways or in flooding zones might be flooded and lose inventory or revenue from closures.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Vegetation is vulnerable to heavy rain. *Impacts:* Local vegetation would be affected by significant rain levels, causing soil erosion and crop loss.
	Critical Facilities and Infrastructure	*Vulnerability:* Stormwater systems and drainage structures are vulnerable to heavy rain. *Impacts:* During heavy rains, the culvert at 700 East and 3300 South can overflow, flooding nearby homes and residential buildings.
	Community Activities	*Vulnerability:* Community events, fairs, and markets are vulnerable to heavy rain. *Impacts:* Community activities in Harmony Park may be disrupted by heavy rain.
High Wind	People	*Vulnerability:* The entire population in South Salt Lake is vulnerable to high wind. Wind events occur over a large area and can impact the whole city as well as neighboring jurisdictions. *Impacts:* Those who are unsheltered or who work primarily outdoors may be severely injured by sudden gusts of wind or by unsecured objects caught in the wind. Drivers may be affected by sudden gusts of wind and become unable to control the vehicle's direction, especially on I-80 and I-15. Debris on roads would also impact driving.
	Structures	*Vulnerability:* All structures in South Salt Lake are vulnerable to high wind. *Impacts:* High winds may down trees, damage roofs, and break windows. Debris can cause road closures and affect emergency vehicle access. Sidewalks, fences, sheds, homes, vehicles, and many other items of property could be damaged.
	Economic Assets	*Vulnerability:* Businesses may experience disruption due to high wind. *Impacts:* Windstorms may affect highway and train travel to and within SSL.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Trees and parks are vulnerable to high wind. *Impacts:* High winds may cause damage or destruction to city park trees and add increased stress to playground equipment.
	Critical Facilities and Infrastructure	*Vulnerability:* Utility systems and transportation are vulnerable to high wind. *Impacts:* Damaged tree limbs can block roads and interfere with power lines. Windstorms can cause severe damage to power lines, destroy sidewalks, cause road closures, damage city communications towers

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		and buildings, and disrupt power. The widespread loss of power can take days to restore.
	Community Activities	*Vulnerability:* Public events are vulnerable to high wind. *Impacts:* There may be severe disruptions and potential injuries caused by high wind events at any of the city's public events, such as the 4th of July Parade, Mural Fest, Craftoberfest, and Celebrate SSL. These events could overwhelm essential services like police and fire.
Lightning	People	*Vulnerability:* Lightning can occur anywhere in South Salt Lake, and all populations are vulnerable. People engaging in outdoor recreation are at increased risk, and unhoused populations are particularly at risk. *Impacts:* SSL has many recreational parks, and those recreating outdoors may be subject to lightning storms. Lightning can cause severe injury or death. The homeless population may not be able to obtain shelter quickly.
	Structures	*Vulnerability:* All structures are vulnerable to lightning. *Impacts:* Lightning can ignite fires or cause electrical damage. Storms can cause power outages, which affect essential services like police and fire response.
	Economic Assets	*Vulnerability:* Businesses are vulnerable to disruption from lightning. *Impacts:* Local businesses may suffer if there is a prolonged power outage or lightning event. There are cascading events if lightning is coupled with heavy rain or high winds.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Historic trees and homes are vulnerable to lightning strikes. *Impacts:* Mature trees and historic buildings may be damaged by lightning strikes, which could potentially cause fires.
	Critical Facilities and Infrastructure	*Vulnerability:* Power networks, emergency response, and healthcare facilities are vulnerable to disruptions from lightning. *Impacts:* Power networks may be impacted by lightning and critical facilities could be disrupted if they lack power. Essential services could be disrupted if there are road closures or debris on the road caused by lightning. Additionally, it may be difficult to help patients if there are downed power lines or power disruptions.
	Community Activities	*Vulnerability:* Public events are vulnerable to the effects of lightning. *Impacts:* Outdoor events may be affected by lightning, especially during the summer months. Sheltering a large number of people could pose an issue.
Severe Winter Weather	People	*Vulnerability:* Severe winter weather can affect the entire city. All South Salt Lake residents are vulnerable. Elderly, young, disabled, and unhoused populations are particularly vulnerable. *Impacts:* Heavy snow, blizzards, and snow squalls happen frequently in the winter months. Snowy or icy conditions can lead to injuries from slips and falls. Unhoused populations may experience hypothermia. Elderly individuals may struggle with mobility and experience cardiac problems from shoveling heavy snow. People with disabilities may depend on assistance that might be delayed or unavailable during storms. Those without reliable transportation could become stranded.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		People driving on snowy roads can be injured in car accidents due to slick conditions.
	Structures	*Vulnerability:* Homes and businesses have limited vulnerability to severe winter weather. *Impacts:* Homes and other structures could be affected by heavy snow or blizzards, especially roofs.
	Economic Assets	*Vulnerability:* Businesses may experience disruptions due to severe winter weather. *Impacts:* The flow of commerce may be disrupted if the highways, such as I-80 or I-15, and the Roper Train Yard are disrupted by heavy snow or blizzards. Employers may be temporarily affected when roads are unsafe for travel.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Vegetation, wildlife, and historic buildings are vulnerable to the effects of severe winter weather. *Impacts:* Historical structures may be at risk, depending on their building material or roof age, if the snow exceeds a certain amount. Roofs could collapse from the heavy load or affect power. Local vegetation might be impacted by heavy snow or blizzards. Wildlife migration patterns could be disrupted by consistent heavy snow and blizzard conditions.
	Critical Facilities and Infrastructure	*Vulnerability:* Power systems and transportation are vulnerable to severe winter weather. *Impacts:* Power may be interrupted in heavy snow or blizzard conditions, disrupting government operations, healthcare facilities, and emergency response. There may be an increased demand for response and medical care if there are many traffic accidents. Transportation may be temporarily disrupted in heavy snow, blizzard, icing, and snow squall conditions. I-15, I-80, State Street, 3300 South, and other routes could be closed or experience significant delays. Rail and transit lines may also be delayed.
	Community Activities	*Vulnerability:* Public events are vulnerable to severe winter weather. *Impacts:* If transportation is affected, there could be temporary disruptions to daily activities. Commutes to work or entertainment in SSL may be disrupted.
Tornado	People	*Vulnerability:* The entire South Salt Lake population could be affected by a tornado. Tornadoes are rare but could potentially occur anywhere in the city. *Impacts:* Residents are vulnerable to serious injury from blowing debris, uprooted trees, or falling limbs, and structural collapse. Individuals living in mobile homes face higher risks, as these structures can be easily damaged. Those with limited mobility, such as the elderly and people with disabilities, may struggle to reach safety quickly.
	Structures	*Vulnerability:* Any structure near or on the path of a tornado is vulnerable to damage. This could occur anywhere in South Salt Lake, and all buildings are vulnerable. *Impacts:* Homes and businesses could sustain heavy damage from a tornado, including roofs torn from homes, broken windows, and walls damaged or compromised. Mobile homes and some older homes are

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		particularly at risk due to their light weight and insecure foundations. Large-span structures can have roofs easily lifted by tornado winds, which may affect commercial and other large structures between the train yard and the Jordan River.
	Economic Assets	*Vulnerability:* Businesses are vulnerable to interruption in the event of a tornado. *Impacts:* Any business in the path of the tornado is vulnerable. Tornadoes can damage retail and commercial structures, warehouses, hotels, restaurants, and other businesses. Damage to power or communication systems will cause temporary business closures. Operational downtime and damage to structures and inventory may lead to lost revenue and potentially lost wages or layoffs. Recovery would be challenging if local businesses or homeowners do not have the funds or an insurance policy in place to make repairs or rebuild. Roads and bridges may be blocked, which may disrupt access to businesses or interrupt supply chains.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Parks and open spaces are vulnerable to damage from tornadoes. *Impacts:* Cultural resources, including monuments and parks that are vital to community heritage, also may be at risk. South Salt Lake's parks and open spaces could be severely damaged by tornado.
	Critical Facilities and Infrastructure	*Vulnerability:* Fire and police stations, city facilities, healthcare clinics, and utility systems are vulnerable. Any aboveground facilities in the path of the tornado could be affected. *Impacts:* Public safety buildings, schools, and other civic facilities may need emergency inspections or repairs and may be closed temporarily. Utilities like communication towers or power stations are at risk. Disruption to these services might affect the operation of other critical facilities. If there's debris on the roads or highways, it would create significant delays in emergency response.
	Community Activities	*Vulnerability:* Public events are vulnerable to cancellation due to tornadoes. *Impacts:* Outdoor events such as festivals, fairs, and sporting events may be canceled, reducing opportunities for social engagement. Any community activity taking place during or in the immediate aftermath of a tornado would be affected.
Wildfire	People	*Vulnerability:* There is limited wildfire risk in South Salt Lake, but fire may be possible in undeveloped land near the Jordan River. Air quality could be affected. *Impacts:* The unhoused population and those engaging in recreation along the Jordan River may be vulnerable to harm from wildfires. Although SSL has a low wildfire risk, there is potential for wildfires to move in from surrounding cities like Millcreek and Salt Lake City. The entire valley could experience poor air quality and related health impacts from wildfire in the region. Children, the elderly and those with respiratory health problems are at higher risk for complications from poor air quality.
	Structures	*Vulnerability:* The risk to structures from wildfires in SSL is low.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		Impacts: A few structures near undeveloped areas along the Jordan Willow could potentially be damaged by a wildfire.
	Economic Assets	*Vulnerability:* Outdoor recreation businesses are vulnerable to impacts from wildfires. *Impacts:* Golf courses and local parks would be impacted by a wildfire moving into SSL or poor air quality from fires in neighboring cities. How fast the city recovers would dictate whether people choose to visit local businesses or recreate in SSL again.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Local vegetation and wildlife are vulnerable to impacts from wildfires. *Impacts:* Riparian vegetation and wildlife along Jordan River could be adversely affected by a wildfire.
	Critical Facilities and Infrastructure	*Vulnerability:* Power supply is vulnerable to disruption by wildfires. *Impacts:* Emergency response, healthcare, and other city services could be disrupted by a power outage resulting from a wildfire.
	Community Activities	*Vulnerability:* Public events are vulnerable to cancellation due to wildfires. *Impacts:* Outdoor community activities would be impacted by a wildfire if people cannot find shelter. Outdoor events may be canceled due to wildfire smoke. Other factors, such as high winds and lightning, can increase the severity of a wildfire.
Dam Failure	People	*Vulnerability:* Although SSL does not have any dams within the city, there are a few high and significant hazard dams in neighboring cities. People in potential inundation areas are vulnerable, primarily in the eastern and northern areas of the city (see maps in Volume 1). *Impacts:* Dam failure can cause swift-moving floodwaters that may injure those downstream. Flooding from dam failure would significantly impact the local population in terms of sheltering, road access, and medical assistance. Injuries are likely, and socially vulnerable groups like the elderly, youth, and unsheltered individuals are at greater risk.
	Structures	*Vulnerability:* Structures within dam inundation boundaries could be damaged by flood. *Impacts:* Residences and businesses downstream of dams are likely to experience damage if a dam fails.
	Economic Assets	*Vulnerability:* Business are vulnerable to disruption due to dam failure. *Impacts:* Businesses in potential inundation areas could experience structural damage and inventory loss. Damage to utility systems or roads may disrupt business functions. If an insurance policy is not in place or the funds are not available to make necessary repairs after flooding from a dam failure, it will be difficult for local businesses to recoup lost revenue.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Vegetation, parks, and natural waterways are vulnerable to impacts from dam failure. *Impacts:* Waterways and open spaces like parks may be flooded and experience damage and deterioration. Local vegetation would be impacted, leading to soil erosion.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
	Critical Facilities and Infrastructure	*Vulnerability:* Two police stations, one fire station, four schools, and five county facilities are within dam failure inundation boundaries in South Salt Lake. Additionally, major transportation routes such as I-80, State Street, 2100 South, Trax/FrontRunner, and utilities are at risk. *Impacts:* Critical infrastructure would be compromised. Emergency response facilities and community assets could be damaged and services unavailable following a dam failure. Power substations could be damaged, leading to power outages. Water supply could be disrupted if reservoir dams fail. Roads could be damaged or blocked, disrupting access to communities and contributing to emergency response delays. Additionally, a medical surge could occur if there are numerous injuries or fatalities.
	Community Activities	*Vulnerability:* Public events are vulnerable to disruption due to dam failure. *Impacts:* Outdoor community activities would be impacted if people do not feel safe or if the area is still in the process of rebuilding.
Civil Disturbance	People	Business owners (looting) and those attending community events or large gatherings could be affected.
	Structures	Local businesses along State Street, Main Street, or near the jail may be affected by civil disturbance. In addition, the SSL City Hall, Justice Court, and police and fire stations may be affected.
	Economic Assets	There may be damage to parks, city-owned property, vehicles, or new development.
	Natural, Historic, and Cultural Resources	The SSL Community Center, Granite Library, Tracy Aviary, and/or churches in the area may see damage or destruction to property.
	Critical Facilities and Infrastructure	Drinking water, clinics, the jail, the Roper Train Yard, power, and schools may be affected by a civil disturbance event.
	Community Activities	The 4th of July, Celebrate SSL, Mural Fest, Spooky City Hall, and Craftoberfest may be disrupted by civil disturbances.
Cyberattack	People	The public will have a difficult time accessing municipal services. Services to the public may be slowed. This may impact Fire and Police interaction with the public, Finance, and Communication capabilities.
	Structures	Physical security may be compromised so commercial and residential structures are at risk. If the hacker can get into the system, they could change settings or get into homes.
	Economic Assets	Economic flow of services may be disrupted or delayed from the city to its residence and vice versa.
	Natural, Historic, and Cultural Resources	Physical security could be compromised in historic buildings. Valuable items could be stolen if the hackers can gain access.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
	Critical Facilities and Infrastructure	Water services may be affected for the entire city during a severe cyberattack. Essential services could be disrupted if emergency calls cannot be routed.
	Community Activities	Planning for community activities, such as the City's 4th of July Parade, Festivals, and Celebrate SSL, may be disrupted during a cyberattack. This would impact city revenue.
Hazardous Materials Incident (Transporta-tion & Fixed Facility)	People	Those most vulnerable to a hazmat spill include those who are immunocompromised, children, the elderly, and unsheltered populations.
	Structures	Depending on the hazardous material, it could compromise the building components and cause structures to be evacuated. It could cause long-term closures of bridges and railways.
	Economic Assets	A hazmat incident at or near Roper Train Yard, I-80, or I-15 causing severe damage would disrupt the flow of goods across the country.
	Natural, Historic, and Cultural Resources	Parks may have to be evacuated in the event of a hazmat incident. Local vegetation would be significantly impacted by hazardous materials, impacting long-term growth and soil quality. Local wildlife may die due to the contaminated vegetation.
	Critical Facilities and Infrastructure	SSL's drinking and/or stormwater may be affected during a hazmat incident. If roads and highways are closed, it could affect emergency response.
	Community Activities	During a community activity, a hazmat event could force an evacuation or a shelter-in-place directive. This would severely disrupt the 4th of July Parade, City Festivals and/or Celebrate SSL.
Public Health Epidemic/ Pandemic	People	As seen with the 2020 COVID-19 pandemic, the individuals most vulnerable include those who are immunocompromised, frontline workers, the elderly, children, and those who are pregnant.
	Structures	Commercial and residential properties would be impacted by a pandemic or epidemic, especially if social distancing is necessary or stores need to limit the amount of people in them.
	Economic Assets	Roper Train Yard and interstate travel of goods may be disrupted. In addition, the closure of schools may affect these assets.
	Natural, Historic, and Cultural Resources	There may be an increased population visiting the Fitts and Harmony Parks.
	Critical Facilities and Infrastructure	The Resource Centers that shelter those unhoused may be affected. Medical surge is a concern if people are sick and need to be transported to a hospital.
	Community Activities	Community activities would be disrupted, such as the 4th of July Parade, the City Festivals, and Celebrate SSL.
Terrorism	People	SSL is one of the most diverse cities in Utah. Those from an international origin may be at an increased risk of a terrorist attack.
	Structures	SSL city facilities, homes, and businesses surrounding the train yard and the highways may be affected during a terrorism threat.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
	Economic Assets	SSL city facilities may not operate at full capacity for a short period, and the flow of goods by train or highway may be severely disrupted.
	Natural, Historic, and Cultural Resources	Visits to cultural or historic areas in SSL may be reduced if people do not feel safe.
	Critical Facilities and Infrastructure	SSL water services may be severely impacted during and after a terrorist event. Medical surge is possible if there's a high number of fatalities or injuries.
	Community Activities	4th of July, Celebrate SSL, Mural Fest, and Craftoberfest, may be the target or may be disrupted and cause severe damage during or after a terrorist event.

Hazards Not Profiled

Avalanche and landslide/slope failure have been omitted from further discussion of hazard impacts and from mitigation actions. As shown in the hazard description in Volume 1, avalanche and landslide risk is primarily in the Wasatch and Oquirrh Mountains in Salt Lake County. South Salt Lake has mostly flat terrain and minimal risk of impacts from these hazards. No previous occurrences of avalanche or landslide have impacted South Salt Lake.

Problems soils were identified in the mitigation action table of South Salt Lake's 2019 Hazard Mitigation Plan annex; however, no hazard profile details were included in the annex regarding the vulnerability of the city to problem soils, and no reports of damage from previous occurrences were found. Because this hazard was not profiled in the county plan or neighboring jurisdictions, and risk is low, the city opted not to complete a hazard profile for problem soils.

Jurisdiction-Specific Changes in Vulnerability

Hazard events can impact communities, infrastructures, and ecosystems. The severity of these impacts can be influenced by climate change, population patterns, and land use developments. Understanding these factors is crucial for the city of South Salt Lake to develop a resilient community and minimize the impacts of hazards. Table 10 displays the changes within the community and the related effects on each identified hazard affecting the city of South Salt Lake.

Table 10: Jurisdiction-Specific Changes in Vulnerability in the City of South Salt Lake

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
Avalanche	N/A	N/A	N/A	N/A
Drought	Climate change creates an increased chance of drought,	The increased population affects water access,	The city could consider additional	Increased

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	especially if there is decreased snowpack and rain to get us through the summer.	potentially leading to water rationing and/or higher crime rates to get water.	regulations to limit water irrigation for residential and/or commercial use.	
Earthquake	Climate can impact soil and water quality, causing soil erosion and changes in wildlife patterns. Local vegetation would be impacted by an earthquake. Drought conditions can contribute to an earthquake.	The increased population makes it more challenging for SSL to recover from an earthquake. If people do not have insurance policies or the funds in place to rebuild, this significantly impacts the local economy.	Earthquakes are widespread and will affect every area. People may choose to move out of SSL if earthquake risk is high or recovery efforts take a long time.	Increased
Extreme Heat	There are more high heat days and warnings for periods where temperatures do not cool overnight. Incidence and duration of heat waves have increased. Wildlife migration patterns may change to adapt to the extreme heat.	An increased population will add to the possibility of a heat island effect. Outdoor recreation would be impacted by extreme heat, with people avoiding the middle of the day when it is very warm. Outdoor workers would need shade or more frequent breaks.	Extreme heat could affect watering, which would impact residential properties as well as commercial properties like golf courses.	Increased
Extreme Cold	Extreme cold would impact local vegetation and wildlife, which impacts the local ecosystem as far as wildlife migration patterns and growth.	Extreme cold impacts tourism in SSL. Revenue loss is a concern if people choose not to visit local businesses or go outside their homes due to the weather conditions.	Properties like golf courses may be repurposed to adapt to the cold weather conditions.	Increased
Flooding	Climate change is making storms more intense and severe. Over the last five years, there have been several minor	The population increase, especially for vulnerable groups, is a concern for rescue and	Some areas along the Jordan River are in a floodplain. Commercial or residential	Same

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	and close-call events. Increased flooding impacts water and soil quality. Soil erosion and ecosystem disruption are concerns.	recovery efforts. Emergency response efforts may be impacted.	properties may need to be rezoned or relocated if they are repetitive loss properties.	
Landslide/Slope Failure	N/A	N/A	N/A	N/A
Radon	Warmer temperatures can impact radon levels, allowing it to seep into foundation cracks or soil. Permafrost thaw releases contaminants into the atmosphere, affecting soil, water, and air quality.	Increase of population – Radon dependent upon area and dwelling. If people aren't aware of their radon levels or do not have the funds to mitigate radon, it places their long-term health in jeopardy.	Land use may change if there are high radon levels in certain areas. Residents may move outside SSL.	Same
Heavy Rain	Storms have become more severe in recent years. When they are frequent, soil becomes saturated and the water has nowhere to go. This can contribute to soil and water quality issues.	Changes in population have not affected heavy rain events. However, heavy rain events can impact emergency response and create medical surges if there are a significant number of traffic accidents.	No large changes in land use or development. The city has identified storm drain issues. Heavy rain can lead to flooding, which impacts the local economy.	Same
High Wind	Stronger storms have brought more down slope wind events and other sudden high winds.	The daytime population is at risk, especially during the evening commute, if there are road closures or debris. Emergency vehicle access is a concern.	N/A – areas of growth not impacted more than others by high wind.	Same
Lightning	More extreme weather may increase the occurrence of lightning.	More people recreating outdoors means an increased chance	Lightning can impact local vegetation, which impacts land development.	Same

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
		of someone being hit by lightning.	Downed trees from lightning can impact recovery efforts or place outdoor areas like golf courses at greater risk.	
Severe Winter Weather	The last few winters have had larger, more extreme storms and widespread transportation impacts. This impacts local wildlife and vegetation as far as soil and water quality.	With an increased population, it may add increased risk to roads and outdoor spaces.	Frequent heavy snow and blizzards may cause people to relocate to other areas of the valley. Local businesses may lose revenue if people choose not to visit or cannot access them due to the conditions.	Same
Tornado	Thunderstorm frequency can increase the likelihood of tornadoes. There are impacts on local vegetation and wildlife as far as water, air, and soil quality.	The increased population places the daytime population as well as socially vulnerable groups at greater risk. The evening and morning work commutes would be affected by a tornado as far as traffic accidents, emergency response, and debris in roads.	Land use could change if residents choose to live in different areas of the county due to tornado frequency and risk.	Same
Wildfire	Soil erosion, drought conditions, and high winds impact the likelihood of a wildfire moving into SSL. The golf courses are a concern.	The daytime population is a concern as far as emergency response efforts, especially if people want to get away from the wildfire and clog up roads/ highways.	Residents and local businesses may move out of SSL if they cannot financially recover from a wildfire.	Same
Dam Failure	Permafrost thaw and increased precipitation could	The daytime population would	Residents and local businesses could move out of	Same

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	lead to more dam failures. Additionally, snowpack levels and melt rates can impact the likelihood of a dam failure, which would significantly impact SSL.	be impacted as far as transportation.	dam inundation areas, impacting the local economy.	
Civil Disturbance	Conversations about climate change can incite hostility, which would impact emergency response efforts.	The daytime population in SSL would be significantly impacted as far as transportation to and from SSL.	Multiple county buildings including the jail and Men's Resource Center could impact a civil disturbance incident.	Increased
Cyberattack	N/A – Climate change will not affect the likelihood of a cyberattack.	A cyberattack could impact the city's reputation, causing people to look elsewhere for basic services.	May delay economic development with inability to process permitting.	Increased
Hazardous Materials Incident (Transporta-tion & Fixed Facility)	Climate change can have an impact on hazmat incidents. It may contribute to extreme weather events that can damage storage facilities. Temperature is a consideration for storage of some materials.	Although the population has increased, the risk to the population has not increased. The daytime population is at risk as far as potential road closures or emergency response efforts.	A hazmat incident could have long-term impacts on water and soil quality, affecting local vegetation.	Same
Public Health Epidemic/ Pandemic	Climate change may play a factor in the spread of an epidemic or pandemic.	N/A – SSL's population is not changing drastically. However, the daytime population may be impacted if there are social distancing measures in place or a restriction on the number of people in buildings. This would impact the local economy	If more people are working remotely, this can impact property values. People may buy in other areas, affecting the revenue of local businesses.	Same

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
		if people are not getting lunch in the city, not recreating outside, or choosing to work remotely.		
Terrorism	Climate change does not increase SSL's risk of being targeted for a terrorist event. However, discussions surrounding climate change can lead to civil disturbances or terrorism events.	A larger, more diverse population may make SSL more of a target for terrorist activity.	If an area in SSL is deemed unsafe, people may not recreate in the area or purchase property.	Same

Additional Public Involvement

The city of South Salt Lake provided several opportunities for public participation. Figure 1 is an example of public outreach.

Figure 1: Social Media Post for the Hazard Mitigation Survey

Plan Integration

Incorporating the underlying principles of the Hazard Mitigation Plan and its recommendations into other plans is a highly effective and low-cost way to expand their influence. All plan participants will use existing

methods and programs to implement hazard mitigation actions where possible. As previously stated, mitigation is most successful when it is incorporated into the day-to-day functions and priorities of government and public service. This plan builds on the momentum developed through previous and related planning efforts and mitigation programs, and it recommends implementing actions where possible through these other program mechanisms. These existing mechanisms include the following:

- Regularity Capabilities
- Administrative Capabilities
- Fiscal Capabilities

Respective planning stakeholders will conduct implementation and incorporation into existing planning mechanisms and will be done through the routine actions of:

- Monitoring other planning/program agendas;
- Attending other planning/program meetings;
- Participating in other planning processes; and
- Monitoring community budget meetings for other community program opportunities.

The successful implementation of this plan will require constant and vigilant review of existing plans and programs for coordination and multi-objective opportunities that promote a safe, sustainable community. Regular efforts should be made to monitor the progress of mitigation actions implemented through other planning mechanisms. Where appropriate, priority actions should be incorporated into planning updates. Table 11 lists existing planning mechanisms in which the Hazard Mitigation Plan has been integrated. Table 12 lists the opportunities for integrating elements of this plan into other plans.

Table 11: Integration of Previous Plans by the City of South Salt Lake

Plan	Description
General Plan	Incorporation of known vulnerabilities

Table 12: Opportunities for Integration with Future Plans of the City of South Salt Lake

Plan	Description
Strategic Mobility Plan	Travel needs to, through, and from the city
Moderate Income Housing Plan	Inform mitigation actions and policies to prevent resident exposure to hazards
Parks, Open Space, Trail, and Community Centers Master Plan	Inform mitigation actions for recreation areas
Urban Forestry Plan	Incorporation of mitigation actions to reduce hazard risks
Pandemic-Specific Continuity of Operations Plan	Incorporation of mitigation actions to reduce hazard risks when there's a power failure, communication issue, pandemic, etc.
Comprehensive Emergency Management Plan	Guides the city's actions before, during, and after a disaster

Capability Assessment

Local mitigation capabilities are existing authorities, policies, programs, and resources that reduce hazard impacts or could help carry out hazard mitigation activities.

Planning and Regulatory Capabilities

Planning and regulatory capabilities are the plans, policies, codes, and ordinances that prevent and reduce the impacts of hazards.

Table 13: Assessment of the Planning Capabilities of the City of South Salt Lake

Plan	Does it address hazards? (Y/N)	How can it be used to implement mitigation actions?	When was the last update? When is the next update?
General Plan	Y	Incorporate goals and implementation strategies into mitigation actions	August 17, 2021
Capital Improvement Plan	Y	By allocating funding and resources for projects that reduce risk and enhance resilience to hazards.	Completion of plan is scheduled for 2026–2027
Climate Change Adaptation Plan	N	N/A	N/A
Community Wildfire Protection Plan (CWPP)	N – minimal wildfire risk so a CWPP has not been created	Inform the public about general wildfire risk and ensure coordination between surrounding jurisdictions/agencies	N/A
Economic Development Plan	Y – section in General Plan	Identify funding sources and responsible departments/parties for mitigation actions	August 17, 2021
Land Use Plan	Y – Parks Open Space, Trails, and Community	Incorporate	2015
Comprehensive Emergency Management Plan	Y	Incorporate disaster response efforts into mitigation actions	February 2024
Stormwater Management Plan	Y	Incorporate flooding response efforts into mitigation actions	2024
Transportation Plan	Y	Incorporate known issues and transportation improvement efforts into mitigation actions	2020
Substantial Damage Plan	N	N/A	N/A

DRAFT

Plan	Does it address hazards? (Y/N)	How can it be used to implement mitigation actions?	When was the last update? When is the next update?
Other? (Describe)	Pandemic Continuity of Operations	Incorporate staffing needs into mitigation actions to improve response efforts	March 30, 2020

Table 14: Assessment of the Regulations and Ordinances of the City of South Salt Lake

Regulation/Ordinance	Does it effectively reduce hazard impacts?	Is it adequately administered and enforced?	When was the last update? When is the next update?
Building Code	Y; South Salt Lake has adopted the state's building codes, including the International Building Code (IBC 2021) as amended.	Y	2021
Flood Insurance Rate Maps	Y	Y	2023
Floodplain Ordinance	Y	Y	2020
Subdivision Ordinance	Y	Y	2023
Zoning Ordinance	Y	Y	2023
Natural Hazard-Specific Ordinance (Stormwater, Steep Slope, Wildfire)	Y	Y	2023
Acquisition of Land for Open Space and Public Recreation Use	Y	Y	2021
Prohibition of Building in At-Risk Areas	Y	Y	2023
Other? (Describe)			

Administrative and Technical Capabilities

Administrative and technical capabilities include staff and their skills. They also include tools that can help carry out mitigation actions.

Table 15: Assessment of the Administrative Capabilities of the City of South Salt Lake

Administrative Capability	In Place? (Y/N)	Is staffing adequate?	Are staff trained on hazards and mitigation?	Is coordination between agencies and staff effective?
Chief Building Official	Yes	Yes	Yes	Yes
Civil Engineer	Yes	Yes	Yes	Yes
Community Planner	Yes	Yes	Yes	Yes

DRAFT

Administrative Capability	In Place? (Y/N)	Is staffing adequate?	Are staff trained on hazards and mitigation?	Is coordination between agencies and staff effective?
Emergency Manager	Yes	Yes	Yes	Yes
Floodplain Administrator	Yes	Yes	Yes	Yes
Geographic Information System (GIS) Coordinator	Yes	Yes	Yes	Yes
Planning Commission	Yes	Yes	Yes	Yes
Fire Safe Council	No	N/A	N/A	N/A
CERT (Community Emergency Response Team)	Yes	Yes	Yes	Yes
Active VOAD (Voluntary Agencies Active in Disasters)	Yes	Yes	Yes	Yes
Other? (Please describe.)				

Table 16: Assessment of the Technical Capabilities of the City of South Salt Lake[3]

Technical Capability	In Place? (Y/N)	How has it been used to assess/mitigate risk in the past?	How can it be used to assess/mitigate risk in the future?
Mitigation Grant Writing	Yes, coordination with SLCo EM	Has not been used	Grant funding can be used to reduce risk of local hazards.
Hazard Data and Information	Y	Identified areas with a lot of emergency calls to prioritize resources.	Improve response times and reduce risk to hazards.
GIS	Y	Identified areas that are at risk of flooding as well as transportation challenges	Prioritize areas based on mitigation actions to reduce hazard risk
Mutual Aid Agreements	Yes	Coordination between agencies	Improve response times and procedures between agencies/surrounding jurisdictions, especially if there are power failures or road closures for an extended period.
Other? (Please describe.)			

[3] SLCo EM = Salt Lake County Emergency Management.

DRAFT

Financial Capabilities

Financial capabilities are the resources to fund mitigation actions. Talking about funding and financial capabilities is important to determine what kinds of projects are feasible, given their cost. Mitigation actions like outreach programs are lower cost and often use staff time and existing budgets. Other actions, such as earthquake retrofits, could require substantial funding from local, state, and federal partners. Partnerships, including those willing to donate land, supplies, in-kind matches, and cash, can be included.

Table 17: Assessment of the Financial Capabilities of the City of South Salt Lake

Funding Resource	In Place? (Y/N)	Has it been used in the past and for what types of activities?	Could it be used to fund future mitigation actions?	Can it be used as the local cost match for a federal grant?
Capital Improvements Project Funding	Yes	Yes, it has been used all throughout the city for all types of projects	Yes	Yes
Community Development Block Grant	Yes	The last 2 years it has been for rebuilding the community center, and this year it'll be used for affordable housing.	Yes	No
Stormwater Utility Fee	Yes	Operation of the storm water system	Yes	Yes
Impact fees for new development	Yes	Yes, fees for water, sewer and parks have been used for new construction on businesses. Impact fee for sewer are being used to build a new pump station and fund a new well.	Yes, for select projects	Yes, for select projects
State funding programs	Yes	Yes, used in wastewater for upgrade to Central Valley Sewer District	Yes	Yes

Education and Outreach Capabilities

Education and outreach capabilities are programs and methods that could communicate about and encourage risk reduction. These programs may be run by a participant or a community-based partner. Partners, especially those who work with underserved communities, can help identify additional education and outreach capabilities.

DRAFT

Table 18: Assessment of the Education and Outreach Capabilities of the City of South Salt Lake[4]

Education and Outreach Capability	In Place? (Y/N)	Does it currently incorporate hazard mitigation?	Could it be used to support mitigation in the future?
Community Newsletter(s)	Y	Y	Y
Hazard Awareness Campaigns (such as Firewise, Storm Ready, Severe Weather Awareness Week, School Programs)	Y	Y	Y
Public Meetings/Events (Please describe.)	Y	Y	Y
Emergency Management Listserv	Y	Y	Y
Local News	Y	Y	Y
Distributing Hard Copies of Notices (e.g., public libraries, door-to-door outreach)	Y	N	Y
Insurance Disclosures/Outreach	Y	N	Y
Organizations that Represent, Advocate for, or Interact with Underserved and Vulnerable Communities (Please describe.)	Y	Y	Y
Social Media (Please describe.)	Yes	Y The city runs monthly campaigns, some involving mitigation actions individuals can take in their daily lives	Y
Other? (Please describe.)	Websites, Community events, CERT trainings, disaster response training with elected officials.	Y	Y

Opportunities to Expand and/or Improve Capabilities

Actions that can expand and improve existing authorities, plans, policies, and resources for mitigation include budgeting for mitigation actions, passing policies and procedures for mitigation actions, adopting and implementing stricter mitigation regulations, approving mitigation updates, and making additions to existing plans as new needs are recognized. Table 19 lists the opportunities for the city of South Salt Lake.

[4] CERT = Community Emergency Response Team.

Table 19: Opportunities to Expand and/or Improve the Capabilities of the City of South Salt Lake

Capability	Opportunity to Expand and/or Improve
Planning and Regulation	The city could develop a new plan for managing trees. This would help reduce risks from hazards like drought, extreme heat, and wildfire.
Administrative and Technical	Additional training for city inspectors on how to conduct damage assessments would help with mitigation efforts such as enforcing floodplain management regulations. Additionally, staff could be trained in mitigation grant writing.
Financial	The city has not been awarded Hazard Mitigation Assistance grants yet. Applying for federal mitigation grants such as the Hazard Mitigation Grant Program (HMGP) and Flood Mitigation Assistance (HMA) can help expand funding capabilities.
Education and Outreach	Develop education programs and/or campaigns to target specific groups, including homeowners, business owners, schools, and those with access and functional needs. Develop and continue educational programs to protect against extreme heat and flood dangers for youth.

Mitigation Strategy

Mitigation strategies provide proactive measures that are designed to minimize the impacts of hazards on the city of South Salt Lake. Table 20 shows mitigation action alternatives, and Table 21 shows the status of previous mitigation activities. Table 22 is the 2025 mitigation action plan for the city of South Salt Lake.

Table 20: Mitigation Action Alternatives for the City of South Salt Lake

Action	Type of Action	Selected for inclusion in the plan?	If not selected, why not?
Provide public education regarding radon, lightning, drought, floods, earthquakes, extreme cold/heat and heavy rain events through live trainings and web-based, print, and broadcast media.	Education and Awareness Programs	Yes	
Conduct an inventory and assessment of communications equipment and systems and identify needs.	Structure and Infrastructure Projects	Yes	
Conduct training and awareness activities on communication equipment, tools, and systems.	Structure and Infrastructure Projects	Yes	
Provide information on landscaping alternatives for persons subject to green area requirements.	Natural Systems Protection	Yes	
Forestry Plan – identify appropriate trees for climate zone.	Natural Systems Protection	Yes	
Identify city-owned structures at risk of earthquake damage.	Structure and Infrastructure Projects	Yes	

Action	Type of Action	Selected for inclusion in the plan?	If not selected, why not?
Pursue and implement needed mutual aid agreements for goods and services before or during an incident.	Local Plans and Regulations	Yes	
Train and certify City Inspectors to conduct pre/post-disaster damage assessments.	Local Plans and Regulations	Yes	
Adopt a soil cell retention specification in the downtown area.	Local Plans and Regulations	Yes	
Establish agreements to share communications equipment between agencies involved in emergency operations.	Local Plans and Regulations	Yes	
Establish notification capabilities and procedures for emergency personnel.	Local Plans and Regulations	Yes	
Assess the following critical facilities for structural weaknesses: SSL City Hall, police station, fire stations, Public Works building, SSL Community Center, and well sites.	Structure and Infrastructure Projects	Yes	
Identify structural deficiencies at Historic Scott School.	Structure and Infrastructure Projects	Yes	
Update parking lot to improve water retention at SSL Police Department and Historic Scott School.	Structure and Infrastructure Projects	Yes	
Inventory the trees.	Natural Systems Protection	Yes	
Use GIS to identify city-owned facilities and infrastructure at risk of flooding.	Natural Systems Protection	Yes	
Confirm accuracy of FEMA and Salt Lake County flood plain maps.	Structure and Infrastructure Projects	Yes	
Develop education programs and/or campaigns to target specific groups including homeowners, business owners, schools, and those with access and functional needs.	Education and Awareness Programs	Yes	
Develop and continue educational programs to protect against extreme heat and flood dangers to youth.	Education and Awareness Programs	Yes	
Redevelop SSL's Public Works campus.	Structure and Infrastructure Projects	Yes	
Capital Improvement Plan.	Local Plans and Regulations	Yes	

Action	Type of Action	Selected for inclusion in the plan?	If not selected, why not?
Increase storm drain capacity at 700 W.	Structure and Infrastructure Projects	Yes	
Increase storm drain capacity at 300 W.	Structure and Infrastructure Projects	Yes	
Install storm drain facility in southeast SSL.	Natural Systems Protection	Yes	
Install storm drains that flow into underground stormwater storage.	Natural Systems Protection	Yes	

DRAFT

Table 21: Status of Prior Mitigation Actions of the City of South Salt Lake[5]

Action	Hazard(s)	Agency Lead	Support Agency(ies)	Status Update
Conduct an inventory and assessment of communications equipment and systems and identify needs.	All hazards	SSL EM	SSL PD, SSL FD, SLCo EM, SSL PW	Ongoing – There are upgrades being made to all city Public Safety radios and SSL's staff emergency communications system. SSL will continue to improve its communications.
Conduct training and awareness activities on communication equipment, tools, and systems.	All hazards	SSL EM	SLCo EM, SSL PD, SSL FD, SSL PW	Ongoing – Training and awareness activities on communications are ongoing. SSL participates in training and exercises involving our HAM radio team, updating the CEMP, including communication notifications, and upgrading public safety radios.
Establish agreements to share communications equipment between agencies involved in emergency operations.	All hazards	SSL EM	SSL Communications, SSL PD, SSL FD, SLCo EM, SSL PW	Ongoing/Completed – Interlocal agreements between SSL FD and SSL PD to ensure that communications equipment can be shared between agencies.
Establish notification capabilities and procedures for emergency personnel.	All hazards	SSL EM	SSL Communications, SSL FD, SSL PD, SLCo EM	Ongoing – SSL is updating its CEMP, which includes establishing notification capabilities and procedures for emergency personnel.
Evaluate vulnerability of critical communications systems.	All hazards	SSL PW and SSL Communications	SSL EM, VECC, SSL PD, SSL FD, SLCo EM, SSL PW	Ongoing – SSL evaluates areas of vulnerability and develops solutions, such as moving one of our repeaters to City Hall to help with HAM radio communications.

[5] CEMP = Comprehensive Emergency Management Plan, MOU = memorandum of understanding, PIO = Public Information Officer, SSL = South Salt Lake, SSL FD = South Salt Lake Fire Department, SSL PD = South Salt Lake Police Department, SSL PW = South Salt Lake Public Works, UFA = Unified Fire Authority, VECC = Salt Lake Valley Emergency Communications Center.

DRAFT

Action	Hazard(s)	Agency Lead	Support Agency(ies)	Status Update
Establish a coordinating group to address long-term communication needs and implementation strategies.	All hazards	SSL EM	Communications, SSL PD, SSL FD, SLCo EM, SSL PW, VECC	Ongoing – Multiple groups (PIO, Policy Group) have been identified to help with implementing strategies. SSL will continue working with the county and internally to address long-term communications needs.
Acquire, upgrade, and/or integrate communications equipment and systems as determined by coordinating group.	All hazards	SSL Communications	SSL EM, SSL FD, SSL PD, SLCo EM, VECC, SSL PW	Ongoing – SSL has purchased new radios for its Public Safety Teams and has purchased new equipment and systems (such as Catapult EMS) to maintain operability.
Utilize GIS to identify facilities and infrastructure at risk.	All hazards	SSL GIS	SSL EM, SSL PD, SSL PW, SSL FD, SLCo EM	Ongoing – A capital facilities campaign will help address facilities and infrastructure at risk using GIS.
Assess critical facilities for hazard exposure, structural weaknesses, power, communications and equipment resources and redundancy, and adequate emergency procedures.	All hazards	SSL PW	SSL EM, SSL GIS, and SSL FD	Ongoing/Completed – A general understanding of building facilities has been updated. A new Public Works building will be constructed in 2026 to address structural weaknesses.
Pursue and implement needed mutual aid agreements.	All hazards	SSL EM	SLCo EM, SLCo PW, local jurisdictions EM, local jurisdictions PW, UFA, local jurisdictions FD, local jurisdictions PD	Ongoing – SSL has multiple interlocal agreements with nearby cities and MOUs for city inspectors conducting damage assessments.

DRAFT

Action	Hazard(s)	Agency Lead	Support Agency(ies)	Status Update
Provide education regarding all natural hazards through live trainings, as well as web-based, print, and broadcast media.	All hazards	SSL EM	SLCo EM, SSL FD, SSL PW, SSL PD, SSL Communications	Ongoing/Completed – SSL EM has provided educational training regarding flooding and earthquakes and will continue to provide educational materials, training, and resources to staff and the public to prepare for natural disasters.
Develop education programs to target groups including homeowners, developers, schools, and people with special needs.	All hazards	SSL EM	Promise SSL, SSL Communications, SSL FD, SSL PD, SLCo EM, SSL PW	Ongoing – Targeted education programs have been developed for specific groups, including homeowners and school aged children.
Provide information on landscaping alternatives for persons subject to green area requirements.	Drought	SSL EM	SSL PW	Ongoing/Completed – A new ordinance is complete and will be updated further. The city is retrofitting water-wasting landscapes.
Identify structures at risk of earthquake damage.	Earthquake	SSL PW	SSL EM, SSL GIS, SLCo EM, and SSL FD	Ongoing – Through the Capital Facilities Plan, select buildings/ infrastructure have been identified and will continue to be identified.
Determine potential flood impacts and identify areas in need of additional flood control structures.	Flood	SSL City Engineer and SSL PW	SSL EM, SSL FD, SLCo EM	Ongoing – SSL has continued development throughout the city and identified potential flood impacts on any new development. Areas in need of additional flood control structures have been identified.

DRAFT

Action	Hazard(s)	Agency Lead	Support Agency(ies)	Status Update
Address identified problems through construction of debris basins, flood retention ponds, emergency dissipaters or other flood control structures.	Flood	SSL City Engineer and SSL PW	SSL EM, SLCo EM	Ongoing – SSL City Engineering and Public Works have identified several areas in the most recently annexed parts of the city that need stormwater facilities.
Establish maintenance and repair programs to remove debris, improve resistance, and otherwise maintain effectiveness of stormwater and flood control systems.	Flood	SSL PW	SSL EM	Completed/Ongoing – SSL Public works established maintenance and repair programs that are continuously updated.
Identify and assess structures for deficiencies.	Flood	SSL City Engineer and SSL PW	SSL EM, SSL FD	Completed/Ongoing – Deficiencies have been identified, and they have either been addressed or are in the process of being addressed.
Modify structures as needed to address deficiencies.	Flood	SSL City Engineer and SSL PW	SSL EM, SSL FD	Ongoing/Completed – Structures have been and will continue to be modified as needed to address deficiencies.
Train and Certify City Inspectors to Conduct Pre/Post-Disaster Damage Assessments.	Earthquake	SSL Community Development Department	SSL EM, SSL FD, SSL PD, SSL PW, SLCo EM	Ongoing/Completed – All SSL city Building Inspectors are trained and certified to conduct pre/post disaster damage assessments for both residential and commercial structures.
Conduct a Seismic Vulnerability Assessment of City-owned critical facilities.	Earthquake	SSL Facilities	SSL EM, SSL FD, SLCo EM	Ongoing – Capital Facilities Plan will outline a seismic vulnerability assessment of city-owned critical facilities.

DRAFT

Action	Hazard(s)	Agency Lead	Support Agency(ies)	Status Update
Conduct a Geotechnical Study.	Problem Soils	SSL Engineering	SSL PW, SSLs Facilities	Ongoing/Completed – No longer profiled. Most new city buildings had a geotechnical study completed before construction.

DRAFT

Table 22: 2025 Mitigation Action Plan for the City of South Salt Lake[6]

#	Action	Hazard(s)	Lead Agency	Potential Partners	Benefits (Losses Avoided)	Cost Estimate	Funding Source(s)	Time-frame	Priority	Comments
1	Provide public education regarding radon, lightning, drought, flooding, earthquakes, extreme cold/heat, and heavy rain events through live training and web-based, print, and broadcast media.	Radon, Lightning, Drought, Flooding, Earthquakes, Extreme Cold, Extreme Heat, and Heavy Rain	SSL EM	SSL PIO, SSL FD, SSL PW, SSL PD, Promise SSL, SLCo EM	Provides educational benefits to underserved populations	Low	SSL general fund	Long term	High	Update the public on hazard information and mitigation measures, including available grant funding and hazard-specific opportunities. For example, provide information on radon mitigation systems (radon), lightning rods and surge protectors (lightning), water conservation (drought), rain gardens, utility elevations, flood mapping, dam inundation areas, (flooding, heavy rain), home weatherization, including the installation of proper insulation (extreme cold, extreme heat).
2	Conduct an inventory and assessment of communications equipment and systems and identify needs.	Earthquake, Flood, Wind, Tornado	SSL EM	SSL FD, SSL PD, SSL PW	Enhances interoperability	Low	SSL general fund	Short term	High	
3	Conduct training and awareness activities on communications equipment, tools, and systems.	Earthquake, Flooding, High Wind, Tornado	SSL EM	SSL FD, SSL PD, SSL PW, SLCo EM	Enhances interoperability	Low	SSL general fund	Short term	High	
4	Provide information on landscaping alternatives for persons subject to green area requirements.	Drought, Extreme Heat, Wildfire	SSL Neighborhoods	SSL Urban Forestry, SSL Water Division, SSL FD, SLCo EM	Protects city culinary supply & preserves urban forest	Low	Jordan Valley Water Conservancy District, SSL Water Division, SSL FD, SLCo EM, UDWR	Short term	High	
5	Forestry Plan – identify and plant appropriate trees for the climate zone, focusing west of State Street.	Earthquake, Drought, Wildfire, Extreme Heat	SSL Neighborhoods	FFSL, SLCo EM, SSL PW, SSL EM	Maintains city operations and protecting assets	Low	Community Forestry Partnership grant, SSL general fund, SSL PW	Short term	High	
6	Identify city-owned structures at risk of earthquake damage.	Earthquake	SSL Facilities	SSL Community Development, SSL FD, SSL EM, SLCo EM	Protects lives and property	Medium	SSL general fund, HMGP grant	Medium	Medium	
7	Pursue and implement mutual aid agreements for goods and services before or during an incident.	Earthquake, Flood, Windstorm, Tornado, Extreme Cold	SSL EM	SSL FD, SSL Legal Department, SSL PD, SLCo EM, UDEM, local	Reduces delay of services or displacement	Low	SSL general fund	Short term	Medium	There are multiple organizations with which SSL would like to pursue mutual aid agreements. These agreements will take time to develop.

[6] EMPG = Emergency Management Performance Grant, FFSL = Division of Forestry, Fire, and State Lands, FMA = Flood Mitigation Assistance, HMGP = Hazard Mitigation Grant Program, SLCo EM = Salt Lake County Emergency Management, SLCo PW = Salt Lake County Public Works, SSL = South Salt Lake, SSL EM = South Salt Lake Emergency Management, SSL FD = South Salt Lake Fire Department, SSL IT = South Salt Lake Information Technology, SSL PD = South Salt Lake Police Department, SSL PIO = South Salt Lake Public Information Officer, SSL PW = South Salt Lake Public Works, UDEM = Utah Division of Emergency Management, UDWR = Utah Division of Water Resources.

#	Action	Hazard(s)	Lead Agency	Potential Partners	Benefits (Losses Avoided)	Cost Estimate	Funding Source(s)	Time-frame	Priority	Comments
				jurisdictions EM, SLCo PW						
8	Train and certify city inspectors to conduct pre/post-disaster damage assessment.	Earthquakes, Floods, Tornado, Wind damage	Community Development	SSL FD, SSL EM, SLCo EM	Ensures a more efficient response to an incident	Low	SSL general fund, HMGP grant	Short term	High	
9	Adopt a soil cell retention specification in the downtown area.	Drought, Extreme Heat, Flooding, Heavy Rain, Severe Winter Weather	SSL Engineering	SSL Community Development	Enhances quality of life, reduces risk of climate change, and has environmental benefits	Medium	HMGP grant, FMA grant, EMPG grant	Short term	Medium	This plan will be developed in the next year. However, the project itself will take time to implement.
10	Establish agreements to share communications equipment between agencies involved in emergency operations.	Civil Disturbance, Dam Failure, Drought, Earthquake, Extreme Cold, Extreme Heat, Flooding, Hazardous Materials, Heavy Rain, High Wind, Lightning, Public Health Epidemic/ Pandemic, Radon, Severe Winter Weather, Terrorism, Tornado	SSL EM	SSL PW, SSL PIO, SSL FD, SSL PD, SSL IT, SSL Engineering, SLCo EM, local jurisdictions EM, SLCo PW	Reduces delay of services or displacement	Low	SSL general fund	Short term	High	
11	Establish notification capabilities and procedures for emergency personnel.	Civil Disturbance, Dam Failure, Drought, Earthquake, Extreme Cold, Extreme Heat, Flooding, Hazardous Materials, Heavy Rain, High Wind, Lightning, Public Health Epidemic/ Pandemic, Radon, Severe Winter Weather, Terrorism, Tornado	SSL EM	SSL FD, SSL PD, SSL PW, SSL PIO, SSL Engineering, SLCo EM	Reduces delay of service	Low	SSL general fund, SLCo EM, EMPG grant	Short term	High	
12	Assess the following critical facilities for structural weaknesses: SSL City Hall, the police station, fire stations, Public Works building, SSL Community Center and well sites.	Earthquake, High Wind, Tornado	SSL Engineering, SSL Facilities	SSL PW, SSL Community Development, SSL PD, SSL FD	Identifies risk associated with critical facilities that provide essential services for city residents and formulates a plan to update identified weaknesses	Medium	HMGP grant, SSL general fund	Long term	Medium	This project will take time to develop. The city has some information on the building history of these facilities which will be used to help determine which buildings are prioritized in this project.
13	Identify structural deficiencies at Historic Scott School.	Earthquake	SSL Engineering, SSL Facilities	SSL Community Development	Identifies risk associated with Historic Scott School that provide services for city youth and the city's art program and formulates a plan to update identified weaknesses	Medium	SSL general fund, HMGP grant	Short	High	
14	Update parking lot to improve water retention at SSL PD and Historic Scott School.	Drought	SSL Facilities	SSL Community Development, SSL Engineering, SSL PW	Reduces risk of climate change and contains environmental benefits	Medium	SSL general fund	Medium	Low	
15	Inventory city trees and prepare management plan.	Drought, Extreme Heat, Wildfire	SSL Parks/ Neighborhoods	SSL PW	Reduces risk of climate change and contains environmental benefits	Medium	SSL general fund, Community Forestry Partnership grant	Medium	High	

DRAFT

#	Action	Hazard(s)	Lead Agency	Potential Partners	Benefits (Losses Avoided)	Cost Estimate	Funding Source(s)	Time-frame	Priority	Comments
16	Use GIS to identify city-owned facilities and infrastructure at risk of flooding.	Flooding	SSL GIS	SSL EM, SSL PW, SSL Facilities, SSL Engineering, SLCo EM	Reduces possibility of displacement	Low	SSL general fund	Medium term	Low	The city uses older maps and FEMA flood plain maps to help identify these areas. The city ultimately wants to take a closer look at these areas in conjunction with the location of city-owned facilities.
17	Confirm accuracy of FEMA and SLCo floodplain maps.	Flooding, Heavy Rain	SSL Engineering	SSL GIS, SLCo Flood Control Engineering, SLCo EM	Reduces delay of services	Low	SSL general fund, SLCo Flood Control Engineering	Medium	Medium	
18	Develop educational programs and/or campaigns to target specific groups, including homeowners, business owners, schools, and those with access and functional needs.	Civil Disturbance, Dam Failure, Drought, Earthquake, Extreme Cold, Extreme Heat, Flooding, Hazardous Materials, Heavy Rain, High Wind, Lightning, Public Health Epidemic/ Pandemic, Radon, Severe Winter Weather, Terrorism, Tornado	SSL EM	Promise SSL, SSL PIO, SSL PW, SLCo EM	Benefits underserved populations and enhances quality of life	Low	SSL general fund, HMGP grant	Long term	High	
19	Develop and continue educational programs to protect against extreme heat and flood dangers to youth.	Extreme Heat, Flooding, Drought, Dam Failure, Heavy Rain, Extreme Heat, Severe Winter Weather	SSL EM	SSL PIO, Promise SSL, SLCo EM, SSL PW, SSL PD, SSL FD	Benefits underserved populations and enhances quality of life	Low	SSL general fund, HMGP grant	Long Term	High	Educational programs are continually updated and shared. As this is somewhat of an ongoing project, it is deemed “long term.”
20	Redevelop SSL’s Public Works Campus.	Earthquake	SSL PW	Layton Construction, Method Design	Reduces delay of services	High	SSL general fund	Short	High	
21	Develop a Capital Improvement Plan.	Earthquake, Flooding, Extreme Cold, Extreme Heat, Heavy Rain, Severe Winter Weather, High Wind, Lightning, Public Health Epidemic/Pandemic, Hazardous Materials, Dam Failure	SSL PW	SSL Engineering	Identifies system deficiencies on critical infrastructure	Medium	SSL general fund	Medium	High	
22	Increase storm drain capacity at 700 W.	Flooding, Heavy Rain, Severe Winter Weather, Dam Failure	SSL Engineering	SSL PW		High	Wasatch Front Regional Council’s Surface Transportation Program and local SSL match	Short	High	Reduce flooding risk in the northeast part of the community.
23	Increase storm drain capacity at 300 W.	Flooding, Heavy Rain, Severe Winter Weather, Dam Failure	SSL Engineering	SSL PW		High	Wasatch Front Regional Council’s Surface Transportation Program and local SSL match	Long	Medium	Reduce flooding risk in the northeast part of the community.

DRAFT

#	Action	Hazard(s)	Lead Agency	Potential Partners	Benefits (Losses Avoided)	Cost Estimate	Funding Source(s)	Time-frame	Priority	Comments
24	Install storm drain facility in southeast SSL.	Flooding, Drought, Heavy Rain, Severe Winter Weather, Extreme Heat	SSL Engineering	SSL PW	Installation of storm drain reduces the likelihood of flooding while retaining groundwater to prevent drought	High	Community Development Block grant, SSL general fund	Long	Medium	
25	Install storm drains that flow into underground stormwater storage.	Flooding, Drought, Heavy Rain, Severe Winter Weather, Dam Failure, Extreme Heat	SSL Engineering	SSL PW	Installation of storm drain reduces the likelihood of flooding while retaining groundwater to prevent drought	Medium	SSL general fund	Short	High	
26	Work with county and state agencies to conduct risk studies or engineering assessments to identify the needs for improving dam safety condition rating.	Dam Failure	SLCo EM	Dam Owners, Salt Lake County Public Works Flood Control Engineering, Utah Division of Water Rights Dam Safety Section, Salt Lake City Public Utilities, Local Governments	Reduce potential losses from the failure of HHPDs.	Medium	Salt Lake County General Fund, HHPD Grant, HMGP Grant	Medium	Medium	High hazard potential dams with potential impacts on South Salt Lake City and a safety condition rating of fair: SLCO Rotary Glen Park and SLCO Scott Avenue. HHPDs with potential impacts on SLC and a safety condition rating of poor: Mountain Dell.
27	Partner with county and state agencies, as well as neighboring jurisdictions, to rehabilitate or complete other safety projects for high hazard dams based on dam safety reports or risk studies.	Dam Failure	SLCo EM	Dam Owners, Salt Lake County Public Works Flood Control Engineering, Utah Division of Water Rights Dam Safety Section, Salt Lake City Public Utilities, Local Governments	Reduce potential losses from the failure of HHPDs.	High	Salt Lake County General Fund, HHPD Grant, HMGP Grant	Long term	High	See above.

DRAFT

Mitigation Action Prioritization

The mitigation actions were evaluated based on the STAPLEE criteria.

Table 23: Mitigation Action Prioritization – STAPLEE

Action #	Social	Technical	Administrative	Political	Legal	Economic	Environmental	Priority
1		3	4	4	4	4	4	High
2	N/A	3	3	N/A	N/A	3	n/a	High
3	N/A	3	3	N/A	N/A	3	n/a	High

DRAFT

City of Taylorsville Annex

To participate in this multi-jurisdictional hazard mitigation plan (MJHMP) update for Salt Lake County (SLCo), the governing body of the city of Taylorsville passed a formal resolution, a copy of which is maintained at the local government offices.

Planning Process Contact Information

Table 1 provides information on the point of contact during the updating of the MJHMP.

Table 1: Contact Information for the City of Taylorsville

Name	Contact Information
Jay Ziolkowski	**Phone**: 801-824-3670 **email:** jayz@taylorsvilleut.gov

The city of Taylorsville has a fully integrated approach to hazard mitigation planning and program implementation. During the 2024 update process, the MJHMP participation roles in Table 2 were recorded.

Table 2: Participant List for the City of Taylorsville

Name	Title	Jurisdiction
Jay Ziolkowski	Emergency Manager	City of Taylorsville
Ben White	City Engineer	City of Taylorsville
Mark McGrath	Long-Range Planner	City of Taylorsville
John Taylor	City Administrator	City of Taylorsville

Jurisdiction Profile

Date of Incorporation

July 1, 1996

Location and Description

The city of Taylorsville is in the center of the Salt Lake Valley, lying just west of the Jordan River and covering 10.8 square miles. The city is encircled by neighboring jurisdictions including the cities of Kearns, Murray, West Jordan, and West Valley. In the near distance, the city is propped between the Wasatch and Oquirrh Mountain ranges. Much of the land is dedicated to developed residential and commercial use.

DRAFT

Population

The 2022 American Community Survey 5-Year Estimate from the U.S. Census Bureau records the population of the city of Taylorsville as 57,819 people.

Demographics

The median age is 34.4. Among residents, 26.6% speak a language other than English at home, 12.9% are older than 65, and 9.1% live below the poverty level. In Taylorsville, 11.8% of individuals have a disability.[1]

Brief History

The city is named after the prominent Utah figure, John Taylor, who resided there in the 1880s. However, the first settlers arrived in Taylorsville in 1848 and used the close access to the Jordan River to water their crops. The area slowly grew through the 19th century with names of Taylorsville, Bennion, and Kearns. Much of the area was purchased by the federal government for a military training facility during WWII, which brought with it much of the infrastructure including water and sewage. In the 1980s, many businesses began to develop in the area of Taylorsville bringing with them larger numbers of residents. Because of the increase in population, residents became concerned about the high growth rates affecting aspects such as public safety. In 1995, residents in Taylorsville, Bennion, and Kearns voted with a 70% majority to incorporate, a process completed in 1996 during the state of Utah's centennial celebrations, making Taylorsville "Utah's Centennial City."

Climate

The city of Taylorsville has an average annual temperature of 53.1°F and receives 14.7 inches of precipitation.

Public Services

Taylorsville launched the Taylorsville City Police Department in 2021 following a transition period after ending their contract with the Unified Police Department. Taylorsville is served by Unified Fire Authority for fire and EMS services. The city is served by Taylorsville-Bennion Improvement District, Granger Hunger Improvement District, Kearns Improvement District, Dominion Energy and Rocky Mountain power. The city offers many emergency preparedness programs, including a Community Emergency Response Team, amateur radio emergency communications, and CPR classes.

DRAFT

[1] U.S. Census Bureau. "Taylorsville City, Utah." https://data.census.gov/profile/Taylorsville_city,_Utah?g=160XX00US4975360

Governing Body

The city of Taylorsville's governing body consists of a mayor and five elected council members. It also has a Youth City Council.

Development Trends

Recently, a temple of the Church of Jesus Christ of Latter-Day Saints was built in the city. Although most of the city's land has already been developed and/or dedicated to a specific purpose, the community has continued to grow. Over the past quarter-century, the population has grown at a steady rate, albeit much slower than many western cities in the county. Taylorsville is proud to have the head offices of Salt Lake Community College at its Taylorsville Redwood Campus where thousands of students receive their secondary education in many trade and traditional fields. Businesses like American Express, Sorenson Research Park, the Utah Department of Transportation, and Nelson Laboratories are found in the city and provide employment opportunities to many Taylorsville residents and others in the neighboring communities. To that end, the city has rolled out a "20/20 Vision" for the year 2020 and beyond. That vision focuses on new business and economic growth taking place across the city, as well as development opportunities and projects on the horizon. It includes efforts to bring new business and housing to the city and plans for prime development locations, transportation and land use.

Jurisdiction-Specific Hazards and Risk

The Calculated Priority Risk Index (CPRI) is a comprehensive assessment tool for evaluating and prioritizing risks in each context. It considers various factors, such as probability, impact, and urgency, to determine the level of risk associated with events or situations. The results for each hazard, including its risk factor (RF) value, are shown in Table 3. The results are based on the criteria in

Table 4 and the equation that follows it. The CPRI helps organizations and individuals make informed decisions about risk management and mitigation strategies. It provides a systematic approach to identifying and addressing potential issues, allowing for a more efficient allocation of resources and proactive risk prevention. With the CPRI, stakeholders can prioritize their focus on the most critical risks, leading to more effective risk management and, ultimately, better outcomes.

Table 3: Calculated Priority Risk Index Values for the City of Taylorsville

Type of Hazard Event	Probability of Future Events	Spatial Extent	Severity of Life/ Property Impact	Warning Time	Duration	Response Capacity	Risk Factor Value
Avalanche	4	1	2	4	2	1	2.6
Drought	4	4	2	1	4	1	2.8
Earthquake	3	4	4	4	3	2	3.4
Extreme Heat	4	4	3	1	3	1	3
Extreme Cold	3	4	2	1	3	1	2.4

Type of Hazard Event	Probability of Future Events	Spatial Extent	Severity of Life/ Property Impact	Warning Time	Duration	Response Capacity	Risk Factor Value
Flooding	4	3	3	3	3	1	3.1
Landslide/ Slope Failure	2	1	2	4	1	2	2
Radon	4	4	2	1	4	2	2.9
Heavy Rain	4	3	2	3	1	1	2.6
High Wind	4	3	3	3	2	1	3
Lightning	4	2	2	4	1	1	2.6
Severe Winter Weather	4	3	2	2	2	1	2.6
Tornado	2	2	3	4	1	2	2.4
Wildfire	4	3	3	4	3	1	3.2
Dam Failure	2	2	3	2	2	3	2.4
Civil Disturbance	2	1	2	4	2	2	2.1
Cyberattack	2	3	3	4	3	2	2.7
Hazardous Materials Incident (Transporta-tion & Fixed Facility)	3	1	2	4	1	1	2.2
Public Health Epidemic/ Pandemic	3	4	3	1	4	1	2.8
Terrorism	2	1	3	4	2	1	2.3

Table 4: Criteria for the Calculated Priority Risk Index

Risk Index Factor	Degree of Risk Level		Criteria	Factor Weight for Degree of Risk Level
Probability of Future Events	1	Unlikely	Less than 1 percent probability of occurrence in the next year or a recurrence interval of greater than every 100 years.	30%
	2	Occasional	1 to 10 percent probability of occurrence in the next year or a recurrence interval of 11 to 100 years.	
	3	Likely	11 to 90 percent probability of occurrence in the next year or a recurrence interval of 1 to 10 years.	

DRAFT

Risk Index Factor	Degree of Risk Level		Criteria	Factor Weight for Degree of Risk Level
	4	Highly Likely	91 to 100 percent probability of occurrence in the next year or a recurrence interval of less than 1 year.	
Spatial Extent	1	Limited	Less than 10% of the planning area could be impacted.	10%
	2	Small	10%–25% of the planning area could be impacted	
	3	Significant	25%–50% of the planning area could be impacted.	
	4	Extensive	50%–100% of the planning area could be impacted.	
Severity of Life/Property Impact	1	Negligible	Less than 5% of the affected area's critical and non-critical facilities and structures are damaged/ destroyed. Only minor property damage and minimal disruption of life. Temporary shutdown of critical facilities.	30%
	2	Limited	More than 5% and less than 25% percent of property in the affected area is damaged/ destroyed. Complete shutdown of critical facilities for more than one day but less than one week.	
	3	Critical	More than 25% and less than 50% of property in the affected area was damaged/destroyed. Complete shutdown of critical facilities for over a week but less than one month.	
	4	Catastrophic	Over 50% of critical and non-critical facilities and infrastructures in the affected area are damaged/ destroyed. Complete shutdown of critical facilities for more than one month.	
Warning Time	1	Self-defined	More than 24 hours	10%
	2	Self-defined	12 to 24 hours.	
	3	Self-defined	6 to 12 hours.	
	4	Self-defined	Less than 6 hours.	
Duration	1	Brief	Up to 6 hours.	10%
	2	Intermediate	Up to one day.	
	3	Extended	Up to one week.	
	4	Prolonged	More than one week.	
Response Capacity	1	High	Significant resources and capability to respond to this kind of event; staff are trained, experienced, and ready.	10%
	2	Medium	Some resources and capability to respond to this kind of staff; some staff may be trained, experienced, and ready while others may need additional support.	

DRAFT

Risk Index Factor	Degree of Risk Level		Criteria	Factor Weight for Degree of Risk Level
	3	Low	Limited resources and capability to respond to this kind of event; additional staff or staff training needed.	
	4	None	No resources and capability to respond to this kind of event; additional outside support would be required.	

RISK FACTOR (RF) EQUATION

RF Value = [(Probability x 0.30) + (Spatial Extent x 0.10) + (Severity of Life/Property Impact x 0.30) + (Warning Time x 0.10) + (Duration x 0.10) + (Response Capacity x 0.10)]

Hazards with an RF value greater than or equal to 2.5 are considered high risk. Those with RF values of 2.0 to 2.4 are considered moderate risk hazards, and those with an RF value less than 2.0 are considered low risk. The highest possible RF value is 4.

Hazard Event History

Examining hazard event histories provides valuable insights to inform decision-making and help prioritize resources for risk prevention and response efforts. No hazard events have been recorded for the city of Taylorsville since the 2019 plan update, with the exception of the Covid-19 Pandemic in 2020.

National Flood Insurance Program Summary

The city of Taylorsville participates in the National Flood Insurance Program (NFIP). Table 5 displays statistics related to the NFIP. The city of Taylorsville does not participate in the Community Rating System (CRS).

Table 5: National Flood Insurance Program Status for the City of Taylorsville[2]

Initial FHBM Identified	Initial FIRM Identified	Current Effective Map Date	Adopted Date	Date Joined NFIP	Tribal
–	09/21/2001	09/25/2009	2009	10/09/1998	No

[2] FIRM = Flood Insurance Rate Map, FHBM = Flood Hazard Boundary Map

Table 6: National Flood Insurance Overview for the City of Taylorsville

Community ID	Number of Losses	Total Net Payment	Active Policies	Total Coverage
4901248	2	$4,112.10	35	$17,917,000

The city of Taylorsville has designated the City Engineer or designee as the Floodplain Administrator. The current Flood Damage Prevention Regulations were adopted on 1/6/2021. The current effective FIRM is from 9/25/2009. The Building Department oversees permitting, with support from other departments including Engineering. Substantially damaged/substantially improved structures are identified through the permitting process.

Jurisdiction-Specific Vulnerabilities and Impacts

Table 7 provides information on the vulnerable assets in the city of Taylorsville, including its critical facilities, highlighting the city's vulnerability to identified hazards. It also describes the potential impacts to the community arising from those vulnerabilities. Impacts are the consequences or effects of each hazard on the assets. By understanding the risks associated with these assets, local authorities can develop proactive strategies to mitigate vulnerabilities and ensure the safety and functionality of these important assets during hazard events. These data sets are invaluable for decision-making and prioritizing resources for emergency response and preparedness efforts, ultimately contributing to more effective risk management and greater resilience in the community.

Vulnerable assets in Taylorsville include 15 schools, such as the SLCC Redwood Road campus; 2 police stations; 2 fire stations; and 1 emergency operations center (EOC). Major transportation routes include the I-215 West Belt, Bangerter Highway, 5400 South, 4700 South, 3900 S/4100 South, Redwood Road, and 2700 W. Recreation assets in the community include Vista Park/Vista Sports Complex, Millrace Park Fore Lakes Golf Course, Meadowbrook Golf Course, the Jordan River and Jordan River Parkway trail, Southridge Park, and Swenson Valley Regional Park.

Table 7: Jurisdiction-Specific Vulnerabilities and Impacts in the City of Taylorsville

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
Avalanche	People	*Vulnerability:* Very low risk. Avalanche risk is primarily limited to mountains with steep terrain and higher snow accumulation. Taylorsville is located in the valley and does not have terrain or snow accumulations that pose a risk within the city. Individuals vulnerable to avalanches primarily include outdoors enthusiasts like skiers and hikers who may lack proper avalanche knowledge and safety precautions or do not monitor avalanche forecasts.
	Structures	No structures in Taylorsville are in avalanche-prone areas.
	Economic Assets	*Vulnerability:* Minimal economic risk in Taylorsville. *Impacts:* Avalanche in nearby cities that rely on tourism-related businesses, such as ski resorts and outdoor recreation facilities, may cause disruptions, leading to financial losses.

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
	Natural, Historic, and Cultural Resources	No natural, historic, or cultural resources are in avalanche-prone areas.
	Critical Facilities and Infrastructure	*Vulnerability:* No critical facilities in Taylorsville are vulnerable to avalanches. *Impacts:* Taylorsville residents may experience indirect disruptions if transportation routes near the canyons are closed or damaged by an avalanche.
	Community Activities	*Vulnerability:* Avalanche is unlikely to directly affect activities within Taylorsville. *Impacts:* Activities like skiing, snowboarding, and snowmobiling are vulnerable to avalanches due to heavy snowfall and participants' lack of safety knowledge. Residents may avoid recreation in backcountry areas in other cities or unincorporated county areas due to avalanche conditions.
Drought	People	*Vulnerability:*. All residents are vulnerable due to limited drinking water or water for landscape irrigation. *Impacts:* Drought can limit water supply for drinking, cooking, cleaning and other household use. Drought can lead to decreased water quantity and quality and increased incidence of illness and/or disease. Drought also affects air quality.
	Structures	*Vulnerability:* The growth of structures is restricted by the lack of water for future development and landscaping. *Impacts:* Drought can cause soils to contract which may cause cracks in foundations or walls. Foundations can crack due to drying and contracting soil, leading to potential issues like uneven floors, misaligned doors and windows, and damage to sewer pipes.
	Economic Assets	*Vulnerability:* Businesses face losses as a result of drought conditions. *Impacts:* Prolonged drought may lead to water restrictions or increased costs for culinary water and irrigation water for landscaping.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Trees and parks are vulnerable to drought conditions. *Impacts:* Drought can stress the health of trees and other vegetation.
	Critical Facilities and Infrastructure	*Vulnerability:* Water supply systems, agriculture, and emergency services are susceptible to drought. *Impacts:* Reduced precipitation impacts water availability and crop yields. Fire departments may struggle with wildfire management due to limited resources. Public health facilities face water quality challenges that affect drinking water and sanitation. Health clinics may experience increased strain during droughts due to health complications arising from water scarcity, a decline in water quality and sanitation, as well as heat-related illnesses and the spread of vector-borne diseases.
	Community Activities	*Vulnerability:* Recreation and public events are affected by drought. *Impacts:* Recreational spaces struggle with maintenance, and households may encounter restrictions and costs for landscaping and pools. Parks and golf courses may experience deterioration in the

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		health of vegetation and their aesthetic appeal during drought. Decreased attendance at outdoor events.
Earthquake	People	*Vulnerability:* All Taylorsville residents are vulnerable. Taylorsville can experience earthquakes from the West Valley Fault, which intersects the city, or the Wasatch Fault. *Impacts:* People may be injured or killed by falling objects or collapsed structures. Others may be displaced from their homes. Those living in older buildings not up to seismic standards, families with young children, the elderly, and individuals with disabilities who may struggle to evacuate are vulnerable. Residents near fault lines and those in densely populated areas are also at higher risk. In addition, individuals lacking resources for disaster preparedness, such as emergency supplies and evacuation information, may find it difficult to respond effectively during an earthquake, thus increasing their vulnerability.
	Structures	*Vulnerability:* All structures are vulnerable, including homes, businesses, and government facilities. *Impacts:* Damage to homes and businesses is likely. Taylorsville has moderate to high liquefaction potential in the northeast half of the city which adds to vulnerability of structures in that area. Older buildings not built according to modern seismic codes, unreinforced masonry, and homes with inadequate foundations may be vulnerable. Many lack the retrofitting needed to withstand earthquakes, and those built on unstable soil or near fault lines are at higher risk. Large commercial buildings without flexible designs can sustain severe damage. Overall, outdated construction practices and poor site selection contribute to this vulnerability.
	Economic Assets	*Vulnerability:* Commerce *Impacts:* Commerce may shut down temporarily and some businesses may close permanently. The local economy, reliant on retail and services, could face significant disruptions during seismic events. In addition, certain soil types can amplify ground shaking, increasing the risk of damage to these assets. Many businesses located on Redwood Road, such as between I-215 and 5400 South are in areas of moderate to high liquefaction potential and may have higher vulnerability to damage.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Historic structures and landmarks often lack modern seismic retrofitting, making them susceptible to damage. Cultural resources, including community centers, may also be at risk due to their architectural styles and inadequate building codes, compromising their integrity and the heritage they represent.
	Critical Facilities and Infrastructure	*Vulnerability:* Schools, health clinics, and emergency services buildings are vulnerable to earthquakes, particularly those that are older with lower construction standards. Transportation/major roads, water supply systems, communication systems, and power distribution are vulnerable. *Impacts:* Widespread outages of these community lifelines are likely. Disruptions to power, water, and communication can delay response and recovery efforts. Transportation routes including major roads, bridges and overpasses may be damaged. Impassable roads disrupt the delivery of goods and materials and inhibit emergency response.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		The absence of retrofitting in older structures increases these vulnerabilities.
	Community Activities	*Vulnerability:* Public gatherings, school events, and large festivals are vulnerable to earthquakes. *Impacts:* Many day-to-day activities may be canceled following a strong earthquake. Recovery efforts may disrupt education, recreation, business, government services, and social activities for an extended period. Canceled public events and social activities affect community engagement.
Extreme Heat	People	*Vulnerability:* Extreme heat can affect the whole city. All Taylorsville residents are vulnerable. *Impacts:* Extreme heat can lead to heat-related illness such as dehydration, heat exhaustion, and heat stroke. Certain individuals are more vulnerable to the effects of extreme heat, including adults over 65, individuals with pre-existing health conditions, and young children, as they struggle to regulate body temperature. Socioeconomically disadvantaged individuals may lack access to cooling resources, while outdoor workers are at higher risk of heat-related illnesses due to physical labor without adequate hydration and rest.
	Structures	*Vulnerability:* Extreme heat can be detrimental to homes, businesses, industry, and city-owned buildings. *Impacts:* Residential buildings with inadequate insulation and ventilation and commercial buildings lacking reflective roofing and proper shading may be vulnerable. Materials like metal and glass can amplify heat retention, while areas with limited green space typically experience higher temperatures.
	Economic Assets	*Vulnerability:* Businesses are vulnerable to losses due to extreme heat. *Impacts:* Construction or other outdoor occupations may lose productivity during extreme heat. Businesses may struggle to absorb the increased energy costs for air conditioning. Agricultural operations can have reduced yields and higher water demand due to heat stress. The outdoor recreation industry may see decreased participation during heat waves, affecting local businesses that rely on visitors. In addition, the energy infrastructure could face strain from increased cooling demands, leading to outages.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Parks and recreation areas are vulnerable to the effects of extreme heat. *Impacts:* Local plant species and wildlife habitats can suffer from drought conditions, leading to reduced biodiversity. Historic buildings may degrade due to high temperatures, causing materials to deteriorate and paint to peel. In addition, parks and recreational areas may see a decline in appeal if vegetation is stressed by heat.
	Critical Facilities and Infrastructure	*Vulnerability:* Health clinics, city facilities, and transportation systems are vulnerable to damage from extreme heat. *Impacts:* Healthcare facilities may experience increased demand due to heat-related medical issues. Residents may depend on city facilities as cooling stations. Transportation systems are at risk of damage, such as buckling roads which could cause significant disruptions on I-

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		215 or other major roads. Power grids may be strained by higher demands for electricity for cooling, leading to potential outages. Power outages could disrupt services at all other critical facilities, including fire and police stations.
	Community Activities	*Vulnerability:* Public events are vulnerable to extreme heat. *Impacts:* Activities like outdoor sports, fairs, and agricultural practices are vulnerable to extreme heat. These events can pose health risks, particularly for participants such as youth athletes and elderly residents who may suffer from heat-related illnesses. Extreme heat may affect the turnout or ability of staff to work at the city's local events such as Taylorsville Dayzz.
Extreme Cold	People	*Vulnerability:* Extreme cold can occur everywhere in the city, making all Taylorsville residents vulnerable. *Impacts:* Extreme cold can lead to severe health impacts, including frostbite and hypothermia. The elderly face increased risks due to health issues and mobility challenges, while children may be susceptible if they lack proper winter clothing. Individuals experiencing homelessness or financial hardship often lack access to heated shelters and resources for protection against the cold. Those with pre-existing health conditions may experience worsened symptoms at low temperatures. Low-income residents may struggle with increased heating costs for homes.
	Structures	*Vulnerability:* Residential homes and commercial buildings are vulnerable to extreme cold. *Impacts:* Homes with poor insulation or inadequately sealed windows and doors are prone to significant heat loss. Older buildings lacking modern energy efficiency standards may also suffer from freezing pipes and structural damage. Commercial and industrial buildings used for storage or manufacturing that are not properly insulated can be at risk, especially if they are not occupied regularly and the heating is inconsistent.
	Economic Assets	*Vulnerability:* All businesses are vulnerable to extreme cold *Impacts:* Increased heating costs affect all businesses. Agricultural operations, such as greenhouses and livestock farms, may experience crop and livestock losses, impacting revenue. Icy roads can disrupt transportation networks, affecting logistics and supply chains. Power lines are at risk of outages from ice accumulation, impacting operations for all local businesses. Energy-intensive facilities may face higher operational costs due to increased heating needs. Retail and hospitality businesses may have reduced traffic. Cold weather can halt construction or manufacturing projects.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Trees, vegetation, and parks are vulnerable to extreme cold. *Impacts:* Due to prolonged cold, local vegetation and wildlife habitats may suffer from plant stress and reduced food availability. Culturally significant sites, including monuments and public art, may also be damaged.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
	Critical Facilities and Infrastructure	*Vulnerability:* Critical facilities, transportation networks, and power systems are vulnerable to extreme cold. *Impacts:* Water treatment plants can face frozen pipes and equipment failures. Icy conditions may increase accident risks on transportation infrastructure. Accidents or delays can occur on primary routes such as I-215, Bangerter Highway, and Redwood Road. Power generation facilities may struggle to meet heating demands. Ice accumulation during extreme cold may damage power lines and lead to outages. Operations of fire and police stations or healthcare clinics could be disrupted by power failures or water line breaks. Access to essential services could be disrupted. Residential and commercial buildings lacking proper insulation are also at risk of heating system failures, endangering occupants.
	Community Activities	*Vulnerability:* Public events are vulnerable to extreme cold. *Impacts:* Schools and offices may delay opening or remain closed. Youth sports, festivals, and outdoor markets are vulnerable to extreme cold. Harsh temperatures can deter participation, impacting community engagement. At-risk groups, such as the elderly and young children, face health risks like frostbite and hypothermia, further limiting outdoor involvement.
Flooding (and Heavy Rain)	People	*Vulnerability:* Residents near the Jordan River are in Special Flood Hazard Zones. *Impacts:* Flooding primarily affects residents near the Jordan River but can also occur in other low-lying areas, especially during heavy rainfall or snowmelt. Individuals without reliable transportation may struggle to evacuate quickly, while low-income families often lack resources for flood-prevention measures. The elderly and those with disabilities may face mobility challenges, increasing their risk during emergencies. Overall, factors such as geographic location, economic status, and physical ability contribute to the community's varying levels of vulnerability to flooding.
	Structures	*Vulnerability:* Structures vulnerable to flooding primarily include those in low-lying areas or near the Jordan River, primarily residences. *Impacts:* Residential properties in flood plains and commercial buildings without proper drainage systems or flood-resistant designs face significant risks during heavy rain or snowmelt. Older structures may be more susceptible due to outdated construction standards. Overall, a combination of location and construction features contributes to their vulnerability to flooding.
	Economic Assets	*Vulnerability:* Businesses near flood-prone areas are vulnerable to flooding. *Impacts:* Commercial properties, especially retail centers and warehouses near rivers or low-lying areas, are at high risk during heavy rainfall. Structures and inventory can be damaged by flooding, causing lost revenue. Residential developments in flood-prone zones also can suffer damage, impacting property values. Public infrastructure, such as roads and utilities, may experience disruptions, leading to costly repairs. Agricultural land can be affected by excess water, reducing crop yields.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
	Natural, Historic, and Cultural Resources	*Vulnerability:* The Jordan River open space and parks are vulnerable to flooding *Impacts:* Natural areas like wetlands, rivers, and streams are at risk of habitat destruction. Cultural resources, such as parks and public spaces, can become unusable, affecting community events. Factors contributing to their vulnerability include inadequate flood management, urban development that alters water flow, and the increasing frequency of extreme weather events due to climate change.
	Critical Facilities and Infrastructure	*Vulnerability:* No critical facilities were identified within SFHAs. However, transportation and utility networks are vulnerable to flooding. *Impacts:* Flooding could affect major transportation routes, including major roads that cross the Jordan River such as 4100 South, 4500 South, and 5400 South. Damaged or blocked roads can disrupt emergency response, and isolate communities. In addition, inadequate drainage systems and urban development encroaching on floodplains increase these risks.
	Community Activities	*Vulnerability:* Public events and recreation activities are vulnerable to flooding *Impacts:* Due to the area's geography and infrastructure, outdoor events, sports, and farmers' markets are vulnerable to flooding. Parks and open spaces can quickly become inundated during heavy rainfall or rapid snowmelt. Residential neighborhoods near rivers, roads, and bridges are at risk of flash floods, which can disrupt transportation and emergency services.
Landslide/ Slope Failure	People	*Vulnerability:* There is minimal risk of landslides to Taylorsville residents. *Impacts:* Landslides are primarily a risk near steep or unstable slopes. The topography in Taylorsville is relatively flat, and landslide risk to people and structures is minimal. Residents who commute to neighboring cities could potentially be affected if transportation routes closer to the mountains are blocked by landslides. Small localized slope failure may occur in areas with human-made slopes such as along freeway over and underpasses or other development, or due to erosion along stream banks. The landslide susceptibility map in Volume 1 shows some small areas of risk along the Jordan River. Residents on steep slopes or near unstable geological formations are most vulnerable to landslides and slope failures. Their risk is heightened by inadequate drainage systems, loose soil conditions due to heavy rainfall or rapid snowmelt, and older structures not designed for such events. A lack of awareness about the signs of impending landslides, along with limited resources for hazard monitoring and emergency preparedness, further increases their susceptibility.
	Structures	*Vulnerability:* There is minimal risk to structures in Taylorsville from landslides. *Impacts:* There are relatively few steep slopes within the city. Heavy rainfall, ground shaking from an earthquake, or loose soil may contribute to small, localized slope failures near the Jordan River.
	Economic Assets	There is minimal economic risk in Taylorsville from landslides.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
	Natural, Historic, and Cultural Resources	There is minimal vulnerability of natural, historic, and cultural resources in Taylorsville from landslides.
	Critical Facilities and Infrastructure	*Vulnerability:* There is minimal risk to critical facilities and infrastructure in Taylorsville from landslides. *Impacts:* Heavy rain, earthquakes, or destabilization of slopes during development may contribute to slope failures. Although unlikely to happen in Taylorsville, landslides in neighboring jurisdictions may have indirect impacts. Roadways, and essential services like water supply and power lines may be at risk.
	Community Activities	There is minimal risk to community activities in Taylorsville from landslides.
Radon	People	*Vulnerability:* Forty-one percent of homes tested in Taylorsville have showed dangerous levels of radon. *Impacts:* Residents in homes with high levels of radon have high risk of lung cancer. Homeowners in older buildings in areas with high radon potential are most at risk. Families with young children or elderly members are especially at risk due to their increased sensitivity to health impacts.
	Structures	*Vulnerability:* Radon poses minimal impacts to structures; it is primarily a health risk. *Impacts:* Although radon doesn't directly impact structures, the condition of structures contributes to radon levels that pose a risk to occupants. Structures with concrete slabs or basements are particularly vulnerable to radon exposure, as radon can seep in from the soil. Homes in areas with high uranium content are at greater risk, especially in older houses with inadequate ventilation. Cracks in floors and walls can allow radon to enter.
	Economic Assets	*Vulnerability:* Home values are vulnerable to radon exposure. *Impacts:* Residential and commercial properties in South Salt Lake may experience lower market value and increased maintenance costs due to radon remediation needs. Radon presence can lead to health issues, decrease property values, and complicate real estate transactions, impacting homeowners and investors alike.
	Natural, Historic, and Cultural Resources	There is minimal vulnerability to these resources in Taylorsville.
	Critical Facilities and Infrastructure	*Vulnerability:* Public buildings are vulnerable to radon exposure. *Impacts:* Schools in high-radon areas pose risks for children if they do not have proper ventilation. Healthcare facilities also are at risk, affecting both patients and staff. Other city buildings such as fire and police stations may have leaks in foundations that may expose employees to radon.
	Community Activities	*Vulnerability:* There is limited vulnerability to public events from radon exposure.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		Impacts: Radon is a long-term exposure risk and hasn't typically affected day-to-day activities.
High Wind	People	*Vulnerability:* The entire population in Taylorsville is vulnerable to high wind. Wind events occur over a large area and can impact the whole city as well as neighboring jurisdictions. *Impacts:* High wind can cause injuries if people are struck by blowing debris or falling tree limbs. The elderly may face mobility challenges that hinder their ability to seek shelter, while children might not fully grasp the dangers of severe weather. Individuals with disabilities or health issues may struggle to react quickly. Those living in mobile homes or poorly constructed houses are at greater risk of damage, as are people who work outdoors and may be exposed during sudden wind events.
	Structures	*Vulnerability:* All structures in Taylorsville are vulnerable to high wind, including two mobile home parks. *Impacts:* High winds may down trees, damage roofs, and break windows. Structures can also be damaged by trees uprooted by high wind. Carports, sheds, fences, and accessory structures are easily damaged by high winds and can contribute to blowing debris. Taylorsville has two large mobile home parks that are at high risk due to their inability to withstand strong high winds. Single-story homes, commercial buildings, and agricultural facilities like barns may be at risk. Residential homes with large flat roofs or lightweight materials may struggle to withstand strong winds, while commercial buildings with extensive glass can suffer from breakage and structural damage. Agricultural structures often lack proper reinforcement, making them prone to collapse. The vulnerability of these buildings is heightened in open areas with no landscaping or natural windbreaks, which can help diffuse wind energy.
	Economic Assets	*Vulnerability:* Businesses are vulnerable to disruption from high winds. *Impacts:* Commercial buildings, such as retail stores, might have large signage and awnings that can be damaged, leading to business interruptions. Businesses may not be able to conduct normal operations if power is out or roads are blocked by debris. Agricultural assets such as greenhouses and livestock facilities face risks from wind destruction, impacting crops and animals. The vulnerability of these assets is largely due to construction quality, location, and the presence of loose materials that can become projectiles.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Trees, open spaces, and parks are vulnerable to high winds *Impacts:* Natural resources like mature trees and agricultural lands are vulnerable to high winds, which can cause uprooting and wind erosion. Historic structures also may be at risk if their materials are not resilient, potentially leading to damage or collapse. Cultural resources, such as outdoor art installations and community spaces, can be disrupted or damaged by strong winds.
	Critical Facilities and Infrastructure	*Vulnerability:* Power distribution systems, communication, and transportation infrastructure are vulnerable to high winds. *Impacts:* Utility infrastructure, such as power lines and communications towers, is at risk, potentially leading to outages.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		Bridges and overpasses may be compromised, and falling branches from nearby trees can block access routes. This vulnerability stems from design limitations and the materials used.
	Community Activities	*Vulnerability:* Public events, sports, recreation, and Taylorsville Dayzz are vulnerable to high winds. *Impacts:* Outdoor events like festivals and sporting activities may result in injuries to patrons from falling debris and damaged structures. Farmers' markets and open-air concerts also can face challenges, with tents being uprooted. In addition, recreational activities in parks—such as picnics and playground use—become unsafe during high winds. The vulnerability of these activities stems from their outdoor settings, where structures and unattached items can easily be compromised, leading to safety risks and disruptions. Events may be delayed or canceled.
Lightning	People	*Vulnerability:* Lightning can occur anywhere in South Salt Lake, and all populations are vulnerable. People engaged in outdoor recreation are at increased risk. Unhoused populations are also at risk. *Impacts:* Lightning can cause severe injury or death. Outdoor enthusiasts like athletes and golfers are at risk due to their exposure in open areas during thunderstorms. Athletes participating in outdoor sports may also struggle to find shelter quickly. In addition, young children and the elderly are more vulnerable, as they may not be aware of the dangers of lightning or may be slower to seek protection. Those lacking access to warning systems or education on lightning safety are at further risk during severe weather.
	Structures	*Vulnerability:* All structures are vulnerable to lightning. *Impacts:* Lightning can ignite fires or cause electrical damage from power surges. Due to their height and exposure, tall buildings, communications towers, and open-frame agricultural barns are particularly vulnerable to lightning strikes. Those with metallic components or inadequate grounding systems face increased risk because metal conducts electricity. In addition, residential homes near tall trees may be at risk if the trees are struck and energy is transferred to the structure.
	Economic Assets	*Vulnerability:* Businesses are vulnerable to disruption from lightning events. *Impacts:* Local businesses may suffer if there is a prolonged power outage or lightning event. Cascading impacts may occur if lightning is coupled with heavy rain or high winds. Commercial buildings with metal roofing or equipment may face electrical surges, disrupting operations.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Mature trees and parks are vulnerable to lightning strikes. *Impacts:* Trees can attract lightning due to their height. Cultural resources, such as monuments and outdoor sculptures, also can be damaged by lightning. Outdoor equipment at parks may be damaged. The risk increases in areas with frequent thunderstorms and dry conditions.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
	Critical Facilities and Infrastructure	*Vulnerability:* Power networks, communication networks, emergency response, and healthcare facilities are vulnerable to lightning strikes. Impacts. Communications towers, schools, hospitals, and power lines may be at risk. Communications towers attract lightning due to their height and metal structure. Power networks may be impacted by lightning and critical facilities could be disrupted if they lack power. Essential services could be disrupted if there are road closures or debris on the road from the lightning. Additionally, it may be difficult to help patients if there are downed power lines or power disruptions.
	Community Activities	*Vulnerability:* Public events are vulnerable to lightning strikes. *Impacts:* Outdoor recreational areas that attract crowds are at risk during thunderstorms, posing dangers to infrastructure and public safety. Events may be delayed or canceled. Sports practices, concerts, picnics, and festivals are particularly vulnerable to lightning strikes. Participants in these events often find themselves in open areas without adequate shelter and may be unprepared for sudden weather changes, leading to dangerous situations.
Severe Winter Weather	People	*Vulnerability:* Severe winter weather can affect the entire city. All Taylorsville residents are vulnerable. The elderly, young, disabled, and unhoused populations are particularly vulnerable. *Impacts:* Heavy snow, blizzards, and snow squalls happen frequently in the winter months. Snowy or icy conditions can lead to injuries from slips and falls. Unhoused populations may experience hypothermia. Elderly individuals may struggle with mobility. They may also experience cardiac problems from shoveling heavy snow. People with disabilities may depend on assistance that can be delayed or unavailable during storms. Those without reliable transportation could become stranded. People driving on snowy roads can be injured in car accidents in slick conditions.
	Structures	*Vulnerability:* There is moderate vulnerability to homes and businesses from severe winter weather. *Impacts:* Homes and other structures could be affected by heavy snow/blizzard, especially roofs. Flat-roofed buildings are prone to snow accumulation, risking roof collapse if not cleared. Older homes might have weakened roofs or inadequate insulation, making them susceptible to snow loads and ice dams. Commercial buildings with large open spaces may face risks if their roofs do not meet snow load requirements.
	Economic Assets	*Vulnerability:* Businesses are vulnerable to disruptions from severe winter weather. *Impacts:* Retail businesses can experience significant losses from decreased customer traffic and delayed shipments. Construction projects may face delays and increased costs. Transportation and logistics companies are particularly impacted, as snow can hinder vehicle movement, leading to delivery delays. In addition, public services may struggle to maintain continuity during severe weather events.
	Natural, Historic, and	*Vulnerability:* Trees and parks are vulnerable to severe winter weather.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
	Cultural Resources	*Impacts:* Local vegetation can be impacted by heavy snow or a blizzard. Trees and branches can break under heavy snow.
	Critical Facilities and Infrastructure	*Vulnerability:* Power systems and transportation networks are vulnerable to severe winter weather. *Impacts:* Power may be interrupted in heavy snow or blizzard conditions. Power outages can disrupt government operations, healthcare facilities, and emergency response. Communications infrastructure can be damaged, impeding signals. Transportation networks like roads and bridges can become delayed or impassable in heavy snow, blizzard, or snow squall conditions, hindering emergency responses. There may be an increased demand for response and medical care if there are a lot of traffic accidents. These vulnerabilities stem from reliance on systems that may not be equipped to handle extreme winter weather.
	Community Activities	*Vulnerability:* Public events are vulnerable to severe winter weather. *Impacts:* Outdoor community gatherings may be at risk. Severe weather can lead to low attendance. If transportation is affected, there could be temporary disruptions to daily activities.
Tornado	People	*Vulnerability:* Any member of the Taylorsville population could be affected by a tornado. Residents in mobile home parks are particularly vulnerable. Tornadoes are rare but could potentially occur anywhere in the city. *Impacts:* Residents are vulnerable to serious injury from blowing debris, uprooted trees or falling limbs, and structural collapse. Individuals living in mobile homes face higher risks, as these structures can be easily damaged. Those with limited mobility, such as the elderly and people with disabilities, may struggle to reach safety quickly. Families with young children might have difficulty ensuring everyone's safety during a warning. In addition, residents unfamiliar with tornado preparedness or without timely weather alerts are at greater risk. Those in lower socioeconomic conditions often live in areas less equipped for disaster response.
	Structures	*Vulnerability:* Any structure near or on the path of a tornado is vulnerable, and this could occur anywhere in Taylorsville; all buildings are vulnerable. Mobile homes are particularly vulnerable. *Impacts:* Homes and businesses could sustain heavy damage from a tornado, including roofs torn from homes, broken windows, and walls damaged or compromised. Mobile homes are particularly at risk due to their lightweight and insecure foundations. Older commercial buildings that do not meet modern codes also may be weak, and large-span structures such as warehouses can have roofs easily lifted by tornado winds.
	Economic Assets	*Vulnerability:* Businesses are vulnerable to interruption from a tornado. *Impacts:* Any business in the path of the tornado is vulnerable. Tornadoes can damage retail and commercial structures, warehouses, hotels, restaurants and other businesses. Damage to power or communication systems can cause temporary business closures. Operational downtime and damage to structures and inventory may lead to lost revenue and potentially lost wages or layoffs. Roads and

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		bridges may be blocked, which may disrupt access to businesses or interrupt supply chains.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Parks and open spaces are vulnerable to tornado damage. *Impacts:* Cultural resources, including monuments and parks that are vital to community heritage, may be at risk. Taylorsville's parks and open spaces could be severely damaged by a tornado.
	Critical Facilities and Infrastructure	*Vulnerability:* Fire and police stations, city facilities, healthcare clinics, and utility systems are vulnerable to a tornado event. Any above-ground facility in the path of a tornado could be affected. *Impacts:* Public safety buildings, schools or other civic facilities may need emergency inspections or repairs and may be closed temporarily. Utilities like communication towers or power stations are at risk. Disrupting these services might affect operation of other critical facilities. Debris or other damage to roads can delay emergency response.
	Community Activities	*Vulnerability:* Public events are vulnerable to a tornado event. *Impacts:* Outdoor festivals, sports events, and markets are vulnerable to tornadoes due to their open spaces and limited options to provide shelter. Events may be delayed or canceled, reducing opportunities for social engagement. Temporary structures, such as tents, can be easily damaged by high winds. Recreational facilities with large glass windows or weak roofs also face significant risks.
Wildfire	People	*Vulnerability:* There is limited wildfire risk in Taylorsville, but fire may be possible in undeveloped land near Jordan River, impacting air quality. *Impacts:* The entire valley could experience poor air quality and related health impacts from a wildfire in the region. Children, the elderly, and those with respiratory health problems are at higher risk for complications from poor air quality.
	Structures	*Vulnerability:* The risk to structures from wildfire in Taylorsville is low. *Impacts:* A few structures near undeveloped areas along the Jordan River could potentially be damaged by a wildfire.
	Economic Assets	*Vulnerability:* Businesses, particularly those involved in outdoor recreation, may face interruption due to wildfires. *Impacts:* Golf courses and local parks would be impacted by a wildfire or poor air quality.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Local vegetation and wildlife are vulnerable to impacts from wildfire. *Impacts:* Riparian vegetation and wildlife along the Jordan River could be affected.
	Critical Facilities and Infrastructure	*Vulnerability:* Power could be disrupted by a wildfire. *Impacts:* No critical facilities were identified in areas at risk of wildfire. Fires elsewhere in the county could potentially cause utility disruptions or outages. Emergency response, healthcare, and other city services could be disrupted by a power outage.
	Community Activities	*Vulnerability:* Public events are vulnerable to disruptions from wildfires.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		Impacts: Recreational activities and outdoor events like festivals and sports, especially during hot, windy conditions may experience increased risk. Outdoor events may be canceled due to wildfire smoke. In addition, landscaping with dry grasses and shrubs increases susceptibility during fire season, putting local infrastructure, such as schools and neighborhoods, at risk.
Dam Failure	People	*Vulnerability*: Very little area in Taylorsville has been identified within a dam failure inundation boundary. Inundation areas from the east side of the valley end near the Jordan River at the city's eastern border. Two significant hazard dams just south of Taylorsville may pose a risk, but inundation areas have not been mapped. Individuals living near dams, particularly in low-lying areas, are most vulnerable to dam failure and potential flooding. *Impacts*: Residents may be displaced if homes are damaged. Families with young children, the elderly, and low-income residents may struggle to evacuate quickly, while individuals with disabilities may face significant barriers during emergencies.
	Structures	*Vulnerability*: Residential homes in low-lying areas, bridges, and roadways near rivers may be vulnerable. Vulnerabilities arise from outdated dam infrastructure, insufficient spillway capacity, and a lack of warning systems, which can worsen the impact of dam failure and threaten lives and property. *Impacts:* Homes and businesses downstream face damage from rapid flooding.
	Economic Assets	*Vulnerability:* No businesses within Taylorsville are in mapped dam failure inundation boundaries, but businesses may experience indirect losses. *Impacts:* Roads, bridges, and utilities could suffer catastrophic damage from dam failure, disrupting transport and services. These outages could interrupt businesses' day-to-day activities and may result in losses.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Waterways, habitats, and historical and cultural sites are vulnerable to dam failure. *Impacts:* Natural resources like local waterways and wetlands could suffer habitat loss, while historically significant sites, including old irrigation systems, risk flooding and deterioration. Cultural resources, such as community centers and parks, also may face damage, affecting local gatherings.
	Critical Facilities and Infrastructure	*Vulnerability:* Although no critical facilities in Taylorsville were identified within dam failure inundation boundaries, the city may be affected by damage to infrastructure outside of Taylorsville. *Impacts:* Water treatment plants, power infrastructure, and hospitals may be vulnerable. Water treatment plants rely on a consistent water supply, and dam failure can disrupt operations and compromise public health. Power substations or distribution lines could be damaged and disrupt service to the city. Hospitals face safety risks and evacuation challenges. Transportation infrastructure, such as roads and bridges, may be compromised, hampering emergency response.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
	Community Activities	*Vulnerability:* Recreational activities and community events are vulnerable to the impacts of dam failure. *Impacts:* Recreational pursuits like fishing, boating, and swimming in reservoirs and events in parks located downstream may be at risk. These activities are vulnerable to sudden flooding from a dam breach. Recreation areas may be closed and events canceled.
Civil Disturbance	People	Low-income individuals may lack the resources for safety, while the elderly or disabled may struggle to navigate emergencies. Young people, particularly teenagers, may be drawn into unrest, influenced by social dynamics. In addition, marginalized individuals may feel targeted or compelled to participate. A lack of community cohesion and trust in authorities can further heighten tensions.
	Structures	Government buildings, commercial properties, and infrastructure, such as bridges and transportation hubs may be vulnerable. Government buildings may be targeted for their symbolic authority, while retail stores can attract crowds during protests. Residential neighborhoods also can be affected, especially in areas with heightened tensions. The vulnerability of these structures stems from their visibility and importance to the community, combined with factors such as location and ongoing social issues.
	Economic Assets	Retail establishments, especially shopping centers, are at risk as they often become focal points for protests. Transportation systems can be disrupted by blockades, hindering access to services. Financial institutions may face vandalism or theft, while critical service providers, such as hospitals, could experience strain during unrest. Several economic assets are vulnerable to civil disturbances, primarily due to their visibility and reliance on foot traffic.
	Natural, Historic, and Cultural Resources	Parks and open spaces may suffer from vandalism or destruction during uncontrolled events. Historic sites can become targets, as they symbolize authority or cultural significance. Cultural resources such as community centers and places of worship, also may be affected, as they play a vital role in community identity. Their vulnerability lies in the potential for damage during protests.
	Critical Facilities and Infrastructure	Governmental buildings, schools, and healthcare facilities may be at risk, since they often symbolize authority and serve as community hubs, making them targets during unrest. Utility infrastructure, such as water and power facilities, is also at risk of disruption. Its visibility and essential services contribute to its vulnerability during civil disturbances.
	Community Activities	Public demonstrations, parades, and local government meetings are particularly vulnerable to civil disturbances. These events often attract large crowds and can become tense, especially around contentious social or political issues. Factors such as the local demographic, economic conditions, and recent events can heighten these vulnerabilities, making it easier for conflicts to arise during passionate public gatherings.
Cyberattack	People	Older adults often lack familiarity with technology and online security, making them easy targets for phishing scams. Individuals engaging in online banking or shopping without strong security measures also face heightened risks. Families with children may be less vigilant about

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		internet safety, allowing cybercriminals to exploit personal information. In addition, small business owners without robust cybersecurity practices are prime targets for attacks that can disrupt operations.
	Structures	Critical infrastructure, such as power plants, water treatment facilities, and transportation systems, often lack robust cybersecurity measures. Commercial businesses, especially financial institutions and healthcare providers, also are at risk due to weaker data protection and employee training. Educational institutions may be vulnerable because of limited funding for cybersecurity and outdated software. Obsolete technology and insufficient training enhance the susceptibility of these structures to cyber threats.
	Economic Assets	Financial institutions, such as banks and credit unions, are at risk of data theft and service disruption. Small and medium-sized businesses often lack robust cybersecurity measures, making them attractive targets. In addition, local government agencies and critical infrastructure, such as water treatment facilities, might have outdated security protocols, posing threats to public safety. The rise of remote work further exacerbates vulnerabilities, as employees accessing networks from home can unintentionally expose systems to risks. Overall, the combination of outdated technology and insufficient cybersecurity practices increases the vulnerability of an area's economic assets.
	Natural, Historic, and Cultural Resources	Natural resources like water management systems and wildlife databases can be compromised, disrupting ecosystems. Historic sites and museums that digitize collections are at risk of losing valuable artifacts and data. In addition, cultural organizations managing events may face threats if their systems lack adequate security. The limited resources of smaller organizations further increase this vulnerability
	Critical Facilities and Infrastructure	Energy and utility services, such as electricity and water systems, which often rely on outdated technology, may be vulnerable. Transportation infrastructure, such as traffic management and public transit, is also at risk due to networked systems. Healthcare facilities that use electronic records and connected medical devices face vulnerabilities that can compromise patient safety.
	Community Activities	Online registration for events, local government services, and educational programs that rely on digital tools may be targeted due to inadequate security measures, outdated software, and insufficient staff training.
Hazardous Materials Incident (Transporta-tion & Fixed Facility)	People	Individuals with pre-existing health conditions, such as respiratory issues, and the elderly are at higher risk due to their compromised health. Children also are more susceptible. Those living near industrial areas or transport routes for hazardous materials face increased exposure risk, while low-income families may lack resources and information to effectively prepare for incidents.
	Structures	Industrial facilities, such as manufacturing plants and warehouses, often store hazardous chemicals which may leak. Residential buildings, schools, and hospitals also are at risk, particularly if located along transportation routes for hazardous materials. Older buildings may lack modern safety features, increasing their vulnerability.

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
	Economic Assets	Industrial facilities, transportation infrastructure, and nearby commercial properties may be affected. Industrial facilities handling chemicals are at risk of spills or leaks, while roads and railways used for transporting hazardous materials can lead to accidents and contamination. In addition, nearby commercial and residential areas face potential health risks and economic losses.
	Natural, Historic, and Cultural Resources	Waterways and habitats are vulnerable to hazardous materials incidents, which can disrupt ecosystems. Historic sites and structures may suffer damage from toxic exposure, leading to degradation over time. In addition, cultural landmarks risk losing their significance due to contamination events. The proximity of these resources to industrial areas or transport routes exacerbates their risk.
	Critical Facilities and Infrastructure	Chemical manufacturing plants, waste treatment facilities, and transportation networks, such as highways and railroads may be at risk. Their vulnerability stems from factors such as proximity to residential areas, aging infrastructure, and inadequate safety measures. Natural hazards, such as flooding and earthquakes, can further increase risks by damaging containment systems.
	Community Activities	Local markets, school events, and outdoor gatherings are vulnerable to hazardous materials incidents if they are near industrial zones and transport corridors. This risk is heightened by inadequate emergency preparedness, lack of public awareness, and the potential for spills during transport. Large crowds at events can complicate evacuation efforts, increasing the risks for participants and nearby residents.
Public Health Epidemic/ Pandemic	People	Individuals with pre-existing health conditions like asthma and heart disease and adults over 65 may be vulnerable. Low-income families may struggle to access healthcare and vaccinations, increasing their risk. Marginalized communities with limited access to information and those living in high-density conditions also are at greater risk due to the rapid spread of diseases and the challenges in implementing preventive measures.
	Structures	Several structures are vulnerable to public health epidemics or pandemics, particularly due to their ability to facilitate the spread of disease. High-density residential areas, such as apartment complexes, are at risk, as close living quarters can lead to faster transmission. Public gathering spaces, such as schools and community centers, also pose significant threats because large groups are in confined spaces. Healthcare facilities can become hotspots for infections if infection control measures are insufficient. In addition, workplaces with high foot traffic, such as retail stores, contribute to vulnerability.
	Economic Assets	Small businesses in retail, hospitality, and food service are particularly vulnerable to public health epidemics or pandemics. These sectors face risks from fluctuating consumer demand and potential operational restrictions. The tourism industry also is affected, as travelers may avoid high-risk areas. Healthcare facilities can become overwhelmed, straining resources and impacting operations. In addition, local supply chains may experience disruptions, leading to shortages and inflation. Overall, the direct effects of illness, along with prolonged shutdowns and consumer hesitance, leave these economic assets exposed to significant downturns.

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
	Natural, Historic, and Cultural Resources	Natural resources like wildlife and ecosystems can be disrupted by increased human activity, raising the risk of zoonotic diseases. Historic sites may deteriorate due to reduced visitor access and funding, while cultural resources, such as community events, face cancelations, impacting social connections.
	Critical Facilities and Infrastructure	Public health epidemic or pandemic incidents can affect healthcare facilities, nursing homes, public transportation systems, schools, and food supply chains. Hospitals and clinics may become overwhelmed with patients, while vulnerable populations in nursing homes are at higher risk. Public transportation can facilitate the spread of disease, and schools gather large groups, thereby increasing transmission potential. These facilities often lack adequate resources, including medical supplies and testing capabilities, making them more susceptible to the impacts of a health crisis.
	Community Activities	Large gatherings like festivals and sporting events can facilitate the rapid spread of diseases due to close contact. Public transportation also is at risk, as it serves many people in confined spaces. Schools and childcare facilities are particularly susceptible, given that children can easily transmit infections. In addition, food-related events, such as farmers' markets, can pose risks if hygiene practices are not followed. The interconnectedness of community members and varying adherence to health guidelines further exacerbate these vulnerabilities.
Terrorism	People	Young children and newcomers may lack awareness of potential threats, while the elderly and individuals with disabilities may struggle to respond quickly in emergencies. Marginalized communities often face bias, making them more susceptible to targeting. In addition, those with lower socioeconomic status may lack access to security measures and emergency preparedness resources.
	Structures	Government buildings, transportation hubs, commercial centers, and public spaces are particularly vulnerable to terrorism incidents. Government buildings are symbolic targets, while transportation hubs and commercial centers are attractive due to their potential for high casualties and crowd presence. Public spaces also are at risk due to their open nature and lack of security. Their vulnerability is heightened by inadequate security measures, high occupancy rates, and their locations in densely populated areas, which can amplify the impact of incidents.
	Economic Assets	Infrastructure, commercial establishments, and community facilities may be vulnerable. Critical infrastructure, such as transportation networks and power grids, could disrupt the economy if targeted. Commercial establishments, especially those with high foot traffic, and community facilities like schools and hospitals also are at risk as they can provoke widespread concern and disruption. Their accessibility and interconnectivity increase vulnerability, meaning that damage to one asset can have a broader economic impact and hinder recovery efforts.
	Natural, Historic, and	Natural resources like water supplies and parks could be targeted for their significance to the community. Historic sites and cultural resources, such as museums or community centers, also are at risk

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
	Cultural Resources	due to their accessibility and importance to local identity. Their vulnerability is often heightened by inadequate security measures.
	Critical Facilities and Infrastructure	Public transportation systems, healthcare facilities, schools, and utility services like water and power plants may be affected. Their vulnerability arises from high accessibility and the potential impact of an attack, as crowded transportation and public spaces can lead to mass casualties and panic. Attacking utility services could disrupt the town's essential functions, creating chaos.
	Community Activities	Festivals, parades, and sporting events are particularly vulnerable to terrorism incidents. These events attract large crowds, making it easier for perpetrators to inflict harm and instill fear. In addition, community centers and places of worship serve as social hubs, increasing their risk. Factors such as limited security measures and open access to public spaces contribute to this vulnerability.

Hazards Not Profiled

Avalanche and Landslide/Slope Failure have been omitted from further discussion of hazard impacts and from mitigation actions. As shown in the hazard description in Volume 1, avalanche and landslide risk is primarily in the Wasatch and Oquirrh Mountains in Salt Lake County. Taylorsville has mostly flat terrain and minimal risk of impacts from these hazards. No previous occurrences of avalanche or landslide have impacted Taylorsville.

Jurisdiction-Specific Changes in Vulnerability

Hazard events can impact communities, infrastructures, and ecosystems. The severity of these impacts can be influenced by climate change, population patterns, and land use developments. Understanding these factors is crucial for the city of Taylorsville as it works to develop a resilient community and minimize the impacts of hazards. Table 8 displays the unique changes within the community and the related effects on each identified hazard affecting the city of Taylorsville.

DRAFT

Table 8: Jurisdiction-Specific Changes in Vulnerability in the City of Taylorsville

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
Avalanche	N/A	N/A	N/A	N/A
Drought	Climate change affects drought incidents by altering precipitation patterns and increasing temperatures. Warmer weather can lead to longer dry periods and more severe droughts, while changes in rainfall can reduce snowpack in nearby mountains, which is crucial for summer water supply. Higher temperatures also increase evaporation rates, further straining local water resources.	Drought can significantly influence population patterns by impacting economic opportunities and quality of life. Water scarcity often leads to reduced agricultural productivity, prompting residents to migrate to areas with more stable job prospects. Increased water costs can make living less affordable, driving some residents away. Conversely, efforts to address drought, such as sustainable development or improved water management, may attract newcomers, resulting in changes in the community's demographic composition over time.	Increased commercial development in Taylorsville increases water demand in the city and heightens the risk of drought.	Increased
Earthquake	Rising temperatures can lead to glacial melting, which affects pressure on tectonic plates and may trigger seismic activity through isostatic rebound. In addition, increased rainfall and flooding can erode soil, weakening structural integrity and heightening vulnerability during earthquakes. Although the direct links between climate change and earthquakes are still under investigation, environmental effects may impact the region's seismic risk.	Earthquakes can significantly alter population patterns by prompting residents to leave for safer areas after a seismic event. This migration can lead to changes in population density and attract new residents and businesses during the rebuilding process. The perception of the area as a safe place to live may shift, impacting long-term demographics, as some residents return to rebuild while others relocate permanently.	Increased development, residential, commercial, and infrastructure, are at risk of damage from earthquakes and liquefaction. An active fault is located in Taylorsville that puts development at extra risk.	Stayed the same
Extreme Heat	Climate change significantly impacts extreme heat by increasing the frequency and	Extreme heat may cause residents to relocate due to damaged homes or safety concerns. Some may move to areas	Developments like Volta and South Redwood that add density also increase	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	intensity of heat waves. Rising global temperatures lead to longer and hotter summers, affecting residents and local infrastructure while heightening health risks, especially for vulnerable populations. Urban heat islands resulting from reduced vegetation and extensive pavement further amplify these effects.	perceived as safer or seek better job opportunities elsewhere. The economic impact and infrastructure damage can also make certain neighborhoods less desirable, leading to shifts in demographics and the socioeconomic landscape as new residents with different backgrounds move in.	surface temperatures and the risk of extreme heat.	
Extreme Cold	Climate change may increase the intensity of winter storms. Higher atmospheric temperatures allow for more moisture, resulting in heavier snowfall and potentially lower temperatures during these events. In addition, fluctuations in weather patterns may disrupt seasonal cycles, leading to unpredictable periods of extreme cold mixed with warmer spells.	Extreme cold may drive some residents to relocate to warmer areas. Harsh winters can hinder economic activities and deter new residents and businesses, influencing housing demand and the attractiveness of certain neighborhoods. This may disproportionately affect lower-income families, leading to changes in demographics and socioeconomic stratification in the community.	Increased growth of commercial and residential developments in Taylorsville increases energy demand during extreme cold events, stressing the electrical grid and increasing the risk associated with extreme cold.	Increased
Flooding	Higher temperatures increase the frequency and intensity of extreme weather events and alter precipitation patterns. They lead to more intense rainstorms and accelerated snowmelt from nearby mountains, raising water levels in rivers and streams. This combination raises the risk of flooding, especially in areas with inadequate drainage and urban development in flood-prone zones, heightening the potential	Flooding can significantly alter population patterns by displacing residents from affected areas, leading them to seek shelter elsewhere. This may cause a population decline in areas where flooding occurs, as individuals might hesitate to return due to ongoing risks or property damage. As neighborhoods become less desirable, people may migrate to safer areas, changing demographic trends and putting pressure on housing in those regions. Over time, these shifts can influence urban planning and development,	No developments in Taylorsville have been constructed in the special flood hazard area. Increased impervious surfaces due to development across Taylorsville could contribute to ponding and other pluvial flooding.	Stayed the same

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	for damage to homes and infrastructure.	as local governments address flooding risks and changing population needs.		
Landslide/ Slope Failure	N/A	N/A	N/A	N/A
Radon	Climate change can affect radon levels by altering soil temperatures and moisture conditions. Higher temperatures may increase radon emissions from the ground, while heavy rainfall can change groundwater and soil saturation, impacting radon migration into buildings.	Radon exposure can influence population patterns as increased health awareness may drive families to move away from areas with high radon levels. This shift could particularly affect vulnerable groups, changing demographics and demand in the housing market. Homes with lower radon levels may become more sought after, and public health campaigns can encourage community action, making previously undesirable areas more attractive once mitigation measures are implemented.	Development in Taylorsville has not increased radon risk.	Stayed the same
Heavy Rain	Climate change increases the frequency and intensity of heavy rain, as higher temperatures allow the atmosphere to hold more moisture. This leads to stronger storms, flash flooding, and overwhelmed drainage systems.	Heavy rain can shift population patterns by pushing residents out of flood-prone areas and attracting them to safer neighborhoods. Frequent flooding may lead to evacuations and economic disruptions, prompting relocations. Over time, ongoing heavy rains can affect housing demand and community stability, altering the town's population distribution.	Increased impervious surfaces due to development across Taylorsville could contribute to ponding and other pluvial flooding.	Increased
High Wind	Climate change affects high winds by altering atmospheric patterns and increasing extreme weather events. Rising temperatures may lead to more substantial, unpredictable winds and more frequent	High winds can alter population patterns by making certain areas less desirable. Frequent damage may drive residents to safer neighborhoods, deter newcomers, and slow growth in affected regions.	New development, especially subdivisions with few wind breaks, increases the risk of wind damage.	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	thunderstorms, posing risks to infrastructure and air quality.			
Lightning	Climate change increases temperatures and alters precipitation, leading to more intense thunderstorms and frequent lightning strikes. Urbanization can enhance this effect, posing risks to public safety and infrastructure.	Lightning can influence population patterns by causing property damage and wildfires, leading some residents to relocate. Areas with higher lightning activity may deter new residents, while safer locations might see increased migration as people seek protection from severe weather.	New multistory buildings, like in the Volta development, are more exposed to damage from lightning strikes.	Increased
Severe Winter Weather	Climate change impacts heavy snow and blizzards by altering precipitation patterns. Higher temperatures can lead to more rain than snow, affecting snowpack levels—additionally, increased storm intensity results in heavier, more unpredictable snowfall.	Increased population means an increased number of people needing to get to work and requiring quicker snow removal. Heavy snow or blizzards can impact population patterns by influencing where people live and work. Transportation disruptions may lead residents to seek housing closer to jobs, increasing density in some areas while depopulating others. Families might also avoid regions with frequent heavy snowfall, shifting demand to milder areas. Over time, these trends can alter community demographics and economic activity, prompting adjustments in town planning and resource allocation.	As development increases in Taylorsville, the risk of damage and increased responsibility due to severe winter storms has risen. With new subdivisions the city is responsible for plowing, rescues, and evacuations during heavy snow events.	Increased
Tornado	Climate change may increase the frequency and intensity of tornadoes. Higher temperatures lead to more moisture in the air, creating conditions for severe thunderstorms. Changes in wind patterns and precipitation can also heighten tornado risks, resulting in more destructive	Tornadoes can influence population patterns by prompting residents to move to safer areas after damage occurs. This can decrease density in affected neighborhoods while increasing the demand for housing in safer regions. New residents may also move in for recovery opportunities, altering demographics. Over time, repeated tornado threats might push long-term residents to areas with better	Tornadoes are rare in Taylorsville, but increased development has put more structures in place that could be damaged by tornadoes.	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	storms and greater threats to infrastructure and communities.	disaster preparedness, reshaping the town's population distribution.		
Wildfire	By raising temperatures and creating drier conditions, prolonged droughts lead to more dry vegetation, which serves as fuel for fires. Erratic seasons extend the growing period, while more lightning strikes can ignite wildfires. These factors heighten the threat to ecosystems and community safety.	Displaced individuals often seek safer areas, shifting demographics, while declining property values might deter newcomers. Conversely, some may be drawn to rebuilding efforts, impacting long-term growth and community dynamics.	New development in Taylorsville has not changed the risk of wildfire.	Increased
Dam Failure	Climate change raises the risk of dam failure by causing heavier rainfall and rapid snowmelt. These changes can overwhelm dams and compromise their integrity, highlighting the need for urgent safety assessments and upgrades to protect communities downstream.	Dam failure can impact population patterns by displacing residents and altering demographics. Evacuations can lead to an influx into safer areas, while destruction may deter new residents and contribute to population decline. Fear of future disasters may also prompt remaining individuals to relocate, changing the community's composition and affecting population density and economic activity.	New development in Taylorsville has not changed the risk of dam failure.	Increased
Civil Disturbance	Climate change can increase civil disturbances by intensifying environmental stresses and social tensions. Rising temperatures may lead to droughts, wildfires, and poor air quality, particularly affecting vulnerable communities. Resource scarcity, especially water, can spark conflicts and protests. In addition, an influx of migrants from harder-hit areas may strain local resources,	Civil disturbances may encourage residents to move for safety, leading to outflows and new arrivals. These events can reveal social issues, impacting community dynamics, employment, and property values, ultimately reshaping demographics and social cohesion.	New development in Taylorsville has not changed the risk of civil disturbance.	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	further escalating tensions. This cycle of unrest is driven by the impacts of climate change on the environment and community dynamics.			
Cyberattack	Cyberattacks are possible on the industry, which is seen as producing large amounts of greenhouse gases and burning fossil fuels. Climate change can heighten cyberattack risk by increasing vulnerabilities during extreme weather. Disruptions like power outages offer cybercriminals opportunities, as focusing on emergency responses can weaken cybersecurity measures. As organizations adopt new technologies to cope with climate impacts, they may unintentionally introduce additional vulnerabilities.	Cyberattacks can change population patterns by eroding trust in essential services. Compromised systems may cause residents to leave due to safety concerns, while high-profile incidents can deter businesses, leading to job losses. This perception of vulnerability may also make the town less appealing to newcomers, resulting in demographic shifts and affecting local development.	New development in Taylorsville has not changed the risk of cyberattack.	Increased
Hazardous Materials Incident (Transporta-tion & Fixed Facility)	Climate change elevates the risk of hazardous materials incidents by increasing extreme weather events like heavy rain and wildfires. These events can breach storage tanks and heighten material volatility. Vulnerable infrastructure can lead to more spills or accidents, while climate shifts may also introduce new challenges for managing	Hazardous materials incidents may cause evacuations and temporary declines in density. In the long run, unsafe areas may deter new residents, affecting growth and diversity. Negative perceptions can lower property values and economic prospects, leading families to relocate, impacting local demographics.	New development in Taylorsville has not changed the risk associated with hazardous materials.	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	hazardous substances and public health.			
Public Health Epidemic/ Pandemic	Climate change impacts public health by increasing the spread of vector-borne diseases and raising the risk of waterborne illnesses due to flooding or drought. Worsening air quality can also exacerbate respiratory conditions like asthma, especially in vulnerable populations.	Epidemics or pandemics may prompt migration for safety and better healthcare. Vulnerable groups may move to areas with improved services, while economic instability can drive people to seek new employment opportunities. Restrictions, like quarantine measures, can limit movement and social interactions, reshaping the community's demographics and impacting local economies.	New development in Taylorsville has not changed the risk of a pandemic/ epidemic.	Increased
Terrorism	Terrorist activity is sometimes centered around climate change. Climate change impacts terrorism incidents by creating conditions of resource scarcity and social unrest. Increased competition for essential resources, such as water, can fuel tensions, making communities more vulnerable to extremist ideologies. Extreme weather events may disrupt social order and infrastructure, offering terrorist groups opportunities to exploit crises. In addition, climate-driven population displacement can heighten tensions in receiving areas, raising the risk of domestic terrorism. Law enforcement's focus on climate-related challenges can also limit its capacity to address terrorism threats. Ultimately, while climate	Terrorism incidents can alter population patterns by instilling fear and prompting residents to relocate to perceived safer areas, resulting in demographic shifts and potential declines in property values. Some neighborhoods may see an outflow of residents, while others could experience an influx of people seeking refuge from violence. In addition, increased security measures may deter businesses and residents from certain locations, leading to long-term changes in population density and urban development patterns.	New development in Taylorsville has not changed the risk of terrorism.	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	change may not directly cause terrorism, its effects can create an environment conducive to extremist activities.			

DRAFT

Additional Public Involvement

The city of Taylorsville provided several opportunities for public participation. Figure 1 and Figure 2 are examples of public outreach. An announcement about the mitigation plan update with a link to the public survey was also included in the City Journal mailer sent to residents in October.

Figure 1: Public Survey Flyer Posted in City Hall Lobby

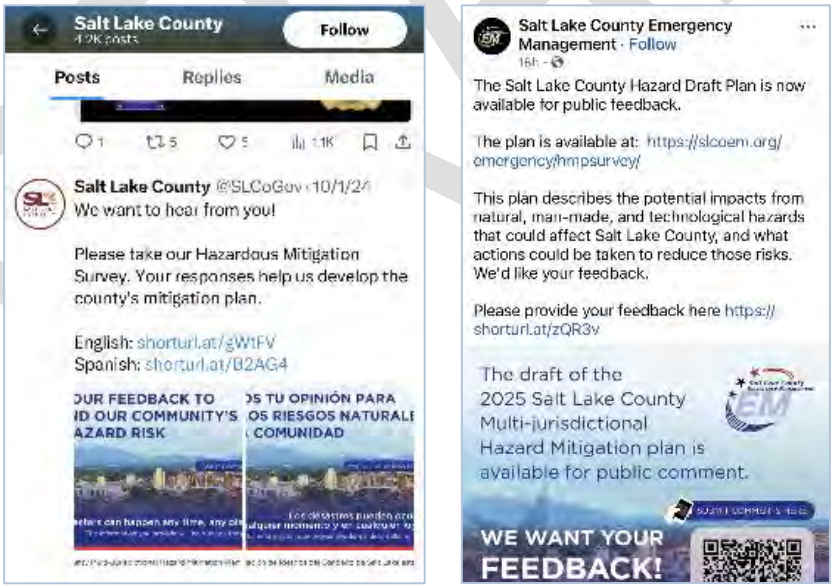

Figure 2: Social Media Posts for the Hazard Mitigation Survey (*left*) and Draft Plan Review (*right*)

Plan Integration

Incorporating the underlying principles of the Hazard Mitigation Plan and its recommendations into other plans is a highly effective and low-cost way to expand their influence. All plan participants will use existing methods and programs to implement hazard mitigation actions where possible. As previously stated, mitigation is most successful when it is incorporated into the day-to-day functions and priorities of government and public service. This plan builds on the momentum developed through previous and related planning efforts and mitigation programs, and it recommends implementing actions where possible through these other program mechanisms. These existing mechanisms include the following:

- Regularity Capabilities
- Administrative Capabilities
- Fiscal Capabilities

Respective planning stakeholders will conduct implementation and incorporation into existing planning mechanisms and will be done through the routine actions of:

- Monitoring other planning/program agendas
- Attending other planning/program meetings
- Participating in other planning processes; and
- Monitoring community budget meetings for other community program opportunities.

The successful implementation of this plan will require constant and vigilant review of existing plans and programs for coordination and multi-objective opportunities that promote a safe, sustainable community. Regular efforts should be made to monitor the progress of mitigation actions implemented through other planning mechanisms. Where appropriate, priority actions should be incorporated into planning updates. Table 9 lists existing planning mechanisms in which the Hazard Mitigation Plan has been integrated.

Table 10 lists the opportunities for integrating elements of this plan into other plans

Table 9: Previous Plan Integration by the City of Taylorsville

Plan	Description
Development standards in municipal code	Incorporation of known vulnerabilities.

Table 10: Opportunities for Integration with Future Plans of the City of Taylorsville

Plan	Description
Comprehensive Emergency Management Plan (CEMP)	Framework for preparedness, response, recovery, and mitigation of hazards.
General Plan	Could update with current risk information and mitigation actions. Addresses known vulnerabilities.

DRAFT

Plan	Description
Mid-Valley Active Transportation Plan	Cottonwood Heights, Holladay, Midvale, Millcreek, Murray, and Taylorsville are working together to establish better active transportation options across the region.
Taylorsville Economic Development Plan	Incorporation of mitigation actions to reduce hazard risks to businesses.
Area Development Plans	Bus Rapid Transit (BRT) Area Plans, Center Point, West Point, and other site specific plans can incorporate actions to reduce hazard risk.
Moderate Income Housing Plan	Inform mitigation actions and policies to prevent resident exposure to hazards
Stormwater Management Plan	Incorporate actions relating to flood control and natural resources.

Capability Assessment

Local mitigation capabilities are existing authorities, policies, programs, and resources that reduce hazard impacts or could help carry out hazard mitigation activities.

Planning and Regulatory Capabilities

Planning and regulatory capabilities are the plans, policies, codes, and ordinances that prevent and reduce the impacts of hazards.

Table 11: Assessment of the Planning Capabilities of the City of Taylorsville

Plan	Does it address hazards? (Y/N)	How can it be used to implement mitigation actions?	When was the last update? When is the next update?
General Plan	Y	Incorporate goals and implementation strategies into mitigation actions	2006
Capital Improvement Plan	Y – in General Plan	By allocating funding and resources for projects that reduce risk and enhance resilience to hazards.	2006
Climate Change Adaptation Plan	Unknown	Unknown	Unknown
Community Wildfire Protection Plan	Y	Inform the public about general wildfire risk and ensure coordination between surrounding jurisdictions/agencies	Unknown
Economic Development Plan	Y – in General Plan	Identify funding sources and responsible departments/parties for mitigation actions	2006

Acquisition of Land for Open Space and Public Recreation Use	Unknown	Unknown	Unknown
Prohibition of Building in At-Risk Areas	Y	Y	Unknown
Other? (Describe)			

[3] IBC: International Building Code, IRC: International Residential Code, IPC: International Plumbing Code, IMC: International Mechanical Code, IFGC: International Fuel Gas Code, IECC: International Energy Conservation Code, NEC: National Electrical Code

Administrative and Technical Capabilities

Administrative and technical capabilities include staff and their skills. They also include tools that can help carry out mitigation actions.

Table 13: Assessment of the Administrative Capabilities of the City of Taylorsville

Administrative Capability	In Place? (Y/N)	Is staffing adequate?	Are staff trained on hazards and mitigation?	Is coordination between agencies and staff effective?
Chief Building Official	Y	Y	Unknown	Y
Civil Engineer	Y	Y	Unknown	Y
Community Planner	Y	Y	Unknown	Y
Emergency Manager	Y	Y	Y	Y
Floodplain Administrator	Y	Y	Unknown	Y
Geographic Information System (GIS) Coordinator	Y	Y	Unknown	Y
Planning Commission	Y	Unknown	Unknown	Unknown
Fire Safe Council	Unknown	Unknown	Unknown	Unknown
CERT (Community Emergency Response Team)	Y	Y	Y	Y
Active VOAD (Voluntary Agencies Active in Disasters)	Y	Y	Y	Y
Other? (Please describe.)				

Table 14: Assessment of the Technical Capabilities of the City of Taylorsville

Technical Capability	In Place? (Y/N)	How has it been used to assess/mitigate risk in the past?	How can it be used to assess/mitigate risk in the future?
Mitigation Grant Writing	Unknown	Unknown	Grant funding can be used to reduce risk to local hazards.
Hazard Data and Information	Y	Unknown	Improve response times and reduce risk to hazards.
GIS	Y	Identify areas at risk to various hazards	Prioritize areas based on mitigation actions to reduce hazard risk
Mutual Aid Agreements	Y	Improved response through coordination between agencies	Improve response times and procedures between agencies/ surrounding jurisdictions, especially if there are power failures or road closures for an extended period.

DRAFT

Technical Capability	In Place? (Y/N)	How has it been used to assess/mitigate risk in the past?	How can it be used to assess/mitigate risk in the future?
Other? (Please describe.)			

Financial Capabilities

Financial capabilities are the resources to fund mitigation actions. Talking about funding and financial capabilities is important to determine what kinds of projects are feasible, given their cost. Mitigation actions like outreach programs are lower cost and often use staff time and existing budgets. Other actions, such as earthquake retrofits, could require substantial funding from local, state, and federal partners. Partnerships, including those willing to donate land, supplies, in-kind matches, and cash, can be included.

Table 15: Assessment of the Financial Capabilities of the City of Taylorsville[4]

Funding Resource	In Place? (Y/N)	Has it been used in the past and for what types of activities?	Could it be used to fund future mitigation actions?	Can it be used as the local cost match for a federal grant?
Capital Improvements Project Funding	Yes	Yes, it has been used throughout the city for all types of projects	Yes	Yes
General Funds	Yes	Y, used to fund emergency management programs and response capabilities	Y	Y
Community Development Block Grant	Yes	Housing rehabilitation, Senior Center and public facilities improvements.	Yes	No
Property, Sales, Income, or Special Purpose Taxes	Y	Used to fund fire and police operations	Y	N
Stormwater Utility Fee	Yes	Operation of the storm water system	Yes	Yes
Impact fees for new development	Unknown	Unknown	Unknown	Unknown
Federal-funded programs (Please describe)	Y	Fire department applies for federal funding through FEMA for equipment and staffing.	Y, BRIC, FMA, other grants could be used	N

[4] BRIC = Building Resilient Infrastructure and Communities, FMA = Flood Mitigation Assistance.

Education and Outreach Capabilities

Education and outreach capabilities are programs and methods that could communicate about and encourage risk reduction. These programs may be run by a participant or a community-based partner. Partners, especially those who work with underserved communities, can help identify additional education and outreach capabilities.

Table 16: Assessment of the Education and Outreach Capabilities of the City of Taylorsville[5]

Education and Outreach Capability	In Place? (Y/N)	Does it currently incorporate hazard mitigation?	Could it be used to support mitigation in the future?
Community Newsletter(s)	Y	Y – CERT training info, waterwise landscaping, hazard awareness/ preparedness	Y
Hazard Awareness Campaigns (such as Firewise, Storm Ready, Severe Weather Awareness Week, School Programs)	Y	Y	Y
Public Meetings/Events (Please describe.)	Y	Y	Y
Emergency Management Listserv	Unknown	Unknown	Y
Local News	Y	Y	Y
Distributing Hard Copies of Notices (e.g., public libraries, door-to-door outreach)	Unknown	Unknown	Y
Insurance Disclosures/Outreach	Unknown	Unknown	Y
Organizations that Represent, Advocate for, or Interact with Underserved and Vulnerable Communities (Please describe.)	Unknown	Unknown	Y
Social Media (Please describe.)	Y	Y	Y
Other? (Please describe.)			

Opportunities to Expand and/or Improve Capabilities

Actions that can expand and improve existing authorities, plans, policies, and resources for mitigation include budgeting for mitigation actions, passing policies and procedures for mitigation actions, adopting and implementing stricter mitigation regulations, approving mitigation updates, and making additions to existing plans as new needs are recognized. Table 17 lists the opportunities for the city of Taylorsville.

[5] CERT = Community Emergency Response Team.

Table 17: Opportunities to Expand and/or Improve the Capabilities of the City of Taylorsville

Capability	Opportunity to Expand and/or Improve
Planning and Regulation	Planning capabilities could be enhanced by aligning older plans, such as the General Plan, with more recent hazard data, areas of concern, and mitigation recommendations as outlined in this hazard mitigation plan.
Administrative and Technical	Multiple positions could benefit from additional training on hazard mitigation and mitigation grant writing. Additionally, partnerships with community-based organizations and other federal, state, and local government entities can be expanded to help support mitigation at a local level.
Financial	The city has not been awarded Hazard Mitigation Assistance (HMA) grants yet. Applying for grant programs such as the Hazard Mitigation Grant Program (HMGP) and Flood Mitigation Assistance (FMA) can expand this capability.
Education and Outreach	The city can expand current capabilities by developing hazard-specific public outreach campaigns and coordination with groups such as the Community Emergency Response Team (CERT) to promote mitigation at a grassroots level.

Mitigation Strategy

Mitigation strategies provide proactive measures that are designed to minimize the impacts of hazards on the city of Taylorsville. Table 18 shows mitigation action alternatives, and

Table 19 shows the status of previous mitigation activities. Table 20 is the 2025 mitigation action plan for the city of Taylorsville.

Table 18: Mitigation Action Alternatives for the City of Taylorsville

Action	Type of Action	Selected for inclusion in the plan?	If not selected, why not?
Stormwater Management	Local Plans and Regulations	Yes	
Building Codes	Local Plans and Regulations	Yes	
Infrastructure (Bridges)	Structure and Infrastructure Projects	Yes	
Education	Education and Awareness Programs	Yes	

Table 19: Status of Prior Mitigation Actions of the City of Taylorsville[6]

Action	Hazard(s)	Agency Lead	Support Agency	Status Update
Fix and repair drainage by increasing drainage	Flood (Riverine and	Taylorsville EM		On-going. Some areas are complete, such as some

Action	Hazard(s)	Agency Lead	Support Agency	Status Update
area and expanding inlets and outlets	Urban/Flash Flooding)			upgrades to drainage containment areas, plus retrofit to the Little Cottonwood Creek confluence (backflow).
Conduct a Hazardous Material Flow Study	Hazardous Materials Release	Taylorsville EM		Incomplete. To be requested as part of a transportation study for major state roads in the city.
Establish agreements to share communications equipment between agencies involved in emergency operations	All hazards	Taylorsville EM		On-going. Partnerships between Law Enforcement, the state, and SLVECC.
Establish notification capabilities and procedures for emergency personnel	All hazards	Taylorsville EM		On-going. Recent update to the city EOP.
Establish a coordinating group to address long-term communication needs and implementation strategies	All hazards	Taylorsville EM		On-going. There is no formal committee designated as such in the city administration. However, as part of the Police Department Strategic Plan, communications equipment and updates are perpetually addressed. Taylorsville EM continues to coordinate with the local Amateur Radio Club (monthly meetings held at City Hall).
Acquire, upgrade, and/or integrate communications equipment and systems as determined by coordinating group	All hazards	Taylorsville EM		Ongoing, as part of the Police Department Strategic Plan. With respect to City Hall, incomplete. Plans and funding for additional equipment for the Council Chamber (to serve as the city ECC) are forthcoming.
Implement improvements to address identified in assessment	All hazards	Taylorsville EM		Incomplete.
Identify structures at risk to earthquake damage	Earthquake	City Engineering Division		Incomplete. City engineer and inspector to work with UFA on any potential, pre-identifying structures.
Determine potential flood impacts and identify areas in need of	Flood	City Engineering Division		On-going. Continued efforts to identify and provide upgrades to existing bridges along the Jordan River and canals.

DRAFT

Action	Hazard(s)	Agency Lead	Support Agency	Status Update
additional flood control structures				
Address identified problems through construction of debris basins, flood retention ponds, energy dissipaters or other flood control structures	Flood	City Engineering Division		On-going. Skyview basin.
Establish maintenance and repair programs to remove debris, improve resistance and otherwise maintain effectiveness of storm water and flood control systems	Flood	Taylorsville–Bennion Improvement District		Ongoing. Plan in place for perpetual maintenance and upgrades to existing storm drains and a contract to remove debris during peak seasons and storms. The city does have a Storm Water Master Plan.
Identify and assess structures for deficiencies	Flood	City Engineering Division		Incomplete. More research is needed and pending.
Modify structures as needed to address deficiencies	Flood	City Engineering Division		Incomplete (see above).
Continue to Enforce Building Codes, Development Codes and Zoning Ordinance	Earthquake, Flood and Severe Weather	City of Taylorsville Building Division, City of Taylorsville Community Development Department		On-going. Permitting processes, inspections, etc.
Continue to Execute Training and Exercise Program	Earthquake, Pandemic, Flood and Severe Weather	Taylorsville EM		Incomplete. Personal preparedness taught to city employees over the past two years, but exercises.
Educate Residents and Businesses through Public Information and Events	All hazards	Public Information Officer, Emergency Manager		Open-ended. Safety fairs, City Council meetings, the Public Safety Committee, Storm Water Coalition, social media outreach, website, etc.

DRAFT

City of West Jordan Annex

To participate in this multi-jurisdictional hazard mitigation plan (MJHMP) update for Salt Lake County (SLCo), West Jordan provided a letter of commitment to engage in the planning process. Following completion of the plan, the governing body of the city of West Jordan passed a formal resolution to adopt the plan, a copy of which is maintained at the local government offices.

Planning Process Contact Information

Table 1 provides information on the point of contact during the updating of the MJHMP.

Table 1: Contact Information for the City of West Jordan

Name	Contact Information
Jeffory Mulcahy	Phone: 801-834-8502; email: Jeff.mulcahy@westjordan.utah.gov

The city of West Jordan has a fully integrated approach to hazard mitigation planning and program implementation. During the 2024 update process, the MJHMP participation roles in Table 2 were recorded.

Table 2: Participant List for the City of West Jordan

Name	Title	Jurisdiction
Jeffory Mulcahy	Emergency Manager	City of West Jordan/Fire Department
Doug Rolfe	Building Official	West Jordan Community Development
Larry Gardner	City Planner	West Jordan City
Del Brady	Risk Manager	West Jordan City

Date of Incorporation

January 10, 1941

DRAFT

Location and Description

Situated along the southwestern end of the Salt Lake Valley, West Jordan lies at an elevation of approximately 4,330 feet and is bordered by the Oquirrh Mountains to the west and the Jordan River to the east. The city of West Jordan is a suburb of Salt Lake City and is one of Utah's fastest growing cities with significant growth since the 1970s. The city is known for its blend of historical and modern attractions with a mix of suburban charm and historical significance.

Population

The 2023 American Community Survey 5-Year Estimate from the U.S. Census Bureau records the population of the city of West Jordan as 114,908 people.[2]

Demographics

Most of the 114,908 people are between the ages of 35 and 44, with a median age of 33.9; 58,165 (50.6%) are females and 56,743 (49.4%) are males. English is the primary language in 80.6% of homes,, with 13.5% Spanish, 2.9% other Indo-European languages, 2% Asian and Pacific Island languages, and 1% other languages.

Brief History

Mormon settlers led by Brigham Young arrived in the Salt Lake Valley in 1847 named the river west of Salt Lake City the Western Jordan after the River Jordan in the Middle East. Later it was simplified to the Jordan River. However, the City of West Jordan retained its name. The city was established around 1849 on the river's western banks, with Archibald Gardner building one of the first sawmills in 1850 and the first leather tannery west of the Mississippi River in 1851. West Jordan's economy was largely based on agriculture, mills, and mining.

Climate

The City of West Jordan has a cold semi-arid climate (Dsa Köppen classification) characterized by a chilly and moderate climate. Average high temperatures are approximately 81°F in the summer and approximately 25.9°F in the winter. Rain each year is approximately 19.6 inches, and snowfall averages 53.2 inches annually.

Public Services

The city offers a multitude of services to its residents. The city has a fire department, police department, animal services, public works, and other development, planning and administrative services. The city is an active participant in the Salt Lake County Local Emergency Planning Committee. This committee

[2] U.S. Census Bureau QuickFacts. Population Estimate July 1, 2023. https://www.census.gov/quickfacts/fact/table/westjordancityutah/PST045224#PST045224.

DRAFT

fulfills the federal requirements for chemical reporting and emergency planning as specified in federal law 42 USC Chapter 116, the Community Right-to-Know Act.

Governing Body

The governing body for the City of West Jordan consists of a Strong Mayor and a seven-member City Council. Members of this governing body are elected by the people.

Development Trends

West Jordan is Utah's third-largest city, with an estimated population in 2023 of almost 115,000 residents.

Jurisdiction-Specific Hazards and Risk

The Calculated Priority Risk Index (CPRI) is a comprehensive assessment tool for evaluating and prioritizing risks in a given context. It considers various factors, such as probability, impact, and urgency, to determine the level of risk associated with events or situations. The results for each hazard, including its risk factor (RF) value, are shown in Table 5. The results are based on the criteria in

Table 6 and the equation that follows it. The CPRI helps organizations and individuals make informed decisions about risk management and mitigation strategies. It provides a systematic approach to identifying and addressing potential issues, allowing for a more efficient allocation of resources and proactive risk prevention. With the CPRI, stakeholders can prioritize their focus on the most critical risks, leading to more effective risk management and, ultimately, better outcomes.

Table 5: Calculated Priority Risk Index Values for the City of West Jordan

Type of Hazard Event	Probability of Future Events	Spatial Extent	Severity of Life/ Property Impact	Warning Time	Duration	Response Capacity	Risk Factor Value
Avalanche	1	1	1	1	1	1	1
Drought	4	4	2	1	4	1	2.8
Earthquake	3	4	4	4	4	2	3.5
Extreme Heat	4	4	3	1	3	1	3
Extreme Cold	3	4	2	1	3	1	2.4
Flooding	3	2	2	3	3	1	2.4
Landslide/Slope Failure	1	1	1	1	1	1	1
Radon	4	4	2	1	4	2	2.9
Heavy Rain	4	3	2	3	1	1	2.6
High Wind	4	3	3	3	2	1	3
Lightning	4	2	2	4	1	1	2.6

DRAFT

Type of Hazard Event	Probability of Future Events	Spatial Extent	Severity of Life/ Property Impact	Warning Time	Duration	Response Capacity	Risk Factor Value
Severe Winter Weather	4	3	2	2	2	1	2.6
Tornado	2	2	3	4	1	2	2.4
Wildfire	3	2	2	4	3	1	2.5
Dam Failure	2	2	3	2	2	3	2.4
Civil Disturbance	2	1	2	4	2	2	2.1
Cyberattack	2	3	3	4	3	2	2.7
Hazardous Materials Incident (Transportation & Fixed Facility)	3	1	2	4	1	1	2.2
Public Health Epidemic/ Pandemic	3	4	3	1	4	1	2.8
Terrorism	2	1	3	4	2	1	2.3

Table 6: Criteria for the Calculated Priority Risk Index

Risk Index Factor	Degree of Risk Level		Criteria	Factor Weight for Degree of Risk Level
Probability of Future Events	1	Unlikely	Less than 1 percent probability of occurrence in the next year or a recurrence interval of greater than every 100 years.	30%
	2	Occasional	1 to 10 percent probability of occurrence in the next year or a recurrence interval of 11 to 100 years.	
	3	Likely	11 to 90 percent probability of occurrence in the next year or a recurrence interval of 1 to 10 years.	
	4	Highly Likely	91 to 100 percent probability of occurrence in the next year or a recurrence interval of less than 1 year.	
Spatial Extent	1	Limited	Less than 10% of the planning area could be impacted.	10%
	2	Small	10%–25% of the planning area could be impacted	
	3	Significant	25%–50% of the planning area could be impacted.	

DRAFT

Risk Index Factor	Degree of Risk Level		Criteria	Factor Weight for Degree of Risk Level
	4	Extensive	50%–100% of the planning area could be impacted.	
Severity of Life/Property Impact	1	Negligible	Less than 5% of the affected area's critical and non-critical facilities and structures are damaged/destroyed. Only minor property damage and minimal disruption of life. Temporary shutdown of critical facilities.	30%
	2	Limited	More than 5% and less than 25% percent of property in the affected area is damaged/ destroyed. Complete shutdown of critical facilities for more than one day but less than one week.	
	3	Critical	More than 25% and less than 50% of property in the affected area was damaged/destroyed. Complete shutdown of critical facilities for over a week but less than one month.	
	4	Catastrophic	Over 50% of critical and non-critical facilities and infrastructures in the affected area are damaged/destroyed. Complete shutdown of critical facilities for more than one month.	
Warning Time	1	Self-defined	More than 24 hours	10%
	2	Self-defined	12 to 24 hours.	
	3	Self-defined	6 to 12 hours.	
	4	Self-defined	Less than 6 hours.	
Duration	1	Brief	Up to 6 hours.	10%
	2	Intermediate	Up to one day.	
	3	Extended	Up to one week.	
	4	Prolonged	More than one week.	
Response Capacity	1	High	Significant resources and capability to respond to this kind of event; staff are trained, experienced, and ready.	10%
	2	Medium	Some resources and capability to respond to this kind of staff; some staff may be trained, experienced, and ready while others may need additional support.	
	3	Low	Limited resources and capability to respond to this kind of event; additional staff or staff training needed.	
	4	None	No resources and capability to respond this kind of event; additional outside support would be required.	

DRAFT

RISK FACTOR (RF) EQUATION

RF Value = [(Probability x 0.30) + (Spatial Extent x 0.10) + (Severity of Life/Property Impact x 0.30) + (Warning Time x 0.10) + (Duration x 0.10) + (Response Capacity x 0.10)]

Hazards with an RF value greater than or equal to 2.5 are considered high risk. Those with RF values of 2.0 to 2.4 are considered moderate risk hazards, and those with an RF value less than 2.0 are considered low risk. The highest possible RF value is 4.

Hazard Event History

Examining hazard event histories provides valuable insights to inform decision-making and help prioritize resources for risk prevention and response efforts. Table 7 lists the hazard events impacting the city of West Jordan since the 2019 plan update, as recorded in the Storm Events Database from the National Centers for Environmental Information.

Table 7: History of Hazard Events in the City of West Jordan

Type of Hazard Event	FEMA Disaster #	Date(s)	Damage or Impacts	Description
Avalanche		N/A	N/A	N/A
Drought		05/13/2021	Water restrictions	Governor declared state of emergency for drought conditions
Earthquake		03/18/2020	Water tank inlet and outlet lines damaged	5.7 M earthquake with an epicenter in Magna, Utah. Presidential Disaster Declaration. An earthquake damaged the inlet and outlet lines to a Zone 4 water tank. The lines required excavation, removal and replacement.
Extreme Heat		N/A	N/A	N/A
Extreme Cold		N/A	N/A	N/A
Flooding		09/11/2020	Three homes flooded	Canal overflowed, causing flooding in three homes.
Landslide/Slope Failure		N/A	N/A	N/A
Radon		N/A	N/A	N/A
Heavy Rain	N/A	08/12/2022	Five homes with varying interior and exterior damage from stormwater runoff	A private developer built inadequate drainage, allowing water runoff from the construction site onto two neighboring private properties, flooding one resident's basement and washing away another's landscaping. During the same storm, Barney's Creek drainage failed, and stormwater overflowed into a neighborhood, damaging one basement and washing

Figure 1: Damage from a Windstorm, 2020

National Flood Insurance Program Summary

The city of West Jordan participates in the Nation Flood Insurance Program (NFIP). Table 8 displays statistics related to the NFIP. The city of West Jordan does not participate in the Community Rating System (CRS).

Table 8: National Flood Insurance Program Status for the City of West Jordan[3]

Initial FHBM Identified	Initial FIRM Identified	Current Effective Map Date	Adopted Date	Date Joined NFIP	Tribal
07/19/1974	09/01/1987	09/25/2009	2009	09/01/1987	No

Table 9: National Flood Insurance Overview for the City of West Jordan

Community ID	Number of Losses	Total Net Payment	Active Policies	Total Coverage
490108	5	$14,082.83	34	$10,466,000

The city of West Jordan has designated the City Engineer as the Floodplain Administrator. The city's current floodplain ordinance, titled the Floodplain Overlay Zone, was adopted on 12/18/2024. The current effective FIRM is dated 9/25/2009. The Building & Safety Division is responsible for checking, permitting, and inspecting all new construction, additions, remodels and alterations, and demolitions. The Engineering Department collaborates with the Building & Safety Division to review and approve development. Substantial damage/substantial improvement determinations are made through the

[3] FIRM = Flood Insurance Rate Map, FHBM = Flood Hazard Boundary Map

DRAFT

permitting process. Once identified, structures are required to come into compliance with current codes, including protections for future flood damage.

Jurisdiction-Specific Vulnerabilities and Impacts

Table 10 provides information on the vulnerable assets in the city of West Jordan, including its critical facilities, highlighting the city's vulnerability to identified hazards. It also describes the potential impacts to the community arising from those vulnerabilities. Impacts are the consequences or effects of each hazard on the assets. By understanding the risks associated with these assets, local authorities can develop proactive strategies to mitigate vulnerabilities and ensure the safety and functionality of these important assets during hazard events. This data is invaluable for decision-making and prioritizing resources for emergency response and preparedness efforts, ultimately contributing to more effective risk management and greater resilience in the community.

Vulnerable assets within West Jordan include the 114,908 residents, 1 hospital, 1 police station, 4 fire stations, 1 EOC, and 35 schools including the SLCC Jordan campus. Major transportation routes include Bangerter Highway, Mountain View Corridor, 7800 South, 9000 South, and Copper Hills Parkway. The South Valley Regional Airport and Trax Line are also important transportation assets. Recreation and outdoor assets include Veterans Memorial Park, Conservation Garden Park, Constitution Park, West Jordan Soccer Complex, and Mountain View Golf Course.

Table 10: Jurisdiction-Specific Vulnerabilities and Impacts in the City of West Jordan

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
Avalanche	People	West Jordan does not have the terrain and snowpack conditions to experience an avalanche.
	Community Activities	N/A—the city is not located in an avalanche path, so there is no immediate impact on West Jordan events.
Drought	People	*Vulnerability:* All residents are vulnerable to drought due to water scarcity. *Impacts:* Residents may be affected by water restrictions. There is a possible lack of culinary water for all populations. The elderly, young, and those experiencing homelessness are particularly vulnerable and might not be able to obtain water for hydration. Residents may face restrictions or increased costs for water. Air and water quality may be vulnerable to drought, and this can impact public health.
	Structures	*Vulnerability:* All buildings are susceptible. *Impacts:* Extreme drought can cause soils to contract, which can damage foundations.
	Economic Assets	*Vulnerability:* Business disruptions, agriculture, and tourism are vulnerable to drought. *Impacts:* If water supply is affected, costs for culinary and irrigation water could increase. Higher costs could impact businesses such as golf courses, or public areas such as city parks. Water scarcity impacts agriculture and may reduce crop yields. Recreational activities may decline, harming tourism.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
	Natural, Historic, and Cultural Resources	*Vulnerability:* Vegetation and wildlife, parks, Barney's Creek, and Bingham Creek are vulnerable to drought. *Impacts:* Prolonged drought can stress vegetation and wildlife. Parks, creeks, and other green spaces that are dependent on water may see a reduction in flora and fauna, which can impact biodiversity. Undeveloped areas may be more at risk to wildfire.
	Critical Facilities and Infrastructure	*Vulnerability:* Public facilities are vulnerable to drought. *Impacts:* Water supply systems are susceptible to drought and may struggle to deliver adequate water supply to the community. City facilities will also be under water restrictions. Utah has been in prolonged drought for many years. Water restrictions have been put in place by Jordan Valley Water and by the City of West Jordan. Residents have been asked voluntarily to cut down on outdoor watering during this time.
	Community Activities	*Vulnerability:* Public events may be affected by drought conditions. *Impacts:* The largest community event, the Western Stampede, occurs in July. If there is a drought such that the city could not run water, there might be a need to limit Rodeo watering. This could lead to the cancellation of the Rodeo portion of the event because the dirt would be too hard for participants to compete safely.
Earthquake	People	*Vulnerability:* All residents are vulnerable to earthquakes. The impacts of earthquakes can be substantial. In the event of a high-magnitude quake, the state Division of Emergency Management has projected mass casualties and deaths. *Impacts:* Falling objects and collapsed structures will cause injuries. Many day-to-day activities, such as school and work, may be disrupted. People may be displaced from their homes. In addition, psychological effects, such as increased anxiety, can affect the community.
	Structures	*Vulnerability:* Many structures, including residences and businesses, may be damaged or destroyed in an earthquake. *Impacts:* Homes and businesses might sustain significant structural damage, posing safety risks. Shaking from a moderate to strong earthquake can damage walls, chimneys, and foundations. Damage may be extensive, and buildings may become unusable. Businesses may be forced to close, and residents may be displaced. Older structures, especially those built before 1975, likely are not built to withstand earthquakes and are likely to have more severe damage.
	Economic Assets	*Vulnerability:* Businesses are at risk from earthquake impacts. *Impacts:* A high-magnitude earthquake could damage buildings and infrastructure, preventing businesses from operating. Employees might not be able to get to work, and there could be supply-line stoppages. Businesses will likely lose revenue, and workers could be severely impacted by wage loss. Economic loss could be felt across the region. Repairs can lead to high costs, potential declines in property values, and disruptions to local businesses, ultimately impacting job availability and the overall economy.
	Natural, Historic, and	*Vulnerability:* Historic structures are highly susceptible to earthquake damage.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
	Cultural Resources	*Impacts:* The Historic West Jordan Ward Meetinghouse and other older structures could be destroyed.
	Critical Facilities and Infrastructure	*Vulnerability:* City assets, police and fire stations, and infrastructure are vulnerable to earthquakes. *Impacts:* Immediate damage to infrastructure may disrupt essential services, such as water, electricity, and transportation, complicating recovery efforts. An earthquake may compromise police and fire stations, resulting in little or no response. Hospitals sustaining damage could be non-operational. Water and wastewater systems and pipelines can be damaged. Power and communications systems may be damaged and inoperable, which can hinder response efforts. Transportation will likely be disrupted by road damage. City Hall lies in a liquefaction-susceptible zone, which could make the facility unavailable and disrupt government continuity. This building is also the primary Emergency Operations Center (EOC). The Public Works facility, which houses city vehicles and serves as a backup EOC, could also be affected.
	Community Activities	*Vulnerability:* Public events are at risk during earthquakes. *Impacts:* If an earthquake were to happen during an event, there could be injuries. Community events and recreation activities may be canceled following an earthquake. To mitigate this, there is an earthquake section in the city's event action plan, and there are signs at events stating what to do/where to evacuate to.
Extreme Heat	People	*Vulnerability:* All residents are vulnerable to extreme heat. *Impacts:* Extreme heat can significantly affect public health, increasing the risk of heat-related illnesses, especially among vulnerable individuals. Those without access to shade, air conditioning, and water are vulnerable to heat-related illness, such as heat exhaustion, heat stroke, and dehydration. In addition, extreme temperatures worsen air quality by raising ozone levels, which poses respiratory risks. Residents and businesses could be affected, particularly the homeless community. City employees who work outdoors should take precautions.
	Structures	*Vulnerability:* Homes, businesses, industry, and city-owned buildings are vulnerable to extreme heat. *Impacts:* Extreme heat can impact the ability to provide cool air effectively.
	Economic Assets	*Vulnerability:* Business losses are possible during extreme heat events. *Impacts:* Higher cooling costs for businesses and residents are likely. Outdoor businesses, such as construction and landscaping, could decline in productivity. Retail could be impacted if people avoid outdoor activities during the peak of the heat.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Parks and recreation are vulnerable to extreme heat. *Impacts:* Extreme heat can contribute to worsening drought conditions, which may stress vegetation and wildlife. Both heat and drought can contribute to increased wildfire risk.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
	Critical Facilities and Infrastructure	*Vulnerability:* Power infrastructure, roads, and rail lines are susceptible to extreme heat. *Impacts:* Extreme heat strains energy resources due to the higher demand for air conditioning, potentially leading to power outages. Heat can cause roads to buckle and crack, and rail lines and bridges might also be damaged, leading to increased maintenance costs and safety concerns.
	Community Activities	*Vulnerability:* Public events, including the Western Stampede rodeo, are at risk during extreme heat. *Impacts:* The largest event occurs in July, so if there is an extreme heat warning, the city would have to consider the needs of participants, staff, and spectators. There may be increased visits to the medical tent, and there might be a need to bring in cooling fans or open the adjacent city-owned arts building as a cooling center for people during the event. Some events may need to be canceled.
Extreme Cold	People	*Vulnerability:* All West Jordan residents are vulnerable to extreme cold. *Impacts:* Below-freezing temperatures occur annually in West Jordan. They impact the elderly, low-income, and transient populations the most. Individuals exposed to extreme cold can experience life-threatening health effects, including hypothermia and frostbite. Residents may struggle with increased costs of heating homes. Salt Lake County has taken the lead in opening warming shelters for those without the capability to heat their homes, among other measures. Those who work outdoors may be affected and should take precautions.
	Structures	*Vulnerability:* Homes and businesses are susceptible to extreme cold. *Impacts:* Extreme cold can lead to frozen pipes, which can burst and cause water damage to homes and businesses.
	Economic Assets	*Vulnerability:* Business disruptions are possible due to extreme cold. *Impacts:* If businesses cannot maintain heating in their buildings, they may have to close and send employees home. In addition, there may be higher heating costs for homes and businesses.
	Natural, Historic, and Cultural Resources	Minimal vulnerability exists in West Jordan.
	Critical Facilities and Infrastructure	*Vulnerability:* Water system, city facilities, and power are susceptible to extreme cold. *Impacts:* Water systems have been affected in the past, as the cold has caused multiple water main breaks. Increased energy demand will increase costs and may overwhelm systems, leading to outages. If cold weather is combined with ice and snow, downed power lines may also disrupt power systems. Facilities are at risk of water failure or damage if pipes freeze or heating is not adequate. Additional city resources may be needed, particularly during Code Blue alerts.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
	Community Activities	*Vulnerability:* Minimal vulnerability exists as there are no outdoor events during the winter. However, if needed, a number of facilities in the city could be used as warming centers.
Flooding	People	*Vulnerability:* Residents in flood zones are vulnerable to flooding. *Impacts:* Flooding can result in people being displaced from homes. Public health may also be compromised due to waterborne diseases and stress-related issues.
	Structures	*Vulnerability:* Homes and businesses in flood zones are at risk. *Impacts:* Homes and other structures could be damaged or destroyed.
	Economic Assets	*Vulnerability:* Businesses in flood zones are susceptible to flooding impacts. *Impacts:* Flooding in the business community would cause economic loss, increased insurance costs, and declining property values.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Water contamination is a risk during flooding. *Impacts:* Floodwaters can introduce contaminants from streets and industrial areas, which can pollute water sources.
	Critical Facilities and Infrastructure	*Vulnerability:* Power, communication, transportation, and wastewater systems are vulnerable to flooding. *Impacts:* Flooding can damage power infrastructure and communications facilities, and outages can contribute to unsafe conditions. Transportation networks may be damaged, and roads and bridges could be blocked, which could disrupt emergency response. Sewer systems could overflow and lead to contamination.
	Community Activities	*Vulnerability:* Public events are at risk during flooding. *Impacts:* Flooding could cause major issues at the site and for those traveling to/from events. Community events may be canceled for safety reasons when flooding is predicted.
Landslide/ Slope Failure	People	*Vulnerability:* West Jordan is mostly flat, with limited terrain that would contribute to landslides. *Impacts:* The risk is minimal to people, structures, critical facilities, or community activities.
Radon	People	*Vulnerability:* Sixty-two percent of homes tested in West Jordan had dangerous levels of radon (utahradon.org). *Impacts:* Radon exposure is the second leading cause of lung cancer. Higher cancer rates could lead to increased healthcare expenses. Employees or residents in underground structures, basements, tunnels, or older buildings may be exposed to unsafe radon levels. Many residents may not test for radon, making them unaware of dangerous levels.
	Structures	*Vulnerability:* Radon is primarily a public health risk and does not directly impact structures. However, it can enter homes through foundation cracks. *Impacts:* Incorporating radon-resistant construction in new developments is essential for safety.
	Economic Assets	*Vulnerability:* Home values are at risk due to radon exposure.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		Impacts: High radon levels can reduce home values if mitigation is required. People may endure health-related costs due to the public health effects of radon.
	Natural, Historic, and Cultural Resources	There is minimal risk from radon to natural, historic, and cultural resources.
	Critical Facilities and Infrastructure	*Vulnerability:* City facilities and water sources are susceptible to radon accumulation. *Impacts:* Employees and patrons in city facilities may be vulnerable if radon levels accumulate to high levels. Radon can dissolve into groundwater, affecting local drinking water sources.
	Community Activities	Radon is not a threat to West Jordan events, locations, or parks, as it disperses in open spaces.
Heavy Rain	People	*Vulnerability:* Residents along Barney's Creek or Bingham Creek, or low-lying areas, are vulnerable to heavy rain impacts. *Impacts:* Heavy rain could result in flooding, which could impact residents. People near drainage systems and waterways may be at risk of injury or drowning during flash flooding. Residents may be displaced if their homes are flooded.
	Structures	*Vulnerability:* Homes and businesses in low lying areas or near creeks are at risk. *Impacts:* Flooding could cause damage to these structures.
	Economic Assets	*Vulnerability:* Business interruptions are possible due to flooding. *Impacts:* Flooding could result in the loss of revenue for businesses.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Parks, open spaces, and creeks are susceptible to heavy rain impacts. *Impacts:* Heavy rain could cause damage. Increased soil erosion can harm ecosystems. Runoff could affect water quality.
	Critical Facilities and Infrastructure	*Vulnerability:* Emergency response facilities and transportation system are at risk. *Impacts:* During flood events, water is likely to fill natural channels and regional detention ponds. FEMA flood zones will see large amounts of water, but most of these areas have the capacity to handle 100-year (1% chance) events. Localized flooding will be expected where inlets are clogged with debris. Heavy rain could overwhelm drainage systems. Roads could be inundated or washed out. Heavy rain could overwhelm drainage systems. Roads could be inundated or washed out, which could delay emergency response.
	Community Activities	*Vulnerability:* Community events and recreation activities are susceptible to heavy rain. *Impacts:* Outdoor activities could be canceled or postponed. Additionally, several outdoor events within the Western Stampede could be cancelled, as the arena dirt would be unsafe for participants. This decision would come from the contractors specific to that area and from the event's Emergency Response Plan.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
High Wind	People	*Vulnerability:* High wind can affect the entire city, so all residents are vulnerable. *Impacts:* Injuries may be caused by flying debris or falling trees.
	Structures	*Vulnerability:* Homes, businesses, and schools are susceptible to high wind damage. *Impacts:* High winds can cause structural damage to houses, businesses, and other infrastructure. Trees can fall and damage buildings or vehicles. Flying debris can shatter windows. Sheds, fences, and older homes are more vulnerable to wind damage. Public facilities, such as schools, parks, and community centers in West Jordan, could endure wind-related damage.
	Economic Assets	*Vulnerability:* Businesses are at risk during high wind events. *Impacts:* High wind events can lead to power outages and structural damage, forcing businesses to close, leading to losses in revenue. Higher claims for damage can also lead to increased insurance premiums for homeowners and businesses.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Parks are susceptible to high wind damage. *Impacts:* Wind could cause damage to trees and outdoor equipment.
	Critical Facilities and Infrastructure	*Vulnerability:* Critical facilities and infrastructure are at risk during high wind events. *Impacts:* Wind could cause damage to power lines and IT network lines. Power and communications systems could be disrupted, and emergency response could be delayed as a result. Roads may be blocked by debris.
	Community Activities	*Vulnerability:* Outdoor events are vulnerable to high wind impacts. *Impacts:* High wind events can occur during any event season. When tents are used, they must be weighted with cement blocks to eliminate flight hazards. Events may be postponed or canceled.
Lightning	People	*Vulnerability:* Lightning can occur anywhere in West Jordan, and all populations are vulnerable. People engaging in recreation activities outdoors, outdoor workers, and unhoused populations are at increased risk. *Impacts:* Lightning strikes could cause injury or death.
	Structures	*Vulnerability:* All structures are vulnerable to lightning. *Impacts:* Fires are one of the most common and destructive results of a lightning strike. Homes, schools, or commercial buildings can catch fire if lightning hits roofs, chimneys, or power systems. Lightning can damage electric systems.
	Economic Assets	*Vulnerability:* Business disruption is possible due to lightning. *Impacts:* Cancellation or disruption of outdoor events can lead to economic losses.
	Natural, Historic, and Cultural Resources	N/A

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
	Critical Facilities and Infrastructure	*Vulnerability:* Power infrastructure is susceptible to lightning strikes. *Impacts:* Transformers, substations, or power lines can be knocked out by lightning, affecting hundreds or thousands of residents. Operations of critical facilities could be limited if power is out.
	Community Activities	*Vulnerability:* Public events, including the Rodeo, are vulnerable to lightning. *Impacts:* Outdoor events may be affected by lightning, especially during the summer months. Sheltering a large number of people could be an issue. A lightning plan is part of the Event Action Plan for each event, and the city coordinates with the National Weather Service for spot weather reports. A plan is in place for evacuating due to lightning.
Severe Winter Weather	People	*Vulnerability:* Severe winter weather can affect the entire city. All West Jordan residents are vulnerable. Elderly, young, disabled, and unhoused populations are particularly vulnerable. *Impacts:* Severe winter weather can trap people in their homes or at work. It may require opening warming shelters. Additionally, there is an increased risk of vehicle accidents.
	Structures	*Vulnerability:* Homes and businesses are at risk during severe winter weather. *Impacts:* Heavy snow load can damage roofs or collapse facilities.
	Economic Assets	*Vulnerability:* Businesses are susceptible to disruptions from severe winter weather. *Impacts:* Heavy snow/blizzards discourage people from going out shopping and disrupt supply lines.
	Natural, Historic, and Cultural Resources	N/A
	Critical Facilities and Infrastructure	*Vulnerability:* Emergency response facilities, power infrastructure, and roads are susceptible to severe winter weather impacts. *Impacts:* Power may be interrupted in heavy snow or blizzard conditions. Power outages can disrupt government operations, healthcare facilities, and emergency response. There may be an increased demand for response and medical care if there are a lot of traffic accidents. Transportation may be temporarily disrupted in heavy snow, blizzard, icing, and snow squall conditions.
	Community Activities	*Vulnerability:* There is minimal vulnerability, as there are no outside events during the winter. *Impacts:* Events may be delayed. Should there be extreme cold on the day of a Veterans Day or holiday event, there is a backup plan in place to shift the venue inside. If roads are deemed unsafe by police or the Utah Department of Transportation, the event would be canceled to keep travelers safe.
Tornado	People	*Vulnerability:* Tornadoes are uncommon and have not caused losses in West Jordan. However, a tornado could cause injury or death if one were to occur. *Impacts:* People are vulnerable to serious injury from blowing debris, falling tree limbs, or structural collapse.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
	Structures	*Vulnerability:* Homes, businesses, and mobile homes are at risk during tornadoes. *Impacts:* Tornadoes could cause structural damage from high winds, flying debris, or falling trees. Roofs can be torn off and windows broken. West Jordan has two mobile home communities which are particularly vulnerable to damage in a tornado due to their light weight and insecure foundations.
	Economic Assets	*Vulnerability:* Businesses are susceptible to tornado impacts. *Impacts:* Damage to businesses or infrastructure could lead to lost revenue.
	Natural, Historic, and Cultural Resources	N/A
	Critical Facilities and Infrastructure	*Vulnerability:* Power and communication systems are susceptible to tornado impacts. *Impacts:* Tornadoes could damage power or communications systems. Disruptions to these services might affect the operation of other critical facilities.
	Community Activities	*Vulnerability:* Public events are at risk during tornadoes. *Impacts:* Tornadoes may disrupt or cause the cancellation of outdoor events such as sports, fairs, and markets. While unlikely, this type of incident can occur during the event season. When tents are used, they must be weighted with cement blocks to eliminate flight hazards. The city is considering adding evacuation sites to the event Emergency Response Plan.
Wildfire	People	*Vulnerability:* All residents could be affected. *Impacts:* Wildfire smoke contains fine particulates that can trigger asthma, bronchitis, and other respiratory issues—especially for children, seniors, and those with existing health conditions.
	Structures	*Vulnerability:* Structures near undeveloped land are at risk. Risk is highest along the western border of the city near the Oquirrh foothills. *Impacts:* Building density is not high in at-risk areas, but homes and other structures could be affected by wildfire. Homes not directly touched by flames may suffer internal damage from smoke and falling ash.
	Economic Assets	*Vulnerability:* Businesses are vulnerable to wildfire impacts. *Impacts:* Wildfires can close major highways or roads leading in and out of West Jordan, delaying the delivery of goods and materials. If major supply routes, like I-15 or I-215, are impacted, businesses will face delays in receiving products and materials, disrupting inventory and production. If local businesses or manufacturers experience damage, West Jordan may lose key suppliers, causing further disruption to the economy as businesses scramble to find alternative sources. Wildfires can damage power lines and substations, leading to outages in West Jordan and possibly disrupting businesses, especially those that rely on electricity for day-to-day operations. Restaurants, grocery stores, and other services may have to shut down due to lack of power. The economic recovery after a wildfire could take months or

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		years, as businesses and homeowners rebuild. During this period, economic activity may be sluggish, and many residents and business owners may struggle to regain financial stability.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Parks and open spaces are susceptible to wildfire impacts. *Impacts:* Wildfire can damage or destroy vegetation in parks and open spaces.
	Critical Facilities and Infrastructure	*Vulnerability:* Power and road infrastructure are at risk during wildfires. *Impacts:* Wildfires can damage power lines, substations, or transformers, causing rolling blackouts or extended outages. Operations of critical facilities would be impacted by power outages. Roads used by emergency services may be closed, hampering response times to medical or law enforcement emergencies.
	Community Activities	*Vulnerability:* There is minimal danger from wildfires, as the city has no wildland–urban interface. *Impacts:* However, if fire were to break out, people would be evacuated similarly to during a lightning storm, and safe points of exit would be announced based on road closures. Outdoor sports, events, or city gatherings (e.g., farmers markets or school games) may be postponed or canceled due to air quality or evacuation needs.
Dam Failure	People	*Vulnerability:* West Jordan could be affected by a failure of the Bingham Canyon Reservoir, located west of the city. Residents in the dam inundation boundary could be affected. *Impacts:* Flooding from a failure of the dam could displace residents and businesses. Possible injury or death could occur if people are caught in downstream flooding from a dam failure. Long-term effects could affect community stability and public health. Four canals run through the city that could have similar impacts.
	Structures	*Vulnerability:* All structures in the dam inundation boundary are at risk. *Impacts:* Damage to buildings, including homes and businesses, could occur.
	Economic Assets	*Vulnerability:* Businesses in the inundation boundary are vulnerable to flooding impacts. Impact: Business closures and shutdowns could occur in the event of flooding. Lost revenue or inventory could result from flooding. Damage to utility systems or roads may disrupt business functions.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Parks located below the dam are at risk in the event of a failure. *Impacts:* Parks may be damaged or inaccessible following a dam failure, while floodwaters may contaminate local waterways and disrupt ecosystems.
	Critical Facilities and Infrastructure	*Vulnerability:* Four schools, one police station, and one hospital are in the potential inundation area, as are major roads. *Impacts:* Six critical facilities are in the potential inundation area and may be damaged or have their functionality disrupted following a dam failure. Fast-moving floodwaters from a dam failure could damage roadways and other transportation networks, including Mountain View Corridor, Bangerter Highway, and Sugar Factory Road. Power

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		infrastructure and communication systems could also be disrupted, which would affect operations of critical facilities.
	Community Activities	*Vulnerability:* Outdoor recreation areas are at risk in the inundation area. *Impacts:* Parks and golf courses in the inundation area may be inaccessible following a dam failure.
Civil Disturbance	People	Possible injuries and deaths
	Structures	Damage to buildings, vehicles, or other assets.
	Economic Assets	Damage to businesses; looting/stealing
	Natural, Historic, and Cultural Resources	While civil disturbances typically target urban areas, they can also spread to nearby parks, natural spaces, or other recreational facilities, potentially causing physical damage or making these areas unsafe for public use
	Critical Facilities and Infrastructure	Possible damage to infrastructure
	Community Activities	This would disrupt an event. For large events where this is more likely to happen, police are on site at all times, monitoring and able to assist.
Cyberattack	People	Panic. Residents may have their personal data compromised, including sensitive information such as social security numbers, addresses, or financial details. This could lead to identity theft or financial fraud.
	Structures	While cyberattacks are less likely to cause direct physical damage to structures, they can disrupt building systems that rely on automated control, such as heating, ventilation, and air conditioning (HVAC), or smart building technologies, leading to inconvenience or higher operating costs.
	Economic Assets	Disruptions to billing, ticketing, and online business. In the prior ransomware attack, the city recovered and did not pay a ransom, but there could be challenges bringing programs/data back online.
	Natural, Historic, and Cultural Resources	Cyberattacks could disrupt local natural resource management systems, including water treatment facilities affecting how these resources are managed
	Critical Facilities and Infrastructure	Damage to cyber systems.
	Community Activities	This would disrupt event ticketing capabilities as evidenced by a cyberattack on the city in 2023 during its largest annual event. Digital tools used for event organization, ticket sales, or communication (e.g., city websites, event apps) could be compromised or taken offline, leading to cancellations or significant delays in public events
Hazardous Materials Incident	People	There are multiple corridors for transporting HazMat, including train rail. An event could cause injury and/or death to residents and the business community. Exposure to hazardous materials such as toxic

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
(Transporta-tion & Fixed Facility)		chemicals, gases, or radioactive substances can cause acute health issues, including respiratory problems, burns, poisoning, or even death, especially if the incident occurs near residential areas or school.
	Structures	A HazMat incident involving explosive materials could cause structural damage.
	Economic Assets	Business closures, highway/rail stoppages, supply line disruptions
	Natural, Historic, and Cultural Resources	Hazardous materials can have a devastating effect on the local environment, poisoning soil, groundwater, and vegetation. If a release occurs near natural areas like parks, rivers, or wetlands, the damage could be long-lasting.
	Critical Facilities and Infrastructure	Transportation networks may be closed, which can disrupt travel and commerce in the area. Depending on the event, roads or other infrastructure may be damaged.
	Community Activities	If this happened during the large event in July with tens of thousands of people on site, it could become a mass casualty incident.
Public Health Epidemic/ Pandemic	People	Injury and death
	Structures	Hospitals, clinics, and other healthcare facilities will face enormous pressure as they try to care for patients. In some cases, medical facilities may need to expand capacity (e.g., setting up field hospitals or temporary care facilities) to handle the overflow of cases.
	Economic Assets	Quarantines, curfews, etc. affect business and contribute to lost revenue.
	Natural, Historic, and Cultural Resources	N/A
	Critical Facilities and Infrastructure	During these incidents, personnel would have to be rotated and separated to prevent the spread of the disease to the workforce. Staffing could be an issue during such an event. Needed repair and maintenance of critical infrastructure could be a problem.
	Community Activities	Depending on the incident, events would be canceled to minimize person-to-person contact to mitigate the threat.
Terrorism	People	Panic, injury, death
	Structures	Possible damage to facilities
	Economic Assets	Would disrupt businesses
	Natural, Historic, and Cultural Resources	Possible damage to facilities

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
	Critical Facilities and Infrastructure	Possible damage to facilities and infrastructure.
	Community Activities	Although police and contracted security are present during events, these are “soft” targets.

Hazards Not Profiled

Avalanche and Landslide/Slope Failure have been omitted from further discussion of hazard impacts and from mitigation actions. As shown in the hazard description in Volume 1, avalanche and landslide risk is primarily in the Wasatch and Oquirrh Mountains in Salt Lake County. West Jordan has mostly flat terrain and minimal risk of impacts from these hazards. No previous occurrences of avalanche or landslide have impacted West Jordan.

Jurisdiction-Specific Changes in Vulnerability

Hazard events can impact communities, infrastructures, and ecosystems. The severity of these impacts can be influenced by climate change, population patterns, and land use developments. Understanding these factors is crucial for the City of West Jordan to develop a resilient community and minimize the impacts of hazards. Table 11 displays the unique changes within the community and the related effects on each identified hazard affecting the City of West Jordan.

DRAFT

Table 11: Jurisdiction-Specific Changes in Vulnerability in the City of West Jordan

Type of Hazard Event	Future conditions	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
Drought	Changes in climate patterns affect drought incidents by altering precipitation patterns and increasing temperatures. Warmer weather can lead to longer dry periods and more severe droughts, while changes in rainfall can reduce snowpack in nearby mountains, crucial for summer water supply. Higher temperatures also increase evaporation rates, further straining local water resources.	Drought can significantly influence population patterns by impacting economic opportunities and the quality of life. Water scarcity often leads to reduced agricultural productivity, prompting residents to migrate to areas with more stable job prospects. Increased water costs can make living less affordable, driving some residents away. Conversely, efforts to address drought, such as sustainable development or improved water management, may attract newcomers, resulting in changes in the community's demographic composition over time.	There are large amounts of growth in West Jordan, including hundreds of new residential units and commercial spaces. This level of development increases the water demand in West Jordan and the risk of drought.	Increased
Earthquake	Rising temperatures can lead to glacial melting, which affects pressure on tectonic plates and may trigger seismic activity through isostatic rebound. In addition, increased rainfall and flooding can erode soil, weakening structural integrity and heightening vulnerability during earthquakes. Although the direct links between climate change and earthquakes are still under investigation, environmental effects may impact the region's seismic risk.	Earthquakes can significantly alter population patterns by prompting residents to leave for safer areas after a seismic event. This migration can lead to changes in population density and attract new residents and businesses during the rebuilding process. The perception of the area as a safe place to live may shift, impacting long-term demographics, as some residents return to rebuild while others relocate permanently.	All new development in West Jordan is at risk of earthquake damage to some extent. Nearby active faults put all structures at risk. The risk is mitigated to some extent by modern building codes.	Stayed the same
Extreme Heat	Impacts of extreme heat are increasing in frequency and	By causing residents to relocate due to damaged homes or safety	The high amount of development, particularly on the	Increased

DRAFT

Type of Hazard Event	Future conditions	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	intensity of heat waves. Rising global temperatures lead to longer and hotter summers, affecting residents and local infrastructure while heightening health risks, especially for vulnerable populations. Urban heat islands from reduced vegetation and extensive pavement further amplify these effects.	concerns. Some may move to areas perceived as safer or seek better job opportunities elsewhere. The economic impact and infrastructure damage can also make certain neighborhoods less desirable, leading to shifts in demographics and the socioeconomic landscape as new residents with different backgrounds move in.	western edge of West Jordan, increases density and reduces vegetation, both of which can increase temperatures during extreme heat events.	
Extreme Cold	By increasing the intensity of winter storms. Higher atmospheric temperatures allow for more moisture, resulting in heavier snowfall and potentially lower temperatures during these events. In addition, fluctuations in weather patterns may disrupt seasonal cycles, leading to unpredictable periods of extreme cold mixed with warmer spells.	By driving some residents to relocate to warmer areas. Harsh winters can hinder economic activities and deter new residents and businesses, influencing housing demand and the attractiveness of certain neighborhoods. This may disproportionately affect lower-income families, leading to changes in demographics and socioeconomic stratification in the community.	Increased growth of commercial and residential developments in West Jordan increases energy demand during extreme cold events, stressing the electrical grid.	Increased
Flooding	Higher temperatures increase the frequency and intensity of extreme weather events and alter precipitation patterns. They lead to more intense rainstorms and accelerated snowmelt from nearby mountains, raising water levels in rivers and streams. This combination raises the risk of flooding, especially in areas with inadequate drainage and urban development in flood-prone zones, heightening the	Flooding can significantly alter population patterns by displacing residents from affected areas, leading them to seek shelter elsewhere. This may cause a population decline where flooding occurs, as individuals might hesitate to return due to ongoing risks or property damage. As neighborhoods become less desirable, people may migrate to safer areas, changing demographic trends and putting	All developments in West Jordan have been built according to flood ordinances. Increased impervious surfaces due to development across West Jordan could contribute to ponding and other pluvial flooding.	Decreased

DRAFT

Type of Hazard Event	Future conditions	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	potential for damage to homes and infrastructure.	pressure on housing in those regions. Over time, these shifts can influence urban planning and development, as local governments address flooding risks and changing population needs.		
Radon	Climate change can affect radon levels by altering soil temperatures and moisture conditions. Higher temperatures may increase radon emissions from the ground, while heavy rainfall can change groundwater and soil saturation, impacting radon migration into buildings.	Radon exposure can influence population patterns as increased health awareness may drive families to move away from areas with high radon levels. This shift could particularly affect vulnerable groups, changing demographics and demand in the housing market. Homes with lower radon levels may become more sought after, and public health campaigns can encourage community action, making previously undesirable areas more attractive once mitigation measures are implemented.	Development in West Jordan has not increased the radon risk.	Decreased
Heavy Rain	Climate change increases the frequency and intensity of heavy rain, as higher temperatures allow the atmosphere to hold more moisture. This leads to stronger storms, flash flooding, and overwhelming drainage systems.	Heavy rain can shift population patterns by pushing residents out of flood-prone areas and attracting them to safer neighborhoods. Frequent flooding may lead to evacuations and economic disruptions, prompting relocations. Over time, ongoing heavy rains can affect housing demand and community stability, altering the town's population distribution.	Increased impervious surfaces due to development across West Jordan could contribute to ponding and other pluvial flooding.	Increased

DRAFT

Type of Hazard Event	Future conditions	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
High Wind	Climate change affects high winds by altering atmospheric patterns and increasing extreme weather events. Rising temperatures may lead to more substantial, unpredictable winds and more frequent thunderstorms, posing risks to infrastructure and air quality.	High winds can alter population patterns by making certain areas less desirable. Frequent damage may drive residents to safer neighborhoods, deter newcomers, and slow growth in affected regions.	The increased growth in West Jordan has put more structures in the city that could be damaged by high winds. The risk is especially high for multistory buildings in and around downtown West Jordan.	Increased
Lightning	Climate change increases temperatures and alters precipitation, leading to more intense thunderstorms and frequent lightning strikes. Urbanization can enhance this effect, posing risks to public safety and infrastructure.	Lightning can influence population patterns by causing property damage and wildfires, leading some residents to relocate. Areas with higher lightning activity may deter new residents, while safer locations could increase migration as people seek protection from severe weather.	The increased growth in West Jordan has put more structures in the city that could be damaged by lightning strikes.	Increased
Severe Winter Weather	Climate change impacts heavy snow and blizzards by altering precipitation patterns. Higher temperatures can lead to more rain than snow, affecting snowpack levels—additionally, increased storm intensity results in heavier, more unpredictable snowfall.	Increased population equals an increased number of people needing to get to work and quicker snow removal. Heavy snow or blizzards can impact population patterns by influencing where people live and work. Transportation disruptions may lead residents to seek housing closer to jobs, increasing density in some areas while depopulating others. Families might also avoid regions with frequent heavy snowfall, shifting demand to milder areas. Over time, these trends can alter community demographics and economic activity, prompting	With large development increases in West Jordan, the risk of damage and increased responsibility due to severe winter storms has gone up. With new subdivisions, the city is responsible for plowing, rescues, and evacuations from heavy snow events.	Increased

DRAFT

Type of Hazard Event	Future conditions	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
		adjustments in town planning and resource allocation.		
Tornado	Climate change may increase the frequency and intensity of tornadoes. Higher temperatures lead to more moisture in the air, creating conditions for severe thunderstorms. Changes in wind patterns and precipitation can also heighten tornado risks, resulting in more destructive storms and greater threats to infrastructure and communities.	Tornadoes can influence population patterns by prompting residents to move to safer areas after damage occurs. This can decrease density in affected neighborhoods while increasing the demand for housing in safer regions. New residents may also move in for recovery opportunities, altering demographics. Over time, repeated tornado threats might push long-term residents to areas with better disaster preparedness, reshaping the town's population distribution.	The increased growth in West Jordan has put more structures in the city that could be damaged by tornadoes.	Increased
Wildfire	By raising temperatures and creating drier conditions, prolonged droughts lead to more dry vegetation, which serves as fuel for fires. Erratic seasons extend the growing period, while more lightning strikes can ignite wildfires. These factors heighten the threat to ecosystems and community safety.	Displaced individuals often seek safer areas, shifting demographics, while declining property values might deter newcomers. Conversely, some may be drawn to rebuilding efforts, impacting long-term growth and community dynamics.	Development on West Jordan's western edge is adjacent to high wildfire areas in the Oquirrh Mountains. These developments include the West Jordan Industrial Center and Jordan Hills.	Increased
Dam Failure	Climate change raises the risk of dam failure by causing heavier rainfall and rapid snowmelt. These changes can overwhelm dams and compromise their integrity, highlighting the need for urgent	Dam failure tornadoes can impact population patterns by displacing residents and altering demographics. Evacuations can lead to an influx in safer areas, while destruction may deter new residents and contribute to a	Development in West Jordan has not increased the risk of dam failure.	Increased

DRAFT

Type of Hazard Event	Future conditions	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	safety assessments and upgrades to protect communities downstream.	population decline. Fear of future disasters may also prompt remaining individuals to relocate, changing the community's composition and affecting population density and economic activity.		
Civil Disturbance	Climate change can increase civil disturbances by intensifying environmental stresses and social tensions. Rising temperatures may lead to droughts, wildfires, and poor air quality, particularly affecting vulnerable communities. Resource scarcity, especially water, can spark conflicts and protests. In addition, an influx of migrants from harder-hit areas may strain local resources, further escalating tensions. This cycle of unrest is driven by the impacts of climate change on the environment and community dynamics.	By encouraging residents to move for safety, leading to outflows and new arrivals. These events can reveal social issues, impacting community dynamics, employment, and property values, ultimately reshaping demographics, and social cohesion.	Development in West Jordan has not increased the risk of civil disturbance.	Increased

DRAFT

Type of Hazard Event	Future conditions	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
Cyberattack	Possible attack on the industry, which is seen as producing large amounts of greenhouse gases and burning fossil fuels. Climate change can heighten cyberattack risk by increasing vulnerabilities during extreme weather. Disruptions like power outages offer cybercriminals opportunities, but focusing on emergency responses can weaken cybersecurity measures. As organizations adopt new technologies to cope with climate impacts, they may unintentionally introduce additional vulnerabilities.	Cyber-attacks can change population patterns by eroding trust in essential services. Compromised systems may cause residents to leave due to safety concerns, while high-profile incidents can deter businesses, leading to job losses. This perception of vulnerability may also make the town less appealing to newcomers, resulting in demographic shifts and affecting local development.	Development in West Jordan has not increased the risk of cyberattack.	Increased
Hazardous Materials Incident (Transportation & Fixed Facility)	Climate change elevates the risk of hazardous materials incidents by increasing extreme weather events like heavy rain and wildfires. These events can breach storage tanks and heighten material volatility. Vulnerable infrastructure can lead to more spills or accidents, while climate shifts may also introduce new challenges for managing hazardous substances and public health.	By causing evacuations and temporary declines in density. In the long run, unsafe areas may deter new residents, affecting growth and diversity. In addition, negative perceptions can lower property values and economic prospects, leading families to relocate, which impacts local demographics.	Development in West Jordan has not increased the risk of a hazardous materials incident.	Increased
Public Health Epidemic/ Pandemic	By increasing the spread of vector-borne diseases and raising the risk of waterborne illnesses due to flooding or drought. Worsening air quality can also exacerbate respiratory conditions like asthma,	By prompting migration for safety and better healthcare. Vulnerable groups may move to areas with improved services, while economic instability can drive people to seek new employment opportunities. In addition,	Development in West Jordan has not increased the risk of an epidemic/pandemic.	Increased

DRAFT

Type of Hazard Event	Future conditions	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	especially in vulnerable populations.	restrictions like quarantine measures can limit movement and social interactions, reshaping the community's demographics and impacting local economies.		
Terrorism	Terroristic activity is sometimes centered around climate change. Climate change impacts terrorism incidents by creating conditions of resource scarcity and social unrest. Increased competition for essential resources, such as water, can fuel tensions, making communities more vulnerable to extremist ideologies. Extreme weather events may disrupt social order and infrastructure, offering terrorist groups opportunities to exploit crises. In addition, climate-driven population displacement can heighten tensions in receiving areas, raising the risk of domestic terrorism. Law enforcement's focus on climate-related challenges can also limit its capacity to address terrorism threats. Ultimately, while climate change may not directly cause terrorism, its effects can create an environment conducive to extremist activities.	Terrorism incidents can alter population patterns by instilling fear and prompting residents to relocate to perceived safer areas, resulting in demographic shifts and potential declines in property values. Some neighborhoods may see an outflow of residents, while others could experience an influx of people seeking refuge from violence. In addition, increased security measures may deter businesses and residents from certain locations, leading to long-term changes in population density and urban development patterns.	Development in West Jordan has not increased the risk of terrorism.	Increased

DRAFT

Additional Public Involvement

The City of West Jordan provided several opportunities for public participation. An announcement of the plan and link to the public survey was included in the City Journal mailer sent to residents. Figure 1 illustrates examples of public outreach.

Figure 2: Social Media Posts for the Hazard Mitigation Survey (*left*) and the Draft Plan Review (*right*)

Plan Integration

Incorporating the underlying principles of the Hazard Mitigation Plan and its recommendations into other plans is a highly effective and low-cost way to expand their influence. All plan participants will use existing methods and programs to implement hazard mitigation actions where possible. As previously stated, mitigation is most successful when it is incorporated into the day-to-day functions and priorities of government and public service. This plan builds on the momentum developed through previous and related planning efforts and mitigation programs, and it recommends implementing actions where possible through these other program mechanisms. These existing mechanisms include the following:

- Regularity Capabilities
- Administrative Capabilities
- Fiscal Capabilities

Respective planning stakeholders will conduct implementation and incorporation into existing planning mechanisms and will be done through the routine actions of:

- Monitoring other planning/program agendas
- Attending other planning/program meetings

DRAFT

- Participating in other planning processes; and
- Monitoring community budget meetings for other community program opportunities.

The successful implementation of this plan will require constant and vigilant review of existing plans and programs for coordination and multi-objective opportunities that promote a safe, sustainable community. Regular efforts should be made to monitor the progress of mitigation actions implemented through other planning mechanisms. Where appropriate, priority actions should be incorporated into planning updates. Table 12 lists existing planning mechanisms in which the Hazard Mitigation Plan has been integrated.

Table 13 lists the opportunities for integrating elements of this plan into other plans.

Table 12: Integration of Previous Plans by the City of West Jordan

Plan	Description
None	N/A

Table 13: Opportunities for Integration with Future Plans of the City of West Jordan

Plan	Description
Comprehensive Emergency Management Plan	Framework for how the city will prepare for, respond to, recover from, and mitigate hazards. Hazard-specific annexes, including cyberattack, earthquake, public health, wildfire, and active threat/active shooter, are currently under revision and will reference updated information from the mitigation plan.
General Plan	Integrate hazard information in various sections, including land use, environment, economic development, and historic preservation.
Parks Master Plan	Outlines a 10-year vision and priorities for parks, recreation, trails, and open space. Mitigation goals could be integrated with other goals for open spaces.
Moderate Income Housing	Plan to ensure moderate income housing needs for the city could identify hazard impacts to housing availability.
Water Conservation Plan	Describes the city's current water supply and demands and water conservation goals and recommendations.
Sanitary Sewer Master Plan	Plan evaluates the existing system under future wastewater loading to show the need for existing system improvements that are necessary through buildout, as part of an overall Capital Facilities Plan, and the need and location for new facilities to accommodate future growth and development on the west side and interior of the city.
Storm Drainage Master Plan	Activities to manage and regulate stormwater runoff caused by development and to help mitigate flooding and environmental impacts.
Transportation Master Plan	Guides transportation infrastructure investments for the future.
Active Transportation Master Plan	Extension of the Transportation Master Plan to address sidewalk, trail, and bike lane projects.

DRAFT

Plan	Description
Water Master Plan	The water master plan identifies recommended improvements that resolve existing and projected future deficiencies in the water system throughout the city's service area over the next 10 years.

Capability Assessment

Local mitigation capabilities are existing authorities, policies, programs, and resources that reduce hazard impacts or could help carry out hazard mitigation activities.

Planning and Regulatory Capabilities

Planning and regulatory capabilities are the plans, policies, codes, and ordinances that prevent and reduce the impacts of hazards.

Table 14: Assessment of the Planning Capabilities of the City of West Jordan

Plan	Does it address hazards? (Y/N)	How can it be used to implement mitigation actions?	When was the last update? When is the next update?
General Plan	Y	Chapter nine addresses hazard mitigation. All plans, codes, ordinances, standards and specifications have been written and developed to provide mitigation action to all things at all levels. For example, this would include, but not limited to underground utility requirement, bridge/culvert design, detention/retention facilities, hydrodynamic separators installed, seismic standards on buildings, etc.	2023; 2029
Capital Improvement Plan	Y	See above	Jun 2024; Jun 2025
Climate Change Adaptation Plan	No	See above	
Community Wildfire Protection Plan	Y	See above	Aug 2024; Aug 2025
Economic Development Plan	No	See above	
Land Use Plan	Y	See above	Mar 2023; Mar 2028
Local Emergency Operations Plan	Y	See above	2024; 2029

DRAFT

Plan	Does it address hazards? (Y/N)	How can it be used to implement mitigation actions?	When was the last update? When is the next update?
Stormwater Management Plan	Y	See above	Dec 2020; Dec 2025
Transportation Plan	Y	See above	Sep 2024; Sep 2029
Substantial Damage Plan	Unknown	Unknown	Unknown

Table 17: Assessment of the Technical Capabilities of the City of West Jordan

Technical Capability	In Place? (Y/N)	How has it been used to assess/mitigate risk in the past?	How can it be used to assess/mitigate risk in the future?
Mitigation Grant Writing	Y	Allowed for mitigation and improvement	Continue program and funding
Hazard Data and Information	Y	Allowed for mitigation and improvement	Continue program and funding
GIS	Y	Allowed for mitigation and improvement	Continue program and funding
Mutual Aid Agreements	Y	Allowed for mitigation and improvement	Continue program and funding
Other? (Please describe.)			

Financial Capabilities

Financial capabilities are the resources to fund mitigation actions. Talking about funding and financial capabilities is important to determine what kinds of projects are feasible, given their cost. Mitigation actions like outreach programs are lower cost and often use staff time and existing budgets. Other

DRAFT

actions, such as earthquake retrofits, could require substantial funding from local, state, and federal partners. Partnerships, including those willing to donate land, supplies, in-kind matches, and cash, can be included.

Table 18: Assessment of the Financial Capabilities of the City of West Jordan

Funding Resource	In Place? (Y/N)	Has it been used in the past and for what types of activities?	Could it be used to fund future mitigation actions?	Can it be used as the local cost match for a federal grant?
Capital Improvement Project Funding	Y	Y	Y	Y
General Funds	Y	Y – Chapter 9 of the West Jordan General Plan addresses hazard mitigation. It is used to protect, preserve, and restore hillsides, ridgelines, and foothills of the Oquirrh Mountains and along the Jordan River. Designs should maximize water conservation, protect and improve air quality, and employ environmentally sound building practices.	Y	Y

Other?				

Education and Outreach Capabilities

Education and outreach capabilities are programs and methods that could communicate about and encourage risk reduction. These programs may be run by a participant or a community-based partner. Partners, especially those who work with underserved communities, can help identify additional education and outreach capabilities.

Table 19: Assessment of the Education and Outreach Capabilities of the City of West Jordan

Education and Outreach Capability	In Place? (Y/N)	Does it currently incorporate hazard mitigation?	Could it be used to support mitigation in the future?
Community Newsletter(s)	Y	N	Y
Hazard Awareness Campaigns (such as Firewise, Storm Ready, Severe Weather Awareness Week, School Programs)	Y	Y	Y
Public Meetings/Events (Please describe.)	Y	Y – Monthly meetings with residents for emergency preparedness	Y

Insurance Disclosures/Outreach	Y	Unknown	Y
Organizations that Represent, Advocate for, or Interact with Underserved and Vulnerable Communities (Please describe.)	Y	N	Y
Social Media (Please describe.)	Y	Y – City website, emergency preparedness tab	Y
Other? (Please describe.)			

Opportunities to Expand and/or Improve Capabilities

Actions that can expand and improve existing authorities, plans, policies, and resources for mitigation include budgeting for mitigation actions, passing policies and procedures for mitigation actions, adopting and implementing stricter mitigation regulations, approving mitigation updates, and making additions to existing plans as new needs are recognized. Table 20 lists the opportunities for the city of West Jordan.

Table 20: Opportunities to Expand and/or Improve the Capabilities of the City of West Jordan

Capability	Opportunity to Expand and/or Improve
Planning and Regulation	The city can update the Community Wildfire Protection Plan (CWPP) on a regular basis, including in 2025. Incorporating the latest data will help the city stay ahead of changing conditions.
Administrative and Technical	Current GIS capabilities can be expanded by mapping facilities and infrastructure at risk. These maps can help identify vulnerable areas and be incorporated into future mitigation projects. Additional support with code enforcement, including promoting defensible space, would be beneficial as well.
Financial	The city can explore options for funding pre-disaster mitigation through private and nonprofit sources in addition to federal sources. Additionally, when available, the city can apply for grants like the Hazard Mitigation Grant Program (404) and Public Assistance (PA Mitigation/406). Combining opportunities like Public Assistance and CDBG with hazard mitigation initiatives can help increase community resilience in alignment with other community priorities.
Education and Outreach	The city can explore more hazard-specific outreach campaigns, such as for hazards like radon. Additionally, partnerships can help advance public outreach and engagement. Pursuing opportunities to connect with other organizations, such as community-based organizations, would expand this capability.

Mitigation Strategy

Mitigation strategies provide proactive measures that are designed to minimize the impacts of hazards on the City of West Jordan. Table 21 shows mitigation action alternatives, and Table 22 shows the status of previous mitigation activities. Table 23 is the 2025 mitigation action plan for the city of West Jordan.

DRAFT

Table 21: Mitigation Action Alternatives for the City of West Jordan

Action	Type of Action	Selected for inclusion in the plan?	If not selected, why not?
Continue adding mitigation information to the city website	Education and Awareness Programs	Y	
Determine potential flood impacts and identify areas in need of additional flood control structures	Structure and Infrastructure Projects	Y	
Address identified problems through construction of debris basins, flood retention ponds, energy dissipaters or other flood control structures	Structure and Infrastructure Projects	Y	
Integrate technology systems throughout the City	Education and Awareness Programs	Y	

Table 22: Status of Prior Mitigation Actions of the City of West Jordan[4]

Action	Hazard(s)	Agency Lead	Support Agency(ies)	Status Update
Increase the size and capacity of drainage facilities	Flooding	City of West Jordan	West Jordan Public Works	Ongoing – West Jordan adopted a new storm drain master plan in 2023. Improvements in the plan are in the process of funding, design and construction.
Seismic Retrofitting of the water tanks	Earthquake	City of West Jordan	Community Development	Complete.
Establish notification capabilities and procedures for emergency personnel	All hazards	West Jordan GIS	Fire, Police, Public Affairs	Complete – We utilize the following: Landline phone, Cellular phone, SMS text messaging, email, Microsoft Teams, GoTo City phone system

[4] CEMP = Comprehensive Emergency Management Plan, COOP = Continuity of Operations Plan, IPAWS = Integrated Public Alert and Warning System, NFIP = National Flood Insurance Program, NWS = National Weather Service, THIRA = Threat and Hazard Identification and Risk Assessment, UDEM = Utah Division of Emergency Management

DRAFT

Action	Hazard(s)	Agency Lead	Support Agency(ies)	Status Update
Establish a coordinating group to address long-term communication needs and implementation strategies	All hazards	West Jordan	Emergency Management, Public Affairs	Ongoing – Includes representatives from EM, Police, Fire, IT, Public Affairs, and Public Works Fleet.
Utilize GIS to identify facilities and infrastructure at risk	All hazards	West Jordan	Public Works/ Community Development	Ongoing – Utilizing GIS, and also UDEM's Critical Infrastructure Program.
Assess critical facilities for hazard exposure, structural weaknesses, power, communications and equipment resources and redundancy, and adequate emergency procedures	All hazards	West Jordan	Fire	Ongoing – New Public Works building and remodeling of City Hall have dramatically slowed this process.
Implement improvements to address hazards identified in assessment	All hazards	West Jordan	City of West Jordan – All Departments	Ongoing Once new hazard assessment and THIRA are completed, improvement planning will be implemented on identified hazards.
Provide education regarding all natural hazards through live trainings, as well as web-based, print, and broadcast media	All hazards	West Jordan	City of West Jordan – All Departments	Ongoing – Currently participating in live training for employees and residents. Working with Public Affairs on web-based education material. Rely on county and state for print and broadcast media products.
Develop education programs to target specific groups including homeowners, developers, schools and people with special needs	All hazards	West Jordan	City of West Jordan – All Departments	Ongoing – Preparedness classes are offered monthly to residents. Also, provide an Employee Preparedness Seminar series, as well as presentations for local church groups. Looking for opportunities to provide educational presentations to other demographics/groups in the city.

DRAFT

Action	Hazard(s)	Agency Lead	Support Agency(ies)	Status Update
Coordinate with existing public education programs such as the American Red Cross, Utah Living with Fire, Be Ready Utah, the National Weather Service, etc.	Drought	West Jordan	City of West Jordan – All Departments	Complete
Coordinate with water districts to plan for, develop and/or expand secondary water	Flooding	West Jordan	Public Works Department	Complete – Drought Management Plan adopted by City Council.
Encourage Communities to actively participate in NFIP	Flooding	West Jordan	Public Utilities Department	Ongoing.
Determine potential flood impacts and identify areas in need of additional flood control structures	Flooding	West Jordan	Public Utilities Department	Ongoing – West Jordan adopted a new storm drain master plan in 2023. Improvements listed in the plan are in the process of funding, design and construction.
Address identified problems through construction of debris basins, flood retention ponds, energy dissipaters or other flood control structures	Flooding	West Jordan	Public Utilities Department	Ongoing – West Jordan adopted a new storm drain master plan in 2023. Improvements listed in the plan are in the process of funding, design and construction.
Establish maintenance and repair programs to remove debris, improve resistance and otherwise maintain effectiveness of storm water and flood control systems	Flooding	West Jordan	Public Utilities Department	Complete.
Identify and assess structures for deficiencies	Flooding	West Jordan	Public Utilities Department	Complete.

DRAFT

Action	Hazard(s)	Agency Lead	Support Agency(ies)	Status Update
Modify structures as needed to address deficiencies	Flooding	West Jordan	Public Utilities Department	Ongoing – West Jordan adopted a new storm drain master plan in 2023. Improvements listed in the plan are in the process of funding, design and construction.
Assist NWS in making other agencies and departments aware of available resources	Severe Weather	West Jordan	Public Affairs	Ongoing.
Assist Forest Service, Utah Avalanche Forecast Center, and other organizations in promoting avalanche hazard awareness for backcountry users	Severe Weather	West Jordan		Incomplete
Increase public awareness and compliance with keeping storm drains and ditches free from debris, particularly green waste.	Flood	Public Works Department, Storm Water Manager	Public Utilities Department/ Public Affairs	Complete – Added adopt an inlet program. “We all live downstream” educational program.
Increase emphasis in our code enforcement efforts to create defensible space between undeveloped fields and residential and commercial property.	Wildland Fire	City Attorney, Code Enforcement	City Attorney/ Public Affairs	Ongoing.
Educate residents on the IPAWS system to provide greater warning for individuals living in areas being impacted by severe weather	Severe Weather	West Jordan Emergency Management	Public Affairs	Ongoing.
Emphasis needs to be placed on the development of a citywide continuity of operations plan.	Pandemic	West Jordan Emergency Program Manager, West Jordan Facilities Manager, West Jordan IT Manager	Facilities Manager/IT Manager	Ongoing – COOP initiated and included in the City’s draft CEMP.

DRAFT

Action	Hazard(s)	Agency Lead	Support Agency(ies)	Status Update
Participate in a public awareness campaign to alert homeowners to the presence of radon gas production from the soil.	Radon	West Jordan Emergency Program Manager	Community Outreach Manager	Ongoing – Educational presentation available for resident preparedness.

DRAFT

Table 23: 2025 Mitigation Action Plan for the City of West Jordan[5]

#	Action	Hazard(s)	Lead Agency	Potential Partners	Benefits (Losses Avoided)	Cost Estimate	Funding Source(s)	Time-frame	Priority	Comments
1	Purchase night vision goggles for SWAT unit.	Terrorism	WeJo Police Department	Local jurisdiction PDs, UPD, state Department of Public Safety/Joint Special Operations Group, Sheriff's Office	Enhanced interdiction and disruption, operational coordination, and screening, search, and detection. Increased officer/community safety during night operations.	Low – approx. $12,000 each	SHSP Grant	Short term	High	
2	Develop and implement public education programs on disaster awareness and mitigation for residents.	Civil Disturbance, Dam Failure, Drought, Earthquake, Extreme Cold, Extreme Heat, Flooding, Hazardous Materials Incident, Heavy Rain, High Wind, Lightning, Public Health Epidemic, Radon, Severe Winter Weather, Terrorism, Tornado, Wildfire	WeJo EM	WeJo departments, local jurisdictions, SLCo EM, UDEM	Increased understanding of local resources, improved relationships with the public and stakeholders. Outlined plans/SOPs for programs.	Low	WeJo EM budget, WeJo General Fund	Short term	Medium	
3	Integrate WebEOC, Crisis Track, GIS, and other technological enhancements throughout the city.	Civil Disturbance, Dam Failure, Drought, Earthquake, Extreme Cold, Extreme Heat, Flooding, Hazardous Materials Incident, Heavy Rain, High Wind, Lightning, Public Health Epidemic, Radon, Severe Winter Weather, Terrorism, Tornado, Wildfire	SLCo EM	WeJo departments, Juvare, local jurisdictions	Common operating platform for stakeholders, increased situational awareness, improved response time.	Low	SLCo EM, UFA, WeJo General Fund, staff time	Medium	Medium	Rely on SLCo EM for guidance/direction
4	Enhance and continue to promote the implementation of CERT and SAFE Hubs.	Civil Disturbance, Dam Failure, Drought, Earthquake, Extreme Cold, Extreme Heat, Flooding, Hazardous Materials Incident, Heavy Rain, High Wind, Lightning, Public Health Epidemic, Radon, Severe Winter Weather, Terrorism, Tornado, Wildfire	WeJo EM	SLCo EM, local jurisdictions	Increased awareness of local resources.	Low	SLCo EM, WeJo General Fund, state of Utah	Short term	Medium	SAFE Hubs (previously S.A.F.E. Neighborhoods) are going through a rebrand currently with a new public awareness campaign and information for all partners.
5	Develop an Enhanced Notification Communication System for the city.	Civil Disturbance, Dam Failure, Drought, Earthquake, Extreme Cold, Extreme Heat, Flooding, Hazardous Materials Incident, Heavy Rain, High Wind, Lightning, Public Health Epidemic, Radon, Severe Winter Weather, Terrorism, Tornado, Wildfire	WeJo PA	WeJo departments	Early notification of impending disaster to decrease loss of life. Improved relationships with the public and stakeholders. Faster delivery of information with templates/plans ready to go.	High – $1 million	WeJo PA and Customer Service budgets	Short term	Medium	
6	Promote the Firewise Initiative and regularly review/update the CWPPs for at-risk communities.	Wildfire	WeJo Fire	UFA, SLCo Em, local jurisdictions	Increased awareness of plans (for the public and stakeholders), increased eligibility for grants/other funding sources, and regular review of CWPPs.	Low	Community Wildfire Assistance grant, Fire Prevention and Safety grant, WeJo General Fund Fire Dept. budget	Short term	Medium	

[5] CEMP = Comprehensive Emergency Management Plan, COOP = Continuity of Operations Plan, CWPP = Community Wildfire Protection Plan, FMA = Flood Mitigation Assistance, IPAWS = Integrated Public Alert and Warning System, PD = Police Department, SHSP = State Homeland Security Program, SLCo EM = Salt Lake County Emergency Management, SOP = Standard Operating Procedure, UDEM = Utah Division of Emergency Management, UFA = Unified Fire Authority, UPD = Unified Police Department, WeJo = West Jordan, WeJo EM = West Jordan Emergency Management, WeJo PA = West Jordan Public Affairs.

DRAFT

#	Action	Hazard(s)	Lead Agency	Potential Partners	Benefits (Losses Avoided)	Cost Estimate	Funding Source(s)	Time-frame	Priority	Comments
7	Increase the number of ATC-20 Post-Earthquake Building Safety Evaluators.	Earthquake	WeJo EM	UDEM, SLCo EM, local jurisdictions	Increased capability for determining building safety and reoccupation.	Low	WeJo General Fund	Short term	Medium	Depends on the availability of UDEM instructors.
8	Increase the size and capacity of drainage facilities.	Flooding	WeJo Public Utilities	WeJo Public Works, SLCo Public Works	Decreased flood potential from mountain runoff.	High	WeJo General Fund, Capital Projects Fund, FMA	Ongoing	High	West Jordan adopted a new storm drain master plan in 2023. Improvements listed in the plan are in the process of funding, design, and construction.
9	Establish a coordinating group to address long-term communication needs and implementation strategies.	Civil Disturbance, Dam Failure, Drought, Earthquake, Extreme Cold, Extreme Heat, Flooding, Hazardous Materials Incident, Heavy Rain, High Wind, Lightning, Public Health Epidemic, Radon, Severe Winter Weather, Terrorism, Tornado, Wildfire	West Jordan EM	WeJo PA, WeJo Fire, WeJo Police, WeJo IT, WeJo Public Works	Ensure communication systems remain operational during hazard events to ensure continuity of government, city operations, and other services.	Low	WeJo General Fund	Ongoing	Medium	
10	Use GIS to identify facilities and infrastructure at risk.	Dam Failure, Earthquake, Flooding, Hazardous Materials Incident, Heavy Rain, High Wind, Radon, Severe Winter Weather, Terrorism, Tornado, Wildfire	WeJo Public Works/GIS	WeJo Community Development, SLCo EM/GIS, DEM/GIS	Identification of critical infrastructure for prioritization.	Medium	WeJo General Fund, staff time	Ongoing	Medium	Utilizing GIS, and also UDEM's Critical Infrastructure Program.
11	Assess critical facilities for hazard exposure; structural weaknesses; power, communications, and equipment resources and redundancy; and adequate emergency procedures.	Civil Disturbance, Dam Failure, Drought, Earthquake, Extreme Cold, Extreme Heat, Flooding, Hazardous Materials Incident, Heavy Rain, High Wind, Lightning, Public Health Epidemic, Radon, Severe Winter Weather, Terrorism, Tornado, Wildfire	WeJo Community Development	WeJo Fire	Hardened infrastructure, reduced service interruptions, reduced damage, reduced injury.	High	WeJo General Fund	Ongoing	Medium	
12	Implement improvements to address hazards identified in assessment.	Civil Disturbance, Dam Failure, Drought, Earthquake, Extreme Cold, Extreme Heat, Flooding, Hazardous Materials Incident, Heavy Rain, High Wind, Lightning, Public Health Epidemic, Radon, Severe Winter Weather, Terrorism, Tornado, Wildfire	West Jordan EM	City of West Jordan – All Departments, SLCo EM, Utah DEM	Reduce damage to critical facilities, reduce personal injury, reduce service interruptions.	High	WeJo General Fund, Capital Projects Fund, BRIC, HMGP	Long term	Medium	Once new hazard assessment and THIRA are completed, improvement planning will be implemented on identified hazards.
13	Provide education regarding all natural hazards through live trainings as well as web-based, print, and broadcast media.	Civil Disturbance, Dam Failure, Drought, Earthquake, Extreme Cold, Extreme Heat, Flooding, Hazardous Materials Incident, Heavy Rain, High Wind, Lightning, Public Health Epidemic, Radon, Severe Winter Weather, Terrorism, Tornado, Wildfire	West Jordan EM	WeJo PA, WeJo Fire, WeJo Police, SLCo EM, Utah DEM, WeJo Public Works	Increased local understanding of natural hazards and ways in which residents can reduce their risk. • Drought: Share water conservation techniques and strategies for drought-resistant landscaping. • Earthquake: Provide instruction or resources on home retrofitting.	Low	WeJo General Fund, staff time	Ongoing	Medium	Currently participating in live training for employees and residents. Working with Public Affairs on web-based education material. Rely on county and state for print and broadcast media products.

DRAFT

#	Action	Hazard(s)	Lead Agency	Potential Partners	Benefits (Losses Avoided)	Cost Estimate	Funding Source(s)	Time-frame	Priority	Comments
					• Extreme Heat: Offer information on staying cool and hydrated. • Extreme Cold: Discuss home insulation techniques, safe heating practices, and preparing vehicles for winter conditions. • Flood/Heavy Rain/Dam Failure: Teach floodproofing methods, avoiding areas of high risk, and "Turn Around, Don't Drown". • Lightning: Share safety tips for outdoor lightning protection. • Severe Winter Weather, Tornado, High Wind: Educate on locating self-shelter locations and home weatherization.					
14	Develop education programs to target specific groups, including homeowners, developers, schools, and people with special needs.	Civil Disturbance, Dam Failure, Drought, Earthquake, Extreme Cold, Extreme Heat, Flooding, Hazardous Materials Incident, Heavy Rain, High Wind, Lightning, Public Health Epidemic, Radon, Severe Winter Weather, Terrorism, Tornado, Wildfire	West Jordan EM	SLCo EM, WeJo PA	Increased understanding of how to reduce risks for vulnerable populations.	Low	WeJo General Fund	Ongoing	Medium	Preparedness classes are offered monthly to residents. Also, provide an Employee Preparedness Seminar series, as well as presentations for local church groups. Looking for opportunities to provide educational presentations to other demographics/groups in the city.
15	Actively participate in NFIP.	Flooding	WeJo Flood Plain Manager	WeJo Public Utilities, WeJo EM	Reduced risk of injury and property loss from flooding.	Low	WeJo General Fund	Ongoing	Medium	
16	Determine potential flood impacts and identify areas in need of additional flood control structures.	Flooding, Heavy Rain, Dam Failure	WeJo Flood Plain Manager	WeJo Public Utilities/Stormwater Division, WeJo Public Works, SLCo Public Works	Decreased flood potential for mountain runoff, standing water, etc.	Medium	WeJo General Fund, Capital Projects Fund	Ongoing	Medium	West Jordan adopted a new storm drain master plan in 2023. Improvements listed in the plan are in the process of funding, design and construction.
17	Address identified problems through construction of debris basins, flood retention ponds, energy dissipaters or other flood control structures.	Flooding, Heavy Rain, Dam Failure	WeJo Flood Plain Manager	WeJo Public Utilities, WeJo Public Works, West Jordan EM, SLCo EM	Reduced risk of injury and property loss from flooding.	Medium	WeJo General Fund, Capital Projects Fund, FMA, HMA	Ongoing	Medium	West Jordan adopted a new storm drain master plan in 2023. Improvements listed in the plan are in the process of funding, design and construction.
18	Modify structures as needed to address deficiencies.	Flooding, Heavy Rain, Dam Failure	WeJo Flood Plain Manager	WeJo Public Utilities, WeJo Public Works,	Reduced risk of injury and property loss from flooding.	Medium	WeJo General Fund, Capital	Ongoing	Medium	West Jordan adopted a new storm drain master plan in 2023. Improvements listed in the plan

DRAFT

West Valley City Annex

To participate in this multi-jurisdictional hazard mitigation plan (MJHMP) update for Salt Lake County (SLCo), the governing body of West Valley City passed a formal resolution, a copy of which is maintained at the local government offices.

Planning Process Contact Information

Table 1 provides information on the point of contact during the updating of the MJHMP.

Table 1: Contact Information for West Valley City

Name	Contact Information
John Evans	**Phone**: 801.232.0337 **email:** John.evans@wvc-ut.gov

West Valley City has a fully integrated approach to hazard mitigation planning and program implementation. During the 2024 update process, the MJHMP participation roles in Table 2 were recorded

Table 2: Participant List for West Valley City

Name	Title	Jurisdiction
Karen Lang	Mayor	West Valley City
Ifo Pilli	City Manager	West Valley City
John Evans	Fire Chief and Emergency Manager	West Valley City
Eric Bunderson	City Attorney	West Valley City
John Flores	Asst. City Manager	West Valley City
Dan Johnson	Public Works Director	West Valley City
Steve Pastoric	Community Development Director	West Valley City
Jerry Thompson	Chief Building Official	West Valley City
Jaime Milano	EM Support Specialist	West Valley City
Eric Bunderson	Asst. Emergency Manager	West Valley City
Ken Cushing	Information Technology Director	West Valley City

Existing Plans and Resources

Table 3 lists the plans and resources available to the county.

Moderate Income Housing Plan	Yes	https://www.wvc-ut.gov/DocumentCenter/View/10882/2016-Moderate-Income-Housing-Plan-PDF		

Jurisdiction Profile

Date of Incorporation

1980

Location and Description

West Valley City is approximately 35.4 square miles and is approximately 4,400 feet above sea level. Situated along the northwest side of the Salt Lake Valley, it is bordered by Salt Lake City to the east, Magna to the west, and Taylorsville and Kearns to the south. The Oquirrh Mountains rise to the west of the city while the Jordan River forms its eastern boundary.

Population

The 2022 American Community Survey 5-Year Estimate from the U.S. Census Bureau records the population of West Valley City's population as 134,466 people.

Demographics

Most of the 134,466 people are between the ages of 25 and 34, with a median age of 33.3; 69,219 are males (51.5%) and 65,247 are females (48.5%). English is the primary language in 57.1% of homes,, with 32.8% Spanish, other Indo-European languages 3.3%, Asian and Pacific Islander languages 4.5%, and 2.3% other languages.

DRAFT

Brief History

The first pioneers, which included Joseph and Susanna Harker, settled “over Jordan” in 1848, followed by others who developed farming communities. Canals in the 19th century brought irrigation and further enabled settlement of the area. By the early 20th century, construction of roads, schools, and churches increased social life, which was centered around the Mormon meetinghouse.

The Granger–Hunter Improvement District was established in 1950 to provide water and sewer services, enabling new subdivisions and sparking a residential boom. This brought rapid growth to the area eventually leading to the Granger–Hunter Community Council in 1964. West Valley City was officially incorporated in 1980 and is now the second largest city in Utah.

Climate

West Valley City experiences a cold semi-arid climate with hot, dry summers and cold, wet winters (Dsa Köppen classification). Summer temperatures can surpass 90°F with winter temperatures ranging from 20°F to 30°F. West Valley City experiences significant precipitation, with snowfall ranging from 40 to 50 inches and rainfall of approximately 16 inches each year.

Public Services

As the second largest city in Utah, West Valley City can provide a wide range of services. The city operates a police department, fire and EMS services, public works, planning & zoning, community development, parks and recreation, and many other government services.

The city offers community members the opportunity to participate on city boards and committees, including Board of Adjustments, Clean and Beautiful Committee, Historical Preservation Commission, License Hearing Board, Planning Commission, Professional Standards Review Board, and Sister City Committee.

Governing Body

The governing body of West Valley City consists of a mayor and a seven-member city council. The city council serves as the city government, performing executive functions of different natures. Members of this governing body are elected by the people.

Development Trends

The population of West Valley City, as with the rest of the Wasatch Front, is expected to grow through 2030 and beyond. Currently, high-rise buildings are being built and there are still large areas of older homes. As development continues, more educational opportunities on remodeling and retrofitting should be presented for residents. Internal growth, potential annexation, and increases in density in some areas will impact the overall population of the city. The average population is expected to become increasingly older.

DRAFT

Rapidly changing demographics and population growth will place different demands on aging housing stock. As West Valley City is approaching build-out in terms of raw land, these changes will raise important questions as to how the city grows, what is built, and where to invest resources and prepare for the future. Economic development has continued to be a priority for West Valley City's leaders. Business parks like Lake Park Corporate Center, West Ridge Commerce Park, Decker Lake Business District, and Metro Business Park include corporate headquarters, regional offices, and world-wide distribution centers for companies like Verizon Wireless, Frito Lay, Backcountry.com, United Parcel Service (UPS), and Discover Card. Economic development activities in the heart of the city include a complete redevelopment of Valley Fair Mall and an all-new transit oriented development, Fairbourne Station.

Jurisdiction-Specific Hazards and Risk

The Calculated Priority Risk Index (CPRI) is a comprehensive assessment tool for evaluating and prioritizing risks in a given context. It considers various factors, such as probability, impact, and urgency, to determine the level of risk associated with events or situations. The results for each hazard, including its risk factor (RF) value, are shown in Table 4. The results are based on the criteria in

Table 5 and the equation that follows it. The CPRI helps organizations and individuals make informed decisions about risk management and mitigation strategies. It provides a systematic approach to identifying and addressing potential issues, allowing for a more efficient allocation of resources and proactive risk prevention. With the CPRI, stakeholders can prioritize their focus on the most critical risks, leading to more effective risk management and, ultimately, better outcomes.

Table 4: Calculated Priority Risk Index Values for West Valley City

Type of Hazard Event	Probability of Future Events	Spatial Extent	Severity of Life/ Property Impact	Warning Time	Duration	Response Capacity	Risk Factor Value
Avalanche	1	1	1	1	1	1	1
Drought	4	4	2	1	4	1	2.8
Earthquake	3	4	4	4	3	2	3.4
Extreme Heat	4	4	3	1	3	1	3
Extreme Cold	4	4	2	1	3	1	2.7
Flooding	4	3	3	3	3	1	3.1
Landslide/Slope Failure	1	1	2	4	1	1	1.6
Radon	4	4	2	1	4	2	2.9
Heavy Rain	4	3	2	3	1	1	2.6
High Wind	4	3	3	3	2	1	3
Lightning	4	2	2	4	1	1	2.6
Severe Winter Weather	4	3	2	2	2	1	2.6
Tornado	2	2	3	4	1	2	2.4

Type of Hazard Event	Probability of Future Events	Spatial Extent	Severity of Life/ Property Impact	Warning Time	Duration	Response Capacity	Risk Factor Value
Wildfire	2	3	3	4	3	1	2.6
Dam Failure	1	1	1	2	2	1	1.2
Civil Disturbance	2	1	2	4	2	2	2.1
Cyberattack	2	3	3	4	3	2	2.7
Hazardous Materials Incident (Transportation & Fixed Facility)	3	1	2	4	1	1	2.2
Public Health Epidemic/ Pandemic	3	4	3	1	4	1	2.8
Terrorism	2	1	3	4	2	1	2.3

Table 5: Criteria for the Calculated Priority Risk Index

Risk Index Factor	Degree of Risk Level		Criteria	Factor Weight for Degree of Risk Level
Probability of Future Events	1	Unlikely	Less than 1 percent probability of occurrence in the next year or a recurrence interval of greater than every 100 years.	30%
	2	Occasional	1 to 10 percent probability of occurrence in the next year or a recurrence interval of 11 to 100 years.	
	3	Likely	11 to 90 percent probability of occurrence in the next year or a recurrence interval of 1 to 10 years.	
	4	Highly Likely	91 to 100 percent probability of occurrence in the next year or a recurrence interval of less than 1 year.	
Spatial Extent	1	Limited	Less than 10% of the planning area could be impacted.	10%
	2	Small	10%–25% of the planning area could be impacted	
	3	Significant	25%–50% of the planning area could be impacted.	
	4	Extensive	50%–100% of the planning area could be impacted.	
	1	Negligible	Less than 5% of the affected area's critical and non-critical facilities and structures are damaged/ destroyed. Only minor property damage and	30%

DRAFT

Risk Index Factor	Degree of Risk Level		Criteria	Factor Weight for Degree of Risk Level
Severity of Life/Property Impact			minimal disruption of life. Temporary shutdown of critical facilities.	
	2	Limited	More than 5% and less than 25% percent of property in the affected area is damaged/ destroyed. Complete shutdown of critical facilities for more than one day but less than one week.	
	3	Critical	More than 25% and less than 50% of property in the affected area is damaged/destroyed. Complete shutdown of critical facilities for over a week but less than one month.	
	4	Catastrophic	Over 50% of critical and non-critical facilities and infrastructures in the affected area are damaged/ destroyed. Complete shutdown of critical facilities for more than one month.	
Warning Time	1	Self-defined	More than 24 hours	10%
	2	Self-defined	12 to 24 hours.	
	3	Self-defined	6 to 12 hours.	
	4	Self-defined	Less than 6 hours.	
Duration	1	Brief	Up to 6 hours.	10%
	2	Intermediate	Up to one day.	
	3	Extended	Up to one week.	
	4	Prolonged	More than one week.	
Response Capacity	1	High	Significant resources and capability to respond to this kind of event; staff are trained, experienced, and ready.	10%
	2	Medium	Some resources and capability to respond to this kind of staff; some staff may be trained, experienced, and ready while others may need additional support.	
	3	Low	Limited resources and capability to respond to this kind of event; additional staff or staff training needed.	
	4	None	No resources and capability to respond to this kind of event; additional outside support would be required.	

RISK FACTOR (RF) EQUATION

RF Value = [(Probability x 0.30) + (Spatial Extent x 0.10) + (Severity of Life/Property Impact x 0.30) + (Warning Time x 0.10) + (Duration x 0.10) + (Response Capacity x 0.10)]

DRAFT

Hazards with an RF value greater than or equal to 2.5 are considered high risk. Those with RF values of 2.0 to 2.4 are considered moderate risk hazards, and those with an RF value less than 2.0 are considered low risk. The highest possible RF value is 4.

Hazard Event History

Examining hazard event histories provides valuable insights to inform decision-making and help prioritize resources for risk prevention and response efforts. Per the Storm Events Database of the National Centers for Environmental Information, no significant hazard events have occurred in the West Valley planning area since the 2019 plan update.

National Flood Insurance Program Summary

West Valley City participates in the National Flood Insurance Program (NFIP). Table 6 and

Table 7 display statistics related to the NFIP. West Valley City does not participate in the Community Rating System (CRS).

Table 6: National Flood Insurance Program Status for West Valley City[1]

Initial FHBM Identified	Initial FIRM Identified	Current Effective Map Date	Adopted Date	Date Joined NFIP	Tribal
11/02/1983	05/01/1986	09/25/2009	2009	05/01/1986	No

Table 7: National Flood Insurance Overview for West Valley City

Community ID	Number of Losses	Total Net Payment	Active Policies	Total Coverage
490245	6	$5,903.28	107	$32,229,000

West Valley City has designated the City Engineer as the Floodplain Administrator. The current Flood Damage Prevention Ordinance was adopted on 10/10/2009. The current effective FIRM is dated 9/25/2009. The Building Inspections Division is responsible for issuing permits. Engineering reviews the plans, permits, and construction sites as a part of this process, including permits for construction in the Special Flood Hazard Area. Substantial damage/substantial improvement determinations are made through the permitting and construction inspection process.

Jurisdiction-Specific Vulnerabilities and Impacts

Table 8 provides information on the vulnerable assets in West Valley City, including its critical facilities, highlighting the city's vulnerability to identified hazards. It also describes the potential impacts on the community arising from those vulnerabilities. Impacts refer to the consequences or effects of each hazard on the assets. By understanding the risks associated with these assets, local authorities can develop

[1] FIRM = Flood Insurance Rate Map, FHBM = Flood Hazard Boundary Map

proactive strategies to mitigate vulnerabilities and ensure the safety and functionality of these important assets during hazard events. This data is invaluable for decision-making and prioritizing resources for emergency response and preparedness efforts, ultimately contributing to more effective risk management and greater resilience within the community.

Vulnerabilities in West Valley City include the population of 134,466, and critical facilities such as 1 emergency operations center (EOC), 6 fire stations, 1 hospital, 2 police stations, 35 schools. Major transportation routes include I-215, Bangerter Highway, Mountain View Corridor, Highway 201, 3500 South, and 4100 South. Recreation assets include West Valley Family Fitness Center, Redwood Recreation Center, Stonebridge Golf Club, Utah Cultural Celebration Center, Hunter Park, and Utah First Credit Union Amphitheater.

Table 8: Jurisdiction-Specific Vulnerabilities and Impacts in West Valley City

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
Avalanche	NA	There is no risk of avalanche in West Valley because the city does not have terrain or snow accumulations that pose a risk.
Drought	People	*Vulnerability:* All West Valley residents are vulnerable to drought due to concerns about water supply and public health. *Impacts:* Drought can limit water supply for drinking, cooking, cleaning, and other household uses. Drought can lead to decreased water quantity and quality, increasing the incidence of illness and/or disease. Drought also affects air quality due to increased dust.
	Structures	*Vulnerability:* Homes, businesses, and public facilities are vulnerable to water scarcity. *Impacts:* A lack of water can impact future development and landscaping. In addition, it can lead to increased costs for water. Water-reliant businesses, such as laundromats, restaurants, and car washes, may face higher costs or operational limitations due to water scarcity. Parks, public pools, and other recreational areas that rely on water may face closures or restricted operations due to reduced well water availability.
	Economic Assets	*Vulnerability:* Businesses may suffer losses due to drought conditions. *Impacts:* Prolonged drought may lead to water restrictions or increased costs for culinary water and irrigation water for landscaping. Drought conditions can affect the appeal of local outdoor attractions, reducing tourism and the revenue it generates for local businesses.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Trees, parks, and the Jordan River are vulnerable to drought. *Impacts:* Drought can affect public health. Drought stresses trees and other vegetation, which may become more susceptible to disease and pests.
	Critical Facilities and Infrastructure	*Vulnerability:* Water supply systems, agriculture, and emergency services are susceptible to drought. *Impacts:* Reduced precipitation impacts water availability and crop yields. Fire departments may struggle with wildfire management due to limited resources. Public health facilities face water quality challenges

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		that affect drinking water and sanitation. Drought increases the risk of wildfire, threatening safety and property
	Community Activities	*Vulnerability:* Recreation and public events are vulnerable to drought. *Impacts:* Recreational spaces may struggle with maintenance, and households may encounter restrictions and costs for landscaping and pools. Parks and golf courses may experience deterioration in the health of vegetation and a decline in aesthetic appeal during drought. There may be decreased attendance at outdoor events.
Earthquake	People	*Vulnerability:* All West Valley residents are vulnerable to earthquakes. *Impacts:* People may be injured or killed by falling objects or collapsed structures. Many day-to-day activities, such as school and work, may be disrupted. Some people may be displaced from their homes. Those living in older buildings not up to seismic standards, families with young children, the elderly, and individuals with disabilities who may struggle to evacuate are vulnerable. Residents near fault lines, such as the West Valley Fault that traverses the city, and those in densely populated areas are also at higher risk. Furthermore, individuals lacking resources for disaster preparedness, such as emergency supplies and evacuation information, may find it difficult to respond effectively during an earthquake, thereby increasing their vulnerability. In addition, psychological effects, such as increased anxiety, can affect the community.
	Structures	*Vulnerability:* All structures in West Valley are vulnerable, including homes and businesses, particularly in high liquefaction zones. *Impacts:* Much of the northern and western areas of West Valley are in a high liquefaction potential zone. Structures in this area are more at risk of damage. Homes and businesses might sustain significant structural damage, posing safety risks. Shaking from a moderate to strong earthquake can damage walls, chimneys, and foundations. Damage may be extensive, and buildings may become unusable. Businesses may be forced to close, and residents may be displaced. Older buildings not built according to modern seismic codes, unreinforced masonry, and homes with inadequate foundations may be vulnerable. Many lack the retrofitting needed to withstand earthquakes, and those built on unstable soil or near fault lines are at higher risk. Large commercial buildings without flexible designs can sustain severe damage. Overall, outdated construction practices and poor site selection contribute to their vulnerability.
	Economic Assets	*Vulnerability:* Business and commerce are vulnerable to earthquakes. *Impacts:* The local economy, reliant on retail and services, could face significant disruptions during seismic events. Businesses will likely lose revenue and workers could be severely impacted by wage loss. Economic loss could be felt across the region. The sales tax base would be impacted by business losses. Repairs can lead to high costs, potential declines in property values, and disruptions to local businesses, ultimately impacting job availability and the overall economy.
	Natural, Historic, and	*Vulnerability:* Historic buildings and the Utah Cultural Celebration Center are vulnerable to earthquakes.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
	Cultural Resources	*Impacts:* Historic structures and landmarks often lack modern seismic retrofitting, making them susceptible to damage. Cultural resources, including community centers, may also be at risk of damage, compromising their integrity and the heritage they represent.
	Critical Facilities and Infrastructure	*Vulnerability:* All critical facilities and infrastructure are vulnerable to earthquakes. *Impacts:* Fire and police stations, healthcare facilities, schools, and government buildings may be damaged by earthquakes and their services may be disrupted. Water supply networks, wastewater systems, power distribution networks, and communication systems are also vulnerable to damage from earthquakes and may be inoperable. Critical facilities and government services may not be able to operate until these systems are restored. Several major transportation routes in West Valley could be damaged, and numerous local roads could be damaged and impassable. Road closures may delay emergency response and the delivery of goods and materials as well as inhibit recovery.
	Community Activities	*Vulnerability:* Day-to-day activities, work, education, and community events may be canceled following an earthquake. *Impacts:* Response and recovery efforts may disrupt activities following an earthquake. A stronger magnitude earthquake will likely result in more extended disruptions and cancellations.
Extreme Heat	People	*Vulnerability:* All residents are vulnerable to extreme heat. Vulnerable populations may experience more extreme effects. Vulnerable populations during extreme heat include adults over 65, individuals with pre-existing health conditions, and young children, as they struggle to regulate body temperature. Socioeconomically disadvantaged individuals may lack access to cooling resources, while outdoor workers are at higher risk of heat-related illnesses due to physical labor without adequate hydration and rest. *Impacts:* Extreme heat can significantly affect public health, increasing the risk of heat-related illnesses, especially among vulnerable populations. Individuals without access to shade, air conditioning, and water are vulnerable to heat-related illnesses such as heat exhaustion, heat stroke, and dehydration. In addition, extreme temperatures worsen air quality by raising ozone levels, which poses respiratory risks. Extreme heat can hinder students' learning.
	Structures	*Vulnerability:* Extreme heat can be detrimental to homes, businesses, industry, and city-owned buildings. *Impacts:* Residential buildings with inadequate insulation and ventilation, and commercial buildings lacking reflective roofing and proper shading, may be vulnerable. Materials like metal and glass can amplify heat retention, while areas with limited green space typically experience higher temperatures. West Valley can experience urban heat island effects, which keep temperatures warmer even at night.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
	Economic Assets	*Vulnerability:* Business may suffer losses due to extreme heat. *Impacts:* Agricultural operations can have reduced yields and higher water demand due to heat stress. The outdoor recreation industry may see decreased participation during heat waves, affecting local businesses that rely on visitors. Construction and other outdoor occupations may lose productivity during extreme heat.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Parks and recreation are vulnerable to extreme heat. *Impacts:* Extreme heat can stress vegetation and wildlife in open spaces and parks, causing them to lose their appeal and see reduced use. Local plant species and wildlife habitats can suffer from drought conditions, leading to reduced biodiversity. Extreme heat can also contribute to the risk of wildfire. Historic buildings may degrade due to high temperatures, causing materials to deteriorate and paint to peel.
	Critical Facilities and Infrastructure	*Vulnerability:* City facilities, hospitals, and transportation systems are vulnerable to extreme heat. *Impacts:* Healthcare facilities may experience increased demand due to heat-related medical issues. Schools and other public buildings can suffer from the strain on cooling resources. Some facilities may see increased demand as residents seek out city facilities for relief from the heat. Transportation systems are at risk of damage, such as buckling roads and warped train tracks, which can cause significant disruptions on the many major roads that pass through West Valley. Power grids may be strained by higher demands for electricity for cooling, leading to potential outages.
	Community Activities	*Vulnerability:* Public events and recreational activities are vulnerable to extreme heat. *Impacts:* Activities like outdoor sports, fairs, and markets are vulnerable to extreme heat. These events can pose risks, particularly for participants such as youth athletes and elderly residents who may suffer from heat-related illnesses. Extreme heat may necessitate delays or cancellations of these activities.
Extreme Cold	People	*Vulnerability:* All West Valley residents are vulnerable to extreme cold. Some populations may face higher risk or more severe effects. *Impacts:* Below-freezing temperatures occur annually in West Valley. Individuals exposed to extreme cold can experience life-threatening health effects such as hypothermia and frostbite. The elderly face increased risks due to health issues and mobility challenges, while children may be susceptible if they lack proper winter clothing. Individuals experiencing homelessness or financial hardship often lack access to heated shelters and resources for protection against the cold. Those with pre-existing health conditions may experience worsening symptoms at low temperatures. Low-income residents may struggle with the increased costs of heating their homes.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
	Structures	*Vulnerability:* Residential homes, commercial buildings, and unheated spaces like sheds may be vulnerable. *Impacts:* Homes with poor insulation or inadequately sealed windows and doors are prone to significant heat loss. Older buildings lacking modern energy efficiency standards may also suffer from freezing pipes and structural damage.
	Economic Assets	*Vulnerability:* Business are vulnerable to disruptions caused by extreme cold. *Impacts:* Businesses face increased heating costs. Agriculture, infrastructure, and energy-related businesses may be at risk. Agricultural operations, such as greenhouses and livestock farms, may experience crop and livestock losses, impacting revenue. Icy roads can disrupt transportation networks, affecting logistics and supply chains, while power lines risk outages from ice accumulation, impacting local businesses. Energy-intensive facilities may face higher operational costs due to increased heating needs.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Open space, parks, vegetation, and wildlife are vulnerable to extreme cold. *Impacts:* Due to prolonged cold, local vegetation and wildlife habitats may suffer from plant stress and reduced food availability. This may affect the Jordan River riparian area. Historic structures, especially those not built for severe weather, can deteriorate from below-freezing temperatures and ice. Culturally significant sites, including monuments and public art, may also be damaged.
	Critical Facilities and Infrastructure	*Vulnerability:* City facilities and transportation systems are vulnerable to extreme cold. *Impacts:* Facilities are at risk of water failure or damage if pipes freeze or heating is not adequate. Water infrastructure can face frozen pipes and equipment failures. Icy conditions may increase accident risks on transportation infrastructure, and power generation facilities may struggle to meet heating demands. City resources may be strained to provide warming centers when Code Blue is in effect.
	Community Activities	*Vulnerability:* Community activities and recreation are vulnerable to extreme cold. *Impacts:* Youth sports, festivals, and outdoor markets are vulnerable to extreme cold. Harsh temperatures can deter participation, impacting community engagement. At-risk groups, such as the elderly and young children, face health risks like frostbite and hypothermia, further limiting outdoor involvement. In addition, poorly insulated buildings or inadequate heating in community centers can make gatherings uncomfortable.
Flooding (and Heavy Rain)	People	*Vulnerability:* Residents in flood zones near the Jordan River and unsheltered populations are vulnerable to flooding *Impacts:* Residents in flood zones are at risk of injury and may also be displaced from their homes. Flooding primarily affects residents in low-lying areas near rivers and streams, especially during heavy rainfall or snowmelt. In West Valley, flood zones are along the Jordan River, Coon Creek, and a few isolated low-lying areas. Public health may also be compromised due to waterborne diseases and stress-related issues. Individuals without reliable transportation may struggle to

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		evacuate quickly, while low-income families often lack resources for flood-prevention measures. The elderly and those with disabilities may face mobility challenges, increasing their risk during emergencies. Overall, factors such as geographic location, economic status, and physical ability contribute to the community's varying levels of vulnerability to flooding.
	Structures	*Vulnerability:* All structures in flood hazard zones are vulnerable to flooding. *Impacts:* Both residential and commercial structures are vulnerable to flooding, primarily those in low-lying areas or near the Jordan River. Flooding can cause costly water damage. Residential properties in floodplains and commercial buildings without proper drainage systems or flood-resistant designs face significant risks during heavy rain or snowmelt. Older structures may be more susceptible due to outdated construction standards.
	Economic Assets	*Vulnerability:* Businesses in flood zones are vulnerable to flooding. *Impacts:* Commercial properties, especially retail centers and warehouses near the Jordan River or low-lying areas, are at high risk during heavy rainfall. Structures and inventory can be damaged by flooding, causing lost revenue. Businesses may also be faced with declining property values or increased insurance costs. Public infrastructure, such as roads and utilities, may experience disruptions, which may further impair business operations.
	Natural, Historic, and Cultural Resources	*Vulnerability:* The Jordan River, open spaces, parks, and the Utah Cultural Celebration Center are vulnerable to flooding. *Impacts:* Natural areas like wetlands and streams are at risk of habitat destruction or damage from erosion. Cultural resources, such as parks and public spaces, can become unusable, affecting community events. The Utah Cultural Celebration Center is within the flood zone and could be damaged. Runoff may contain contaminants that affect water quality in the river.
	Critical Facilities and Infrastructure	*Vulnerability:* Three schools are in flood hazard zones, as are major roads such as Highway 201, 900 West, and 1700 West. *Impacts:* Flooding could affect major transportation routes. Damaged or blocked roads can disrupt emergency response and isolate communities. In addition, inadequate drainage systems and urban development encroaching on floodplains increase these risks.
	Community Activities	*Vulnerability:* Public events and recreation activities are vulnerable to flooding. *Impacts:* Outdoor events, sports, and farmers' markets are vulnerable to flooding. Parks and open spaces can quickly become inundated during heavy rainfall or rapid snowmelt. Events may be postponed or canceled.
Landslide	N/A	There is minimal risk in West Valley. The terrain is mostly flat, which presents little risk of landslides.
Radon	People	*Vulnerability:* Twenty-seven percent of homes tested in West Valley have dangerous levels of radon (utahradon.org). *Impacts:* Residents in homes with high levels of radon are at high risk of lung cancer. Homeowners in older buildings in areas with high

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		radon potential are most at risk. Families with young children or elderly members are especially at risk due to their increased sensitivity to health impacts. Many residents may not test for radon, making them unaware of dangerous levels. Increased awareness and public health initiatives are vital for protection.
	Structures	Vulnerabilities: Radon poses minimal impacts on structures, as it is primarily a health risk. *Impacts:* Although radon doesn't directly impact structures, the condition of structures contributes to radon levels that pose a risk to occupants. Structures with concrete slabs or basements are particularly vulnerable to radon exposure, as radon can seep in from the soil. Homes in areas with high uranium content are at greater risk, especially in older houses with inadequate ventilation. Cracks in floors and walls can allow radon to enter. Incorporating radon-resistant construction in new developments is also essential for safety.
	Economic Assets	*Vulnerability:* Home values are vulnerable to the presence of radon. *Impacts:* The presence of radon can lead to health issues, decrease property values, and complicate real estate transactions, impacting homeowners and investors alike.
	Natural, Historic, and Cultural Resources	There is minimal vulnerability of these resources to radon.
	Critical Facilities and Infrastructure	*Vulnerability:* Public buildings are vulnerable to radon exposure. *Impacts:* Schools in high-radon areas pose risks for children if they do not have proper ventilation. Healthcare facilities also are at risk, affecting both patients and staff. Other city buildings, such as fire and police stations, may have leaks in foundations that may expose employees to radon. Inadequate construction practices and a lack of awareness about radon risks often heighten vulnerability.
	Community Activities	*Vulnerability:* There is limited vulnerability of public events to radon. *Impacts:* Radon is a long-term exposure risk and hasn't typically affected day-to-day activities.
High Wind	People	*Vulnerability:* The entire population of West Valley City is vulnerable to high wind. Wind events occur over a large area and can impact the whole city as well as neighboring jurisdictions. *Impacts:* High wind can cause injuries if people are struck by blowing debris or falling tree limbs. The elderly may face mobility challenges that hinder their ability to seek shelter, while children might not fully grasp the dangers of severe weather. Individuals with disabilities or health issues may struggle to react quickly. Those living in mobile homes or poorly constructed houses are at greater risk of damage, as are people who work outdoors and may be exposed during sudden wind events.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
	Structures	*Vulnerability:* All structures in West Valley City, including mobile home parks, are vulnerable to high wind. *Impacts:* High winds may down trees, damage roofs, and break windows. Structures can also be damaged by trees uprooted by high wind. Carports, sheds, fences, and accessory structures are easily damaged by high winds and can contribute to blowing debris. West Valley has 10 mobile/manufactured home communities that are at high risk due to their inability to withstand strong high winds and their insecure foundations. Single-story homes, commercial buildings, and agricultural facilities like barns may be at risk. Residential homes with large flat roofs or lightweight materials may struggle to withstand strong winds, while commercial buildings with extensive glass can suffer from breakage and structural damage. Agricultural structures often lack proper reinforcement, making them prone to collapse. The vulnerability of these buildings is heightened in open areas with no landscaping or natural windbreaks, which can help diffuse wind energy.
	Economic Assets	*Vulnerability*: Business operations are vulnerable to disruption from high wind events. *Impacts:* Commercial buildings, such as retail stores, might have large signage and awnings that can be damaged, leading to business interruptions. Businesses may not be able to conduct normal operations if power is out or roads are blocked by debris. Agricultural assets, such as greenhouses and livestock facilities, face risks from wind destruction, impacting crops and animals. Infrastructure, including power lines and roads, can be compromised, resulting in outages and disruptions. The vulnerability of these assets is largely due to construction quality, location, and the presence of loose materials that can become projectiles.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Trees, open spaces, and parks are vulnerable to high winds. *Impacts:* Natural resources, like mature trees and agricultural lands, are vulnerable to high winds, which can cause uprooting and wind erosion. Historic structures also may be at risk if their materials are not resilient, potentially leading to damage or collapse. Cultural resources, such as outdoor art installations and community spaces, can be disrupted or damaged by strong winds. These vulnerabilities are primarily due to the structural integrity of the resources and their exposure to the elements.
	Critical Facilities and Infrastructure	*Vulnerability:* Power distribution systems, communication, and transportation infrastructure are vulnerable to high winds. *Impacts:* Utility infrastructure, such as power lines and communications towers, is at risk, potentially leading to outages. Bridges and overpasses may be compromised, and falling branches from nearby trees can pose hazards to property and access routes. This vulnerability stems from design limitations and the materials used.
	Community Activities	*Vulnerability:* Public events, sports, and recreational activities are vulnerable to high winds. *Impacts:* Outdoor events like festivals and sporting activities may involve injury from falling debris and damaged structures. Farmers'

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		markets and open-air concerts can also face challenges, as vendor tents can be uprooted. Events may be delayed or canceled. In addition, recreational activities in parks—such as picnics and playground use—become unsafe during high winds. The vulnerability of these activities stems from their outdoor settings, where structures and unattached items can easily be compromised, leading to safety risks and disruptions.
Lightning	People	*Vulnerability:* Lightning can occur anywhere in West Valley City, and all populations are vulnerable. People engaging in outdoor recreational activities are at increased risk. Unhoused populations are also at risk. *Impacts:* Lightning can cause severe injury or death. Outdoor enthusiasts, including athletes and golfers, are at risk during thunderstorms due to their exposure in open areas and may struggle to find shelter quickly. In addition, young children and the elderly are more vulnerable, as they may not be aware of the dangers of lightning or may be slower to seek protection. Those lacking access to warning systems or education on lightning safety are at further risk during severe weather.
	Structures	*Vulnerability:* All structures are vulnerable to lightning strikes. *Impacts:* Lightning can ignite fires or cause electrical damage from power surges. Due to their height and exposure, tall buildings, communications towers, and open-frame agricultural barns are particularly vulnerable to lightning strikes. Those with metallic components or inadequate grounding systems face increased risk because metal conducts electricity. In addition, residential homes near tall trees may be at risk if the trees are struck and energy is transferred to the structure.
	Economic Assets	*Vulnerability:* Business operations are vulnerable to disruption from lightning. *Impacts:* Local businesses may suffer if there is a prolonged power outage or lightning event. There are cascading events if lightning is coupled with heavy rain or high winds. Tall structures like communications towers and power lines are at high risk, as are agricultural buildings, such as barns and silos, which can suffer damage to stored crops and livestock. Commercial buildings with metal roofing or equipment may face electrical surges, disrupting operations. In addition, outdoor recreational areas that attract crowds are at risk during thunderstorms, posing dangers to infrastructure and public safety. Tourism and recreation industries experience an economic burden that includes increased insurance claims and repair costs.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Trees and parks are vulnerable to lightning. *Impacts:* Mature trees in parks can attract lightning due to their height. Trees or playground equipment could be damaged. Historic buildings made of wood or flammable materials are at risk of igniting. Cultural resources, such as monuments and outdoor sculptures, can also be damaged by lightning. The risk increases in areas with frequent thunderstorms and dry conditions. Lightning can spark wildfires in nearby areas, threatening property and the environment.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
	Critical Facilities and Infrastructure	*Vulnerability:* Power networks, communication networks, emergency response, and healthcare facilities are vulnerable to lightning. Communications towers, schools, hospitals, and power lines may be at risk. Communications towers attract lightning due to their height and metal structure. Schools and hospitals, as public gathering places, can be at risk if they do not have proper lightning protection systems. Power lines and substations are also susceptible, potentially causing power outages. Critical facilities may be disrupted if they lack power. Essential services could be disrupted if there are road closures or debris on the road from the lightning. Additionally, it may be difficult to help hospital patients if there are downed power lines or power disruptions.
	Community Activities	*Vulnerability:* Public events are vulnerable to lightning. *Impacts:* Outdoor recreational areas that attract crowds are at risk during thunderstorms, posing dangers to infrastructure and public safety. Events may be delayed or canceled. Sports practices, concerts, picnics, and festivals are particularly vulnerable to lightning strikes. Participants in these events often find themselves in open areas without adequate shelter and may be unprepared for sudden weather changes, leading to dangerous situations. Water-related activities, such as swimming and fishing, also increase risk due to water's conductivity.
Severe Winter Weather	People	*Vulnerability:* Severe winter weather can affect the entire city. All of West Valley City is potentially vulnerable to severe winter weather. *Impacts:* Unsheltered populations are vulnerable to exposure or hypothermia. Heavy snow, blizzards, and snow squalls happen frequently in the winter months. Snowy or icy conditions can lead to injuries from slips and falls. Elderly individuals may struggle with mobility and health issues, while young children lack the awareness needed to navigate severe weather safely. People with disabilities often depend on assistance that might not be available during storms. In addition, those without reliable transportation can become stranded, and low-income families in inadequate housing may lack resources for heating and snow removal.
	Structures	*Vulnerability:* Homes and businesses face some risk from severe winter weather, but significant damage is uncommon. *Impacts:* Flat-roofed buildings are prone to snow accumulation, risking roof collapse if not cleared. Older homes might have weakened roofs or inadequate insulation, making them susceptible to snow load and ice dams. Commercial buildings with large open spaces may face risks if their roofs do not meet snow load requirements. Temporary structures like tents are especially vulnerable, as they are not designed to handle heavy snow. Roof design, material quality, and the age of the building are key factors in how well a structure can withstand heavy snowfall.
	Economic Assets	*Vulnerability:* Business disruptions and increased costs to the city are vulnerabilities during severe winter weather. *Impacts:* Retail businesses can experience significant losses from decreased customer traffic and delayed shipments. Construction projects may face delays and increased costs. Transportation and

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		logistics companies are particularly impacted, as snow can hinder vehicle movement, leading to delivery delays. In addition, public services may struggle to maintain continuity during severe weather events. These conditions can lead to increased costs for businesses and the city for snow removal and have a substantial economic impact.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Parks and open spaces are vulnerable to severe winter weather. *Impacts:* Natural resources like trees can break under heavy snow, which can cause damage in parks. Cultural resources, including public art and community spaces, face access issues during severe winter weather.
	Critical Facilities and Infrastructure	*Vulnerability:* Transportation, power, and communication systems are vulnerable to severe winter weather. *Impacts:* Transportation networks, like roads and bridges, can become impassable, hindering emergency responses. Transit lines may also face delays. Utilities, such as power and water supply systems, are at risk of disruptions from downed lines. Communications infrastructure can be damaged, impeding signals. These vulnerabilities stem from reliance on systems that may not be equipped to handle extreme winter weather.
	Community Activities	*Vulnerability:* Public events are vulnerable to severe winter weather. *Impacts:* Community gatherings may be at risk of delays or cancellations. Severe weather can lead to low attendance, travel delays, and access issues for essential services, such as emergency response and healthcare.
Tornado	People	*Vulnerability:* Any member of the West Valley City population could be affected by a tornado. Tornadoes are rare but could potentially occur anywhere in the city. *Impacts:* Residents are vulnerable to serious injury from blowing debris, uprooted trees or falling limbs, and structural collapse. Individuals living in mobile homes face higher risks, as these structures can be easily damaged. Those with limited mobility, such as the elderly and people with disabilities, may struggle to reach safety quickly. Families with young children might have difficulty ensuring everyone's safety during a warning. In addition, residents unfamiliar with tornado preparedness or without timely weather alerts are at greater risk.
	Structures	*Vulnerability:* Any structure near or on the path of a tornado is vulnerable. This could occur anywhere in West Valley City, and all buildings are vulnerable. Mobile homes face more severe damage. *Impacts:* West Valley has 10 mobile/manufactured home communities that are at high risk due to their inability to withstand strong winds and insecure foundations. Other homes and businesses could sustain heavy damage from a tornado, including roofs torn from homes, broken windows, and walls damaged or compromised. Single-story homes and those with flat roofs often lack the support needed to withstand high winds. Mobile homes are particularly at risk due to their light weight and insecure foundations. Older commercial buildings and large-span structures, such as warehouses, can have

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		roofs easily lifted by tornado winds. Overall, inadequate materials, poor design, and age increase the risk of damage from tornadoes.
	Economic Assets	*Vulnerability:* Businesses throughout the city are vulnerable to tornadoes. *Impacts:* Tornadoes can damage retail and commercial structures, warehouses, hotels, restaurants, and other businesses. Damage to power or communication systems can cause temporary business closures. Operational downtime and damage to structures and inventory may lead to lost revenue and potentially lost wages or layoffs. Roads and bridges can be compromised, disrupting transportation and service access.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Parks and trees are vulnerable to tornadoes. Impacts. West Valley City's parks and open spaces could be severely damaged by tornado. Trees, playground equipment, and other outdoor features could be damaged.
	Critical Facilities and Infrastructure	*Vulnerability:* Fire and police stations, city facilities, hospitals, and utility systems are vulnerable to tornadoes. Any aboveground facilities in the path of the tornado could be affected. *Impacts:* Public safety buildings, schools, or other civic facilities may need emergency inspections or repairs and may be closed temporarily. Hospitals, schools, and emergency response centers are vulnerable to tornadoes due to their structural design and large open spaces that may not withstand high winds. Utilities like water treatment plants and power stations are also at risk, as damage to these facilities can disrupt essential services. In addition, any structures not built to modern codes might lack the reinforcements necessary to endure severe weather, increasing vulnerability for the facilities and surrounding communities.
	Community Activities	*Vulnerability:* Public events are vulnerable to tornadoes. *Impacts:* Outdoor festivals, sports events, and markets are vulnerable to tornadoes due to their open spaces and limited options to provide shelter. Temporary structures, such as tents, can be easily damaged by high winds. Schools and recreational facilities with large glass windows or weak roofs also face significant risks.
Wildfire	People	*Vulnerability:* A small portion of West Valley City is vulnerable to wildfire, primarily in open spaces near the Jordan River, along Highway 201, and in the far western section of the city between U-111 and Mountain View Corridor. Residents near these areas are at risk. *Impacts:* Residents near these areas may need to evacuate if a wildfire occurs. Individuals with physical disabilities or health issues who may struggle to evacuate, and low-income families lacking resources for fire safety measures, may be vulnerable. Older adults might have reduced mobility, making them more dependent on others for assistance. The entire valley could experience poor air quality and related health impacts from a wildfire in the region. Children, the elderly, and those with respiratory health problems are at higher risk for complications from poor air quality.
	Structures	*Vulnerability:* Homes and businesses near moderate wildfire risk zones are vulnerable.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		Impacts: Most properties are not in dense vegetation, but those made of wood or near heavily vegetated areas may be vulnerable. Properties near the Wildland-Urban Interface are at higher risk due to surrounding flammable vegetation. Inadequate defensible space, such as insufficient clearing of dry grass and shrubs, increases susceptibility. Roofs made of combustible materials and buildings that lack fire-resistant features are particularly at risk during wildfire events.
	Economic Assets	*Vulnerability:* Business near open spaces are vulnerable to wildfire. *Impacts:* Properties near wildland areas are at high risk, especially if they lack defensible space and fire-resistant landscaping. Commercial assets, such as retail centers close to grassland or undeveloped regions, can suffer damage from flames and smoke, affecting the local economy. Agricultural lands also are susceptible, as wildfires can destroy crops and livestock, leading to financial losses. Vital infrastructure, such as power lines and water pipelines, can be disrupted, causing further economic repercussions. These vulnerabilities are heightened by dry conditions and high winds, which can facilitate the spread of fires. Outdoor recreation businesses, such as golf courses, could see fewer visits if air quality is poor.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Vegetation, parks, and water quality are vulnerable to wildfires. *Impacts:* Natural resources like forests and grasslands are at risk because dry vegetation and accumulated brush can easily ignite. The increasing frequency of drought and extreme heat, exacerbated by climate change, heightens these vulnerabilities. Riparian vegetation and wildlife along the Jordan River could be affected. Erosion and runoff following a fire may degrade water quality in creeks and rivers.
	Critical Facilities and Infrastructure	*Vulnerability:* Power and emergency services are vulnerable to disruptions from wildfires. *Impacts:* No critical facilities were identified in areas at risk of wildfire. Fires elsewhere in the county could contribute to utility disruptions or outages. There may be increased demands on city facilities and services.
	Community Activities	*Vulnerability:* Public events are vulnerable to wildfires. *Impacts:* Recreational activities and outdoor events, such as festivals and sports, may experience risk, especially during hot, windy conditions. Outdoor events may be canceled due to wildfire smoke. In addition, landscaping with dry grasses and shrubs increases susceptibility during fire season, putting local infrastructure, such as schools and neighborhoods, at risk.
Dam Failure	N/A	No significant or high hazard dams are located in West Valley City, and no inundation boundaries from neighboring cities affect West Valley assets.
Civil Disturbance	People	Low-income individuals may lack the resources for safety, while the elderly or disabled may struggle to navigate emergencies. Young people, particularly teenagers, may be drawn into unrest, influenced by social dynamics. In addition, marginalized individuals may feel targeted or compelled to participate. A lack of community cohesion and trust in authorities can further heighten tensions.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
	Structures	Government buildings, commercial properties, and infrastructure, such as bridges and transportation hubs may be vulnerable. Government buildings may be targeted for their symbolic authority, while retail stores can attract crowds during protests. Residential neighborhoods also can be affected, especially in areas with heightened tensions. The vulnerability of these structures stems from their visibility and importance to the community, combined with factors such as location and ongoing social issues.
	Economic Assets	Retail establishments, especially shopping centers, are at risk as they often become focal points for protests. Transportation systems can be disrupted by blockades, hindering access to services. Financial institutions may face vandalism or theft, while critical service providers, such as hospitals, could experience strain during unrest. Several economic assets are vulnerable to civil disturbances, primarily due to their visibility and reliance on foot traffic.
	Natural, Historic, and Cultural Resources	Parks and open spaces may suffer from vandalism or destruction during uncontrolled events. Historic sites can become targets, as they symbolize authority or cultural significance. Cultural resources, such as community centers and places of worship, also may be affected, as they play a vital role in community identity. Their vulnerability lies in the potential for damage during protests.
	Critical Facilities and Infrastructure	Governmental buildings, schools, and healthcare facilities may be at risk, since they often symbolize authority and serve as community hubs, making them targets during unrest. Utility infrastructure, such as water and power facilities, is also at risk of disruption. Its visibility and essential services contribute to its vulnerability during civil disturbances.
	Community Activities	Public demonstrations, parades, and local government meetings are particularly vulnerable to civil disturbances. These events often attract large crowds and can become tense, especially around contentious social or political issues. Factors such as the local demographic, economic conditions, and recent events can heighten these vulnerabilities, making it easier for conflicts to arise during passionate public gatherings.
Cyberattack	People	Older adults often lack familiarity with technology and online security, making them easy targets for phishing scams. Individuals engaging in online banking or shopping without strong security measures also face heightened risks. Families with children may be less vigilant about internet safety, allowing cybercriminals to exploit personal information. In addition, small business owners without robust cybersecurity practices are prime targets for attacks that can disrupt operations.
	Structures	Critical infrastructure, such as power plants, water treatment facilities, and transportation systems, often lack robust cybersecurity measures. Commercial businesses, especially financial institutions and healthcare providers, also are at risk due to weaker data protection and employee training. Educational institutions may be vulnerable because of limited funding for cybersecurity and outdated software. Obsolete technology and insufficient training enhance the susceptibility of these structures to cyber threats.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
	Economic Assets	Financial institutions, such as banks and credit unions, are at risk of data theft and service disruption. Small and medium-sized businesses often lack robust cybersecurity measures, making them attractive targets. In addition, local government agencies and critical infrastructure, such as water treatment facilities, might have outdated security protocols, posing threats to public safety. The rise of remote work further exacerbates vulnerabilities, as employees accessing networks from home can unintentionally expose systems to risks. Overall, the combination of outdated technology and insufficient cybersecurity practices increases the vulnerability of an area's economic assets.
	Natural, Historic, and Cultural Resources	Natural resources like water management systems and wildlife databases can be compromised, disrupting ecosystems. Historic sites and museums that digitize collections are at risk of losing valuable artifacts and data. In addition, cultural organizations managing events may face threats if their systems lack adequate security. The limited resources of smaller organizations further increase this vulnerability
	Critical Facilities and Infrastructure	Energy and utility services, such as electricity and water systems, which often rely on outdated technology, may be vulnerable. Transportation infrastructure, such as traffic management and public transit, is also at risk due to networked systems. Healthcare facilities that use electronic records and connected medical devices face vulnerabilities that can compromise patient safety.
	Community Activities	Online registration for events, local government services, and educational programs that rely on digital tools may be targeted due to inadequate security measures, outdated software, and insufficient staff training.
Hazardous Materials Incident (Transporta-tion & Fixed Facility)	People	Individuals with pre-existing health conditions, such as respiratory issues, and the elderly are at higher risk due to their compromised health. Children also are more susceptible. Those living near industrial areas or transport routes for hazardous materials face increased exposure risk, while low-income families may lack resources and information to effectively prepare for incidents.
	Structures	Industrial facilities, such as manufacturing plants and warehouses, often store hazardous chemicals which may leak. Residential buildings, schools, and hospitals also are at risk, particularly if located along transportation routes for hazardous materials. Older buildings may lack modern safety features, increasing their vulnerability.
	Economic Assets	Industrial facilities, transportation infrastructure, and nearby commercial properties may be affected. Industrial facilities handling chemicals are at risk of spills or leaks, while roads and railways used for transporting hazardous materials can lead to accidents and contamination. In addition, nearby commercial and residential areas face potential health risks and economic losses.
	Natural, Historic, and Cultural Resources	Waterways and habitats are vulnerable to hazardous materials incidents, which can disrupt ecosystems. Historic sites and structures may suffer damage from toxic exposure, leading to degradation over time. In addition, cultural landmarks risk losing their significance due to contamination events. The proximity of these resources to industrial areas or transport routes exacerbates their risk.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
	Critical Facilities and Infrastructure	Chemical manufacturing plants, waste treatment facilities, and transportation networks, such as highways and railroads may be at risk. Their vulnerability stems from factors such as proximity to residential areas, aging infrastructure, and inadequate safety measures. Natural hazards, such as flooding and earthquakes, can further increase risks by damaging containment systems.
	Community Activities	Local markets, school events, and outdoor gatherings are vulnerable to hazardous materials incidents if they are near industrial zones and transport corridors. This risk is heightened by inadequate emergency preparedness, lack of public awareness, and the potential for spills during transport. Large crowds at events can complicate evacuation efforts, increasing the risks for participants and nearby residents.
Public Health Epidemic/ Pandemic	People	Individuals with pre-existing health conditions like asthma and heart disease and adults over 65 may be vulnerable. Low-income families may struggle to access healthcare and vaccinations, increasing their risk. Marginalized communities with limited access to information and those living in high-density conditions also are at greater risk due to the rapid spread of diseases and the challenges in implementing preventive measures.
	Structures	Several structures are vulnerable to public health epidemics or pandemics, particularly due to their ability to facilitate the spread of disease. High-density residential areas, such as apartment complexes, are at risk, as close living quarters can lead to faster transmission. Public gathering spaces, such as schools and community centers, also pose significant threats because large groups are in confined spaces. Healthcare facilities can become hotspots for infections if infection control measures are insufficient. In addition, workplaces with high foot traffic, such as retail stores, contribute to vulnerability.
	Economic Assets	Small businesses in retail, hospitality, and food service are particularly vulnerable to public health epidemics or pandemics. These sectors face risks from fluctuating consumer demand and potential operational restrictions. The tourism industry also is affected, as travelers may avoid high-risk areas. Healthcare facilities can become overwhelmed, straining resources and impacting operations. In addition, local supply chains may experience disruptions, leading to shortages and inflation. Overall, the direct effects of illness, along with prolonged shutdowns and consumer hesitance, leave these economic assets exposed to significant downturns.
	Natural, Historic, and Cultural Resources	Natural resources like wildlife and ecosystems can be disrupted by increased human activity, raising the risk of zoonotic diseases. Historic sites may deteriorate due to reduced visitor access and funding, while cultural resources, such as community events, face cancelations, impacting social connections.
	Critical Facilities and Infrastructure	Public health epidemic or pandemic incidents can affect healthcare facilities, nursing homes, public transportation systems, schools, and food supply chains. Hospitals and clinics may become overwhelmed with patients, while vulnerable populations in nursing homes are at higher risk. Public transportation can facilitate the spread of disease, and schools gather large groups, thereby increasing transmission potential. These facilities often lack adequate resources, including

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		medical supplies and testing capabilities, making them more susceptible to the impacts of a health crisis.
	Community Activities	Large gatherings like festivals and sporting events can facilitate the rapid spread of diseases due to close contact. Public transportation also is at risk, as it serves many people in confined spaces. Schools and childcare facilities are particularly susceptible, given that children can easily transmit infections. In addition, food-related events, such as farmers' markets, can pose risks if hygiene practices are not followed. The interconnectedness of community members and varying adherence to health guidelines further exacerbate these vulnerabilities.
Terrorism	People	Young children and newcomers may lack awareness of potential threats, while the elderly and individuals with disabilities may struggle to respond quickly in emergencies. Marginalized communities often face bias, making them more susceptible to targeting. In addition, those with lower socioeconomic status may lack access to security measures and emergency preparedness resources.
	Structures	Government buildings, transportation hubs, commercial centers, and public spaces are particularly vulnerable to terrorism incidents. Government buildings are symbolic targets, while transportation hubs and commercial centers are attractive due to their potential for high casualties and crowd presence. Public spaces also are at risk due to their open nature and lack of security. Their vulnerability is heightened by inadequate security measures, high occupancy rates, and their locations in densely populated areas, which can amplify the impact of incidents.
	Economic Assets	Infrastructure, commercial establishments, and community facilities may be vulnerable. Critical infrastructure, such as transportation networks and power grids, could disrupt the economy if targeted. Commercial establishments, especially those with high foot traffic, and community facilities like schools and hospitals also are at risk, as they can provoke widespread concern and disruption. Their accessibility and interconnectivity increase vulnerability, meaning that damage to one asset can have a broader economic impact and hinder recovery efforts.
	Natural, Historic, and Cultural Resources	Natural resources like water supplies and parks could be targeted for their significance to the community. Historic sites and cultural resources, such as museums or community centers, also are at risk due to their accessibility and importance to local identity. Their vulnerability is often heightened by inadequate security measures.
	Critical Facilities and Infrastructure	Public transportation systems, healthcare facilities, schools, and utility services like water and power plants may be affected. Their vulnerability arises from high accessibility and the potential impact of an attack, as crowded transportation and public spaces can lead to mass casualties and panic. Attacking utility services could disrupt the city's essential functions, creating chaos.
	Community Activities	Festivals, parades, and sporting events are particularly vulnerable to terrorism incidents. These events attract large crowds, making it easier for perpetrators to inflict harm and instill fear. In addition, community centers and places of worship serve as social hubs, increasing their

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		risk. Factors such as limited security measures and open access to public spaces contribute to this vulnerability.

Hazards Not Profiled

Avalanche, Landslide/Slope Failure, and Dam Failure have been omitted from further discussion of hazard impacts and from mitigation actions. As shown in the hazard description in Volume 1, avalanche and landslide risk is primarily in the Wasatch and Oquirrh Mountains in Salt Lake County. West Valley City has mostly flat terrain and minimal risk of impacts from these hazards. Also, no high hazard dams or dam inundation boundaries are in West Valley City. No previous occurrences of avalanche, landslide, or dam failure have impacted West Valley City.

Jurisdiction-Specific Changes in Vulnerability

Hazard events can impact communities, infrastructures, and ecosystems. The severity of these impacts can be influenced by climate change, population patterns, and land use developments. Understanding these factors is crucial for West Valley City to develop a resilient community and minimize the impacts of hazards. Table 9 displays the unique changes within the community and the related effects on each identified hazard affecting West Valley City.

DRAFT

Table 9: Jurisdiction-Specific Changes in Vulnerability in West Valley City

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
Avalanche	N/A	N/A	N/A	N/A
Drought	Climate change affects drought incidents by altering precipitation patterns and increasing temperatures. Warmer weather can lead to longer dry periods and more severe droughts, while changes in rainfall can reduce snowpack in nearby mountains, crucial for summer water supply. Higher temperatures also increase evaporation rates, further straining local water resources.	Drought can significantly influence population patterns by impacting economic opportunities and the quality of life. Water scarcity often leads to reduced agricultural productivity, prompting residents to migrate to areas with more stable job prospects. Increased water costs can make living less affordable, driving some residents away. Conversely, efforts to address drought, such as sustainable development or improved water management, may attract newcomers, resulting in changes in the community's demographic composition over time.	Increased development of new commercial businesses, including the Valley Fair Mall, increases water demand in the city and increases the risk of drought.	Increased
Earthquake	Rising temperatures can lead to glacial melting, which affects pressure on tectonic plates and may trigger seismic activity through isostatic rebound. In addition, increased rainfall and flooding can erode soils, weakening structural integrity and heightening vulnerability during earthquakes. Although the direct links between climate change and earthquakes are still under investigation, environmental	Earthquakes can significantly alter population patterns by prompting residents to leave for safer areas after a seismic event. This migration can lead to changes in population density and attract new residents and businesses during the rebuilding process. The perception of the area as a safe place to live may shift, impacting long-term demographics, as some residents return to rebuild while others relocate permanently.	New development in West Valley City is exposed to earthquakes from active faults in the city. Although these developments are at risk, they are built to current codes that mitigate most of the risk.	Stayed the same

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	effects may impact the region's seismic risk.			
Extreme Heat	Climate change significantly impacts extreme heat by increasing the frequency and intensity of heat waves. Rising global temperatures lead to longer and hotter summers, affecting residents and local infrastructure while heightening health risks, especially for vulnerable populations. Urban heat islands from reduced vegetation and extensive pavement further amplify these effects.	By causing residents to relocate due to damaged homes or safety concerns. Some may move to areas perceived as safer or seek better job opportunities elsewhere. The economic impact and infrastructure damage can also make certain neighborhoods less desirable, leading to shifts in demographics and the socioeconomic landscape as new residents with different backgrounds move in.	The high amount of development increases population and reduces vegetation, both of which can increase temperatures during extreme heat events.	Increased
Extreme Cold	By increasing the intensity of winter storms. Higher atmospheric temperatures allow for more moisture, resulting in heavier snowfall and potentially lower temperatures during these events. In addition, fluctuations in weather patterns may disrupt seasonal cycles, leading to unpredictable periods of extreme cold mixed with warmer spells.	By driving some residents to relocate to warmer areas. Harsh winters can hinder economic activities and deter new residents and businesses, influencing housing demand and the attractiveness of certain neighborhoods. This may disproportionately affect lower-income families, leading to changes in demographics and socioeconomic stratification in the community.	Increased growth of commercial and residential developments in West Valley City increases energy demand during extreme cold events, stressing the electrical grid.	Increased
Flooding	Higher temperatures increase the frequency and intensity of extreme weather events and alter precipitation patterns. They lead to more intense rainstorms and accelerated snowmelt from nearby mountains, raising water levels in	Flooding can significantly alter population patterns by displacing residents from affected areas, leading them to seek shelter elsewhere. This may cause a population decline where flooding occurs, as individuals might hesitate	No developments in West Valley City have been located in the special flood hazard area. Increased impervious surfaces due to development across Riverton could contribute to	Decreased

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	rivers and streams. This combination raises the risk of flooding, especially in areas with inadequate drainage and urban development in flood-prone zones, heightening the potential for damage to homes and infrastructure.	to return due to ongoing risks or property damage. As neighborhoods become less desirable, people may migrate to safer areas, changing demographic trends and putting pressure on housing in those regions. Over time, these shifts can influence urban planning and development, as local governments address flooding risks and changing population needs.	ponding and other pluvial flooding.	
Landslide/ Slope Failure	N/A	N/A	N/A	N/A
Radon	Climate change can affect radon levels by altering soil temperatures and moisture conditions. Higher temperatures may increase radon emissions from the ground, while heavy rainfall can change groundwater and soil saturation, impacting radon migration into buildings.	Radon exposure can influence population patterns as increased health awareness may drive families to move away from areas with high radon levels. This shift could particularly affect vulnerable groups, changing demographics and demand in the housing market. Homes with lower radon levels may become more sought after, and public health campaigns can encourage community action, making previously undesirable areas more attractive once mitigation measures are implemented.	Development in West Valley City has not led to increased risk of radon.	Same
Heavy Rain	Climate change increases the frequency and intensity of heavy rain, as higher temperatures allow the atmosphere to hold more moisture. This leads to stronger	Heavy rain can shift population patterns by pushing residents out of flood-prone areas and attracting them to safer neighborhoods. Frequent flooding may lead to	Increased impervious surfaces due to development across West Valley City could contribute to ponding and other types of pluvial flooding.	Increased

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	storms, flash flooding, and overwhelmed drainage systems.	evacuations and economic disruptions, prompting relocations. Over time, ongoing heavy rains can affect housing demand and community stability, altering the city's population distribution.		
High Wind	Climate change affects high winds by altering atmospheric patterns and increasing extreme weather events. Rising temperatures may lead to more substantial, unpredictable winds and more frequent thunderstorms, posing risks to infrastructure and air quality.	High winds can alter population patterns by making certain areas less desirable. Frequent damage may drive residents to safer neighborhoods, deter newcomers, and slow growth in affected regions.	Development in West Valley City has not increased the risk of high winds.	Increased
Lightning	Climate change increases temperatures and alters precipitation, leading to more intense thunderstorms and frequent lightning strikes. Urbanization can enhance this effect, posing risks to public safety and infrastructure.	Lightning can influence population patterns by causing property damage and wildfires, leading some residents to relocate. Areas with higher lightning activity may deter new residents, while safer locations could increase migration as people seek protection from severe weather.	Development in West Valley City, especially multistory developments, has slightly increased the risk of lightning strikes.	Increased
Severe Winter Weather	Climate change impacts heavy snow and blizzards by altering precipitation patterns. Higher temperatures can lead to more rain than snow, affecting snowpack levels—additionally, increased storm intensity results in heavier, more unpredictable snowfall.	Increased population equals an increased number of people needing to get to work and quicker snow removal. Heavy snow or blizzards can impact population patterns by influencing where people live and work. Transportation disruptions may lead residents to seek housing closer to jobs, increasing density in some areas while depopulating others.	With large development increases in West Valley City, the risk of damage and increased responsibility for severe winter storms has gone up. With new subdivisions, the city is responsible for plowing, rescues, and evacuations during heavy snow events.	Increased

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
		Families might also avoid regions with frequent heavy snowfall, shifting demand to milder areas. Over time, these trends can alter community demographics and economic activity, prompting adjustments in city planning and resource allocation.		
Tornado	Climate change may increase the frequency and intensity of tornadoes. Higher temperatures lead to more moisture in the air, creating conditions for severe thunderstorms. Changes in wind patterns and precipitation can also heighten tornado risks, resulting in more destructive storms and greater threats to infrastructure and communities.	Tornadoes can influence population patterns by prompting residents to move to safer areas after damage occurs. This can decrease density in affected neighborhoods while increasing the demand for housing in safer regions. New residents may also move in for recovery opportunities, altering demographics. Over time, repeated tornado threats might push long-term residents to areas with better disaster preparedness, reshaping the city's population distribution.	West Valley City is not at high risk for tornadoes, but the increased development slightly raises the risk by building more structures in the city that could be damaged.	Increased
Wildfire	By raising temperatures and creating drier conditions, prolonged droughts lead to more dry vegetation, which serves as fuel for fires. Erratic seasons extend the growing period, while more lightning strikes can ignite wildfires. These factors heighten the threat to ecosystems and community safety.	Displaced individuals often seek safer areas, shifting demographics, while declining property values might deter newcomers. Conversely, some may be drawn to rebuilding efforts, impacting long-term growth and community dynamics.	Developments on the western side of the city, near the Oquirrh Mountains, are adjacent to high-risk wildfire areas and are at higher risk themselves.	Increased
Dam Failure	N/A	N/A	N/A	N/A

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
Civil Disturbance	Climate change can increase civil disturbances by intensifying environmental stresses and social tensions. Rising temperatures may lead to droughts, wildfires, and poor air quality, particularly affecting vulnerable communities. Resource scarcity, especially water, can spark conflicts and protests. In addition, an influx of migrants from harder-hit areas may strain local resources, further escalating tensions. This cycle of unrest is driven by the impacts of climate change on the environment and community dynamics.	By encouraging residents to move for safety, leading to outflows and new arrivals. These events can reveal social issues, impacting community dynamics, employment, and property values, ultimately reshaping demographics, and social cohesion.	Development in West Valley City has not increased the risk of civil disturbance.	Increased
Cyberattack	Possible attack on the industry, which is seen as producing large amounts of greenhouse gases and burning fossil fuels. Climate change can heighten cyberattack risk by increasing vulnerabilities during extreme weather. Disruptions like power outages offer cybercriminals opportunities, but focusing on emergency responses can weaken cybersecurity measures. As organizations adopt new technologies to cope with climate impacts, they may unintentionally introduce additional vulnerabilities.	Cyberattacks can change population patterns by eroding trust in essential services. Compromised systems may cause residents to leave due to safety concerns, while high-profile incidents can deter businesses, leading to job losses. This perception of vulnerability may also make the city less appealing to newcomers, resulting in demographic shifts and affecting local development.	Development in West Valley City has not increased the risk of cyberattack.	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
Hazardous Materials Incident (Transportation & Fixed Facility)	Climate change elevates the risk of hazardous materials incidents by increasing extreme weather events like heavy rain and wildfires. These events can breach storage tanks and heighten material volatility. Vulnerable infrastructure can lead to more spills or accidents, while climate shifts may also introduce new challenges for managing hazardous substances and public health.	By causing evacuations and temporary declines in density. In the long run, unsafe areas may deter new residents, affecting growth and diversity. In addition, negative perceptions can lower property values and economic prospects, leading families to relocate, which impacts local demographics.	Development in West Valley City has not increased the risk of a hazardous materials incident.	Increased
Public Health Epidemic/ Pandemic	By increasing the spread of vector-borne diseases and raising the risk of waterborne illnesses due to flooding or drought. Worsening air quality can also exacerbate respiratory conditions like asthma, especially in vulnerable populations.	By prompting migration for safety and better healthcare. Vulnerable groups may move to areas with improved services, while economic instability can drive people to seek new employment opportunities. In addition, restrictions like quarantine measures can limit movement and social interactions, reshaping the community's demographics and impacting local economies.	Development in West Valley City has not increased the risk of an epidemic/pandemic.	Increased
Terrorism	Terroristic activity is sometimes centered around climate change. Climate change impacts terrorism incidents by creating conditions of resource scarcity and social unrest. Increased competition for essential resources, such as water, can fuel tensions, making communities more vulnerable to extremist ideologies. Extreme weather events may disrupt social	Terrorism incidents can alter population patterns by instilling fear and prompting residents to relocate to perceived safer areas, resulting in demographic shifts and potential declines in property values. Some neighborhoods may see an outflow of residents, while others could experience an influx of people seeking refuge from violence. In addition, increased security	Development in West Valley City has not increased the risk of a terrorism incident.	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	order and infrastructure, offering terrorist groups opportunities to exploit crises. In addition, climate-driven population displacement can heighten tensions in receiving areas, raising the risk of domestic terrorism. Law enforcement's focus on climate-related challenges can also limit its capacity to address terrorism threats. Ultimately, while climate change may not directly cause terrorism, its effects can create an environment conducive to extremist activities.	measures may deter businesses and residents from certain locations, leading to long-term changes in population density and urban development patterns.		

DRAFT

Additional Public Involvement

West Valley City provided several opportunities for public participation. Figure 1 is an example of public outreach.

Figure 1: Social Media Post for the Hazard Mitigation Survey

Plan Integration

Incorporating the underlying principles of the Hazard Mitigation Plan and its recommendations into other plans is a highly effective and low-cost way to expand their influence. All plan participants will use existing methods and programs to implement hazard mitigation actions where possible. As previously stated, mitigation is most successful when it is incorporated into the day-to-day functions and priorities of government and public service. This plan builds on the momentum developed through previous and related planning efforts and mitigation programs, and it recommends implementing actions where possible through these other program mechanisms. These existing mechanisms include the following:

- Regularity Capabilities
- Administrative Capabilities
- Fiscal Capabilities

Respective planning stakeholders will conduct implementation and incorporation into existing planning mechanisms and will be done through the routine actions of:

- Monitoring other planning/program agendas
- Attending other planning/program meetings
- Participating in other planning processes; and

DRAFT

- Monitoring community budget meetings for other community program opportunities.

The successful implementation of this plan will require constant and vigilant review of existing plans and programs for coordination and multi-objective opportunities that promote a safe, sustainable community. Regular efforts should be made to monitor the progress of mitigation actions implemented through other planning mechanisms. Where appropriate, priority actions should be incorporated into planning updates. Table 10 lists existing planning mechanisms in which the Hazard Mitigation Plan has been integrated. Table 11 lists the opportunities for integrating elements of this plan into other plans

Table 10: Previous Plan Integration by West Valley City

Plan	Description
Community Emergency Management Plan	Updated the new plan to align it with the county and surrounding cities. Part of the plan was for some education and response.
City Codes	Adoption of the latest code series allows for building construction to take into account hazards and mitigation efforts

Table 11: Opportunities for Integration with Future Plans of West Valley City

Plan	Description
Community Wildfire Protection Plan	This plan will have to be updated yearly. It outlines areas of the city which could be impacted by wildfire.
Evacuation Plans	This plan will assist the citizens in evacuations for all types of emergencies. The plan will be in coordination with county efforts.

Capability Assessment

Local mitigation capabilities are existing authorities, policies, programs, and resources that reduce hazard impacts or could help carry out hazard mitigation activities.

Planning and Regulatory Capabilities

Planning and regulatory capabilities are the plans, policies, codes, and ordinances that prevent and reduce the impacts of hazards.

Table 12: Assessment of the Planning Capabilities of West Valley City

Plan	Does it address hazards? (Y/N)	How can it be used to implement mitigation actions?	When was the last update? When is the next update?
General Plan	Y	Zoning for new developments	2025
Capital Improvement Plan	Y	We can provide funding for education and for matches to grants.	Yearly
Climate Change Adaptation Plan	Unknown	Unknown	Unknown

Plan	Does it address hazards? (Y/N)	How can it be used to implement mitigation actions?	When was the last update? When is the next update?
Community Wildfire Protection Plan	Y	We provide mitigation and training to areas in our city which are at risk.	2024
Economic Development Plan	Y	Planning for future of the city	Ongoing
Land Use Plan	Y	This is part of the general plan and is updated at the council's direction.	Ongoing
Local Emergency Operations Plan	Y	Provides the response and education for all hazards identified in the city	Yearly
Stormwater Management Plan	Y	Mitigation with flooding potentials and storm runoffs	Updated again in 2026
Transportation Plan	Y	We are currently looking at evacuation routes and planning	Will update in 2025
Substantial Damage Plan	Unknown	Unknown	Unknown
Other? (Describe)			

Table 13: Assessment of the Regulations and Ordinances of West Valley City

Regulation/Ordinance	Does it effectively reduce hazard impacts?	Is it adequately administered and enforced?	When was the last update? When is the next update?
Building Code	Yes; West Valley City adopted the 2021 International Building Code.	Yes by building and fire	Last code cycle 2023
Flood Insurance Rate Maps	Unknown	Unknown	Unknown
Floodplain Ordinance	Unknown	Unknown	Unknown
Subdivision Ordinance	Yes	Yes to ensure proper zoning and safety of the building	On going and with the general plan
Zoning Ordinance	Yes	Locations of all types of structures	Ongoing
Natural Hazard-Specific Ordinance (Stormwater, Steep Slope, Wildfire)	Yes	Wildfire and Storm water are the largest in this area.	2024
Acquisition of Land for Open Space and Public Recreation Use	Yes	The open space and planning for open space is part of the general plan and zoning	Ongoing

Regulation/Ordinance	Does it effectively reduce hazard impacts?	Is it adequately administered and enforced?	When was the last update? When is the next update?
Prohibition of Building in At-Risk Areas	Yes	The southwest portion of the city has limits on what can be built around the industry in the area	
Other? (Describe)			

Administrative and Technical Capabilities

Administrative and technical capabilities include staff and their skills. They also include tools that can help carry out mitigation actions.

Table 14: Assessment of the Administrative Capabilities of West Valley City

Administrative Capability	In Place? (Y/N)	Is staffing adequate?	Are staff trained on hazards and mitigation?	Is coordination between agencies and staff effective?
Chief Building Official	Y	Yes	Yes	Yes
Civil Engineer	Y	Yes	Yes	Yes
Community Planner	Y	Yes	Yes	Yes
Emergency Manager	Y	No	Yes	Yes
Floodplain Administrator	Y	No	Yes	Yes
Geographic Information System (GIS) Coordinator	Y	Yes	Yes	Yes
Planning Commission	Y	Yes	Yes with current zoning and general plan items	Yes
Fire Safe Council	N	N/A	N/A	N/A
CERT (Community Emergency Response Team)	Y	Yes can always have more	No	Yes
Active VOAD (Voluntary Agencies Active in Disasters)	Y	Unknown	Unknown	Unknown
Other? (Please describe.)				

Table 15: Assessment of the Technical Capabilities of West Valley City

Technical Capability	In Place? (Y/N)	How has it been used to assess/mitigate risk in the past?	How can it be used to assess/mitigate risk in the future?
Mitigation Grant Writing	N	Unknown	Unknown
Hazard Data and Information	Y	With the GIS mapping and zoning	Yes

Technical Capability	In Place? (Y/N)	How has it been used to assess/mitigate risk in the past?	How can it be used to assess/mitigate risk in the future?
GIS	Y	GIS function	Yes
Mutual Aid Agreements	Y	Yes used all the time	Yes
Other? (Please describe.)			

Financial Capabilities

Financial capabilities are the resources to fund mitigation actions. Talking about funding and financial capabilities is important to determine what kinds of projects are feasible, given their cost. Mitigation actions like outreach programs are lower cost and often use staff time and existing budgets. Other actions, such as earthquake retrofits, could require substantial funding from local, state, and federal partners. Partnerships, including those willing to donate land, supplies, in-kind matches, and cash, can be included.

Table 16: Assessment of the Financial Capabilities of West Valley City

Funding Resource	In Place? (Y/N)	Has it been used in the past and for what types of activities?	Could it be used to fund future mitigation actions?	Can it be used as the local cost match for a federal grant?
Capital Improvement Project Funding	Yes	Yes for staffing and for education	Yes	Yes
General Fund	Yes	Staffing and education	Yes	Yes
Hazard Mitigation Grant Program (HMGP/404)	Unknown	Unknown	Unknown	Unknown
Building Resilient Infrastructure & Communities (BRIC)	Unknown	Unknown	Unknown	Unknown
Flood Mitigation Assistance (FMA)	Unknown	Unknown	Unknown	Unknown
Public Assistance Mitigation (PA Mitigation/406)	Unknown	Unknown	Unknown	Unknown
Community Development Block Grant (CDBG)	Yes	Assisting with education	Yes	Yes
Natural Resources Conservation Services (NRCS) Programs	Unknown	Unknown	Unknown	Unknown
U.S. Army Corps (USACE) Programs	Unknown	Unknown	Unknown	Unknown
Property, Sales, Income, or Special Purpose Taxes	Unknown	Unknown	Unknown	Unknown

DRAFT

Funding Resource	In Place? (Y/N)	Has it been used in the past and for what types of activities?	Could it be used to fund future mitigation actions?	Can it be used as the local cost match for a federal grant?
Stormwater Utility Fee	Yes	Updating of the system to safely move water	Yes	Yes
Fees for Water, Sewer, Gas, or Electric Services	Unknown	Unknown	Unknown	Unknown
Impact Fees from New Development and Redevelopment	Yes	Facilities	Yes	Yes
General Obligation or Special Purpose Bonds	Unknown	Unknown	Unknown	Unknown
Federal-funded Programs (Please describe)	Unknown	Unknown	Unknown	Unknown
Private Sector or Nonprofit Programs	Unknown	Unknown	Unknown	Unknown
Other?				

Education and Outreach Capabilities

Education and outreach capabilities are programs and methods that could communicate about and encourage risk reduction. These programs may be run by a participant or a community-based partner. Partners, especially those who work with underserved communities, can help identify additional education and outreach capabilities.

Table 17: Assessment of the Education and Outreach Capabilities of West Valley City

Education and Outreach Capability	In Place? (Y/N)	Does it currently incorporate hazard mitigation?	Could it be used to support mitigation in the future?
Community Newsletter(s)	Y	We provide information in billing	yes
Hazard Awareness Campaigns (such as Firewise, Storm Ready, Severe Weather Awareness Week, School Programs)	Unknown	Unknown	yes
Public Meetings/Events (Please describe.)	Y	Provide education at city events and safety fairs	Yes
Emergency Management Listserv	Unknown	Unknown	Unknown
Local News	Y	Information as needed	Yes
Distributing Hard Copies of Notices (e.g., public libraries, door-to-door outreach)	Y	Information as Needed	Yes

DRAFT

Education and Outreach Capability	In Place? (Y/N)	Does it currently incorporate hazard mitigation?	Could it be used to support mitigation in the future?
Insurance Disclosures/Outreach	Unknown	Unknown	Unknown
Organizations that Represent, Advocate for, or Interact with Underserved and Vulnerable Communities (Please describe.)	Y	My Home Town Program	Yes
Social Media (Please describe.)	Yes	EM items of interest are put on the city website.	Yes
Other? (Please describe.)			

Opportunities to Expand and/or Improve Capabilities

Actions that can expand and improve existing authorities, plans, policies, and resources for mitigation include budgeting for mitigation actions, passing policies and procedures for mitigation actions, adopting and implementing stricter mitigation regulations, approving mitigation updates, and making additions to existing plans as new needs are recognized. Table 18 lists the opportunities for West Valley City.

Table 18: Opportunities to Expand and/or Improve the Capabilities of West Valley City

Capability	Opportunity to Expand and/or Improve
Planning and Regulation	The city just completed the wildfire plan and will update it on a yearly basis. Planning and regulations will constantly be looked at as code changes and changes to general plan and zoning regulations. New updates for the Stormwater Management Plan and Transportation Plan are projected in the next two years. Aligning these plans with hazard mitigation strategies will aid in citywide risk reduction.
Administrative and Technical	Floodplain management will have to be expanded. The city will also have to look at additional staffing in the city's Emergency Management division.
Financial	West Valley City will have to look at applying for the Building Resilience Infrastructure and Communities (BRIC) or replacement pre-disaster mitigation program to assist with mitigation activities in the city.
Education and Outreach	Public education will have to be enhanced to provide the latest and best possible information to the citizens. Information should be provided in multiple languages, such as Spanish. Education is an effective mitigation strategy as funding is limited.

Mitigation Strategy

Mitigation strategies provide proactive measures that are designed to minimize the impacts of hazards on West Valley City. Table 19 shows mitigation action alternatives, and

Table 20: Status of Prior Mitigation Actions of West Valley City

shows the status of previous mitigation activities. Table 21 is the 2025 mitigation action plan for West Valley City.

Table 19: Mitigation Action Alternatives for West Valley City

Action	Type of Action	Selected for inclusion in the plan?	If not selected, why not?
Enhance Public Education for emergency management	Education and Awareness Programs	Yes	
Apply for Building Resilient Infrastructure and Communities grant	Structure and Infrastructure Projects	Yes	
Update Comprehensive Emergency Management Plan	Local Plans and Regulations	Yes	
Provide new public education spots on website in Spanish	Education and Awareness Programs	Yes	
Continue with city plan on wetland mitigation	Natural Systems Protection	Yes	

Table 20: Status of Prior Mitigation Actions of West Valley City[2]

Action	Hazard(s)	Agency Lead	Support Agency(ies)	Status Update
Procure generators and hookups for publicly owned buildings and facilities assisting functional access needs populations.	All hazards	West Valley City EM	Public Works and assisted living facilities	Ongoing. Most buildings are complete; still have some buildings to go.
Conduct a Hazardous Flow Study	All hazards	West Valley City EM	Public Works	Ongoing
Conduct an inventory and assessment of communications equipment and systems and identify needs	All hazards	West Valley City EM		Completed. A communications plan and process for the mobile communications unit and EOC have been established.
Establish agreements to share communications equipment between agencies involved in emergency operations	All hazards	West Valley City EM and Communications		Ongoing. Still need to work on sharing with non-government organizations (NGOs).
Evaluate vulnerability of critical communications systems	All hazards	West Valley City EM and Communications		Completed

[2] CED = Community and Economic Development, EM = Emergency Management, IT = Information Technology, MIS = Management Information Systems (Department), NGO = nongovernmental organization, VECC = Salt Lake Valley Emergency Communications Center

Action	Hazard(s)	Agency Lead	Support Agency(ies)	Status Update
Establish a coordinating group to address long-term communication needs and implementation strategies	All hazards	West Valley City EM and Communications		Ongoing
Compile inventory of mutual aid agreements and memoranda of understanding (MOU) and identify deficiencies	All hazards	West Valley City EM		Ongoing. Still need NGO agreements.
Incorporate information about cascading effects of hazards in education programs	All hazards	West Valley City EM		Ongoing
Develop education programs including homeowners, developers, schools and people with special needs	All hazards	West Valley City EM		Ongoing
Implement water-saving devices and practices in public facilities	Drought	West Valley City EM and Public Works		Incomplete
Assist Cities with NFIP application	Flooding	West Valley City EM		Incomplete
Encourage Communities to actively participate in NFIP	Flooding	West Valley City EM		Ongoing
Identify and assess structures for deficiencies	Flooding	West Valley City EM and Public Works		Complete
Modify structures as needed to address deficiencies	Flooding	West Valley City EM and Public Works		Incomplete
Maintain contact with NWS before re-application in 2010	Severe Weather	West Valley City EM		Complete. We are in contact with the countywide system.
Conduct training and awareness activities on communications equipment, tools, and systems.	All hazards	West Valley City Fire and EM		Ongoing.
Establish notification capabilities and procedures for emergency personnel.	All hazards	West Valley City Fire and EM – Dispatch		Complete. We use Rave and other direct call systems.
Establish redundancy for dispatch centers and other critical communications systems.	All hazards	West Valley City MIS		Ongoing. In progress with the Salt Lake Valley Emergency

DRAFT

Action	Hazard(s)	Agency Lead	Support Agency(ies)	Status Update
				Communications Center (VECC).
Acquire, upgrade, and/or integrate communications equipment and systems as determined by coordinating group.	All hazards	West Valley City Fire/EMS		Ongoing We are still purchasing and mostly complete
Establish a coordinating group to address geographic data issues.	All hazards	West Valley City CED/MIS		Incomplete
Examine current data availability and sharing capabilities, evaluate needs, and identify shortcomings.	All hazards	West Valley City EM	IT, CED	Ongoing
Update and expand data on hazards, critical facilities, and critical infrastructure according to assessed needs.	All hazards	West Valley City Fire and EM		Ongoing. Will update every year.
Provide centralized access to geographic data to emergency planners and responders.	All hazards	West Valley City GIS		Ongoing. In progress with the new system.
Integrate existing hazard monitoring networks in emergency operations centers. Utilize sensors, such as weather stations, stream gauges, seismograph stations, road conditions, etc.	All hazards	West Valley City EM		Incomplete. Will have to work with outside agencies.
Identify and implement additional hazard monitoring capabilities.	All hazards	West Valley City EM	Fire	Ongoing.
Utilize GIS to identify facilities and infrastructure at risk.	All hazards	West Valley City MIS		Ongoing. Will change yearly.
Assess critical facilities for hazard exposure, structural weaknesses, power, communications and equipment resources and redundancy, and adequate emergency procedures.	All hazards	West Valley City EM		Ongoing. Will change yearly.
Pursue and implement needed mutual aid agreements.	All hazards	West Valley City EM		Ongoing. Still need to work on the NGO.

DRAFT

Action	Hazard(s)	Agency Lead	Support Agency(ies)	Status Update
Provide education regarding all natural hazards through live trainings and web-based, print, and broadcast media.	All hazards	West Valley City EM		Ongoing
Utilize maps and similar products on City EM website and other media to educate public on areas at risk of hazards.	All hazards	West Valley City MIS		Ongoing. In progress with an entire program.
Continue to encourage water conservation, using outreach material from all water districts in the county.	Drought	Water Districts		Ongoing. Need to work with water companies; not complete.
Emergency Managers will coordinate with local water districts/public utilities to support ongoing conservation efforts.	Drought	West Valley City Public Works and West Valley City Education	Outside Water Districts	Incomplete.
Identify structures at risk of earthquake damage.	Earthquake	West Valley City EM	GIS	Ongoing. Additional analysis is needed.
Research feasibility of an incentive program for retrofitting privately owned buildings, particularly unreinforced masonry.	Earthquake	West Valley City EM		Incomplete.
Complete seismic rehabilitation/retrofitting projects of public buildings at risk.	Earthquake	West Valley City EM		Ongoing. We have completed three fire stations; still working on other facilities.
Provide educational materials to unreinforced masonry home and business owners.	Earthquake	West Valley City EM		Ongoing. Done yearly.
Determine potential flood impacts and identify areas in need of additional flood control structures.	Flooding	West Valley City Public Works and West Valley City Planning		Complete but carrying forward to consider changes and new developments.
Address identified problems through construction of debris basins, flood retention ponds, energy dissipaters or other flood control structures.	Flooding	West Valley City Public Works		Ongoing

DRAFT

Action	Hazard(s)	Agency Lead	Support Agency(ies)	Status Update
Establish maintenance and repair programs to remove debris, improve resistance and otherwise maintain effectiveness of stormwater and flood control systems.	Flooding	West Valley City Public Works		Ongoing
Maintain Hazardous Weather Operations Plan according to StormReady requirements.	Severe Weather	West Valley City EM		Ongoing
Assist NWS in making other agencies and departments aware of available resources.	Severe Weather	West Valley City EM		Ongoing
Work with the NWS to develop large event venue weather safety and evacuation procedures.	Severe Weather	West Valley City EM		Ongoing. We do this for events, but more work is needed.

Table 21: 2025 Mitigation Action Plan for West Valley City[3]

#	Action	Hazard(s)	Lead Agency	Potential Partners	Benefits (Losses Avoided)	Cost Estimate	Funding Source(s)	Timeframe	Priority	Comments
1	Update equipment for the response.	Civil Disturbance	West Valley City Police	West Valley City EM	Be better prepared for responses to civil disturbances to avoid losses to property and life.	Medium	SHSP grant	Short term	High	
2	Retrofit of structure which are vulnerable	Earthquake	West Valley City EM	SLCo EM, SLCo, UDEM	Lessens the damage to structures.	High	BRIC, PDM, WVC General Fund, Capital Project Fund	Long term		
3	Provide upgrades to detection equipment	Hazardous Materials Incident	West Valley City Fire Department	West Valley City EM	Increases accuracy, safety, and emergency response effectiveness.	Medium	WVC General Fund	Short term	Medium	
4	Provide for evacuation routing and mass notifications to residents	Severe Winter Weather – Heavy Snow, Blizzard	West Valley City EM	SLCo EM	Ensures residents receive timely guidance to safely evacuate and remain informed during severe winter weather, thereby reducing risk and enhancing community preparedness.	Medium	WVC General Fund	Medium	Medium	
5	Update of information technology infrastructure	Terrorism (including cyberattacks)	West Valley City Information Technology Department		Strengthens defenses against cyberattacks, protects critical systems and data, and ensures operational continuity amid terrorism threats.	Medium	WVC General Fund	Medium	High	
6	Procure generators and hookups for publicly owned buildings and facilities assisting functional access needs populations.	Flood, Earthquake, Heavy Rain, High Wind, Lightning, Tornado, Severe Winter Weather	West Valley EM	SLCo EM	Ensures critical facilities and facilities with life-sustaining systems remain operational if hazards interrupt power systems.	Medium	WVC General Fund, Private funds	Medium	Medium	
7	Conduct a Hazardous Flow Study.	Hazardous Materials	West Valley City EM	West Valley City Fire Dept.	Better understand the nature of products traveling through West Valley and vulnerabilities associated with them.	Medium	WVC General Fund	Medium	Medium	
8	Establish agreements to share communications equipment between agencies involved in emergency operations.	Drought, Flood, Earthquake, Extreme Cold, Extreme Heat, Radon, Heavy Rain, High Wind, Severe Winter Weather, Tornado, Wildfire, Human-Caused Hazards	West Valley City EM	SLCo EM, other jurisdictions' fire and police communications staff	Ensures effective resource availability, streamlined coordination, and faster response for a wide range of natural and human-caused hazards.	Low	WVC General Fund	Ongoing	Medium	Working with Salt Lake County

[3] BRIC = Building Resilient Infrastructure and Communities, CED = Community and Economic Development, EM = Emergency Management, EMS = Emergency Medical Services, GIS = Geographic Information Systems, NWS = National Weather Service, MIS = Management Information Systems (Department), MIS = Management Information Systems (Department), PDM = Pre-Disaster Mitigation, SHSP = State Homeland Security Program, SLCo EM = Salt Lake County Emergency Management, UDEM = Utah Division of Emergency Management, UDOT = Utah Department of Transportation, UGS = Utah Geological Survey, USGS = United States Geological Survey, UUSS = University of Utah Seismograph Stations, VECC = Salt Lake Valley Emergency Communications Center, WVC = West Valley City

#	Action	Hazard(s)	Lead Agency	Potential Partners	Benefits (Losses Avoided)	Cost Estimate	Funding Source(s)	Timeframe	Priority	Comments
9	Establish a coordinating group to address long-term communications needs and implementation strategies.	Drought, Flood, Earthquake, Extreme Cold, Extreme Heat, Flood, Radon, Heavy Rain, High Wind, Severe Winter Weather, Tornado, Wildfire, Human-Caused hazards.	West Valley City EM	SLCo EM, other local jurisdictions, Communications	Ensures enhanced preparedness across diverse hazards.	Low	WVC General Fund	Ongoing	Medium	Working with city Communications group for this
10	Compile inventory of mutual aid agreements and memoranda of understanding (MOUs) and identify deficiencies.	Drought, Flood, Earthquake, Extreme Cold, Extreme Heat, Flood, Radon, Heavy Rain, High Wind, Severe Winter Weather, Tornado, Wildfire, Human-Caused hazards.	West Valley City EM	SLCo EM, local jurisdictions	Ensures more efficient collaboration during a range of natural and human-caused hazards.	Low	WVC General Fund	Ongoing	Medium	Completed all Fire and EMS. Working with Public Works and Police now.
11	Incorporate information about cascading effects of hazards in education programs.	Drought, Flood, Earthquake, Extreme Cold, Extreme Heat, Flood, Radon, Heavy Rain, High Wind, Severe Winter Weather, Tornado, Wildfire, Human-Caused hazards.	West Valley City EM	SLCo EM	Increases awareness, enhances preparedness, and improves response strategies for interconnected emergencies.	Low	WVC General Fund	Ongoing	Medium	Working with city to have continual education
12	Develop education programs to target specific groups, including homeowners, schools, community-based organizations, and vulnerable populations.	Drought, Flood, Earthquake, Extreme Cold, Extreme Heat, Flood, Radon, Heavy Rain, High Wind, Severe Winter Weather, Tornado, Wildfire, Human-Caused hazards.	West Valley City EM	SLCo EM	Enhances hazard awareness, improves preparedness measures, and fosters greater resilience across diverse communities.	Low	WVC General Fund	Ongoing	Medium	We have completed adult programs and are now working on an elementary school program. Children can learn about hazard mitigation through age-appropriate materials on flood mapping, building wind- and water-resistant homes, retrofitting homes for earthquakes, trimming trees, warning signs, and where to seek shelter.
13	Install new water-saving devices and implement practices in public facilities.	Drought	West Valley City EM	West Valley City Public Works	Reduces water consumption, ensures resource sustainability, and bolsters resilience during drought conditions.	Medium	WVC General Fund	Ongoing	Medium	City facilities are changing over fixtures for conservation in city-owned buildings.
14	Modify structures identified as having deficiencies as needed to address deficiencies.	Flooding, Heavy Rain	West Valley City EM	West Valley Public Works	Reduces flood impact, enhances public safety, and strengthens community resilience.	High	WVC General Fund, Capital Project Funds	Ongoing	Medium	Provide education to citizens in EM programs
15	Conduct training and awareness activities on communications equipment, tools, and systems.	Drought, Flood, Earthquake, Extreme Cold, Extreme Heat, Flood, Radon, Heavy Rain, High Wind, Severe Winter Weather, Tornado, Wildfire, Human-Caused hazards.	West Valley City Fire Department	West Valley City EM	Enhances first responder coordination, improves situational awareness, and strengthens emergency response across diverse hazards.	Minimal	WVC General Fund	Ongoing	High	West Valley City completed monthly tests.
16	Establish redundancy for dispatch centers and other	Drought, Flood, Earthquake, Extreme Cold, Extreme	MIS	SLCo EM, VECC	Ensures uninterrupted emergency coordination,	Medium – $60,000	WVC General Fund	Ongoing	High	West Valley City has this with VECC, as well as its own 800mhz

White City Annex

To participate in this multi-jurisdictional hazard mitigation plan (MJHMP) update for Salt Lake County (SLCo), the governing body of White City passed a formal resolution, a copy of which is maintained at the local government offices.

Planning Process Contact Information

Information on the point of contact during the updating of the MJHMP is shown in Table 1.

Table 1: Contact Information for White City

Name	Contact Information
Brian Buckhout	**Phone**: 925-315-1671 **email:** bbuckhout@unifiedfire.org

White City has a fully integrated approach to hazard mitigation planning and program implementation. During the 2024 update process, the MJHMP participation roles in Table 2 were recorded.

Table 2: Participant List for White City

Name	Title	Jurisdiction
Brian Buckhout	Municipal Planner	Municipal Services District – White City

Jurisdiction Profile

Date of Incorporation

White City became a metro township in January 2017, then converted to a city on May 1, 2024.

Location and Description

White City, located south of Midvale and Cottonwood Heights on the east side of the county, is approximately 0.87 square miles in area and is approximately 4,500 feet above sea level. White City is known for its close-knit community and suburban feel.

Population

The 2022 American Community Survey 5-Year Estimate from the U.S. Census Bureau records White City's population as 5,568 people.

DRAFT

Demographics

Most of the 1,465 people are between the ages of 25 and 34, with a median age of 34.3. Of the 5,568 people in White City 2,794 (50.2%) are males, and 2,774 (49.8%) are females. English is the primary language in 94.6% of homes,, with 3.9% Spanish, and 1.5% other languages.

Brief History

White City was established as a town in 1955 by developers Ken White and Cannon Papanicholas. The first homes were built along Galena Drive in 1957, and the town slowly progressed into a recognized census-designated place. In 2006, White City was granted township, and it became a metro township in 2017. In 2024, the Utah Legislature passed a bill that reclassified White City as a city.

Climate

White City has a humid continental climate (Dfb Köppen classification) characterized by warm summers and cold winters, with consistent precipitation throughout the year. Average highs are approximately 85°F in the summer and approximately 22°F in the winter. Rain each year is approximately 15.4 inches, and snowfall averages 60 inches.

Public Services

White City offers a wide range of public services through the Greater Salt Lake Municipal Services District (MSD). The MSD oversees services including public works, which encompasses the construction and maintenance of roads, snow removal, and street lighting. The MSD also handles planning and zoning, business licensing, inspections, emergency planning, and other municipal services.

Governing Body

White City's governing body—the Mayor and four council members—has the power to create and enforce laws, including the authority to levy taxes.

Development Trends

The city is working on its first-ever General Plan, which will guide future planning and development, encompassing elements such as land use, transportation, moderate-income housing, economic opportunities, infrastructure, and resilience. Over the years, White City has seen significant growth, growing from an unincorporated township in 2006 to an incorporated metro township in 2017, and finally to a city in 2024. There is a strong focus on improving infrastructure to support the growing population, which includes transportation projects and the development of parks and trails.

DRAFT

Jurisdiction-Specific Hazards and Risk

The Calculated Priority Risk Index (CPRI) is a comprehensive assessment tool for evaluating and prioritizing risks in a given context. It considers various factors such as probability, impact, and urgency to determine the level of risk associated with events or situations. The results for each hazard, including its risk factor (RF) value, are shown in Table 3. The results are based on the criteria in

Table 4, and the equation that follows it. The CPRI helps organizations and individuals make informed decisions about risk management and mitigation strategies. It provides a systematic approach to identifying and addressing potential issues, allowing for a more efficient allocation of resources and proactive risk prevention. With the CPRI, stakeholders can prioritize their focus on the most critical risks, leading to more effective risk management and, ultimately, better outcomes.

Table 3: Calculated Priority Risk Index Values for White City

Type of Hazard Event	Probability of Future Events	Spatial Extent	Severity of Life/ Property Impact	Warning Time	Duration	Response Capacity	Risk Factor Value
Avalanche	1	1	1	1	1	1	1.0
Drought	4	4	2	1	4	1	2.8
Earthquake	3	4	4	4	3	2	3.4
Extreme Heat	4	4	3	1	3	1	3
Extreme Cold	3	4	2	1	3	1	2.4
Flooding	4	3	3	3	3	1	3.1
Landslide/ Slope Failure	2	1	2	4	1	2	2
Radon	4	4	2	1	4	2	2.9
Heavy Rain	4	3	2	3	1	1	2.6
High Wind	4	3	3	3	2	1	3
Lightning	4	2	2	4	1	1	2.6
Severe Winter Weather	4	3	2	2	2	1	2.6
Tornado	2	2	3	4	1	2	2.4
Wildfire	4	3	3	4	3	1	3.2
Dam Failure	1	1	1	4	1	1	1.3
Civil Disturbance	2	1	2	4	2	2	2.1
Cyberattack	2	3	3	4	3	2	2.7
Hazardous Materials Incident (Transportation & Fixed Facility)	3	1	2	4	1	1	2.2

DRAFT

Type of Hazard Event	Probability of Future Events	Spatial Extent	Severity of Life/ Property Impact	Warning Time	Duration	Response Capacity	Risk Factor Value
Public Health Epidemic/ Pandemic	3	4	3	1	4	1	2.8
Terrorism	2	1	3	4	2	1	2.3

Table 4: Criteria for the Calculated Priority Risk Index

Risk Index Factor	Degree of Risk Level		Criteria	Factor Weight for Degree of Risk Level
Probability of Future Events	1	Unlikely	Less than 1 percent probability of occurrence in the next year or a recurrence interval of greater than every 100 years.	30%
	2	Occasional	1 to 10 percent probability of occurrence in the next year or a recurrence interval of 11 to 100 years.	
	3	Likely	11 to 90 percent probability of occurrence in the next year or a recurrence interval of 1 to 10 years.	
	4	Highly Likely	91 to 100 percent probability of occurrence in the next year or a recurrence interval of less than 1 year.	
Spatial Extent	1	Limited	Less than 10% of the planning area could be impacted.	10%
	2	Small	10%–25% of the planning area could be impacted	
	3	Significant	25%–50% of the planning area could be impacted.	
	4	Extensive	50%–100% of the planning area could be impacted.	
Severity of Life/Property Impact	1	Negligible	Less than 5% of the affected area's critical and non-critical facilities and structures are damaged/destroyed. Only minor property damage and minimal disruption of life. Temporary shutdown of critical facilities.	30%
	2	Limited	More than 5% but less than 25% percent of property in the affected area is damaged/ destroyed. Complete shutdown of critical facilities for more than one day but less than one week.	
	3	Critical	More than 25% and less than 50% of property in the affected area was damaged/destroyed.	

DRAFT

Risk Index Factor	Degree of Risk Level		Criteria	Factor Weight for Degree of Risk Level
			Complete shutdown of critical facilities for over a week but less than one month.	
	4	Catastrophic	Over 50% of critical and non-critical facilities and infrastructures in the affected area are damaged/destroyed. Complete shutdown of critical facilities for more than one month.	
Warning Time	1	Self-defined	More than 24 hours	10%
	2	Self-defined	12 to 24 hours.	
	3	Self-defined	6 to 12 hours.	
	4	Self-defined	Less than 6 hours.	
Duration	1	Brief	Up to 6 hours.	10%
	2	Intermediate	Up to one day.	
	3	Extended	Up to one week.	
	4	Prolonged	More than one week.	
Response Capacity	1	High	Significant resources and capability to respond to this kind of event; staff are trained, experienced, and ready.	10%
	2	Medium	Some resources and capability to respond to this kind of staff; some staff may be trained, experienced, and ready while others may need additional support.	
	3	Low	Limited resources and capability to respond to this kind of event; additional staff or staff training needed.	
	4	None	No resources and capability to respond this kind of event; additional outside support would be required.	

RISK FACTOR (RF) EQUATION

RF Value = [(Probability x 0.30) + (Spatial Extent x 0.10) + (Severity of Life/Property Impact x 0.30) + (Warning Time x 0.10) + (Duration x 0.10) + (Response Capacity x 0.10)]

Hazards with an RF value greater than or equal to 2.5 are considered high risk. Those with RF values of 2.0–2.4 are considered moderate risk hazards, and those with an RF value less than 2.0 are considered low risk. The highest possible RF value is 4.

Hazard Event History

Examining hazard event histories provides valuable insights to inform decision-making and help prioritize resources for risk prevention and response efforts. The Storm Events Database from the National Centers

DRAFT

for Environmental Information reported that no significant hazard events impacted the White City planning area since the 2019 plan update. Table 5 lists other events that occurred in or near White City.

Table 5: History of Hazard Events in White City

Type of Hazard Event	FEMA Disaster #	Date(s)	Damage or Impacts	Description
Drought			Droughts occur periodically throughout the region. No specific impacts have been documented for White City.	
Earthquake	DR-4548-UT	March 18, 2020	Shaking occurred in White City.	The Wasatch Fault is considered overdue for a major earthquake, with a 57% chance of a 6.0 M or greater earthquake occurring in the next 50 years.
Extreme Heat		Summers of 2020, 2021, 2022, 2023, 2024	9 deaths were reported in Northern Utah, an upward trend in heat exposure and heat-related deaths since 2015.	NA
Flooding		2023	Minor spring flooding	
High Wind	DR-4578-UT	September 7, 2020	Significant windstorm that impacted utilities, residential/ commercial properties, and transportation in parts of the county. Specific impacts in White City were not available.	Salt Lake County and surrounding areas experienced a severe windstorm with winds exceeding 100 mph in some areas.
Severe Winter Weather	N/A	N/A	Winter storms can cause transportation problems.	
Public Health Epidemic/ Pandemic	DR-4525-UT	COVID-19 pandemic	Business closures and economic impacts; temporary school closures	

National Flood Insurance Program Summary

White City participates in the Nation Flood Insurance Program (NFIP). Table 6 displays statistics related to the NFIP. White City does not participate in the Community Rating System.

DRAFT

Table 6: National Flood Insurance Program Status for White City[1]

Initial FHBM Identified	Initial FIRM Identified	Current Effective Map Date	Adopted Date	Date Joined NFIP	Tribal
5/29/20	8/02/12	8/02/12	2012	8/18/20	No

Table 7: National Flood Insurance Policies for White City

Community ID	Number of Losses	Total Net Payment	Active Policies	Total Coverage
490269	0	$0	0	$0

White City has designated the Director of Planning and Development Services as the Floodplain Administrator. The duties of the Floodplain Administrator are supported by the Greater Salt Lake Municipal Services District (MSD). The current Floodplain Hazard Regulations were adopted on 6/2/2023. The current FIRM became effective 8/2/2012. The MSD is responsible for issuing floodplain permits in MSD Member Communities, including White City. The permits include a description of all work, including the type of construction, proposed intent, and location. Substantial damage/substantial improvement structures are identified through the permitting process. Structures that are determined to be substantially damaged or substantially improved are required to come into compliance with current codes. The MSD Building Department provides guidance on how to build in accordance with existing building codes.

Jurisdiction-Specific Vulnerabilities and Impacts

Table 8 provides information on the vulnerable assets in White City, including its critical facilities, highlighting the city's vulnerability to identified hazards. It also describes the potential impacts on the community arising from those vulnerabilities. By understanding the risks associated with these assets, local authorities can develop proactive strategies to mitigate vulnerabilities and ensure the safety and functionality of these important assets during hazard events. These data are invaluable for decision-making and prioritizing resources for emergency response and preparedness efforts, ultimately contributing to more effective risk management and greater resilience in the community.

Vulnerable assets in White City include Alta View Elementary School and Big Bear Park. Primary roads include 10600 South, 700 East, 1300 East, and Sego Lily Drive. Sandy Canal Trail, White City Trail, and trails along Dry Creek are among other community assets. Dimple Dell Regional Park is a county-owned resource that bisects the city along Dry Creek.

Table 8: Jurisdiction-Specific Vulnerabilities and Impacts in White City

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
Avalanche	People	White City is not in an avalanche-prone area.
Drought	People	*Vulnerability:* All White City residents are vulnerable to drought.

[1] FIRM = FHBM = Flood Hazard Boundary Map

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		Impacts: In White City, periods of prolonged drought can lead to water conservation mandates and potential rationing, especially during summer months when demand increases. Reduced water availability can impact public health by decreasing indoor air quality and increasing the spread of airborne dust and pollutants. Vulnerable groups—such as the elderly, young children, and low-income households—may face higher health risks and limited access to cooling or clean water. Outdoor recreation may decline, especially during midday hours when heat and air quality are at their worst.
	Structures	*Vulnerability:* All structures and landscaping are vulnerable to drought. *Impacts:* As soils dry and contract, structural foundations in White City may begin to shift or crack, leading to uneven floors, sticking doors, and plumbing damage. Drought conditions can also raise cooling costs for both homes and businesses as temperatures climb, placing a strain on buildings not designed for extreme heat and low humidity. Limited water supply can slow new development or restrict landscape maintenance.
	Economic Assets	*Vulnerability:* Businesses that rely on climate-controlled environments or outdoor customer activity are vulnerable during drought conditions. *Impacts:* Businesses may struggle with higher operational costs and reduced foot traffic. Residents may face increased energy bills due to prolonged air conditioning use. In addition, fewer people may choose to visit local parks or trails during hot, dry periods, impacting businesses that benefit from recreation and tourism.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Vegetation, parks, and historic sites are vulnerable to drought. *Impacts:* Drought can lead to weakened trees and stressed vegetation, making them more vulnerable to disease and pests. The loss of green cover contributes to soil erosion and degraded air quality. Natural areas and trails in and around White City could become fire-prone, placing historic features, public art, and cultural sites at risk. Water shortages may also hinder efforts to maintain community landmarks and shared green spaces.
	Critical Facilities and Infrastructure	*Vulnerability:* Public services, including firefighting operations and healthcare facilities, are vulnerable during drought conditions. *Impacts:* Public facilities and operations may face challenges due to limited water supply. Fire departments in White City may be hampered in their wildfire response efforts during extended dry spells. Hospitals and public health centers must deal with rising cooling demands and the potential for water quality concerns that could impact sanitation and hygiene.
	Community Activities	*Vulnerability:* Community events and recreation are vulnerable to the impacts of drought. *Impacts:* Community events and programs may need to be altered or canceled during periods of extreme drought. Water restrictions may impact the appearance and usability of public spaces, including sports fields and splash pads. Households may also face limits on irrigation and recreational water use, reducing participation in outdoor activities.
Earthquake	People	*Vulnerability:* All residents are vulnerable to earthquakes.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		Impacts: People can be injured or killed by falling objects or collapsed buildings. Earthquake risk in White City poses a serious concern for residents living in older buildings that were not constructed to current seismic standards. Children, seniors, and people with disabilities may face greater challenges during evacuation or sheltering efforts. In addition, households with limited access to emergency preparedness resources are more likely to suffer severe consequences during and after a seismic event.
	Structures	*Vulnerability:* Many homes and commercial buildings in White City constructed before updated seismic codes may be particularly vulnerable. *Impacts:* Buildings with unreinforced masonry, outdated foundations, or located on unstable ground are more susceptible to collapse or significant damage during an earthquake. Structures that have not been retrofitted, including schools and office complexes, are also at increased risk.
	Economic Assets	*Vulnerability:* All local businesses are vulnerable to earthquakes. *Impacts:* Damage to retail establishments, offices, and public buildings could disrupt White City's local economy. Businesses that suffer structural losses or prolonged closures may face permanent shutdowns if uninsured or underinsured. Key economic contributors such as small shops, service providers, and community centers may struggle to recover. The effects could be more pronounced if the quake occurs during working hours or community events.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Open spaces, parks, and historic buildings are vulnerable to earthquakes. *Impacts:* Natural areas may experience landslides or ground failure during a seismic event, which could damage trails, parks, or water features. Historic buildings in White City are particularly susceptible to structural compromise. Cultural gathering places, including places of worship and local community halls, may face both physical damage and loss of community use if repairs are unaffordable or delayed.
	Critical Facilities and Infrastructure	*Vulnerability:* All critical facilities and infrastructure are vulnerable to earthquakes. *Impacts:* Essential infrastructure may be compromised during a strong earthquake if built before modern design requirements were in place. Utility disruptions to power, water, and telecommunications are likely. Bridges and overpasses in nearby transportation corridors could be rendered impassable, impeding emergency response and evacuations.
	Community Activities	*Vulnerability:* Community events, school functions, and gatherings at civic centers may be at risk during seismic events, especially in densely used public spaces. *Impacts:* Facilities that serve as community anchors could be damaged or temporarily shut down, reducing access to recovery resources. The overall impact on social cohesion and routine services could be significant if damage is widespread.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
Extreme Heat	People	*Vulnerability:* All residents are vulnerable to extreme heat, but some groups may have a higher risk. *Impacts:* Extreme heat can cause dehydration, heat exhaustion, and heat stroke. Vulnerable populations during extreme heat conditions include adults over 65, individuals with pre-existing health conditions, and young children, as they struggle to regulate body temperature. Socioeconomically disadvantaged individuals may lack access to cooling resources, while outdoor workers are at higher risk of heat-related illnesses due to physical labor without adequate hydration and rest. Extreme heat can hinder students' learning.
	Structures	*Vulnerability:* All structures are exposed to extreme heat. *Impacts:* Residential buildings with inadequate insulation and ventilation, as well as commercial buildings lacking reflective roofing and proper shading, may be vulnerable. Materials like metal and glass can amplify heat retention, while areas with limited green space typically experience higher temperatures. Cooling shelters may need to be open in White City to provide basic services for vulnerable groups like the elderly, unsheltered, and young children.
	Economic Assets	*Vulnerability:* Outdoor recreation and related businesses are vulnerable to extreme heat. *Impacts:* Agricultural operations can have reduced yields and higher water demand due to heat stress. The outdoor recreation industry may see decreased participation during heat waves, affecting local businesses that rely on visitors. In addition, the energy infrastructure could face strain from increased cooling demands, leading to outages.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Plants, wildlife, and historic buildings are vulnerable to extreme heat. *Impacts:* Local plant species and wildlife habitats can suffer from drought conditions, leading to reduced biodiversity. Historic buildings may degrade due to high temperatures, which cause materials to deteriorate and paint to peel. In addition, parks and recreational areas may experience overuse and risk their preservation as residents seek relief from the heat.
	Critical Facilities and Infrastructure	*Vulnerability:* Healthcare facilities, public buildings, roads, and the power grid are vulnerable to extreme heat. *Impacts:* Healthcare facilities may experience increased demand due to heat-related medical issues, while schools can suffer from the strain on cooling resources. Transportation systems are at risk of damage, such as buckling roads and warped train tracks. Power grids may be strained by higher demands for electricity for cooling, which can lead to potential outages.
	Community Activities	*Vulnerability:* Activities like outdoor sports, fairs, and agricultural practices are vulnerable to extreme heat. *Impacts:* These events can pose risks, particularly for participants like youth athletes and elderly residents who may suffer from heat-related illnesses. In addition, high temperatures can stress crops, which impacts local farming.
Extreme Cold	People	*Vulnerability:* Residents without adequate shelter or insufficient heating are vulnerable to extreme cold.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		Impacts: Residents of White City can face serious health and safety risks during periods of extreme cold. Older adults may experience complications related to existing health conditions or reduced mobility, which makes it harder to stay warm or access services. Young children are especially vulnerable if they do not have access to warm winter clothing. Individuals experiencing housing insecurity or financial hardship may lack adequate heating, shelter, or resources to stay safe during prolonged cold spells.
	Structures	*Vulnerability:* Older or unmaintained structures are vulnerable to extreme cold. *Impacts:* Homes and commercial buildings throughout White City may suffer from cold-related issues, especially those built before modern insulation standards. Properties with inadequate weather sealing can lose heat rapidly, which puts a strain on heating, ventilation, and air conditioning (HVAC) systems. Prolonged freezing conditions may lead to cracked foundations, frozen pipes, or damage to unheated spaces such as garages or utility sheds. Public infrastructure like sidewalks, roads, and bridges can also deteriorate under heavy freeze-thaw cycles, which increases maintenance needs.
	Economic Assets	*Vulnerability:* All businesses are vulnerable to extreme cold. *Impacts:* Cold weather can have a noticeable economic impact in White City. Businesses reliant on transportation or outdoor labor may be forced to slow operations due to icy roads or hazardous conditions. Additionally, heating costs rise for homes and businesses alike, which can place financial stress on families and small enterprises during peak winter months. Farms and greenhouses in the surrounding region may lose crops or livestock during especially cold periods.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Trees, habitats, and cultural sites are vulnerable to extreme cold. *Impacts:* Local vegetation and wildlife habitats can be disrupted by extreme cold, particularly if water sources freeze or food becomes scarce. Trees may break under the weight of snow and ice, which damages parks or natural spaces. Older buildings and community landmarks not designed for freezing conditions may show signs of deterioration. Cultural assets such as sculptures, murals, or public art may suffer damage from ice buildup or freeze-related cracking.
	Critical Facilities and Infrastructure	*Vulnerability:* Water, power, and roads are vulnerable to extreme cold. *Impacts:* Essential services in White City may be compromised if cold weather leads to system failures. Water infrastructure is particularly at risk of pipe freezing, and energy demand may exceed local capacity, which increases the likelihood of outages. Emergency service buildings must remain operational, but heating system failures or delayed snow removal could hinder response capabilities. Roadway safety is also a concern as snow and ice increase the risk of accidents and delays.
	Community Activities	*Vulnerability:* Outdoor events and community centers are vulnerable to extreme cold. *Impacts:* Outdoor events and programs may be canceled or poorly attended due to frigid temperatures. Travel becomes more difficult, particularly for residents without reliable transportation or snow

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		removal resources. Community centers without efficient heating may struggle to remain open and comfortable for public use, which limits opportunities for social engagement during the colder months.
Flooding (and Heavy Rain)	People	*Vulnerability:* Flooding primarily affects residents in low-lying areas near rivers and streams, such as Dry Creek, especially during heavy rainfall or snowmelt. Dry Creek runs through a corridor of unincorporated county that bisects the city. *Impacts:* Individuals without reliable transportation may struggle to evacuate quickly, while low-income families often lack resources for flood-prevention measures. The elderly and those with disabilities may face mobility challenges, which increases their risk during emergencies. Overall, factors such as geographic location, economic status, and physical ability contribute to the community's varying levels of vulnerability to flooding.
	Structures	*Vulnerability:* Structures vulnerable to flooding primarily include those in low-lying areas or near Dry Creek. *Impacts:* Residential properties in floodplains and commercial buildings without proper drainage systems or flood-resistant designs face significant risks during heavy rain or snowmelt. Older structures may be more susceptible due to outdated construction standards. Overall, a combination of location and construction features contributes to their vulnerability to flooding.
	Economic Assets	*Vulnerability:* Businesses near Dry Creek are vulnerable to flooding. *Impacts:* Commercial properties, especially retail centers and warehouses near rivers or low-lying areas, are at high risk during heavy rainfall. Residential developments in flood-prone zones can also suffer damage, impacting property values. Public infrastructure, such as roads and utilities, may experience disruptions, leading to costly repairs. Agricultural land can be affected by excess water, which reduces crop yields.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Open space corridor along Dry Creek is vulnerable to flooding *Impacts:* Natural areas like wetlands and streams are at risk of habitat destruction, while historic sites and landmarks may sustain structural damage. Cultural resources, such as parks and public spaces, can become unusable, affecting community events. Factors contributing to their vulnerability include inadequate flood management, urban development that alters water flow, and the increasing frequency of extreme weather events due to climate change.
	Critical Facilities and Infrastructure	*Vulnerability:* No critical facilities are located in the flood zone in White City, but transportation and utilities are vulnerable to flooding. *Impacts:* Although facilities in White City are not vulnerable, residents may depend on services in neighboring jurisdictions that could be affected. Hospitals, schools, and transportation networks are vulnerable to flooding due to their proximity to rivers and low-lying areas, which can overflow during heavy rain or snowmelt. Flooding can disrupt emergency services, require schools to evacuate, block transportation routes, and isolate communities. In addition, inadequate drainage systems and urban development encroaching on floodplains increase these risks.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
	Community Activities	*Vulnerability:* Outdoor events and recreation are vulnerable to flooding. *Impacts:* Due to the area's geography and infrastructure, outdoor events, sports, and farmers' markets are vulnerable to flooding. Parks and open spaces can quickly become inundated during heavy rainfall or rapid snowmelt. Residential neighborhoods near rivers, roads, and bridges are at risk of flash floods, which can disrupt transportation and emergency services.
Landslide/ Slope Failure	People	*Vulnerability:* Residents living near hillsides or areas with known soil instability in White City are most at risk during slope failures, especially following heavy rainfall or rapid snowmelt. Areas along Dry Creek have moderate landslide susceptibility. *Impacts:* Residents may be displaced if landslides damage homes. These risks are intensified by inadequate stormwater management systems and limited public awareness about early warning signs such as ground cracking or shifting. Older adults or those without access to transportation may face evacuation challenges if slope instability occurs quickly.
	Structures	*Vulnerability:* Homes and structures along Dry Creek or other slopes are vulnerable to landslides. *Impacts:* Homes and infrastructure built along sloped areas or near drainage channels may be compromised if the ground shifts. Poorly maintained retaining walls, outdated erosion controls, and shallow foundations increase vulnerability. Properties not built with consideration for soil movement or water runoff patterns are especially at risk.
	Economic Assets	*Vulnerability:* Businesses near slopes along Dry Creek are vulnerable to landslides. *Impacts:* Roads, driveways, and utilities in hilly areas of White City could be damaged by slope instability. Property damage may lead to costly repairs or displace residents. Businesses relying on transportation or utility access may be financially impacted if landslides sever roadways or damage pipelines and cables.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Trail systems and open spaces are vulnerable to landslides and slope failure. *Impacts:* Unstable slopes may affect local trails, parks, and natural features. Landslides can alter drainage patterns, harm native vegetation, and destroy habitat. Historic sites in or near old mining corridors or hillside structures could be undermined or rendered inaccessible if soil erosion is severe.
	Critical Facilities and Infrastructure	*Vulnerability:* Roads and emergency services are vulnerable to disruption from slope failure. *Impacts:* Essential services that traverse or border steep terrain are at risk if slope failure occurs. Limited vegetation due to drought or development increases erosion potential. Emergency services may be delayed or obstructed if road access is cut off due to debris or ground displacement.
	Community Activities	*Vulnerability:* Outdoor recreation is vulnerable to landslides and slope failure.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		Impacts: Recreational trails and residential areas on slopes or near unstable land may be closed or restricted following heavy rain. Public infrastructure improvements must consider slope failure potential during planning and construction phases.
Radon	People	*Vulnerability:* Forty-five percent of homes tested in or near White City had dangerous levels of radon. *Impacts:* Radon can result in higher risk of lung cancer. Due to underlying geology in parts of White City, radon exposure is a concern for residents living in homes with basements or slab-on-grade foundations. Children, seniors, and those with respiratory issues are particularly sensitive to long-term radon exposure. Families unaware of radon risks may go years without testing their homes.
	Structures	*Vulnerability:* Older homes, especially those without updated ventilation or sealed foundations, are more likely to accumulate radon gas. *Impacts:* Cracks in concrete floors or poorly ventilated basements create pathways for gas intrusion from the soil. Homes built in areas with elevated natural uranium content are especially susceptible.
	Economic Assets	*Vulnerability:* Property values are vulnerable to the presence of radon. *Impacts:* Radon presence can affect real estate transactions, reducing property value or requiring costly mitigation. Commercial properties, particularly those with underground workspaces or storage areas, may also be impacted. Unmitigated radon issues can discourage investment or delay building use approvals.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Natural systems and historic buildings are vulnerable to radon accumulation. *Impacts:* Soil and groundwater in areas with uranium-rich rock can accumulate radon. Museums or historic buildings built with local stone or concrete may unknowingly trap radon indoors. Without adequate mitigation, long-term exposure could pose a health risk to occupants and staff.
	Critical Facilities and Infrastructure	*Vulnerability:* Public buildings, schools, and healthcare facilities are vulnerable to radon exposure. *Impacts:* Radon can accumulate in community facilities and expose occupants to radon gas. Schools, daycares, and public buildings with basements or concrete floors should be tested for radon. If found, mitigation systems must be installed to ensure occupant safety. Healthcare facilities are especially sensitive, as patients may be more vulnerable to airborne health risks.
	Community Activities	*Vulnerability:* Risk to events is low; risk is primarily a concern due to long-term exposure to radon. *Impacts:* Indoor events in poorly ventilated basements or lower levels may present health concerns if radon levels are high. Awareness campaigns and regular testing can help reduce community risk.
High Wind	People	*Vulnerability:* High wind can occur over the entire city, and all residents are vulnerable. *Impacts:* Residents, particularly those outdoors during wind events, may be injured by flying debris or falling branches. Vulnerable groups may face challenges in getting indoors quickly during sudden gusts.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
	Structures	*Vulnerability:* All structures are vulnerable to high wind. *Impacts:* Flat-roofed homes, older buildings, and sheds may sustain damage during strong winds. Roofing, fencing, and lightweight exterior materials are often the first to fail. In areas with minimal tree cover or landscaping, winds can pick up speed and increase structural exposure.
	Economic Assets	*Vulnerability:* Local businesses are vulnerable to high wind damage. *Impacts:* Windstorms may cause costly damage to local businesses, especially those with large signs, glass storefronts, or outdoor equipment. Interruptions in power or transportation can delay deliveries or reduce customer access. Repeated weather-related damage may result in higher insurance premiums for property owners.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Trees, open spaces, and trail systems are vulnerable to high winds. *Impacts:* Strong winds can uproot trees, damage parks, and strip topsoil. Cultural sites and outdoor installations can be damaged or displaced. These impacts may require expensive cleanup or repairs and can alter community character.
	Critical Facilities and Infrastructure	*Vulnerability:* Power and communication towers, as well as roads, are vulnerable to high winds. *Impacts:* High winds can bring down power lines and communication towers, disrupting essential services. Roadways may become blocked by debris, reducing emergency vehicle access. Public infrastructure such as traffic lights or signage may also be damaged.
	Community Activities	*Vulnerability:* Community events and recreation are vulnerable to high winds. *Impacts:* Outdoor events such as farmers' markets, sports games, and neighborhood gatherings may need to be canceled or rescheduled due to wind hazards. Unsecured tents and canopies can become airborne, increasing safety risks.
Lightning	People	*Vulnerability:* Lightning can strike anywhere in White City, and all residents are vulnerable. *Impacts:* Lightning can cause injury or death to those close to a strike. Outdoor recreationists and workers in open areas are most at risk from lightning strikes. Without timely shelter access or weather alerts, individuals caught in parks, trails, or backyards during thunderstorms may be exposed to injury or even fatality.
	Structures	*Vulnerability:* Tall buildings, communication towers, and barns without lightning rods or proper grounding are especially vulnerable to lightning strikes. *Impacts:* Strikes may ignite fires, damage electrical systems, or crack structural materials.
	Economic Assets	*Vulnerability:* All businesses are vulnerable to lightning-related impacts. *Impacts:* Fires and electrical damage caused by lightning can lead to business interruptions and costly repairs. Equipment damage or data loss may affect technology-driven operations.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
	Natural, Historic, and Cultural Resources	*Vulnerability:* Open space by Dry Creek, vegetation, and cultural sites are vulnerable to lightning strikes. *Impacts:* Lightning can ignite dry brush, damage large trees, or burn historic wood-framed buildings. Cultural landmarks located in open or wooded areas are particularly at risk during storm activity.
	Critical Facilities and Infrastructure	*Vulnerability:* Power distribution and communication systems are vulnerable to lightning-related disruptions. *Impacts:* Power stations, substations, and emergency communication towers are at risk of disruption. Surge-related damage to electrical systems can affect schools, hospitals, and emergency services.
	Community Activities	*Vulnerability:* Outdoor events and recreation are vulnerable to lightning storms. *Impacts:* Outdoor concerts, sports events, and recreation programs may be postponed or canceled during lightning storms. Parks and open spaces may require signs or warning systems to alert visitors.
Severe Winter Weather	People	*Vulnerability:* All residents are vulnerable to severe winter weather. *Impacts:* Extreme cold and heavy snow can trap residents indoors, especially seniors, young children, and individuals without access to snow removal equipment or reliable heating. Those who rely on public transit or walking may struggle to access essential services.
	Structures	*Vulnerability:* All structures, particularly older buildings, are vulnerable to severe winter weather. *Impacts:* Buildings with flat or aging roofs may collapse under heavy snow loads. Poor insulation and outdated HVAC systems increase the risk of frozen pipes and heating failures.
	Economic Assets	*Vulnerability:* All businesses are vulnerable to severe winter weather impacts. *Impacts:* Retail activity can stall during major snow events, especially when roads are unsafe. Service providers, delivery drivers, and contractors may miss appointments or face delays. Energy costs often spike during cold snaps, which strains household and business budgets.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Trees, vegetation, and historic and cultural sites are vulnerable to severe winter weather. *Impacts:* Heavy snow can damage trees, crush underbrush, and disrupt animal habitats. Ice can also harm older buildings and public art installations.
	Critical Facilities and Infrastructure	*Vulnerability:* Power and roads networks are vulnerable to snow and ice. *Impacts:* Utilities and road networks are vulnerable to snow and ice. Emergency services may be delayed due to blocked roads. Power outages from downed lines can affect homes, schools, and shelters.
	Community Activities	*Vulnerability:* Community centers and events are vulnerable to severe winter weather. *Impacts:* Winter weather may cause event cancellations and reduce attendance at community centers, particularly if parking or walkways are inaccessible. Emergency plans must account for vulnerable populations during prolonged storms.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
Tornado	People	*Vulnerability:* Although tornadoes are infrequent in White City, all residents are vulnerable to their impacts. *Impacts:* If a tornado were to occur, residents would be vulnerable to serious injury from blowing debris, uprooted trees, and structural collapse. Mobile home residents and individuals without access to sturdy shelters are at elevated risk. Those with mobility challenges may have difficulty evacuating quickly during warnings.
	Structures	*Vulnerability:* All structures are vulnerable to tornado damage. *Impacts:* Older homes and buildings with weak frames or large glass windows may be significantly damaged by high winds. Large-span roofs—such as those on gyms or warehouses—are particularly susceptible to uplift and collapse.
	Economic Assets	*Vulnerability:* All businesses are vulnerable to tornado impacts. *Impacts:* Tornado damage can shut down local businesses, disrupt public services, and create significant recovery costs. Delays in reopening or accessing insurance support can impact long-term economic stability. Power outages can also affect a business's ability to operate.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Trails, parks, and historic buildings are vulnerable to tornado damage. *Impacts:* Tornadoes can uproot trees and tear through parks, affecting trails and greenways. Historic buildings not retrofitted for wind resistance may be lost entirely.
	Critical Facilities and Infrastructure	*Vulnerability:* Schools, public buildings, and power and road infrastructure are vulnerable to tornado impacts. *Impacts:* Schools, hospitals, and fire stations may suffer functional damage or accessibility issues. Power outages and blocked roads may prevent response crews from reaching affected areas.
	Community Activities	*Vulnerability:* Outdoor events and recreation are vulnerable to tornado disruptions. *Impacts:* Public spaces and recreation centers may close temporarily after a tornado. Outdoor activities require contingency plans, including shelter locations and early warning notifications.
Wildfire	People	*Vulnerability:* Wildfire risk is moderate along the Dimple Dell Park/Dry Creek corridor. *Impacts:* Residents near natural open spaces or the wildland–urban interface are most vulnerable. People with health conditions, older adults, and those without transportation may struggle to evacuate. Smoke inhalation is a concern even outside burn zones.
	Structures	*Vulnerability:* Homes near Dimple Dell/Dry Creek are vulnerable to wildfire damage. *Impacts:* Homes built near vegetation or without fire-resistant materials face heightened risk. Wood fences, dry landscaping, and open eaves increase susceptibility. Ember storms can ignite roofs or attics even if the fire isn't nearby.
	Economic Assets	*Vulnerability:* Businesses near open space parks are vulnerable to wildfire impacts.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		Impacts: Wildfires can disrupt local businesses, damage infrastructure, and reduce property values. Agricultural operations or outdoor-based businesses may lose crops, animals, or inventory. Costs related to suppression, recovery, and lost revenue can be significant.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Parks, trees, habitats, and historic buildings are vulnerable to wildfires. *Impacts:* Parks, forests, and habitat areas can burn quickly during dry, windy conditions. Historic structures built from timber or located in scenic areas may be difficult to protect or restore.
	Critical Facilities and Infrastructure	*Vulnerability:* Power lines, water systems, and transportation routes are vulnerable to wildfire damage. *Impacts:* Fire can damage or destroy communication towers or transformers, interrupting services.
	Community Activities	*Vulnerability:* Community events and recreation are vulnerable during fire season. *Impacts:* During fire season, community events may be canceled due to poor air quality or fire threat. Trails and parks may close, and evacuation plans may disrupt recreational and public services.
Dam Failure	People	Based on the location of high or significant hazard dams and maps of dam inundation areas, There is little risk of dam failure in White City.
Civil Disturbance	People	Low-income individuals may lack the resources for safety, while the elderly or disabled may struggle to navigate emergencies. Young people, particularly teenagers, may be drawn into unrest, influenced by social dynamics. In addition, marginalized individuals may feel targeted or compelled to participate. A lack of community cohesion and trust in authorities can further heighten tensions.
	Structures	Government buildings, commercial properties, and infrastructure, such as bridges and transportation hubs may be vulnerable. Government buildings may be targeted for their symbolic authority, while retail stores can attract crowds during protests. Residential neighborhoods also can be affected, especially in areas with heightened tensions. The vulnerability of these structures stems from their visibility and importance to the community, combined with factors such as location and ongoing social issues.
	Economic Assets	Retail establishments, especially shopping centers, are at risk as they often become focal points for protests. Transportation systems can be disrupted by blockades, hindering access to services. Financial institutions may face vandalism or theft, while critical service providers, such as hospitals, could experience strain during unrest. Several economic assets are vulnerable to civil disturbances, primarily due to their visibility and reliance on foot traffic.
	Natural, Historic, and Cultural Resources	Parks and open spaces may suffer from vandalism or destruction during uncontrolled events. Historic sites can become targets, as they symbolize authority or cultural significance. Cultural resources, such as community centers and places of worship, also may be affected, as they play a vital role in community identity. Their vulnerability lies in the potential for damage during protests.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
	Critical Facilities and Infrastructure	Governmental buildings, schools, and healthcare facilities may be at risk, since they often symbolize authority and serve as community hubs, making them targets during unrest. Utility infrastructure, such as water and power facilities, is also at risk of disruption. Its visibility and essential services contribute to its vulnerability during civil disturbances.
	Community Activities	Public demonstrations, parades, and local government meetings are particularly vulnerable to civil disturbances. These events often attract large crowds and can become tense, especially around contentious social or political issues. Factors such as the local demographic, economic conditions, and recent events can heighten these vulnerabilities, making it easier for conflicts to arise during passionate public gatherings.
Cyberattack	People	Older adults often lack familiarity with technology and online security, making them easy targets for phishing scams. Individuals engaging in online banking or shopping without strong security measures also face heightened risks. Families with children may be less vigilant about internet safety, allowing cybercriminals to exploit personal information. In addition, small business owners without robust cybersecurity practices are prime targets for attacks that can disrupt operations.
	Structures	Critical infrastructure, such as power plants, water treatment facilities, and transportation systems, often lack robust cybersecurity measures. Commercial businesses, especially financial institutions and healthcare providers, are also at risk due to weaker data protection and employee training. Educational institutions may be vulnerable because of limited funding for cybersecurity and outdated software. Obsolete technology and insufficient training heighten the susceptibility of these structures to cyber threats.
	Economic Assets	Financial institutions, such as banks and credit unions, are at risk of data theft and service disruption. Small and medium-sized businesses often lack robust cybersecurity measures, making them attractive targets. In addition, local government agencies and critical infrastructure, such as water treatment facilities, might have outdated security protocols, posing threats to public safety. The rise of remote work further exacerbates vulnerabilities, as employees accessing networks from home can unintentionally expose systems to risks. Overall, the combination of outdated technology and insufficient cybersecurity practices increases the vulnerability of an area's economic assets.
	Natural, Historic, and Cultural Resources	Natural resources like water management systems and wildlife databases can be compromised, disrupting ecosystems. Historic sites and museums that digitize collections are at risk of losing valuable artifacts and data. In addition, cultural organizations managing events may face threats if their systems lack adequate security. The limited resources of smaller organizations further increase this vulnerability.
	Critical Facilities and Infrastructure	Energy and utility services, such as electricity and water systems, which often rely on outdated technology, may be vulnerable. Transportation infrastructure, such as traffic management and public transit, is also at risk due to networked systems. Healthcare facilities

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		that use electronic records and connected medical devices face vulnerabilities that can compromise patient safety.
	Community Activities	Online registration for events, local government services, and educational programs that rely on digital tools may be targeted due to inadequate security measures, outdated software, and insufficient staff training.
Hazardous Materials Incident (Transporta-tion & Fixed Facility)	People	Individuals with pre-existing health conditions, such as respiratory issues, and the elderly are at higher risk due to their compromised health. Children also are more susceptible. Those living near industrial areas or transport routes for hazardous materials face increased exposure risk, while low-income families may lack resources and information to effectively prepare for incidents.
	Structures	Industrial facilities, such as manufacturing plants and warehouses, often store hazardous chemicals which may leak. Residential buildings, schools, and hospitals also are at risk, particularly if located along transportation routes for hazardous materials. Older buildings may lack modern safety features, increasing their vulnerability.
	Economic Assets	Industrial facilities, transportation infrastructure, and nearby commercial properties may be affected. Industrial facilities handling chemicals are at risk of spills or leaks, while roads and railways used for transporting hazardous materials can lead to accidents and contamination. In addition, nearby commercial, and residential areas face potential health risks and economic losses.
	Natural, Historic, and Cultural Resources	Waterways and habitats are vulnerable to hazardous materials incidents, which can disrupt ecosystems. Historic sites and structures may suffer damage from toxic exposure, leading to degradation over time. In addition, cultural landmarks risk losing their significance due to contamination events. The proximity of these resources to industrial areas or transport routes exacerbates their risk.
	Critical Facilities and Infrastructure	Chemical manufacturing plants, waste treatment facilities, and transportation networks, such as highways and railroads may be at risk. Their vulnerability stems from factors such as proximity to residential areas, aging infrastructure, and inadequate safety measures. Natural hazards, such as flooding and earthquakes, can further increase risks by damaging containment systems.
	Community Activities	Local markets, school events, and outdoor gatherings are vulnerable to hazardous materials incidents if they are near industrial zones and transport corridors. This risk is heightened by inadequate emergency preparedness, lack of public awareness, and the potential for spills during transport. Large crowds at events can complicate evacuation efforts, increasing the risks for participants and nearby residents.
Public Health Epidemic/ Pandemic	People	Individuals with pre-existing health conditions like asthma and heart disease and adults over 65 may be vulnerable. Low-income families may struggle to access healthcare and vaccinations, increasing their risk. Marginalized communities with limited access to information and those living in high-density conditions also are at greater risk due to the rapid spread of diseases and the challenges in implementing preventive measures.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
	Structures	Several structures are vulnerable to public health epidemics or pandemics, particularly due to their ability to facilitate the spread of disease. High-density residential areas, such as apartment complexes, are at risk, as close living quarters can lead to faster transmission. Public gathering spaces, such as schools and community centers, also pose significant threats because large groups are in confined spaces. Healthcare facilities can become hotspots for infections if infection control measures are insufficient. In addition, workplaces with high foot traffic, such as retail stores, contribute to vulnerability.
	Economic Assets	Small businesses in retail, hospitality, and food service are particularly vulnerable to public health epidemics or pandemics. These sectors face risks from fluctuating consumer demand and potential operational restrictions. The tourism industry also is affected, as travelers may avoid high-risk areas. Healthcare facilities can become overwhelmed, straining resources and impacting operations. In addition, local supply chains may experience disruptions, leading to shortages and inflation. Overall, the direct effects of illness, along with prolonged shutdowns and consumer hesitance, leave these economic assets exposed to significant downturns.
	Natural, Historic, and Cultural Resources	Natural resources like wildlife and ecosystems can be disrupted by increased human activity, raising the risk of zoonotic diseases. Historic sites may deteriorate due to reduced visitor access and funding, while cultural resources, such as community events, face cancellations, impacting social connections.
	Critical Facilities and Infrastructure	Public health epidemic or pandemic incidents can affect healthcare facilities, nursing homes, public transportation systems, schools, and food supply chains. Hospitals and clinics may become overwhelmed with patients, while vulnerable populations in nursing homes are at higher risk. Public transportation can facilitate the spread of disease, and schools gather large groups, thereby increasing transmission potential. These facilities often lack adequate resources, including medical supplies and testing capabilities, making them more susceptible to the impacts of a health crisis.
	Community Activities	Large gatherings like festivals and sporting events can facilitate the rapid spread of diseases due to close contact. Public transportation also is at risk, as it serves many people in confined spaces. Schools and childcare facilities are particularly susceptible, given that children can easily transmit infections. In addition, food-related events, such as farmers' markets, can pose risks if hygiene practices are not followed. The interconnectedness of community members and varying adherence to health guidelines further exacerbate these vulnerabilities.
Terrorism	People	Young children and newcomers may lack awareness of potential threats, while the elderly and individuals with disabilities may struggle to respond quickly in emergencies. Marginalized communities often face bias, making them more susceptible to targeting. In addition, those with lower socioeconomic status may lack access to security measures and emergency preparedness resources.
	Structures	Government buildings, transportation hubs, commercial centers, and public spaces are particularly vulnerable to terrorism incidents.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		Government buildings are symbolic targets, while transportation hubs and commercial centers are attractive due to their potential for high casualties and crowd presence. Public spaces also are at risk due to their open nature and lack of security. Their vulnerability is heightened by inadequate security measures, high occupancy rates, and their locations in densely populated areas, which can amplify the impact of incidents.
	Economic Assets	Infrastructure, commercial establishments, and community facilities may be vulnerable. Critical infrastructure, such as transportation networks and power grids, could disrupt the economy if targeted. Commercial establishments, especially those with high foot traffic, and community facilities like schools and hospitals also are at risk, as they can provoke widespread concern and disruption. Their accessibility and interconnectivity increase vulnerability, meaning that damage to one asset can have a broader economic impact and hinder recovery efforts.
	Natural, Historic, and Cultural Resources	Natural resources like water supplies and parks could be targeted for their significance to the community. Historic sites and cultural resources, such as museums or community centers, also are at risk due to their accessibility and importance to local identity. Their vulnerability is often heightened by inadequate security measures.
	Critical Facilities and Infrastructure	Public transportation systems, healthcare facilities, schools, and utility services like water and power plants may be affected. Their vulnerability arises from high accessibility and the potential impact of an attack, as crowded transportation and public spaces can lead to mass casualties and panic. Attacking utility services could disrupt the town's essential functions, creating chaos.
	Community Activities	Festivals, parades, and sporting events are particularly vulnerable to terrorism incidents. These events attract large crowds, making it easier for perpetrators to inflict harm and instill fear. In addition, community centers and places of worship serve as social hubs, increasing their risk. Factors such as limited security measures and open access to public spaces, contribute to this vulnerability.

Hazards Not Profiled

Avalanche and Dam Failure have been omitted from further discussion of hazard impacts and from mitigation actions. As shown in the description in Volume 1, avalanche risk is primarily in the Wasatch Mountains in SLCo and White City is not in an inundation zone. No previous occurrences of avalanche or dam failure have impacted White City.

Jurisdiction-Specific Changes in Vulnerability

Hazard events can impact communities, infrastructures, and ecosystems. The severity of these impacts can be influenced by climate change, population patterns, and land use developments. Understanding these factors is crucial for White City to develop a resilient community and minimize the impacts of

DRAFT

hazards. Table 9 displays the unique changes within the community and the related effects on each identified hazard affecting White City.

DRAFT

Table 9: Jurisdiction-Specific Changes in Vulnerability in White City

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
Avalanche	N/A	N/A	N/A	N/A
Drought	Climate change affects drought incidents by altering precipitation patterns and increasing temperatures. Warmer weather can lead to longer dry periods and more severe droughts, while changes in rainfall can reduce snowpack in nearby mountains, crucial for summer water supply. Higher temperatures also increase evaporation rates, further straining local water resources.	Drought can significantly influence population patterns by impacting economic opportunities and the quality of life. Water scarcity often leads to reduced agricultural productivity, prompting residents to migrate to areas with more stable job prospects. Increased water costs can make living less affordable, driving some residents away. Conversely, efforts to address drought, such as sustainable development or improved water management, may attract newcomers, resulting in changes in the community's demographic composition over time.	Development in White City has been minimal since the previous plan update and has not affected the risk of drought.	Increased
Earthquake	Rising temperatures can lead to glacial melting, which affects pressure on tectonic plates and may trigger seismic activity through isostatic rebound. In addition, increased rainfall and flooding can erode soils, weakening structural integrity and heightening vulnerability during earthquakes. Although the direct links between climate change and earthquakes are still under investigation, environmental	Earthquakes can significantly alter population patterns by prompting residents to leave for safer areas after a seismic event. This migration can lead to changes in population density and attract new residents and businesses during the rebuilding process. The perception of the area as a safe place to live may shift, impacting long-term demographics, as some residents return to rebuild while others relocate permanently.	Development in White City has been minimal since the previous plan update and has not affected the risk of earthquakes.	Same

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	effects may impact the region's seismic risk.			
Extreme Heat	Climate change significantly impacts extreme heat by increasing the frequency and intensity of heat waves. Rising global temperatures lead to longer and hotter summers, affecting residents and local infrastructure while heightening health risks, especially for vulnerable populations. Urban heat islands from reduced vegetation and extensive pavement further amplify these effects.	By causing residents to relocate due to damaged homes or safety concerns. Some may move to areas perceived as safer or seek better job opportunities elsewhere. The economic impact and infrastructure damage can also make certain neighborhoods less desirable, leading to shifts in demographics and the socioeconomic landscape as new residents with different backgrounds move in.	Development in White City has been minimal since the previous plan update and has not affected the risk of extreme heat.	Increased
Extreme Cold	By increasing the intensity of winter storms. Higher atmospheric temperatures allow for more moisture, resulting in heavier snowfall and potentially lower temperatures during these events. In addition, fluctuations in weather patterns may disrupt seasonal cycles, leading to unpredictable periods of extreme cold mixed with warmer spells.	By driving some residents to relocate to warmer areas. Harsh winters can hinder economic activities and deter new residents and businesses, influencing housing demand and the attractiveness of certain neighborhoods. This may disproportionately affect lower-income families, leading to changes in demographics and socioeconomic stratification in the community.	Development in White City has been minimal since the previous plan update and has not affected the risk of extreme cold.	Increased
Flooding	Higher temperatures increase the frequency and intensity of extreme weather events and alter precipitation patterns. They lead to more	Flooding can significantly alter population patterns by displacing residents from affected areas, leading them to seek shelter elsewhere. This may cause a	Development in White City has been minimal since the previous plan update and has not affected the risk of flooding.	Decreased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	intense rainstorms and accelerated snowmelt from nearby mountains, raising water levels in rivers and streams. This combination raises the risk of flooding, especially in areas with inadequate drainage and urban development in flood-prone zones, heightening the potential for damage to homes and infrastructure.	population decline where flooding occurs, as individuals might hesitate to return due to ongoing risks or property damage. As neighborhoods become less desirable, people may migrate to safer areas, changing demographic trends and putting pressure on housing in those regions. Over time, these shifts can influence urban planning and development, as local governments address flooding risks and changing population needs.		
Landslide/ Slope Failure	Climate change increases the risk of landslides through heavier rainfall and temperature fluctuations. Intense rain saturates soil, destabilizing slopes, while freeze–thaw cycles weaken the ground. Changes in vegetation can also reduce stability, leading to a higher potential for landslides.	Landslides and slope failures can impact population patterns by making some areas unsafe, leading to displacement and lower property values. This prompts residents to move to safer regions, thereby increasing density in more stable areas. Concerns about future landslides may also deter newcomers from high-risk zones, shaping long-term demographic trends.	Development in White City has been minimal since the previous plan update and has not affected the risk of landslides.	Increased
Radon	Climate change can affect radon levels by altering soil temperatures and moisture conditions. Higher temperatures may increase radon emissions from the ground, while heavy rainfall can change groundwater and soil saturation, impacting radon migration into buildings.	Radon exposure can influence population patterns as increased health awareness may drive families to move away from areas with high radon levels. This shift could particularly affect vulnerable groups, changing demographics and demand in the housing market. Homes with lower radon levels may become more sought after, and public health campaigns can	Development in White City has been minimal since the previous plan update and has not impacted the risk of radon exposure.	Decreased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
		encourage community action, making previously undesirable areas more attractive once mitigation measures are implemented.		
Heavy Rain	Climate change increases the frequency and intensity of heavy rain, as higher temperatures allow the atmosphere to hold more moisture. This leads to stronger storms, flash flooding, and overwhelmed drainage systems.	Heavy rain can shift population patterns by pushing residents out of flood-prone areas and attracting them to safer neighborhoods. Frequent flooding may lead to evacuations and economic disruptions, prompting relocations. Over time, ongoing heavy rains can affect housing demand and community stability, altering the town's population distribution.	Development in White City has been minimal since the previous plan update and has not affected the risk of heavy rain.	Increased
High Wind	Climate change affects high winds by altering atmospheric patterns and increasing extreme weather events. Rising temperatures may lead to more substantial, unpredictable winds and more frequent thunderstorms, posing risks to infrastructure and air quality.	High winds can alter population patterns by making certain areas less desirable. Frequent damage may drive residents to safer neighborhoods, deter newcomers, and slow growth in affected regions.	Development in White City has been minimal since the previous plan update and has not affected the risk of high wind.	Increased
Lightning	Climate change increases temperatures and alters precipitation, leading to more intense thunderstorms and frequent lightning strikes. Urbanization can enhance this effect, posing risks to public safety and infrastructure.	Lightning can influence population patterns by causing property damage and wildfires, leading some residents to relocate. Areas with higher lightning activity may deter new residents, while safer locations could increase migration as people seek protection from severe weather.	Development in White City has been minimal since the previous plan update and has not affected the risk of lightning strikes.	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
Severe Winter Weather	Climate change impacts heavy snow and blizzards by altering precipitation patterns. Higher temperatures can lead to more rain than snow, affecting snowpack levels—additionally, increased storm intensity results in heavier, more unpredictable snowfall.	Increased population equals an increased number of people needing to get to work and quicker snow removal. Heavy snow or blizzards can impact population patterns by influencing where people live and work. Transportation disruptions may lead residents to seek housing closer to jobs, increasing density in some areas while depopulating others. Families might also avoid regions with frequent heavy snowfall, shifting demand to milder areas. Over time, these trends can alter community demographics and economic activity, prompting adjustments in town planning and resource allocation.	Development in White City has been minimal since the previous plan update and has not impacted the risk of severe winter weather.	Increased
Tornado	Climate change may increase the frequency and intensity of tornadoes. Higher temperatures lead to more moisture in the air, creating conditions for severe thunderstorms. Changes in wind patterns and precipitation can also heighten tornado risks, resulting in more destructive storms and greater threats to infrastructure and communities.	Tornadoes can influence population patterns by prompting residents to move to safer areas after damage occurs. This can decrease density in affected neighborhoods while increasing the demand for housing in safer regions. New residents may also move in for recovery opportunities, altering demographics. Over time, repeated tornado threats might push long-term residents to areas with better disaster preparedness, reshaping the city's population distribution.	Development in White City has been minimal since the previous plan update and has not affected the risk of tornadoes.	Increased
Wildfire	By raising temperatures and creating drier conditions, prolonged droughts lead to more dry vegetation, which	Displaced individuals often seek safer areas, shifting demographics, while declining property values might deter newcomers.	Development in White City has been minimal since the previous	Increased

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	serves as fuel for fires. Erratic seasons extend the growing period, while more lightning strikes can ignite wildfires. These factors heighten the threat to ecosystems and community safety.	Conversely, some may be drawn to rebuilding efforts, impacting long-term growth and community dynamics.	plan update and has not affected the risk of wildfires.	
Dam Failure	N/A	N/A	N/A	N/A
Civil Disturbance	Climate change can increase civil disturbances by intensifying environmental stresses and social tensions. Rising temperatures may lead to drought, wildfires, and poor air quality, particularly affecting vulnerable communities. Resource scarcity, especially water, can spark conflicts and protests. In addition, an influx of migrants from harder-hit areas may strain local resources, further escalating tensions. This cycle of unrest is driven by the impacts of climate change on the environment and community dynamics.	By encouraging residents to move for safety, leading to outflows and new arrivals. These events can reveal social issues, impacting community dynamics, employment, and property values, ultimately reshaping demographics, and social cohesion.	Development in White City has been minimal since the previous plan update and has not affected the risk of civil disturbance.	Increased
Cyberattack	Possible attack on the industry, which is seen as producing large amounts of greenhouse gases and burning fossil fuels. Climate change can heighten cyberattack risk by	Cyberattacks can change population patterns by eroding trust in essential services. Compromised systems may cause residents to leave due to safety concerns, while high-profile incidents can deter businesses, leading to job losses.	Development in White City has been minimal since the previous plan update and has not affected the risk of cyberattacks.	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	increasing vulnerabilities during extreme weather. Disruptions like power outages offer cybercriminals opportunities but focusing on emergency responses can weaken cybersecurity measures. As organizations adopt new technologies to cope with climate impacts, they may unintentionally introduce additional vulnerabilities.	This perception of vulnerability may also make the town less appealing to newcomers, resulting in demographic shifts and changes in local development.		
Hazardous Materials Incident (Transportation & Fixed Facility)	Climate change elevates the risk of hazardous materials incidents by increasing extreme weather events like heavy rain and wildfires. These events can breach storage tanks and heighten material volatility. Vulnerable infrastructure can lead to more spills or accidents, while climate shifts may also introduce new challenges for managing hazardous substances and public health.	By causing evacuations and temporary declines in density. In the long run, unsafe areas may deter new residents, affecting growth and diversity. In addition, negative perceptions can lower property values and economic prospects, leading families to relocate, which impacts local demographics.	Development in White City has been minimal since the previous plan update and has not affected the risk of hazardous materials incidents.	Increased
Public Health Epidemic/ Pandemic	By increasing the spread of vector-borne diseases and raising the risk of waterborne illnesses due to flooding or drought. Worsening air quality can also exacerbate respiratory conditions like asthma, especially in vulnerable populations.	By prompting migration for safety and better healthcare. Vulnerable groups may move to areas with improved services, while economic instability can drive people to seek new employment opportunities. In addition, restrictions like quarantine measures can limit movement and social interactions, reshaping the	Development in White City has been minimal since the previous plan update and has not affected the risk of epidemics/ pandemics.	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
		community's demographics and impacting local economies.		
Terrorism	Terroristic activity is sometimes centered around climate change. Climate change impacts terrorism incidents by creating conditions of resource scarcity and social unrest. Increased competition for essential resources, such as water, can fuel tensions, making communities more vulnerable to extremist ideologies. Extreme weather events may disrupt social order and infrastructure, offering terrorist groups opportunities to exploit crises. In addition, climate-driven population displacement can heighten tensions in receiving areas, raising the risk of domestic terrorism. Law enforcement's focus on climate-related challenges can also limit its capacity to address terrorism threats. Ultimately, while climate change may not directly cause terrorism, its effects can create an environment conducive to extremist activities.	Terrorism incidents can alter population patterns by instilling fear and prompting residents to relocate to perceived safer areas, resulting in demographic shifts and potential declines in property values. Some neighborhoods may see an outflow of residents, while others could experience an influx of people seeking refuge from violence. In addition, increased security measures may deter businesses and residents from certain locations, leading to long-term changes in population density and urban development patterns.	Development in White City has been minimal since the previous plan update and has not affected the risk of terrorism.	Increased

DRAFT

Additional Public Involvement

White City provided several opportunities for public participation. Figure 1 presents examples of public outreach.

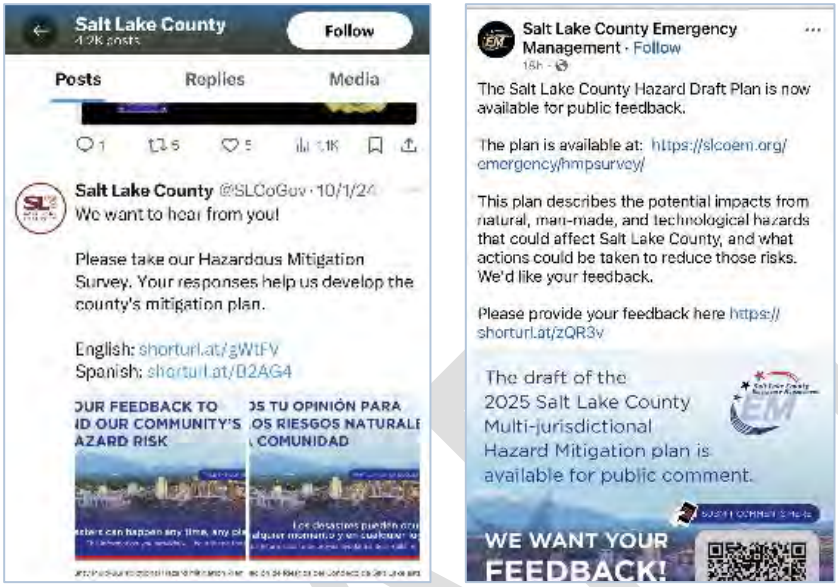

Figure 1: Social Media Posts for the Hazard Mitigation Survey (*left*) and Draft Plan Review (*right*)

Plan Integration

Incorporating the underlying principles of the Hazard Mitigation Plan and its recommendations into other plans is a highly effective and low-cost way to expand their influence. All plan participants will use existing methods and programs to implement hazard mitigation actions where possible. As previously stated, mitigation is most successful when it is incorporated into the day-to-day functions and priorities of government and public service. This plan builds on the momentum developed through previous and related planning efforts and mitigation programs, and it recommends implementing actions, where possible, through these other program mechanisms. These existing mechanisms include:

- Regularity Capabilities
- Administrative Capabilities
- Fiscal Capabilities

Respective planning stakeholders will conduct implementation and incorporation into existing planning mechanisms and will be done through the routine actions of:

- Monitoring other planning/program agendas
- Attending other planning/program meetings
- Participating in other planning processes

DRAFT

- Monitoring community budget meetings for other community program opportunities

The successful implementation of this plan will require constant and vigilant review of existing plans and programs for coordination and multi-objective opportunities that promote a safe, sustainable community. Regular efforts should be made to monitor the progress of mitigation actions implemented through other planning mechanisms. Where appropriate, priority actions should be incorporated into planning updates. Table 10 lists existing planning mechanisms in which the Hazard Mitigation Plan has been integrated. Table 11 lists the opportunities for integrating elements of this plan into other plans.

Table 10: Integration of Previous Plans by White City

Plan	Description
General Plan	Priorities for land use, the community, and transportation in White City

Table 11: Opportunities for Integration with Future Plans of White City

Plan	Description
Comprehensive Emergency Management Plan	Framework for hazard response, recovery, mitigation and preparedness.
Continuity Plan (COOP)	Overview of operational needs in an emergency
Emergency Communications Plan	Overview of emergency communication protocols between White City and other organizations
Community Wildfire Protection Plan	Provides information on wildfire preparedness and response efforts

Capability Assessment

Local mitigation capabilities are existing authorities, policies, programs, and resources that reduce hazard impacts or could help carry out hazard mitigation activities.

Planning and Regulatory Capabilities

Planning and regulatory capabilities are the plans, policies, codes, and ordinances that prevent and reduce the impacts of hazards.

DRAFT

Table 12: Assessment of the Planning Capabilities of White City[2]

Plan	Does it address hazards? (Y/N)	How can it be used to implement mitigation actions?	When was the last update? When is the next update?
General Plan	Y	Project tracking and alignment of White City's overall goals into mitigation actions	2022
Capital Improvement Plan	Y – included in General Plan	Incorporation of funding sources and project tracking over time into mitigation actions	2022
Climate Change Adaptation Plan	N	N/A	N/A
Community Wildfire Protection Plan	Y	Incorporation of wildfire preparedness and response efforts into mitigation actions and responsible agencies	2021
Economic Development Plan	Y – included in General Plan	Alignment of economic goals and funding sources into mitigation actions	2022
Land Use Plan	Y – included in General Plan	Incorporation of land use, agency, and historical information into mitigation actions	2022
Local Emergency Operations Plan	Y – adopted MSD's EOP in 2020, updated to the MSD's CEMP in 2025	White City adopted the MSD's EOP in 2020, which was updated in 2025 and now called the CEMP. It can inform mitigation actions as far as agency involvement, funding sources, and response efforts.	2025
Stormwater Management Plan	Y	Incorporation of stormwater management efforts into flooding, dam failure, heavy rain, and heavy snow/blizzard hazard mitigation actions.	2020
Transportation Plan	Y	Incorporation of transportation goals into mitigation actions	2022
Substantial Damage Plan	N	N/A	N/A

Table 15: Assessment of the Technical Capabilities of White City[4]

Technical Capability	In Place? (Y/N)	How has it been used to assess/mitigate risk in the past?	How can it be used to assess/mitigate risk in the future?
Mitigation Grant Writing	Y, MSD and county	White City is part of the MSD. All services are currently contracted out – UFA, UPD or through the MSD.	Grant applications can include mitigation actions.
Hazard Data and Information	Y, MSD and county	Identify areas most at risk for specific hazards	Identify areas to prioritize for mitigation projects and other efforts
GIS	Y, MSD	Identify, map, and share hazards in the city	GIS can be used for grant applications to show the hazards and areas of interest. GIS can also be used to track mitigation efforts over time.
Mutual Aid Agreements	Y	Assist in emergency planning, resource requests, and emergency response efforts	Can be used to share responsibility of mitigation actions and response efforts
Other? (Please describe.)			

[4] MSD = Municipal Services District, UFA = Unified Fire Authority, UPD = Unified Police Department.

DRAFT

Financial Capabilities

Financial capabilities are the resources to fund mitigation actions. Talking about funding and financial capabilities is important to determine what kinds of projects are feasible given their cost. Mitigation actions like outreach programs are lower cost and often use staff time and existing budgets. Other actions, such as earthquake retrofits, could require substantial funding from local, state, and federal partners. Partnerships, including those willing to donate land, supplies, in-kind matches, and cash, can be included.

Table 16: Assessment of the Financial Capabilities of White City

Funding Resource	In Place? (Y/N)	Has it been used in the past and for what types of activities?	Could it be used to fund future mitigation actions?	Can it be used as the local cost match for a federal grant?
Capital Improvement Project Funding	Y	Road improvements	Yes	Yes
General Funds	Y	No	Yes	Yes
Hazard Mitigation Grant Program (HMGP/404)	Y, not used	No	Yes	No
Building Resilient Infrastructure & Communities (BRIC)	Y, not used	No	Yes	No
Flood Mitigation Assistance (FMA)	Y, not used	No	Yes	No

Other?				

Education and Outreach Capabilities

Education and outreach capabilities are programs and methods that could communicate about and encourage risk reduction. These programs may be run by a participant or a community-based partner. Partners, especially those who work with underserved communities, can help identify additional education and outreach capabilities.

Table 17: Assessment of the Education and Outreach Capabilities of White City[5]

Education and Outreach Capability	In Place? (Y/N)	Does it currently incorporate hazard mitigation?	Could it be used to support mitigation in the future?

Opportunities to Expand and/or Improve Capabilities

Actions that can expand and improve existing authorities, plans, policies, and resources for mitigation include budgeting for mitigation actions, passing policies and procedures for mitigation actions, adopting and implementing stricter mitigation regulations, approving mitigation updates, and making additions to existing plans as new needs are recognized. Table 18 lists the opportunities for White City.

Table 18: Opportunities to Expand or Improve the Capabilities of White City

Capability	Opportunity to Expand and/or Improve
Planning and Regulation	Current planning mechanisms can be expanded to incorporate access and functional needs in plans. The Community Wildfire Protection Plan (2021) can be regularly updated, enabling the city to incorporate the latest conditions and best practices.
Administrative and Technical	The city could use additional building inspectors. Building codes are an effective mitigation method. Additionally, current GIS capabilities can be expanded to track hazards, such as diseases.
Financial	The city can apply for previously unused grants, such as the Flood Mitigation Assistance (FMA) grant program.
Education and Outreach	Implementing hazard-specific public outreach campaigns such as for high wind can help expand current education and outreach approaches.

Mitigation Strategy

Mitigation strategies provide proactive measures that are designed to minimize the impacts of hazards on White City. Table 19 shows mitigation action alternatives, and

Table 20 shows the status of previous mitigation activities. Table 21 is the 2025 mitigation action plan for White City.

DRAFT

Table 19: Mitigation Action Alternatives for White City

Action	Type of Action	Selected for inclusion in the plan?	If not selected, why not?
Continue social media engagement	Education and Awareness Programs		
Adopt new building codes as they are approved to bring some existing structures up to current codes	Structure and infrastructure Projects	Yes	

Table 20: Status of Prior Mitigation Actions of White City[6]

Action	Hazard(s)	Agency Lead	Support Agency(ies)	Status Update
Establish an emergency fund to support response and recovery operations	All hazards	White City	GSL MSD, SLCo EM	Incomplete
Conduct seismic retrofitting and implement a program for residents similar to the "Fix the Bricks" initiative	Earthquake	White City	GSL MSD, SLCo EM	Incomplete
Provide additional education and materials to the public regarding the earthquake risk and potential mitigation actions that can be taken	Earthquake	White City	GSL MSD, SLCo EM, UDEM	Ongoing
Develop a training program for contractors so they become qualified to conduct seismic retrofitting	Earthquake	White City	GSL MSD, SLCo EM	Incomplete

[6] GSL MSD = Greater Salt Lake Municipal Services District, SLCo EM = Salt Lake County Emergency Management, UDEM = Utah Division of Emergency Management.

Table 21: 2025 Mitigation Action Plan for White City[7]

#	Action	Hazard(s)	Lead Agency	Potential Partners	Benefits (Losses Avoided)	Cost Estimate	Funding Source(s)	Time-frame	Priority	Comments
1	Enhance security at critical infrastructure locations to prevent potential terrorist acts.	Terrorism, Civil Disturbance	White City	UPD, UFA, MSD, SLCo IT, SLCo PW, SLCo Clerk's Office, SLCo Sheriff's Office, utility companies, water districts, SLCo EM	Increased security protocols (in both technology and policy) for staff/first responders, clearer expectations and understanding for local jurisdictions and the public	Medium	SLCo EM general funds, UPD general funds, Sheriff's Office general funds, UFA general funds, MSD general funds, utility companies, water districts	Short-term	Medium	
2	Develop and implement public education programs on disaster awareness and mitigation.	Civil Disturbance, Drought, Wildfire, Earthquake, Extreme Heat, Extreme Cold, Flooding, Hazardous Materials Incident, Heavy Rain, High Wind, Landslide/Slope Failure, Lightning, Public Health Epidemic/Pandemic, Radon, Severe Winter Weather, Terrorism, Tornado, Wildfire	White City	UFA, UPD, Sheriff's Office, SLCo PW, SLCo EM, utility companies, water districts, MSD, NWS	Increased understanding of local resources, improved relationships with the public and stakeholders, and outlined plans/SOPs for programs.	Low	SLCo EM general funds, White City general fund, SHSP grant, HSGP grant	Short-term	Medium	Share data via social media, online, and hard copies, as well as coordinate with SLCo EM to identify community representatives that can amplify the mitigation message. For example, sharing opportunities for structural and non-structural retrofits to homes to address earthquakes.
3	Integrate WebEOC, Crisis Track, GIS, and other technological enhancements in White City.	Civil Disturbance, Drought, Wildfire, Earthquake, Extreme Heat, Flooding, Hazardous Materials Incident, Heavy Rain, High Wind, Landslide, Lightning, Public Health Epidemic, Radon, Severe Winter Weather, Terrorism, Tornado, Wildfire	White City	UFA, UPD, SLCo PW, SLCo Health Department, SLCo EM, UDEM, UDOT, utility companies, water districts, MSD	Provision of a common operating platform for stakeholders, increased situational awareness, improved response time.	Low	SLCo EM general funds, UFA general funds, White City general funds, HSGP grant, EOC grant program	Medium-term	Medium	Existing software that we just need additional documentation/training on.
4	Enhance and continue to promote the implementation of CERT and SAFE Hubs.	Civil Disturbance, Drought, Wildfire, Earthquake, Extreme Heat, Extreme Cold, Flooding, Hazardous Materials Incident, Heavy Rain, High Wind, Landslide/Slope Failure, Lightning, Public Health Epidemic/Pandemic, Radon, Severe Winter Weather, Terrorism, Tornado, Wildfire	White City	MSD, SLCo EM	Increased awareness of local resources.	Low	SLCo EM general funds, White City general funds, MSD general funds	Short-term	Medium	SAFE Hubs (previously S.A.F.E. Neighborhoods) is going through a rebrand currently with new public awareness campaign and information for all partners.
5	Establish access and functional needs registry and improve incorporation of those with access and	Civil Disturbance, Drought, Wildfire, Earthquake, Extreme Heat, Extreme Cold, Flooding, Hazardous Materials Incident, Heavy Rain, High Wind, Landslide/Slope Failure,	White City	MSD, SLCo EM	Increased situational awareness for the public and stakeholders, and greater understanding of resources available for those with access and functional needs.	Low	SLCo EM general funds, HSGP grant, White City general funds, MSD general funds	Short-term	High	The State of Utah's Access and Functional Needs Registry is dissolving in 2025. White City needs a way to account for those with access and functional needs,

	functional needs in plans.	Lightning, Public Health Epidemic/Pandemic, Radon, Severe Winter Weather, Terrorism, Tornado, Wildfire								including incorporation into plans/SOPs.
6	Procure generators and transfer switches for schools, public facilities, and critical facilities.	Extreme Heat, Extreme Cold	White City	SLCo EM, MSD, school districts	Provision of backup generators for cooling centers and Code Blue centers. Maintenance of an accurate inventory of what the county has to provide to other agencies or jurisdictions as needed.	Medium	White City general funds, SLCo EM general funds, MSD general funds, school districts, HMA grant	Long-term	Medium	
7	Increase the size of culverts and bridges.	Flooding, Heavy Rain, Severe Winter Weather,	SLCo Flood Control Engineering	SLCo EM, White City, MSD	Allowance for larger runoff during spring melt season, and reduce the amount of debris buildup.	High	SLCo PW capital improvement funds, UDOT, MSD capital improvement funds, White City general funds	Long-term	Medium	
8	Procure FMA grants in coordination with the MSD and SLCo EM.	Flooding, Heavy Rain	MSD	White City, SLCo Flood Control Engineering, SLCo EM	Increased understanding of grants available and how funds can be used for mitigation efforts.	Low	PDM grant, HMGP grant, FMA, NRCS grant, White City/MSD capital improvement budgets and bonds	Medium-term	Medium	
9	Develop an enhanced emergency notification communications system for White City.	Civil Disturbance, Drought, Earthquake, Extreme Heat, Extreme Cold, Flooding, Hazardous Materials Incident, Heavy Rain, High Wind, Landslide/Slope Failure, Lightning, Public Health Epidemic/Pandemic, Radon, Severe Winter Weather, Terrorism, Tornado, Wildfire	SLCo EM	MSD, UFA, UPD, White City, UDOT	Early notification of impending wildfire to decrease loss of life, improved relationships with the public and stakeholders, and faster delivery of information with templates/plans ready to go.	Medium	SLCo EM general funds, MSD general funds, White City general funds, HSGP grant, BRIC grant	Short-term	Medium	
10	Promote the Firewise Initiative and regularly review/update the Community Wildfire Protection Plan (CWPP) for White City.	Wildfire	UFA	SLCo EM, MSD, White City, FFSL	Increased awareness of the plan (for the public and stakeholders), increased eligibility for grants/other funding sources, and regular review of CWPP.	Low	SLCo EM general funds, MSD general funds, White City general funds, Community Wildfire Assistance grant, Fire Prevention and Safety grant	Short-term	Medium	
11	Conduct public awareness campaign on Tier 2 reporting software for chemical reporting.	Hazardous Materials Incident	UFA	SLCo EM, UPD, White City, Sheriff's Office	Increased understanding of Tier 2 reporting and how local agencies can find and submit information. Provision of a common operating platform for hazardous materials reporting.	Low	White City general funds, SLCo EM general funds, LEPC, State of Utah general funds, MSD general funds	Long-term	Medium	

DRAFT

#	Action	Hazard(s)	Lead Agency	Potential Partners	Benefits (Losses Avoided)	Cost Estimate	Funding Source(s)	Time-frame	Priority	Comments
12	Enact local regulations and codes for development to reduce landslide and slope failure damage to critical infrastructure and buildings.	Landslide/Slope Failure	MSD	SLCo EM, UFA, White City, SLCo Office of Regional Development, local utilities	Reduction in the likelihood of landslides and critical infrastructure/building damage, and ensuring that future development is up to code and follows policy to avoid repetitive loss properties.	Medium	SLCo EM general funds, MSD general funds, State of Utah general funds, White City general funds	Long-term	Medium	
13	Leverage WebEOC and GIS to track the spread of contagious disease.	Public Health Epidemic/ Pandemic	SLCo Health Dept	SLCo EM, UFA, MSD, UPD, Sheriff's Office	Use of GIS and WebEOC software to maintain situational awareness and track illnesses in White City.	Low	SLCo EM general funds, SLCo Health Department general funds, State of Utah general funds	Short-term	Medium	White City already has this software; need to improve training and documentation.
14	Create public awareness campaigns and public education programs on radon risks and provide home radon testing.	Radon	SLCo EM	SLCo Aging & Adult Services, UDEQ, SLCo Health Department, White City, MSD	Decrease in radon-caused cancer deaths, increase in engagement and understanding with the public on what SLCo and White City can do or help with.	Low	SLCo general funds, White City general funds, UDEQ general funds	Short-term	Low	
15	Develop road resurfacing project that includes permeable pavement for areas with rain-based flooding.	Severe Weather – Heavy Rain	SLCo Flood Control Engineering	SLCo Parks and Recreation Department, MSD, SLCo PW & Municipal Services, White City, UDOT	Reduction of pollutants discharged in runoff, reduction in maintenance time/costs on roads, and increase traction on roads.	High	SLCo Flood Control Engineering general funds, SLCo PW & Municipal Services general funds, UDOT general funds, FMA, HMGP grant	Long-term	Low	
16	Create a public education program for property owners to learn about tree maintenance and high strength windows	Severe Weather – High Wind	SLCo EM	SLCo Aging & Adult Services, SLCo PW & Municipal Services, UFA, White City, MSD, NWS	Reduction in damage during high wind event to critical infrastructure, prevention of personal injuries (people driving on roads or walking in the neighborhood), and improvement of relationships with stakeholders and the public.	Low	SLCo PW & Municipal Services general funds, SLCo EM general funds, White City general funds, MSD general funds, UFA general funds	Short-term	Low	
17	Develop a severe winter weather mitigation program to maintain access to primary roadways and evacuation routes.	Severe Winter Weather – Heavy Snow, Blizzard	SLCo PW & Municipal Services	SLCo EM, White City, MSD, UDOT, NWS	Use of roads by emergency services like police, fire, and paramedics to provide their services.	Low	MSD general funds, SLCo PW & Municipal Services general funds, White City general funds	Short-term	High	A severe winter storm with heavy snowfall requires our operators and equipment to be used to clear roads and streets for the public and emergency vehicles to use. The primary effort will be to keep the roads open by clearing snow.
18	Conduct public awareness campaign about lightning safety.	Severe Weather – Lightning	White City FD	SLCo Parks and Recreation, UFA, SLCo PW & Municipal Services, SLCo EM, MSD	Increase in lightning strike awareness for the public.	Low	SLCo general funds, MSD general funds, White City general funds	Short-term	Low
