COPPERTON COUNCIL MEETING AGENDA
August 20, 2025

Bingham Canyon Lions Club
8725 Hillcrest St.
Copperton, Utah 84006

****AMENDED AGENDA****

Wednesday, August 20, 2025 – 6:30 PM

The public is encouraged to attend

PUBLIC NOTICE IS HEREBY GIVEN that the Copperton Council will hold a meeting on the **20th day of August 2025** at the Bingham Canyon Lions Club, 8725 Hillcrest St., Copperton, Utah as follows:

***** Portions of the meetings may be closed for reasons allowed by statute. Motions relating to any of the items listed below, including final action, may be taken.***

1. **REGULAR MEETING**
   a. Call to Order
   b. Determine Quorum
   c. Pledge of Allegiance

2. **COMMUNITY INPUT**
   a. Recognize Visiting Officials
   b. Unified Fire Authority (UFA) – ***Chief Nathan Bogenschutz***
      i) Second Quarter Report
   c. Unified Police Department (UPD) – ***Lt. Christopher Benedict***
      i) Introducing Detective Lechuga

3. **WORKSHOP DISCUSSION**
   a. Workshop Discussion on Town Council Emergency Communications – ***Madison Warner, Emergency Municipal Planner***

4. **CONSENT AGENDA** (Discussion/Motion)
   a. Approve Council Meeting Minutes
      i) July 16, 2025
   b. Fiscal Items - ***Mayor Sean Clayton***
      i) Approval of expenditures

5. **PRESENTATION ITEMS**
   a. Hazard Mitigation Plan – ***Madison Warner, Emergency Municipal Planner***

6. **COUNCIL BUSINESS** (Discussion/Motion)
   a. Discussion Regarding Recent Dust Concerns in Copperton – ***Ryan Perry, Rio Tinto***
   b. Dump Voucher Program – ***Council Member Tessa Stitzer***
   c. Bingham Cemetery Board – ***Council Member Tessa Stitzer***
   d. Discussion Regarding **Ordinance 2025-O-05**, Restating Titles 1 (General Provisions) and 2 (Administration) of the Copperton Municipal Code to Comply with H.B. 35 – ***Nathan Bracken, Legal Counsel***

e. UPAHEAD – Emergency Text and Council Messaging Policy Updates – ***Council Member Tessa Stitzer***

7. **COMMITTEE/BOARD UPDATES** (Discussion/Motion)
   a. Legal Updates – ***Nathan Bracken, Attorney***
   b. Bingham Cemetery Board – ***Council Member Stitzer***
   c. Copperton Community Council – ***Council Member Stitzer***
   d. Planning Commission – ***Council Member Severson***

8. **COPPERTON COUNCIL REPORTS** (Discussion/Motion)
   a. Mayor Clayton
      i) Greater Salt Lake Municipal Services District (GSLMSD)
      ii) Council of Governments (COG)
   b. Council Member McCalmon
      i) Unified Police Department (UPD)
      ii) Salt Lake Valley Law Enforcement Service Area (SLVLESA)
   c. Council Member Bailey
      i) Unified Fire Authority (UFA)
      ii) Unified Fire Service Area (UFSA)
   d. Deputy Mayor Stitzer
      i) Wasatch Front Waste and Recycle (WFWRD)
   e. Council Member Severson
      i) Salt Lake County Animal Services

9. **OTHER ANNOUNCEMENTS** (Discussion/Motion)
   a. Public Comment

Please state your name and address for the record. Limit comments to 3 minutes per person.

   b. Announcements

10. **CLOSED SESSIONS IF NEEDED AS ALLOWED PURSUANT TO UTAH CODE §52-4-205**
   a. Discuss the character, professional competence, or physical or mental health of an individual (§ 52-4-205(1)(a))
   b. Discuss pending or reasonably imminent litigation (§ 52-4-205(1)(c))
   c. Discuss the purchase, exchange, or lease of real property (§ 52-4-205(1)(d))
   d. Discuss the deployment of security personnel, devices, or systems (§ 52-4-205(1)(f))

11. **ADJOURN**

ZOOM:
Topic: Copperton Council Meeting
Time: August 20, 2025 06:30 PM Mountain Time (US and Canada)
Join Zoom Meeting

COPPERTON TOWN COUNCIL MEETING

JULY 16, 2025, 6:30 PM
BINGHAM CANYON LIONS CLUB
8725 HILLCREST STREET, COPPERTON, UTAH 84006

COPPERTON TOWN COUNCIL MEETING MINUTES

****DRAFT MINUTES – UNAPPROVED****

JUNE 18, 2025

DRAFT

Council Members Present:
Sean Clayton, Mayor
Tessa Stitzer, Mayor Pro Tempore
Kathleen Bailey, Council Member
Linda McCalmon, Council Member
Kevin Severson, Council Member

Council Members Excused: None

Staff Present:
Nathan Bracken, Legal Counsel (Via Zoom)
Diana Baun, Town Clerk
Dan Torres, Economic Development Manager
Chief Nathan Bogenschutz, UFA
Lt. Chris Benedict, UPD
Sgt. George Jeknavorian, UPD

Others Present:

1. **REGULAR COUNCIL MEETING**

Mayor Clayton, presiding, called the meeting to order at 6:30 PM and noted a quorum was present.

The Pledge of Allegiance was recited.

2. **COMMUNITY INPUT**

   a. **Recognize Visiting Officials** – None

   b. **Unified Fire Authority (UFA)**

Captain Jackson reported on behalf of Chief Bogenschutz, who had been excused due to deployment to New Mexico for flood response. Captain Jackson stated that Station 115 handled 12 calls for service in June. Mayor Sean Clayton expressed appreciation to the responders for extinguishing a recent field fire. Council Member Kathleen Bailey asked how many trucks responded to the fire. Captain Jackson stated that Station 115 sent both its engine and brush truck, and that additional brush trucks responded from West Jordan, South Jordan, and Kennecott. In response to a later question from Kathleen Bailey about the fire's cause, Captain Jackson stated that the origin was unknown, noting only that it appeared to have started beneath a power pole and might have involved a spark.

Council Member Kevin Severson asked whether Station 115 had responded to a vehicle-into-building collision near a Domino's in Herriman. Captain Jackson confirmed that the station's rehab unit responded to that incident and added that, since then, the unit had also responded to several gas leaks and other vehicles-into-buildings incidents, with the department taking greater safety precautions than it had the prior month. Council Member Severson also described being nearby at the time of the Domino's crash.

d. Unified Police Department (UPD)

Lieutenant Chris Benedict reported in place of Chief Craig, who was out of town. He introduced Sgt. George Jeknavorian as the successor to Sergeant Harry Holt, who had transferred to Millcreek, and stated that George Jeknavorian had assisted with Fourth of July planning, was still covering patrol, and would officially transfer to the COP unit on the 27th of the month. He added that Sergeant Borders was absent due to an out-of-county firefighter callout.

Sgt. George Jeknavorian stated that he lived in West Jordan, had served as a police officer with the county and the Unified Police Department for 19 years primarily in patrol, and was available to the council for any needs or suggestions as he transitioned into the new position.

Council Member Tessa Stitzer stated that they had an extended conversation with George Jeknavorian earlier and expressed that the discussion had gone well.

Lieutenant Chris Benedict stated that call statistics (Attachment A) for the prior month were affected by a cell tower outage that misrouted 911 hang-ups to Copperton, which made the report show 100 calls for service. He clarified that actual activity involved approximately 19 calls for service generating nine long-form cases and 10 short-form information reports, which he characterized as slightly down from typical levels. He stated that public order incidents—including suspicious circumstances, welfare checks, and neighbor disputes—numbered five and were consistent with seasonal patterns, and he noted that firework complaints could be included in that category. He stated that he was working to compile canine and shared service statistics for a year-to-date update at the next meeting in order to demonstrate recent major cases and the effectiveness of the UPD shared services model.

Council Member Kathleen Bailey asked what constituted a "morals offense," and Lieutenant Chris Benedict stated that the category could include things like public indecency.

DRAFT

Mayor Clayton moved the order of the agenda around slightly, inviting the representatives from Wasatch Front Waste and Recycling District to give their presentation scheduled for later in the meeting at this time. Those notes are under Item 5A in the minutes.

3. WORKSHOP DISCUSSION

a. Workshop Discussion on Bingham Cemetery Board

Council Member Tessa Stitzer opened an informal discussion regarding the Copperton Cemetery Board, noting that the board still consisted of the same three members who had served since the board's creation in 2016–2017. She stated that the three members—herself, Jerry, and Tammy—had worked well together to maintain records, maps, events, and burials, and that she and Jerry performed most of the interments. She said none of the current members intended to step down, but the ordinance establishing the board contained three-year term limits, which she suggested should be reconsidered. She noted that interments required specific training and experience, which made open applications difficult when a seat became vacant, and that the ordinance was amended in 2019 to require a council member to chair the board for oversight. She recommended eliminating term limits and appointing members as needed.

Mayor Sean Clayton asked why term limits were necessary, stating that the work was specialized and difficult to learn. He suggested removing the term limit and potentially removing the requirement that a council member chair the board, though he supported continuing oversight through liaison or point-of-contact arrangements. Council Member Kathleen Bailey stated that the council now had more understanding of cemetery operations than when the ordinance was created.

Nathan Bracken advised caution against eliminating terms altogether, recommending that the council retain term lengths but remove restrictions on the number of terms a member could serve. He compared the board to a planning commission, noting that terms allowed for periodic reassessment and continuity. He also advised that the board adopt rules of order and comply with open meeting requirements. He explained that sensitive discussions related to burials could be conducted in closed session under the law. Mayor Sean Clayton asked whether the board's role could be restructured so that it would not fall under open-meeting requirements, but Nathan Bracken said the board still qualified as a public body. Council Member Kathleen Bailey supported keeping terms, saying they allowed for orderly rotation when needed.

Council Member Tessa Stitzer raised concerns about complying with the Open and Public Meetings Act when most board meetings involved private family arrangements for burials. Nathan Bracken said closed sessions could be used for such matters, though Council Member Tessa Stitzer noted the difficulty of calling frequent closed sessions on short notice. Mayor Sean Clayton suggested the board function as staff or contractors rather than as an advisory body, but Nathan Bracken said the board still held authority to make decisions. The council discussed whether cemetery revenues were tax-based or fee-based, and Nathan Bracken agreed that since revenues came from fees, there might be an argument that the board was not a public body, but further clarification was needed.

DRAFT

Council Member Tessa Stitzer explained that Copperton's situation differed from other towns that hired sextons or contractors, and that equipment rentals for burials were increasingly expensive and hard to secure. She said recent rentals cost over $1,000 each time, sometimes nearly the full amount charged for an interment, leaving little margin. She and Jerry often operated rented equipment themselves or even dug by hand. She said the board was considering grant funding to purchase equipment and reduce long-term rental costs. She also raised concerns about insurance coverage for volunteers operating heavy machinery, though Mayor Sean Clayton stated they were covered under the town's volunteer policy.

The council discussed raising cemetery fees, which had not changed since 2019. Council Member Tessa Stitzer presented options for 15, 20, and 25 percent increases, stating the current plot fee was $500 and that a 25 percent increase would raise it to $625. She emphasized that the greater expense was interment costs, not the plots themselves. Council Member Kevin Severson and Council Member Kathleen Bailey noted that the fee increase would help cover expenses, and Council Member Linda McCalmon said the board needed to ensure the increase covered costs adequately.

Mayor Sean Clayton suggested charging different rates for residents and non-residents, similar to Riverton Cemetery, where residents paid $1,200 and non-residents paid $3,000, but Council Member Tessa Stitzer and Jerry said residency distinctions were difficult to manage given long-time residents who had moved away. Council Member Kathleen Bailey also pointed out that Copperton residents did not pay property taxes to support the cemetery, unlike Riverton.

The discussion turned to whether board members such as Jerry should receive compensation. Jerry said he and Tammy had invested substantial unpaid time in cemetery work, often six hours or more for a single grave, and suggested compensation could take the form of grave plots rather than money. Council Member Kathleen Bailey supported compensation, and Mayor Sean Clayton suggested the possibility of contracting the work as a business arrangement, which would allow fair pay and the use of owned equipment.

Council Member Tessa Stitzer raised the possibility of contracting out annual cemetery clean-up since volunteer turnout had dwindled, noting only five volunteers had come the previous year. She said rentals and supplies for cleanup days often cost over $1,000, with most costs borne by the board. Mayor Sean Clayton questioned whether such cleanups were required by contract, concluding they were not, though Council Member Tessa Stitzer emphasized the importance of keeping the cemetery presentable for families.

The council also discussed how burial payments were currently handled, with Council Member Tessa Stitzer personally receiving checks and forwarding them for deposit, and she asked for a more formalized system through the Municipal Services District. The council agreed to plan further meetings to review fee increases, ordinance amendments, and possible changes to board structure, with Council Member Tessa Stitzer committing to draft notes for council review.

Mayor Sean Clayton summarized that the council had discussed several options, including fee increases, possible compensation for board members, contracting services, or even selling the

DRAFT

cemetery. Council Member Tessa Stitzer provided background on how Copperton inherited the cemetery from the Jordan School District when it could no longer maintain it. She said the cemetery originated as part of Bingham Canyon, transferred to the school district after the city dissolved in the 1970s, and then to Copperton upon incorporation. She concluded by expressing appreciation for Jerry and Tammy's work on the board. The mayor and council agreed the discussion provided useful direction for potential ordinance and fee changes at the next meeting.

4. CONSENT AGENDA

a. Approve Council Meeting Minutes

i) June 18, 2025

Council Member Stitzer moved to approve the June 18, 2025 Council Meeting Minutes as published. Council Member McCalmon seconded the motion; vote was 5-0, unanimous in favor.

b. Fiscal Items - Mayor Clayton

i) Approval of expenditures

Mayor Clayton asked for approval of $1638.00 in legal fees in June, as well as Insurance costs of $1638.00.

Council Member Bailey moved to approve the expenditures listed above as stated. Council Member Stitzer seconded the motion; vote was 5-0, unanimous in favor.

5. PRESENTATION ITEMS

a. Wasatch Front Waste and Recycling District Presentation

Pam Roberts presented an update on solid waste and recycling services and explained recent billing questions and the reasons for the price increase. She stated that the residential fee was $26 per month billed quarterly at $78, up from $58.50 per quarter, and said the increase was driven by cost growth the agency had not fully kept up with since its last pre-2023 adjustment. She said overall costs had risen about 40 percent, particularly for labor, and described a "pay-for-experience" approach to attract and retain CDL drivers, along with a board-approved market adjustment that added approximately $300,000 in annual labor cost for CDL positions. She said a financial advisory review by Zions Bank recommended a $6.50 increase this year and additional $1.50 increases in 2026 and 2027, but she was working to defer the latter and believed the next increase might be needed in 2027. She reviewed included services—weekly garbage and recycling; seasonal container reservations; Christmas tree collection; leaf bags; a landfill voucher; and can repair and replacement—and noted carts cost over $70 each but black and blue cart repairs and replacements were covered by the standard fee.

Council Member Kevin Severson asked whether the pay-for-experience pay structure had improved recruiting, and Pam Roberts stated that it had.

DRAFT

Pam Roberts detailed cost-control measures, stating that the agency changed equipment for the leaf-bag program and downsized certain trucks, which she said would save about $136,000 this year and $7,000 per replacement cycle thereafter. She explained a tighter process for “go-backs,” under which staff verify missed-can calls with route dash-cam footage because test runs showed about 46 percent of such calls were false; she said collection mileage cost about $25 per mile and reported savings of just over $47,000 from January through June. She reviewed fleet constraints, stating that side-loader trucks were on a seven- to eight-year replacement schedule, four trucks ordered in 2023 had only recently arrived, new CNG trucks cost about $450,000 each versus $400,000 for diesel, and the resale market for used CNG trucks had weakened. She said the board approved purchasing eight diesel trucks, which she said would save $400,000 overall and were expected to have better resale prospects. She added that the agency reduced staffing by four positions—two through vacancies and additional layoffs—and reassigned duties after the quality-assurance inspector retired. She then reported on the seasonal container reservation program, stating it was in its sixth year, the prior street-pile model was no longer feasible due to staffing and illegal dumping, and the former program had required 20 CDL drivers and six ground crew while the current model operated with nine CDL drivers. She said Copperton received 100 percent of requested reservations in 2024 and 2025, that routing moved clockwise through the district, and that Copperton’s 2025 reservations occurred in June with a brief period left open for residents to book remaining containers.

James Kelsey, Sustainability Coordinator, presented recycling and diversion metrics for Copperton. He stated Copperton’s diversion rate was 16.05% in 2024 and 16.63% year-to-date in 2025 against a district goal of 18%. He said Copperton included 285 homes, or approximately 0.33 to 0.36 percent of district customers, generated 393 tons of refuse in 2024 and about 152 tons year-to-date, and produced 69 tons of recycling in 2024 with about 28 tons year-to-date. He reported five tons of green waste in 2024 and roughly 1.5 tons year-to-date with nine subscribers, and he corrected minor typos in a displayed chart regarding Copperton’s share and green-waste proportions. He said Copperton’s clean-recycling rate improved from 66.97 percent in 2021 to 79.5 percent in 2024, and was 78.5 percent year-to-date in 2025, close to the district’s 80 percent target. He explained that processing fees at the material recovery facility depended on market commodity prices, inbound material composition, and contamination rates, and he described the agency’s efforts to reduce contamination through route audits, public education, and increased driver participation, noting driver-submitted contamination reports rose from two last year to 16 this year.

Council Member Kevin Severson asked for clarification on “contamination rate,” and James Kelsey defined it as the presence of non-recyclable materials in recycling loads, citing common contaminants such as plastic bags, Styrofoam, and green waste. In response to a follow-up from Kevin Severson, James Kelsey said leftover product in otherwise recyclable containers accounted for a very small portion of contamination. Council Member Kathleen Bailey asked about wet cardboard, and James Kelsey stated that the processor allowed some moisture but encouraged residents to keep lids closed and break down boxes to minimize moisture.

James Kelsey described data-tracking methods using monthly sample sorts for each city to measure contamination and composition and to target education. He said estimates from 12

DRAFT

sample sorts in 2024 showed Copperton's recycling stream was approximately 58.5% cardboard by weight, with additional components including mixed paper, HDPE (natural and colored), PET drink bottles, aluminum, tin, and mixed plastics such as tubs, jars, and clamshells; he advised keeping caps on plastic bottles so lids could be captured during processing. Council Member Tessa Stitzer asked about pizza boxes, and James Kelsey said they were acceptable if clean and not saturated with grease or food, which Council Member Stitzer interpreted as recycling the clean lid and discarding a soiled bottom. He concluded with estimated annual resource savings attributable to Copperton's recycling—approximately 322,000 gallons of water, 782 mature trees, about 239,000 kilowatt-hours of electricity, a reduction of 55 metric tons of greenhouse gases (roughly the equivalent of 12 passenger vehicles per year), and about 115 cubic yards of compacted landfill space—and said further gains could come from increased participation in the green-waste program.

Mayor Sean Clayton thanked the presenters, stated appreciation for the savings efforts alongside the necessary price increases, and said the council understood that efforts were being made on both sides of the ledger. Council Member Kathleen Bailey congratulated Pam Roberts on retirement.

6. COUNCIL BUSINESS

a. Discussion and Potential Approval of FY2026 Copperton Town Insurance Policy

Mayor Sean Clayton introduced the annual renewal of the town's liability insurance and reported that the overall cost came in lower than the prior year. He stated that the general liability portion was $7,016.69, which was approximately $1,500 less than last year. He said the property insurance, covering the park, playground, bathrooms, and shed, was $2,158.58, and the workers' compensation coverage, which was required, was $636.30, reflecting a $70 decrease from the prior year. He noted the deductible was $1,000 and the assets were valued at $1.3 million. He recommended renewing the coverage through Utah Local Governments Trust and credited Brian Hartsell for working to reduce the cost.

Council Member Stitzer moved to approve the FY2026 Copperton Town Insurance Policy as presented tonight. Council Member McCalmon seconded the motion; vote was 5-0, unanimous in favor.

b. UPAHEAD – Emergency Text and Council Messaging Policy Updates

Council Member Tessa Stitzer reported that the Municipal Services District would have a booth at Copperton Town Days on August 23, where residents could sign up for services, provide feedback, and make suggestions.

Mayor Sean Clayton suggested that the town consider publishing some of the recycling and sustainability metrics presented earlier by Pam Roberts and James Kelsey, such as tree and energy savings, on the town website and in UPAHEAD notices. Council Member Tessa Stitzer said UPAHEAD could be used for that purpose and noted that the Wasatch Front Waste & Recycling District app already provided detailed information and was easy for residents to use.

Council Member Tessa Stitzer then raised the need for a coordinated procedure for sending alerts during emergencies, such as the recent fire, to ensure consistent messaging. She emphasized that if

DRAFT

the incident occurred on private property, such as Rio Tinto's, council members should seek approval from those property owners before issuing alerts. For incidents on town property, she recommended that messages go through the mayor, with all council members communicating via group text or phone to ensure alignment before posting.

Mayor Sean Clayton asked Nathan Bracken whether other municipalities had reverse-911 or similar emergency alert systems, noting that he would like to review their policies. Nathan Bracken stated that Magna Water used such a system under contract but did not appear to have a separate policy, and he noted that other communities often used these systems for general notices rather than emergencies.

Council Member Tessa Stitzer said UPAHEAD was effective in reaching residents quickly but asked how the council could formalize a process to ensure messages were handled properly. Diana Baun reported that Emigration Canyon used CodeRED, with one council member authorized to send alerts but only after receiving approval from the full council, though no written policy existed. Council Member Tessa Stitzer said most UPAHEAD posts were managed by Maridene Alexander, but she herself had full access and could post if needed. She urged the council to establish a clear agreement on communication responsibilities.

Mayor Sean Clayton suggested separating responsibilities, such as having Maridene handle event notifications while a council member managed emergency alerts. Council Member Tessa Stitzer noted UPAHEAD allowed multiple groups to be created for such purposes.

Madison Warner offered to attend a future meeting to share information on how other municipalities managed their alert systems and to help Copperton create a plan tailored to its needs. Mayor Sean Clayton asked Diana Baun to add that item to the next meeting agenda. Council Member Tessa Stitzer added that while informal communication during the recent fire had worked, it was not efficient, and a more streamlined process was needed. Mayor Sean Clayton agreed and said he would also consult with Joe to gather details about another municipality's program in advance of the next discussion.

7. <u>STRATEGIC SESSION</u> - None

8. <u>COMMITTEE/BOARD UPDATES</u>

a. Legal Updates – ***Nathan Bracken, Legal Counsel***

Nathan Bracken reported that he had participated in a second Salt Lake Valley Law Enforcement Service Area (SLVLESA) facilitated discussion earlier that day. He stated that the discussions were going well, that positive progress was being made, and that he would provide the mayor and council with a confidential summary by email.

b. Bingham Cemetery Board – ***Council Member Tessa Stitzer***

None – discussed previously in the meeting.

c. Copperton Community Council – ***Council Member Tessa Stitzer***

Council Member Tessa Stitzer provided a Community Council update, noting that Copperton Town Days would take place on August 22, followed by Movie in the Park on August 23. She

DRAFT

stated it would be a full-day event with both the Municipal Services District and the Copperton Council hosting booths, and she explained that she coordinated and ran the event, which required her to be actively involved throughout the day.

Council Member Sean Clayton asked who the council should contact to obtain an EZ-Up shade tent with the Copperton logo. Diana Baun said Maridene would likely be the right contact. Mayor Sean Clayton asked that Maridene be consulted about acquiring one.

Council Member Tessa Stitzer also reported that BINGO continued to take place and was receiving positive reviews.

d. Planning Commission – ***Council Member Kevin Severson***

No updates – no meeting since last update.

9. COPPERTON COUNCIL REPORTS

a. Mayor Sean Clayton

i) Greater Salt Lake Municipal Services District (GSLMSD)

ii) Council of Governments (COG)

Mayor Sean Clayton provided an update on the Greater Salt Lake Municipal Services District, stating that recent meetings had been relatively short and that the board was considering reducing the schedule to one meeting per month. He said the board continued to approve contracts and budget transfers, and he complimented Daniel Torres, Tamaran, and Daniel Hoffman for their work on operations, cataloging assets, and the new MSD building, which he said was less expensive than leasing county space and provided the district with its own facility. He also noted there had been election-related disputes in other areas of the MSD, but Copperton could use the situation as a learning opportunity since services were now managed internally rather than by the county. He reported that Dan Torres had shared maps with him and Council Member Tessa Stitzer and that he met separately with the Utah Department of Transportation (UDOT) to discuss Bacchus Highway realignment. He said UDOT planned within the next two years to straighten routes in the area, extend 9000 South through to Bacchus, and potentially abandon New Bingham Highway, which the state would transfer to West Jordan for maintenance. He explained that UDOT typically required a road exchange when transferring state routes to local governments, but Copperton had no roads to trade. He said Daniel Torres and Lizel at MSD were helping explore ways to secure fair treatment, such as ensuring the road was brought up to standard and establishing a perpetual maintenance fund. He said if Copperton assumed responsibility, the highway segment within town would become a town asset, which would allow Copperton to control crosswalks, speed features, and design.

Council Member Tessa Stitzer asked about renaming the road, recalling the difficulties residents experienced with address changes during a past renaming effort. She recommended

DRAFT

keeping the existing name, while Mayor Sean Clayton suggested “Old State Highway” as a possible option. Council Member Tessa Stitzer also reported that roadwork completed 4–5 years earlier at the west end of town, near Immaculate Conception Church, was sinking, and she believed the drainage work had been poorly done. Mayor Sean Clayton said that with UDOT’s renewed attention, Copperton would have an opportunity to require corrective work.

Mayor Sean Clayton also said he would soon meet with Tamaran and the contractor for a final walk-through of the first phase of the road project to ensure any damage caused during construction was repaired. He cited an example of a gutter near his home that had been replaced after he reported damage. He asked council members to notify him of any additional issues so they could be included in the final checklist before sign-off. He said the completed phase represented an $800,000 investment, while the second phase would be four times larger, estimated at $3 million, though it had not yet been bid and no contractor had been selected.

b. Council Member Linda McCalmon

i) Unified Police Department (UPD)

ii) Salt Lake Valley Law Enforcement Service area (SLVLESA)

Council Member Linda McCalmon delivered the Unified Police Department update, reporting that the UPD budget had been approved at $64.4 million, an increase of $2.74 million from the prior year. She explained that despite the increase, significant cuts were also made. The budget included a 2.5% markup, a 2.5% cost-of-living adjustment, an 8.3% increase in health insurance costs, seven additional sworn positions, a 1.25% increase in part-time positions, and an overall increase of 3.34%.

She also reported on Salt Lake Valley Law Enforcement Service Area (SLVLESA) matters, stating that the board had reviewed and approved the annual financial report and audit, which went smoothly. She said Rachel provided an update on the Salt Lake County facilitation process, noting that a related meeting was scheduled the following Tuesday. She concluded that the facilitation process appeared to be going well and that the SLVLESA meeting itself was brief.

c. Council Member Kathleen Bailey

i) Unified Fire Authority (UFA)

ii) Unified Fire Service Area (UFSA)

Council Member Kathleen Bailey noted that the meetings had been routine because the budget had already been completed. She reported on growing concerns related to lithium battery fires. She explained that these batteries, found in products such as electric scooters, bikes, and Teslas, were increasingly causing fires. The fires were most often linked to B-grade batteries purchased through vendors such as Amazon, which were not designed for the intended machines but could be adapted for use. These lower-quality batteries burned hotter than recommended ones and could not be extinguished with a regular fire extinguisher. Council Member Bailey cautioned that storing Teslas in garages could present risks and added that public relations efforts would be launched to encourage residents not to leave scooters or

DRAFT

bikes plugged in at all times. She further advised that batteries showing excessive heat or performance issues should no longer be used. She emphasized that precautions should be taken when children brought scooters into facilities like the Recreation Center or parked them at home, reiterating the importance of not leaving them charging continuously.

Mayor Clayton asked whether there was room during Town Days for agencies such as Unified Fire Authority (UFA), Wasatch Front Waste and Recycling District (WFWRD), and Unified Police Department (UPD) to provide informational materials to the public. Council Member Bailey inquired whether UPD was planning a booth. UPD representatives responded that no plans had been made yet, but they would consider participating. The council extended an invitation for UPD to join their booth or space to distribute materials. Mayor Clayton concluded that this type of outreach would be a valuable opportunity to share important safety information with the community.

d. Deputy Mayor Tessa Stitzer

i) Wasatch Front Waste and Recycle (WFWRD)

No updates other than what was discussed earlier in the meeting.

e. Council Member Kevin Severson

i) Salt Lake County Animal Services

No updates at this time – there will be a meeting in two weeks.

10. OTHER ANNOUNCEMENTS

a. Public Comment

David Sanderson spoke on behalf of the Bingham Fireman's Association. He explained that the organization, which traditionally hosted races during the 4th of July festivities, now had only five members, with minimal participation beyond himself, his father, and occasional support from others. He stated that the races cost approximately $1,100 each year, with the Community Council previously contributing $800 annually to offset expenses. This year, however, the contribution was reduced to $500, leaving the Association to cover an additional $600. Sanderson requested that the Town of Copperton contribute $500 to assist with costs, noting that the Association had about four years of funding left and was uncertain how much longer the races would continue given the aging membership. He added that the event had attracted over 225 children this year, based on candy distribution.

Mayor Sean Clayton responded that the Town could likely assist and asked for Sanderson's email address in order to provide him with a form to complete. Mayor Clayton explained that once the form was submitted, the request would be brought before the council at its next meeting for approval and payment. Mr. Sanderson provided his email address for follow-up.

Council Member Tessa Stitzer clarified that the Community Council's decision to reduce its contribution from $800 to $500 was to ensure continued funding for BINGO events, which typically drew about two dozen participants, while still leaving room to increase the budget in the future. Mr. Sanderson acknowledged the change and restated that his group had

DRAFT

personally covered around $600 this year. Council Member Kathleen Bailey asked whether the Association was seeking new membership. Mr. Sanderson responded that the Association had essentially ceased to exist, with little likelihood of revival, and anticipated that the tradition would eventually end. He noted that this might also affect the Lion's Club since the two activities were connected, though for now, volunteers and family members still assisted with setup and operations.

Laura Ingersoll, representing Rio Tinto, also spoke. She offered to provide additional details regarding a recent fire, though not all information could be released immediately. She said she could follow up at the next meeting or provide a report from emergency services if requested. She reminded the council that Copperton's day at the mine was scheduled for August 6 and that free tickets had already been posted on Facebook. Council Member Stitzer noted that notices had also been distributed through UPAHEAD. Ms. Ingersoll explained that tickets would be provided, consistent with other cities, and that flyers would be delivered door-to-door to ensure residents were informed.

Leann Akeron announced that the Copperton Improvement District (CID) would begin issuing fines for watering on Sundays. She explained that due to well problems, residents had been asked not to water on that day, but increasing violations, including by Kennecott, had led to enforcement measures. After a first warning, residents would be fined $50. Council Member Stitzer asked how the fine would be enforced and collected. Ms. Akeron responded that fines would be added to utility bills and that violations could be verified through photos or in-person checks, with door-to-door notifications given for initial warnings. Council Member Linda McCalmon inquired whether watering could resume at 12:01 a.m. on Monday for those scheduled to water that day, and Ms. Akeron confirmed it could. She also explained that repair parts for the wells were difficult to obtain and often required long wait times. Council Member Stitzer asked about long-term plans to address aging equipment. Ms. Akeron replied that while water systems inevitably broke down, repairs and rebuilds were ongoing, allowing the system to remain functional despite the challenges.

Jonathan Pratt asked whether there had been any updates to the annexation plan that had been drafted approximately three years earlier. Council Member Stitzer replied that there were no updates available at this time but promised to provide information in the future if changes occurred.

b. Announcements

Nathan Bracken requested time on the August council agenda to present restated Code Sections 1 and 2 and a related council governance item. He stated that the purpose was to finalize the transition from the metro township form of government to a five-member council form of government and to ensure the framework was in place ahead of upcoming elections.

11. CLOSED SESSIONS IF NEEDED AS ALLOWED PURSUANT TO UTAH CODE §52-4-205

DRAFT

a. Discuss the character, professional competence, or physical or mental health of an individual (§ 52-4-205(1)(a))

b. Discuss pending or reasonably imminent litigation (§ 52-4-205(1)(c))

c. Discuss the purchase, exchange, or lease of real property (§ 52-4-205(1)(d))

d. Discuss the deployment of security personnel, devices, or systems (§ 52-4-205(1)(f))

12. ADJOURN

Council Member Severson moved to adjourn the City Council Meeting. Council Member McCalmon seconded the motion; vote was 5-0, unanimous in favor.

The July 16, 2025 Town Council Meeting adjourned at 8:38 P.M.

This is a true and correct copy of the July 16, 2025 Town Council Meeting Minutes, which were approved on August 20, 2025.

Attest:

Sean Clayton, Mayor

Diana Baun, Town Clerk

Wasatch Front Waste and Recycling District

Report for Town of Copperton Council Meeting Wednesday, July 16, 2025

OUR VISION: A SUSTAINABLE ORGANIZATION THAT PROVIDES FOR THE WELFARE OF OUR COMMUNITIES.

OUR MISSION: TO PROVIDE SUSTAINABLE QUALITY INTEGRATED WASTE AND RECYCLING COLLECTION SERVICES FOR THE HEALTH AND SAFETY OF OUR COMMUNITY…BECAUSE NOT EVERYTHING FITS IN THE CAN.

Sustaining WFWRD Services with the 2025 Fee Increase

The District has experienced 40% overall increased costs ($6,000,000) since 2020 related to needed salary market adjustments and pay for work experience to boost recruitment/retention especially CDL drivers, the Driver Apprentice Program, safety/training, project management & data analysis. There have also been increases for truck maintenance up 47%, replacement truck purchase prices are up 35%, fuel is up 65% and garbage tip fees are up 8%.

Knowing this, and with the advice from the financial advisory team at Zions, the WFWRD Board approved a $6.50 per month fee increase for 2025 (33%) to sustain service levels. The monthly fee is now $26.00 per month/$78.00 per quarter/$312.00 annual for the following services:

- Weekly curbside garbage and recycling collections.
- Seasonal Container Reservation Program (SCRP) with the goal of at least 60 container deliveries per day. (Mid-April through September)
- Can Repair and Replacement.
- Seasonal Services: Central leaf bag collections and curbside Christmas tree collections.
- Landfill Vouchers for a residential truck, car, or trailer load.
- Central glass collections.

Fee History: The last fee increase was implemented in 2023 after five years since our previous fee increase. Hindsight: Waiting five years was too long and $2.50 wasn't enough. We lost the time value of money.

- 2023: $2.50 per home/month increase to $19.50 per month/$58.50 per quarter/$234.00 annual.
- 2018: $2.25 per month, to $17.00 per month/$51.00 per quarter/$204.00 annual.
- 2014: $2.00 per month, from $12.75 to $14.75.
- 2011: $1.75 per month, from $11.00 to $12.75 per month.

WASATCH FRONT
Waste & Recycling District

Financial Stewardship to Reduce Costs

Operations and Staff Changes to Reduce Costs As Follows:

1. **Leaf Bag and Trailer Services**: Changed the type of equipment used for trailers and we saved $68,000 on light duty truck replacements by downsizing to one-ton pick-ups. We will also keep one aging pickup rather than replace and save another $68,000. ($136,000 saved in 2025) Estimated annual replacement savings $7,000.

2. **"Go-Backs":** WFWRD receives reports from residents stating that their can was missed on their collection day. There are high costs associated with going back at $25.00 per mile. (Fully-loaded cost.)

- We conducted two separate 2-week tests in 2024 to verify through dash camera footage if we missed cans, or if resident(s) didn't have their cans out, or they set their cans out after our driver has gone by. Findings: **46% were false** while 54% of the reports were valid.
- Starting in January, the Customer Service Reps began viewing dashcam footage to verify missed pick-ups. If we did miss, we will go-back on the go-back scheduled day. If we did not miss, customer education follows to reduce false reports in the future. (Reminder to have your cans out by 7:00 a.m. on collection day.)
- The results for January through June 2025 is $47,399 in reduced costs. Our goal is to save $150,000 in 2025 by reducing unnecessary go-backs.

3. **2025 Residential Collection Truck Replacements**: The Board voted to save $400,000 on capital purchases by ordering eight diesel side load trucks versus CNG. ($400,00 per truck vs. $450,000). Projections show that the resale for diesel trucks will be a higher dollar.

4. **Personnel Changes and "Right Sizing" Resources:**

- We reduced three positions in 2025 and are absorbing those workloads.
- The former Controller/Treasurer position has been reclassified as an Accountant II, which fits more within our business model. There will be money saved by a reduced salary range.
- A veteran Supervisor retired in May, and our Operations Team has committed to absorb the workload with the remaining four Supervisors, saving an estimated $120,000 annually. The change to the SCRP services with containers being delivered to resident's driveways means fewer staff with employees not needing to clean-up debris on the streets.

Seasonal Container Reservation Program (SCRP) Stats

Overview:

- WFWRD services 285 single family homes up to a fourplex in Copperton.
- The 2025 season marks the sixth year of SCRP.
- We have enough resources to service between 9-11% of the homes in our cities.
- Annual SCRP services run mid-April through September:
  - We started in Murray/Holladay this year and moved clockwise through the District and will end in Millcreek.
  - Copperton service dates were June 17th – 23rd.

Copperton Stats During the Delivery Days of Service:

- 2025: We accommodated 25 out of the 25 requested reservations. Tonnages TBD.
- 2024: Accommodated 30 of the 30 requested reservations and collected 15 tons of bulky waste.

Then ➡

Vs.

Now ➡

Copperton's Impact & Recycling Stream Quality

Diversion Rate – Keeping Material Out of the Landfill for Reuse

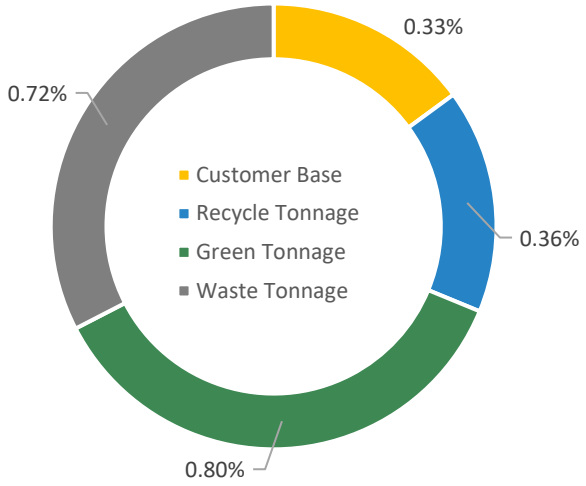
- **2024 Diversion Rate:** 16.05%, with a district-wide goal of 18%
- **January - May Diversion Rate 2025:** 16.63% (a slight increase from 2024)

Copperton's Share of System-Wide Efforts

- 285 Total Customers
  - Represents .33% of District Customers

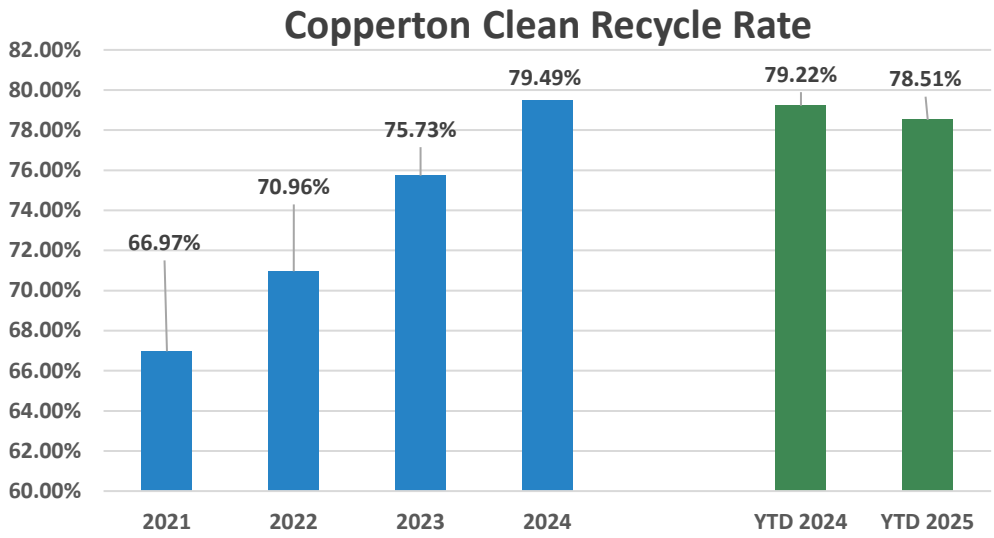
In 2024 Copperton Generated:

- 393.42 Tons of Refuse
  - YTD: 151.63 Tons of Refuse
- 69.18 tons of Recycle material
  - YTD: 28.38 Tons of Recycle
- 5.14 tons of Green Waste
  - YTD: 1.32 Tons of Green Waste
  - 9 Green Waste Subscribers



Copperton's Clean Recycle Rate

- Contamination in the recycle stream has decreased since 2021
- **Lower Contamination = Lower Processing Fees**
- Focus on education and addressing contamination at the Curb through driver participation
- Copperton received **2** reports of contaminated cans in 2024
  - YTD: **16** Copperton Reports



What Are Sample Sorts?

- Monthly inspections of recycling loads.
- Tool to identify material types and contamination.
- Help us shape targeted education campaigns.

What's in the Bin?

2024 Copperton Total Recycle Tonnage: 69.18 Tons

Commodity	Percentage of Load	Weight in Tonnage
OCC (Cardboard)	58.44 %	40.43
Mixed Paper	8.08 %	5.59
HDPE Natural	3.91 %	2.70
HDPE Color	1.80 %	1.24
PET	2.14 %	1.48
Aluminum	1.52 %	1.05
Tin	1.25 %	0.87
Mixed Plastic	2.35 %	1.62
Contamination	20.51 %	14.19

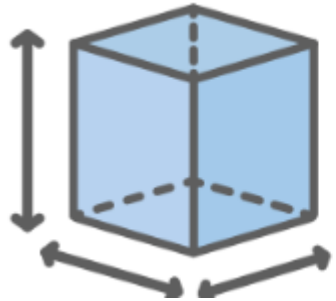
RESOURCES SAVED

322 Thousand
Gallons of Water
Enough water to provide daily usage to **10** people for an entire year.

782
Mature Trees
It is estimated that thesse trees could **118 thousand** cardboard boxes

239
Killowatt- Hours of Electricity
Enough energy to supply **22** homes power for an entire year

55
Metric Tons of Greenhouse Gases
Equivalent to the amount produced by **12** individual cars for an entire year.



115
Cubic Yards of Landfill Space
Salt Lake Landfill Lifespan Estimate: ~ 50+ Years
Trans Jordan Landfill Lifespan Estimate ~ 8-10 Years

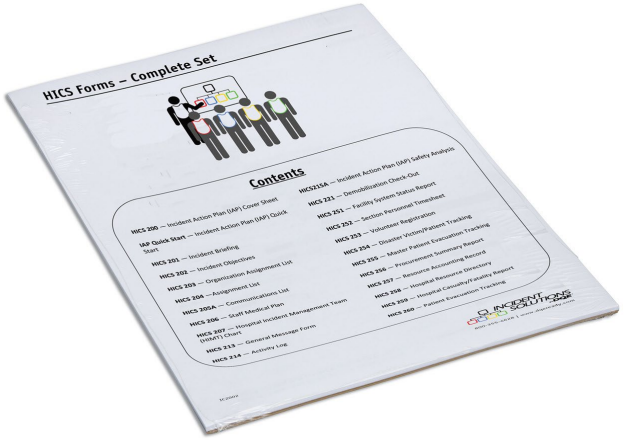
Emergency Operation Information Management

Summary Highlights training from ICS 300, L 0962 Planning section chief, L964 Situation Unit Leader, FEMA EEIs

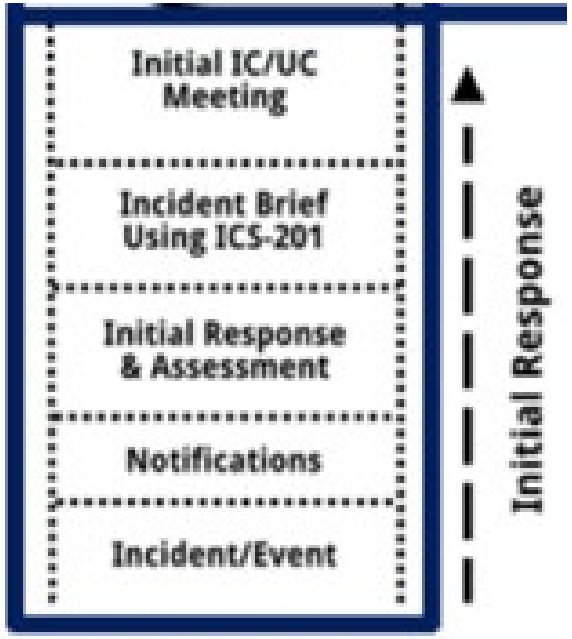
Brief Overview

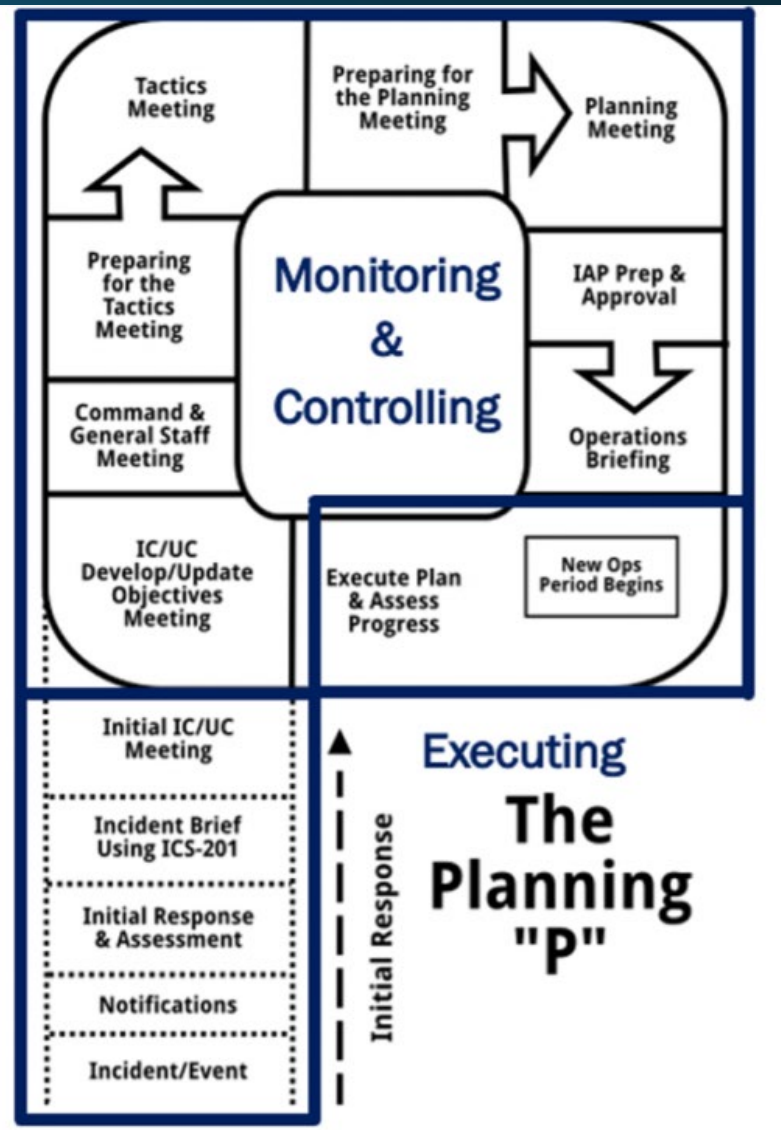
- **Intentions**: Overview the most critical resource an EOC has to offer; which is coordinated real-time information
- Emergency Information Management Structure
- Data Collection
- Analysis
- Information Sharing
- Situational Awareness
- Decision Support
- Impact Assessment
- Report/Brief Cadence
- Will not cover Public Information Officer role

The Planning "P"



Initiation





Essential Elements of Information (EEIs)

- Hazard Specific, Known unknowns
- Specific and Measurable

Weather

Weather forecast and related Information
River forecast and flooding
Extended weather
Pre-landfall Information
Predictive modeling of impacts
Hazard-specific information
Historical information

Impacts

Boundaries of Disaster Area
Boundaries of secondary disaster areas
Jurisdictional boundaries affected
Safety hazards
Evacuations
Debris

Climate Hazard Scenario + Community Member Concerns

Hazard, Risk, Vulnerability Assessment Data and Mapping

Infrastructure Status

Critical infrastructure and facilities
Transportation
Communications
Emergency operations centers

Survivors

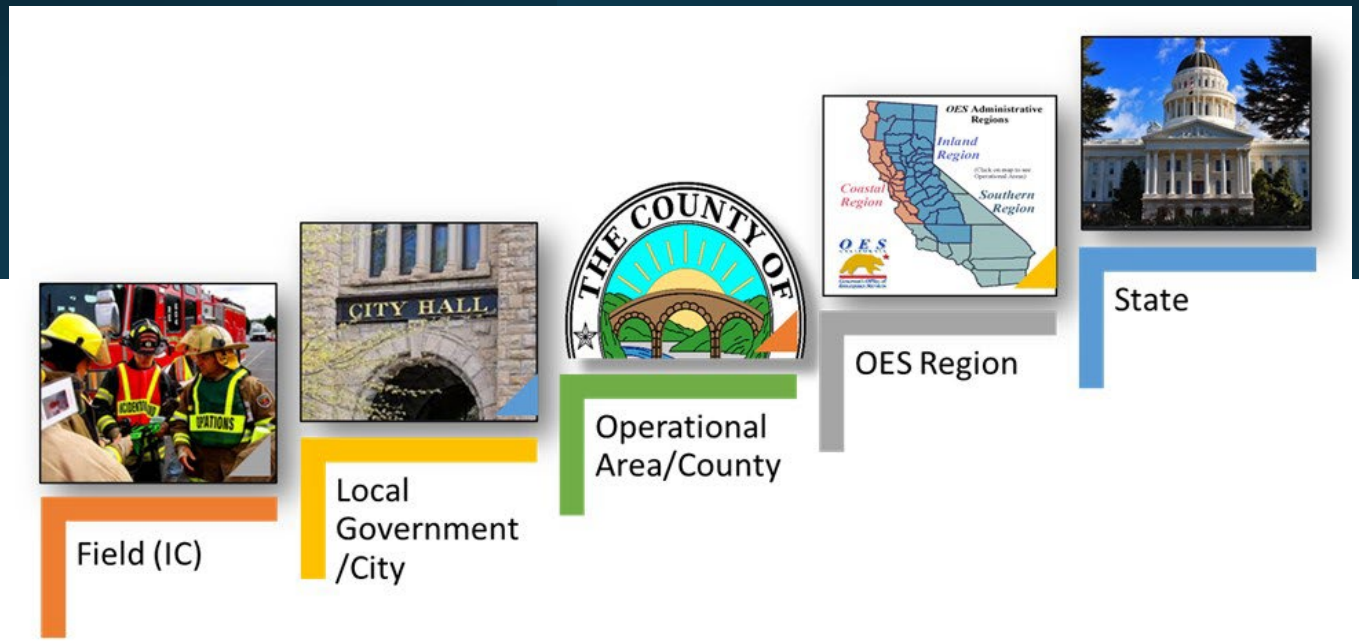
Socio-economic/Political Impacts
Demographics
Evacuations
Shelters
Medical shelters

Assessment (Fact finding phase)

Data Collection

Fact Finding Stage

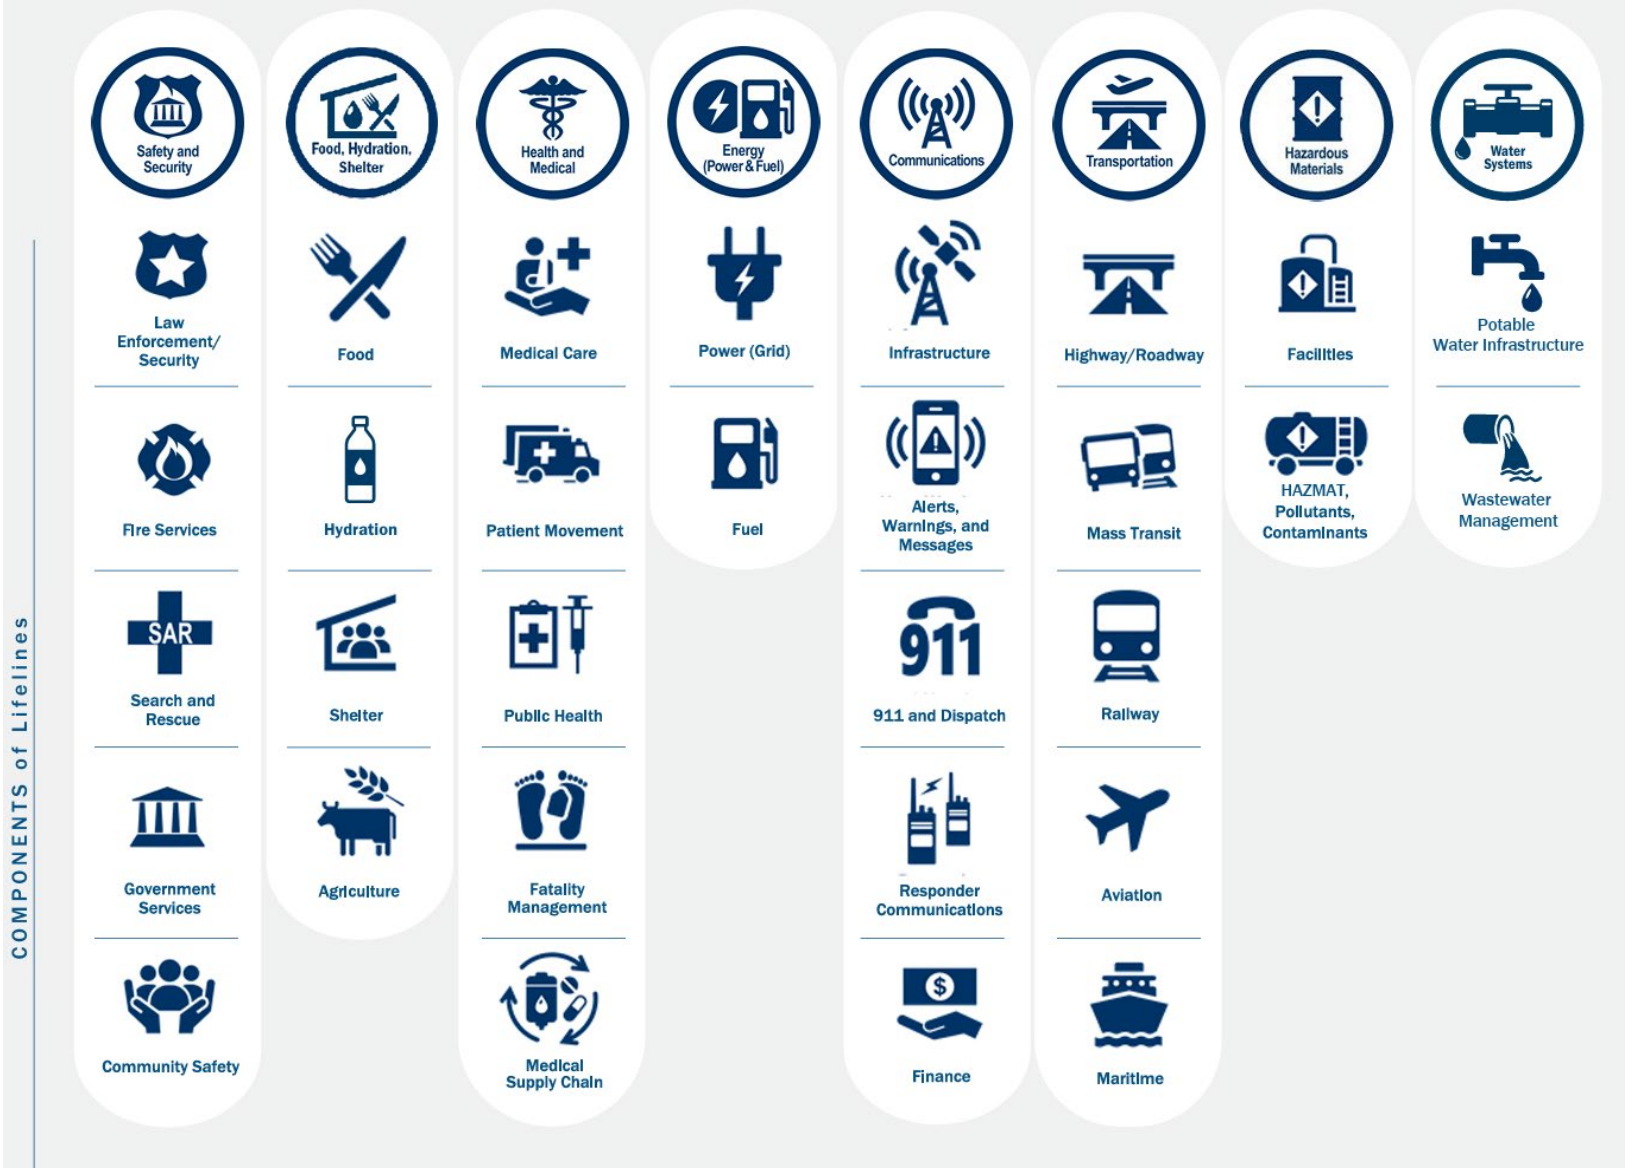
- **Essential Elements of Information; EEIs (Known Unknown)**
- **Request for Information (RFI)**
  - **Per Jurisdiction & Authority**
  - **Leveraging Subject Matter Expertise (SMEs) / Liaisons to source complex EEIs**
  - **Emergency Service Function (ESF) categorize expertise into 15 sections**
  - **Private Sector Agency Reps**



ESF #1 Transportation	ESF #2 Communications	ESF #3 Public Works & Engineering	ESF #4 Firefighting	ESF #5 Information and Planning
ESF #6 Mass Care, Emergency Assistance, Temporary Housing, & Human Services	ESF #7 Logistics	ESF #8 Public Health & Medical Services	ESF #9 Search & Rescue	ESF #10 Oil & Hazardous Materials Response
ESF #11 Agriculture & Natural Resources	ESF #12 Energy	ESF #13 Public Safety & Security	ESF #14 Cross-Sector Business and Infrastructure	ESF #15 External Affairs

Impact Assessment

- Determine if the incident is stable, cascading into a more hazardous situation or downsizing
- Secondary Factors
  - Weather forecast, Human factors
- Cascading Effects
  - Initial event led to other failures
- Advance planning can attempt to mitigate secondary impacts from the initial incident
- Consider critical infrastructure and community lifelines
  - aids in impact assessments and scaling up or down our response



Impact Assessments

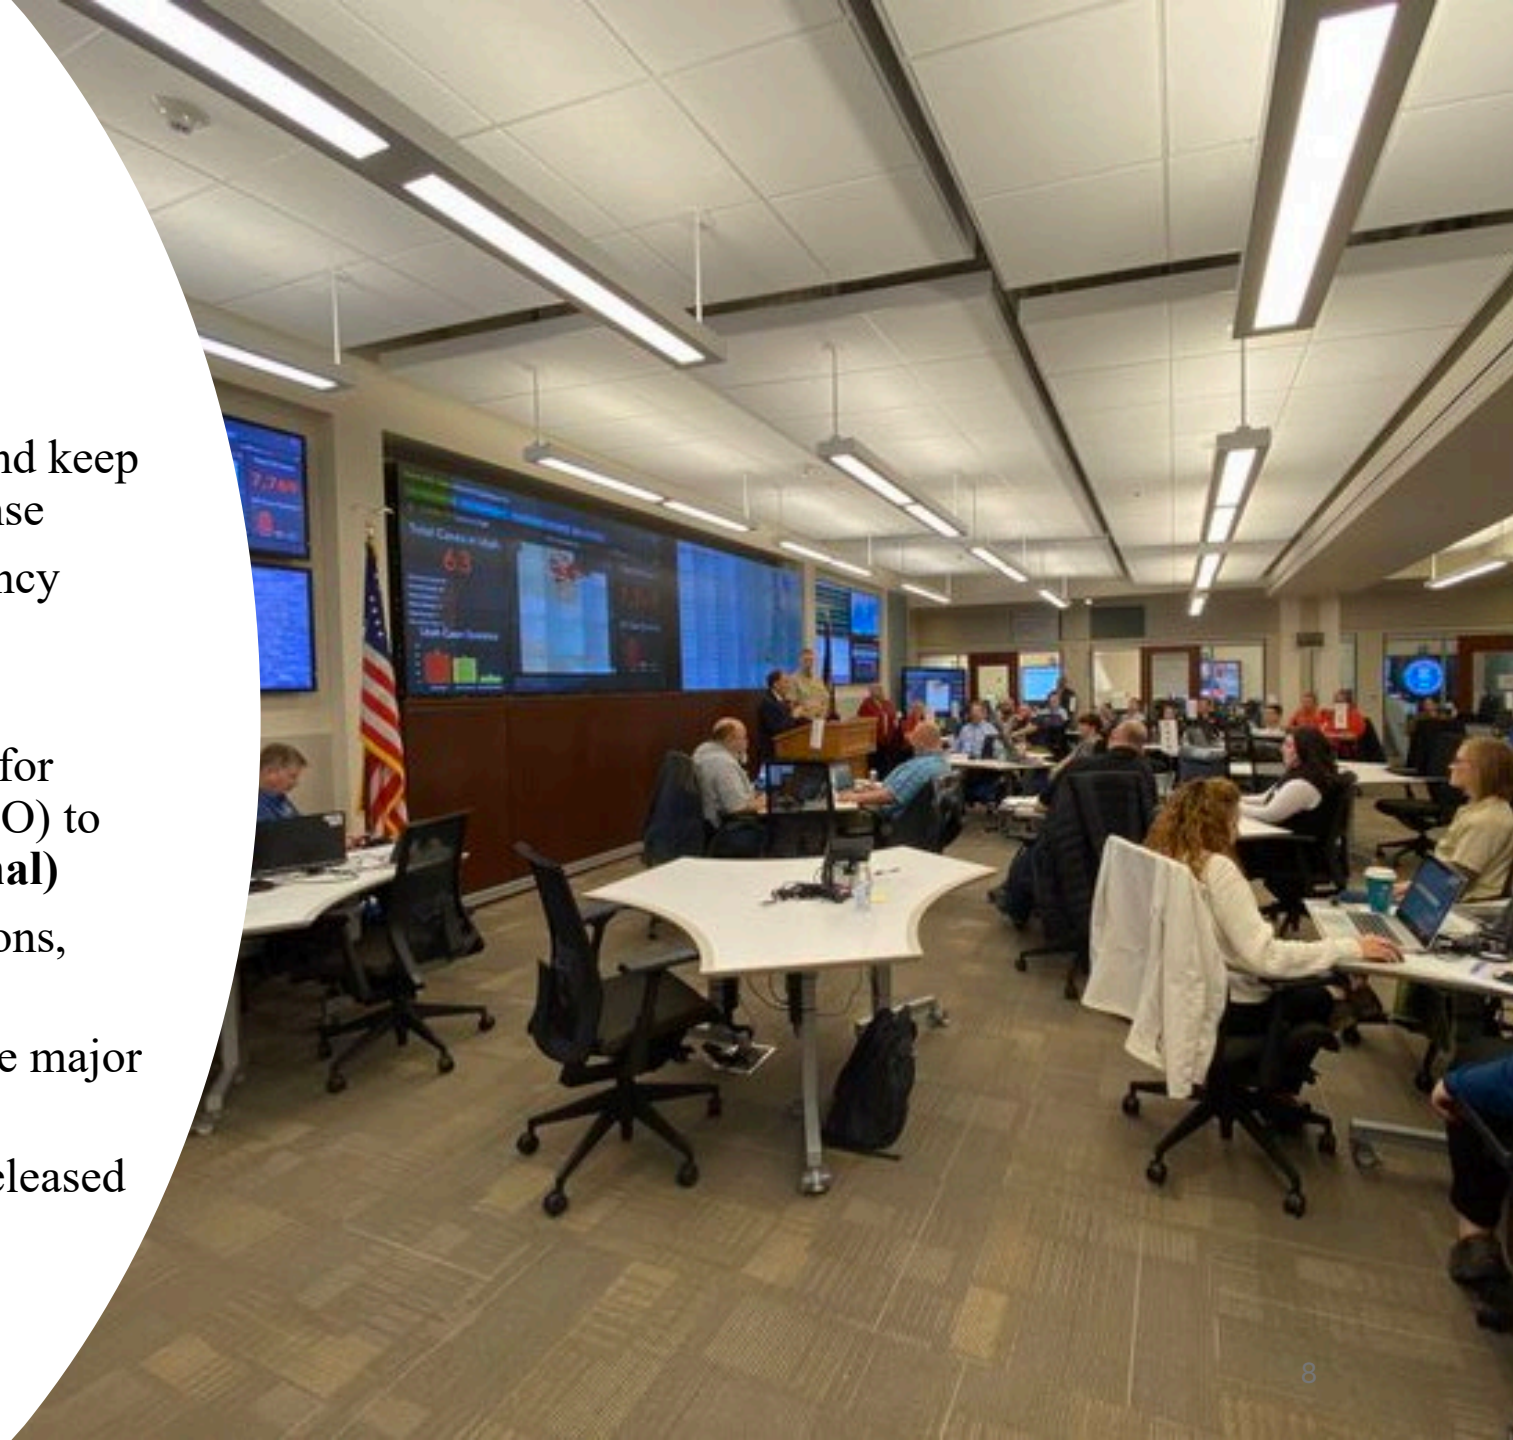
- **Casualties & Injuries:** Number of fatalities and injuries.
- **Infrastructure Damage:** Buildings, utilities, transportation networks affected.
- **Environmental Damage:** Contamination, pollution, or long-term ecological effects
- **Economic Losses:** Business interruptions, government expenditures, and property damage
- **Community & Social Impact:** Displacement, Isolated communities, psychological effects, and public sentiment
- Determines how we scale up or down our operational footprint
- Drives decisions on Public messaging, Resource Request, Proclamations and Recovery operations

Dissemination of Information: Situation Reports

Situation Reports "SitReps",

- Keeps stakeholders informed of the current situation, drives decisions to action and keep "one team" cohesion in supporting the response

- Reports due in by a specific time daily and frequency distances as incident slows
- For Official Use Only (FOUO) **Internal**
- Used to generate executive summaries (**Internal**) for elected officials and public information officer (PIO) to build talking points and public messaging **(External)**
- **Highlights:** status updates, challenges, key decisions, and staffing posture
- Helps identify emerging issues before they become major problems
- Sets an expectation of when information will be released
- Holds accountability and public records



Dissemination of Information: Coordination Calls

Coordination Meeting is an expedited method to collect and disseminate information or to discuss concerns that don't fit within a formal report template.

- Start within an hour of an initial event to brief support staff and issue roles and tasks
- Coordination Calls/meetings continues daily as needed
- Stakeholder should be present even if they have Nothing Significant to Report (NSTR)
- Document meeting minutes to identify action items, hold accountability and maintain public records
- Coord Calls should be no longer than necessary, Brief out high level factors: Department Status, Actions taken, Unmet needs

Common pitfalls in EOC information management

- Not vetting information before reporting it as fact
- Using passive words that are not objective in context
- Not using brief bullet points with time and dates
- Sending internal reports to external partners or public, when in doubt, ask your command staff/PIO
- Reports are not approved and edited by one central point of contact before distribution, inconsistent formatting
- Coordination calls invites are sent externally to public or the press
- Not directing and formalizing your RFIs to the correct jurisdictions (Law, Fire, County OES etc. ..)
- Not providing enough details that drive to decision making
- Not sharing enough to neighboring jurisdictions or incident command post (ICP)
- Not having the SME, Liaisons and stakeholders present to move decisions towards actions
- Not scrubbing outdated information out of your reports as the incident wears on
- Working in silos, not knowing what the other sections are doing
- Avoid Analysis Paralysis: Do not wait on actions or reports until you have every nuance of the situation. Follow up as needed

Town of Copperton Annex

To participate in this multi-jurisdictional hazard mitigation plan (MJHMP) update for Salt Lake County (SLCo), the governing body of the town of Copperton passed a formal resolution, a copy of which is maintained at the local government offices.

Planning Process Contact Information

Table 1 provides information on the point of contact during the updating of the MJHMP.

Table 1: Contact Information for the Town of Copperton

Name	Contact Information
Madison Warner	**Phone:** 801-743-7100; **email:** Mwarner@unifiedfire.org

The town of Copperton has a fully integrated approach to hazard mitigation planning and program implementation. During the 2024 update process, the MJHMP participation roles in Table 2 were recorded.

Table 2: Participant List for the Town of Copperton

Name	Title	Jurisdiction
Madison Warner	Municipal Planner at Salt Lake County Emergency Management	Kearns, Copperton, and Magna
Brad Jewett	Intelligence Specialist	Salt Lake County Emergency Management

Jurisdiction Profile

Date of Incorporation

Copperton became a metro township in January 2017, then converted to a town on May 1, 2024.

Location and Description

The town of Copperton is located southwest of Salt Lake City. The town is approximately 0.3 square miles in area and is approximately 5,400 feet above sea level. It is renowned for its picturesque landscapes and historical importance. The Copperton Historic District, which is listed on the National Register of Historic Places, includes over 230 contributing buildings.

DRAFT

Population

The 2022 American Community Survey 5-Year Estimate from the U.S. Census Bureau records the population of the town of Copperton as 865 people.

Demographics

Most of the 865 people are between the ages of 25 and 34, with a median age of 32; 461 are females (53.3%) and 404 are males (46.7%). English is the primary language in 88.4% of homes,, with 7.9% Spanish, and 3.7% other languages.

Brief History

In 1926, Copperton was established by the Utah Copper Company as a residential area and model city for its employees. It was designed to showcase company-subsidized family life featuring model brick and stucco homes, a community park, and amenities like electricity and paved streets. Construction of housing units ended in the 1930s and company-furnished housing ended in 1955. The town was added to the National Register of Historic Places in 1986 preserving its unique history and architecture.

Climate

The town of Copperton experiences a humid subtropical climate (Cfa Köppen classification) characterized by hot, humid summers and mild winters with consistent precipitation throughout the year. Average highs are approximately 78°F in the summer and approximately 33°F in the winter. Annual precipitation is approximately 16 inches annually with snowfall averaging 79 inches annually.

Public Services

The town of Copperton offers a wide range of public services through the Greater Salt Lake Municipal Services District (MSD). The MSD provides staffing and administrative support and other services and handles planning and zoning, business licensing, code enforcement, inspections, emergency planning, and related municipal services. Public works services are contracted with SLCo Public Works, which encompasses the construction and maintenance of roads, snow removal, and street lighting.

Governing Body

The town of Copperton's governing body is the Copperton Council, which includes the Mayor, Deputy Mayor, and three council members.

Development Trends

The community is physically separated from development in nearby communities by mining operation buffer areas.

DRAFT

Jurisdiction-Specific Hazards and Risk

The Calculated Priority Risk Index (CPRI) is a comprehensive assessment tool for evaluating and prioritizing risks in a given context. It considers various factors, such as probability, impact, and urgency, to determine the level of risk associated with events or situations. The results for each hazard, including its risk factor (RF) value, are shown in Table 3. The results are based on the criteria in Table 3 and the equation that follows it. The CPRI helps organizations and individuals make informed decisions about risk management and mitigation strategies. It provides a systematic approach to identifying and addressing potential issues, allowing for a more efficient allocation of resources and proactive risk prevention. With the CPRI, stakeholders can prioritize their focus on the most critical risks, leading to more effective risk management and, ultimately, better outcomes.

Table 3: Calculated Priority Risk Index Values for the Town of Copperton

Type of Hazard Event	Probability of Future Events	Spatial Extent	Severity of Life/ Property Impact	Warning Time	Duration	Response Capacity	Risk Factor Value
Avalanche	0	0	0	0	0	0	0
Drought	3	4	2	1	4	2	2.6
Earthquake	3	4	4	4	4	3	3.6

Hazardous Materials Incident (Transportation & Fixed Facility)	4	2	3	4	4	3	3.4

DRAFT

Type of Hazard Event	Probability of Future Events	Spatial Extent	Severity of Life/ Property Impact	Warning Time	Duration	Response Capacity	Risk Factor Value
Public Health Epidemic/ Pandemic	2	4	3	1	4	2	2.6
Terrorism	1	3	4	4	3	4	2.9

Table 4: Criteria for the Calculated Priority Risk Index

Risk Index Factor	Degree of Risk Level		Criteria	Factor Weight for Degree of Risk Level
Probability of Future Events	1	Unlikely	Less than 1 percent probability of occurrence in the next year or a recurrence interval of greater than every 100 years.	30%
	2	Occasional	1 to 10 percent probability of occurrence in the next year or a recurrence interval of 11 to 100 years.	
	3	Likely	11 to 90 percent probability of occurrence in the next year or a recurrence interval of 1 to 10 years.	
	4	Highly Likely	91 to 100 percent probability of occurrence in the next year or a recurrence interval of less than 1 year.	
Spatial Extent	1	Limited	Less than 10% of the planning area could be impacted.	10%
	2	Small	10%–25% of the planning area could be impacted	
	3	Significant	25%–50% of the planning area could be impacted.	
	4	Extensive	50%–100% of the planning area could be impacted.	
Severity of Life/Property Impact	1	Negligible	Less than 5% of the affected area's critical and non-critical facilities and structures are damaged/ destroyed. Only minor property damage and minimal disruption of life. Temporary shutdown of critical facilities.	30%
	2	Limited	More than 5% and less than 25% percent of property in the affected area is damaged/ destroyed. Complete shutdown of critical facilities for more than one day but less than one week.	
	3	Critical	More than 25% and less than 50% of property in the affected area was damaged/ destroyed. Complete shutdown of critical facilities for over a week but less than one month.	
	4	Catastrophic	Over 50% of critical and non-critical facilities and infrastructures in the affected area are damaged/	

DRAFT

Risk Index Factor	Degree of Risk Level		Criteria	Factor Weight for Degree of Risk Level
			destroyed. Complete shutdown of critical facilities for more than one month.	
Warning Time	1	Self-defined	More than 24 hours	10%
	2	Self-defined	12 to 24 hours.	
	3	Self-defined	6 to 12 hours.	
	4	Self-defined	Less than 6 hours.	
Duration	1	Brief	Up to 6 hours.	10%
	2	Intermediate	Up to one day.	
	3	Extended	Up to one week.	
	4	Prolonged	More than one week.	
Response Capacity	1	High	Significant resources and capability to respond to this kind of event; staff are trained, experienced, and ready.	10%
	2	Medium	Some resources and capability to respond to this kind of staff; some staff may be trained, experienced, and ready while others may need additional support.	
	3	Low	Limited resources and capability to respond to this kind of event; additional staff or staff training needed.	
	4	None	No resources and capability to respond this kind of event; additional outside support would be required.	

RISK FACTOR (RF) EQUATION

RF Value = [(Probability x 0.30) + (Spatial Extent x 0.10) + (Severity of Life/Property Impact x 0.30) + (Warning Time x 0.10) + (Duration x 0.10) + (Response Capacity x 0.10)]

Hazards with an RF value greater than or equal to 2.5 are considered high risk. Those with RF values of 2.0 to 2.4 are considered moderate risk hazards, and those with an RF value less than 2.0 are considered low risk. The highest possible RF value is 4.

Hazard Event History

Examining hazard event histories provides valuable insights to inform decision-making and help prioritize resources for risk prevention and response efforts. Table 5 lists the hazard events impacting the town of Copperton planning area since the 2019 plan update, as recorded in the Storm Events Database from the National Centers for Environmental Information.

DRAFT

Table 5: History of Hazard Events in the Town of Copperton

Type of Hazard Event	FEMA Disaster #	Date(s)	Damage or Impacts	Description
Avalanche	N/A	N/A	N/A	N/A
Drought	N/A	1930s: The Great Salt Lake and streams experienced low water levels 1950s–1960s: The Great Salt Lake experienced even lower water levels than in the 1930s. 2020: Utah experienced its driest year on record, with record dry soils and low snowpack. 2021: The Great Salt Lake reached an all-time record low due to a drought.	Air quality issues, potential for greater ecosystem collapse.	The entire county faces risk of historic drought.
Earthquake	DR-4548-UT	A 5.7M earthquake was felt March 2020. 1962: Magna 5.2M earthquake and the 1992 Western Traverse Mountains 4.2M earthquake[1]. The Magna earthquake caused minor damage to buildings in several cities and towns within one mile	Some structural damage was reported, mostly on the south end of Copperton. Walls were cracked, plaster was knocked off, and lead paint dust was released. The Greater Salt Lake Municipal Services District, which includes Copperton, received 219 damage reports online. Tens of thousands lost power.	The Wasatch Fault is considered overdue for a major earthquake, with a 57% chance of a 6.0M or greater earthquake occurring in the next 50 years. The Copperton quadrangle may experience significant ground shaking due to nearby faults, primarily the West Valley fault zone and the Wasatch fault zone, but also the Harkers fault and an unnamed fault in the southwest part of the quadrangle for which the time of latest movement is not known. Numerous earthquakes greater than 4.0 magnitude have occurred near

[1] Christensen, 1992; University of Utah Seismograph Stations, 2010a; Figure 3.

DRAFT

Type of Hazard Event	FEMA Disaster #	Date(s)	Damage or Impacts	Description
		(1.6 km) to the southwest of the epicenter, which was approximately 5 miles (8 km) north of Copperton.		the Copperton quadrangle over the past century. The proximity of Bingham Canyon Mine is a concern for larger land mass movement due to an earthquake.
Extreme Heat	N/A	Summers of 2020, 2021, 2022, 2023, 2024	Reported 9 deaths in Northern Utah, an upward trend in heat exposure and heat-related deaths since 2015. Excessive heat can also affect infrastructure.	Specific impacts on Copperton were not available, but general impacts include increased risk of heat-related illness and increased power demand for cooling systems.
Extreme Cold	N/A	Winter of 2022 & 2023	2022: 5 people experiencing homelessness died from cold-related exposure in Salt Lake City, but this threat could impact neighboring jurisdictions.	Specific impacts on Copperton were not available, but extreme cold can contribute to hypothermia and other cold-related illness/ . Increased demand for heating systems. Potential for frozen pipes or other service disruptions.
Flooding	N/A	N/A	Some minor flooding reported by residents due to faulty storm drain.	Minor residential and commercial damage occurred.
Landslide/ Slope Failure	N/A	April 10, 2013	No reported damage to the town of Copperton, as this slide was the result of mining activity and took place in a restricted area with controlled access and distance from the town.	Two massive landslides carried about 145 million tons of waste rock into the open pit at Bingham Canyon, the largest copper mine in the U.S.
Radon	N/A	Radon is present in soils.	The specific impacts of radon in the area are not known (i.e., exact count of illnesses known to be caused by radon), but test results have indicated elevated radon levels in the area.	As shown in Figures 147 and 148 in Volume 1, elevated radon levels have been found in the Copperton area.
Heavy Rain	N/A	N/A	N/A	There have been some significant rains, but no major damage associated.

DRAFT

Type of Hazard Event	FEMA Disaster #	Date(s)	Damage or Impacts	Description
High Wind	N/A	September 8, 2020	N/A	Salt Lake County and surrounding areas experienced a severe windstorm with winds exceeding 100 mph in some areas.
Lightning	N/A	N/A	N/A	N/A
Severe Winter Weather	N/A	N/A	N/A	There have been some significant winter storms, but no major damage was associated.
Tornado	N/A	N/A	N/A	N/A
Wildfire		June 17, 2022 July 30, 2019	Barney's Wash fire Small brush fire	This fire got close to Copperton but was handled by UFA, South Jordan, West Jordan, and Rio Tinto. This was a brush fire. Small brush fire in 2019 on private property south of Copperton. There were issues with access as UFA had to wait for Rio Tinto personnel to give them access.
Dam Failure	N/A	N/A	There are three dams near Copperton with significant hazard ratings that could affect the area.	The inundation areas of these dams are southeast of the town but could impact roadways or other infrastructure that are critical to the town.
Civil Disturbance	N/A	N/A	N/A	N/A
Cyberattack	N/A	N/A	N/A	N/A
Hazardous Materials Incident (Transportation & Fixed Facility)	N/A	N/A	N/A	Rio Tinto stores wastewater from the Bingham Canyon Mine, one of the largest open-pit copper mines in the world and a massive source of toxic chemicals. There are TRI facilities nearby
Public Health Epidemic/ Pandemic	DR-4525-UT	January 20, 2020 – May 11, 2023	Unknown degree of damage done to community and local economy	A pandemic of SARS-CoV-2 (also known as COVID-19) killed millions and has many medical repercussions that are still being studied. There is no specific data on Copperton residents who were affected medically or otherwise.
Terrorism	N/A	N/A	N/A	N/A

DRAFT

National Flood Insurance Program Summary

The town of Copperton participates in the National Flood Insurance Program (NFIP). Table 6 displays statistics related to the NFIP. The town of Copperton does not participate in the Community Rating System.

Table 6: National Flood Insurance Program Status for the Town of Copperton[2]

Init FHBM Identified	Init FIRM Identified	Current Effective Map Date	Adopted Date	Date Joined NFIP	Tribal
12/18/85	12/18/85	9/25/09	2009	6/3/20	No

No information was available regarding active NFIP policies, coverage amounts, losses or payments for the Town of Copperton.

Copperton has designated the Director of Planning and Development Services as the Floodplain Administrator. The duties of the Floodplain Administrator are supported by the Greater Salt Lake Municipal Services District (MSD). The current Flood Damage Prevention and Control Ordinance was adopted on 10/20/2021. The current FIRM became effective 9/25/2009. The MSD is responsible for issuing floodplain permits in MSD Member Communities, including Copperton. The permits include a description of all work, including the kind and type of construction, proposed intent, and location. Substantial damage/substantial improvement structures are identified through the permitting process. Structures that are determined to be substantially damaged or substantial improvements are required to come into compliance with current codes. The MSD Building Department provides guidance on how to build in accordance with existing building codes.

Jurisdiction-Specific Vulnerabilities and Impacts

Table 7 provides information on the vulnerable assets in the town of Copperton, including its critical facilities, highlighting the [town's vulnerability to identified hazards. By understanding the risks associated with these assets, local authorities can develop proactive strategies to mitigate vulnerabilities and ensure the safety and functionality of these important assets during hazard events. This data is invaluable for decision-making and prioritizing resources for emergency response and preparedness efforts, ultimately contributing to more effective risk management and greater resilience in the community.

Community assets that may be vulnerable to hazards in Copperton include the 865 residents, 1 fire station, Copperton Park, and the Bingham Canyon Lions Club community center. Primary roads in Copperton are 10200 South, SR 48 (New Bingham Hwy), and SR 209 (Old Bingham Hwy). The Rio Tinto Kennecott copper mine is a significant industry near Copperton. It is accessed through Copperton and the Kennecott office building is just outside the town. Natural resources in the area include the mineral contents in the nearby hills, vegetation and wildlife in the foothills, and Bingham Creek. The Copperton Historic District includes 237 buildings and 2 contributing structures in the town, mainly homes built for

[2] FIRM = Flood Insurance Rate Map, FHBM = Flood Hazard Boundary Map

employees of the Utah Copper Company between 1926 to 1941. Copperton Community Methodist Church is also listed on the NRHP.

Table 7: Jurisdiction-Specific Vulnerabilities and Impacts in the City of Copperton

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
Avalanche	People	N/A
Drought	People	*Vulnerability:* Drought can affect all populations in Copperton. Prolonged drought conditions can pose serious challenges for vulnerable groups, including seniors, children, low-income households, and individuals experiencing homelessness. *Impacts:* These residents may struggle to afford rising water bills, install water-efficient fixtures, or maintain cooling during extreme heat. Limited access to water can increase the risk of heat-related illnesses and worsen air quality as dust and particulates become more prevalent. Additionally, food security may be impacted if locally grown produce becomes scarce or if prices rise due to agricultural strain across the region. Public health can decline due to water rationing and loss/damage to green or natural spaces.
	Structures	*Vulnerability:* All structures in Copperton are vulnerable to drought. *Impacts:* Many homes in Copperton, especially older ones, may have outdated plumbing systems and appliances that use more water than current efficiency standards allow. As drought persists, properties without waterwise landscaping are more likely to contribute to fire risk from dry vegetation near buildings. Without adequate irrigation alternatives, both curb appeal and safety may decline in residential neighborhoods.
	Economic Assets	*Vulnerability:* Local businesses are vulnerable, particularly those that are dependent on a consistent water supply. *Impacts:* Local businesses that depend on a consistent water supply may experience financial setbacks. Restrictions on water use can reduce business activity, increase operational costs, or result in temporary closures. For a small community like Copperton, the ripple effects of even modest economic disruptions can be significant.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Vegetation in foothills and Copperton Park is vulnerable to drought. *Impacts:* Drought can have a visible impact on Copperton's natural environment, reducing the vitality of parks, greenways, and surrounding foothills. Vegetation loss not only affects the look of public spaces but also degrades habitat for local wildlife. Historic properties, especially those with landscaping or irrigation-dependent grounds, may suffer neglect or deterioration. Airborne dust from dry soils can contribute to respiratory issues and affect the enjoyment of outdoor cultural amenities.
	Critical Facilities and Infrastructure	*Vulnerability:* Copperton's culinary water supply is vulnerable to ongoing drought. *Impacts:* Ongoing drought may strain Copperton's culinary water supply, requiring conservation measures or temporary restrictions. Water-dependent operations at facilities such as senior centers, clinics, and schools could be disrupted. Dry conditions also elevate the

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		risk of wildfires, which can threaten key infrastructure like power lines and water treatment systems. Soil degradation from extended dryness can increase flood risk when sudden rainfall occurs, placing pressure on stormwater systems.
	Community Activities	*Vulnerability:* Community events and Copperton Park are vulnerable to the impacts of drought. *Impacts:* Parks and gathering areas in Copperton may become less inviting or safe during drought due to heat stress, dry grass, and limited irrigation. Community events may be scaled back or canceled during peak summer months to protect public health. Public outreach is essential to promote water conservation strategies, encourage heat safety practices, and educate residents about drought-tolerant landscaping options.
Earthquake	People	*Vulnerability:* All Copperton residents are vulnerable. Vulnerable populations, including the elderly, young children, low-income individuals, and unsheltered persons, may be more affected by an earthquake. *Impacts:* Health impacts can be severe, especially if people are trapped under collapsed homes or other structures.
	Structures	*Vulnerability:* All homes and other structures in Copperton are vulnerable. The 2020 earthquake highlighted the risk, and the brick houses that are predominant in Copperton are historically known to fail during earthquakes. *Impacts:* Unreinforced masonry structures are likely to experience extensive damage from a moderate or strong earthquake. This is a significant concern, as not all residents have the tools or the funds to improve their homes or businesses to withstand a significant earthquake. Residents may be injured and are likely to be displaced if homes are damaged.
	Economic Assets	*Vulnerability:* Businesses throughout the region are vulnerable. *Impacts:* Economic impacts could be great due to direct damage to businesses and service disruptions. Failure of utility and transportation systems can affect businesses' ability to function. In addition, recovery for the community and businesses may be lengthy. Access to emergency services, such as police, fire, and emergency medical services (EMS), may be disrupted.
	Natural, Historic, and Cultural Resources	*Vulnerability:* The Historic District and the environment are vulnerable to earthquakes. *Impacts:* The resources could be severely damaged due to an earthquake. Unreinforced masonry buildings could be affected. Local vegetation and wildlife could be impacted by an earthquake.
	Critical Facilities and Infrastructure	*Vulnerability:* The fire station and all town infrastructure could be negatively affected due to physical damage, utilities failure, and medical surges. *Impacts:* Access to emergency services, such as fire stations, police stations, or medical facilities, could be compromised.
	Community Activities	*Vulnerability:* Community events are vulnerable to earthquakes.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		Impacts: Community gatherings could lead to an increased risk to public safety if an earthquake were to occur in the middle of an event. Future events may be canceled.
Extreme Heat	People	*Vulnerability:* Extreme heat can affect all Copperton residents *Impacts:* In Copperton, extended periods of high temperatures pose a serious health risk. Outdoor workers and residents without access to reliable air conditioning face the highest risk of heat exhaustion or heat stroke. As summer temperatures rise, especially during midday, hospital visits may increase, while outdoor recreation decreases due to the unsafe conditions. Residents will face increased energy costs for cooling systems.
	Structures	*Vulnerability:* All structures in Copperton are vulnerable to extreme heat. *Impacts:* Prolonged heat can stress buildings and infrastructure in Copperton. Roads and pavements may crack, and roofing materials can deteriorate under intense sunlight. Structures lacking proper insulation or cooling systems may become dangerously hot inside, placing residents at risk and overloading electrical systems.
	Economic Assets	*Vulnerability:* All businesses in Copperton are vulnerable to extreme heat. *Impacts:* Businesses in Copperton face rising cooling costs during periods of extreme heat. Companies reliant on outdoor services may need to limit work hours or reduce output, resulting in lost revenue. Recreational venues, including parks and local outdoor markets, could see a drop in attendance, especially during the hottest parts of the day.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Copperton Park is vulnerable to extreme heat. *Impacts:* Local parks and green spaces may suffer from drying vegetation and declining wildlife activity, especially if heat is paired with limited water supply. Trees and plants may become more vulnerable to disease or fire. Additionally, prolonged heat may accelerate the weathering of historic structures, public monuments, and art installations.
	Critical Facilities and Infrastructure	*Vulnerability:* Community centers and power infrastructure are vulnerable to extreme heat. *Impacts:* Essential facilities such as clinics, senior centers, and community shelters in Copperton may experience spikes in utility use as they work to keep interiors cool. Power demand for air conditioning can strain the grid, increasing the risk of localized outages. Fire danger also grows during extreme heat, particularly in areas with dry vegetation.
	Community Activities	*Vulnerability:* Community events are vulnerable to extreme heat. *Impacts:* Community events held during the summer months are at risk of being delayed, relocated, or canceled if cooling measures are not available. Public participation in outdoor gatherings may decrease, especially during excessive heat warnings, limiting community engagement.
	People	*Vulnerability:* All residents are potentially vulnerable to extreme cold. Severe cold spells can be especially hazardous in Copperton for

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
Extreme Cold		vulnerable groups, including seniors, young children, lower-income families, and individuals without stable housing. *Impacts:* Residents without reliable heating, insulation, or winter clothing may struggle to stay safe. Outdoor workers are also at risk of hypothermia and frostbite if protective gear and shelter are not accessible.
	Structures	*Vulnerability:* All structures are vulnerable to extreme cold. *Impacts:* Cold temperatures can cause pipes to freeze and burst in both older and newer homes lacking proper insulation. Prolonged exposure to cold can weaken roofing materials and compromise structural components, especially when followed by heavy snowfall. Repeated freeze–thaw cycles can deteriorate wood, brick, and metal components of buildings over time.
	Economic Assets	*Vulnerability:* Businesses and household budgets are vulnerable to extreme cold. *Impacts:* Heating expenses tend to spike during winter storms and cold snaps, placing a financial burden on both households and businesses. Companies may need to adjust hours of operation or delay projects due to weather-related barriers. The town may also face increased costs for maintaining warming shelters or assisting residents with heating needs.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Wildlife, vegetation, and the Historic District are vulnerable to extreme cold. *Impacts:* Extreme cold can take a toll on native wildlife in Copperton, particularly species not well adapted to sudden drops in temperature. Vegetation may also suffer, especially if cold is accompanied by wind or ice. Historic properties may be at risk of material damage or structural wear due to the expansion and contraction of building components.
	Critical Facilities and Infrastructure	*Vulnerability:* Cold weather can stress key systems in Copperton, including emergency services, utility lines, and water distribution systems. *Impacts:* Power outages are more likely when ice or snow accumulates on lines. Burst pipes in critical facilities, such as fire stations or clinics, could disrupt service delivery during emergencies.
	Community Activities	*Vulnerability:* Community activities are vulnerable to extreme cold. *Impacts:* Outdoor events and programs may be canceled if temperatures become dangerously low or snow makes travel difficult. Icy roads and unreliable vehicles can prevent residents from attending both recreational and essential services. Without sufficient heating in public spaces, community gatherings may have to be postponed or moved indoors.
Flooding	People	*Vulnerability:* People near Bingham Creek or low-lying areas are vulnerable to flooding. No Special Flood Hazard Zones (SFHZs) are within the town boundaries. *Impacts:* Individuals may need rescuing from high waters. Waterborne hazardous materials from Kennecott Mine could pose an additional risk, especially if they overflow Bingham Creek reservoir. Unsheltered populations, young children, low income, and the elderly are a

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		significant concern. Persons displaced by flooding may need public shelter.
	Structures	*Vulnerability:* No SFHZs are within Copperton. Some structures near Bingham Creek or in low-lying areas may be vulnerable to flooding. *Impacts:* Structures may be affected if they are exposed to floodwaters. Damage can include foundation damage, cracked pipes, damaged electrical systems, and mold. In addition, entire structures can be carried away if the water is moving very fast.
	Economic Assets	*Vulnerability:* Kennecott mine and other businesses are vulnerable to flooding. *Impacts:* Flooding could interrupt commerce and cause major interruptions to Kennecott Mine, particularly if roadways are damaged or closed. Rebuilding structures affected by flooding could be a significant cost for the town if financial assistance is not provided or the homeowner does not have flood insurance.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Wildlife, vegetation, and the Historic District are vulnerable to flooding. *Impacts:* Flooding can impact local wildlife and flora/fauna with the sheer amount of water and debris that move into the area. This could impact historical buildings or infrastructure, especially if they do not have flood insurance or the funds to rebuild.
	Critical Facilities and Infrastructure	*Vulnerability:* Roads and utilities are vulnerable to flooding. *Impacts:* Floodwater could damage roads and utilities, and carry hazardous materials. Access to emergency services like police, fire, and medical facilities would be impacted by flooding.
	Community Activities	*Vulnerability:* Community events and Copperton Park are vulnerable to flooding. *Impacts:* The time it takes for the town to recover from a significant flooding event would impact the ability to have community events. Local parks or businesses may not be able to operate.
Landslide/ Slope Failure	People	*Vulnerability:* The majority of landslide risk is associated with Kennecott Mine. This could include its employees. The slope on the north end of town has moderate susceptibility to landslides and could pose a risk to residents. *Impacts:* People could be injured if caught in a landslide. If the mine is affected, residents could lose wages or experience other impacts from possible closures or inability to work.
	Structures	*Vulnerability:* The majority of landslide risk is associated with Kennecott Mine. This could include its structures. The slope on the north side of town may pose a risk of landslide to nearby structures. *Impacts:* Homes could be damaged, and residents displaced. Repairs may be difficult or costly.
	Economic Assets	*Vulnerability:* The majority of landslide risk is associated with Kennecott Mine. *Impacts:* This could disrupt or halt mine operations and lead to loss of revenue and lost wages for employees.
	Natural, Historic, and	*Vulnerability:* Vegetation and environmental contamination are vulnerable to landslides.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
	Cultural Resources	*Impacts:* Landslide can impact local vegetation with excess debris in certain areas that may affect air or water quality. With Rio Tinto nearby, hazardous materials can seep into the soil or impact local wildlife and vegetation.
	Critical Facilities and Infrastructure	*Vulnerability:* Major roadways in and near Copperton, utilities, and emergency response are in landslide-susceptible areas. *Impacts:* Landslides could disrupt transportation to the town or to those who are employed at the Kennecott Mine. Managing debris after an incident would affect the ability of public works to complete their day-to-day duties. In addition, excess debris could affect essential services like power, water, medical facilities, police, and fire. Road access becomes an issue.
	Community Activities	*Vulnerability:* Community activities are vulnerable to landslides. *Impacts:* Community activities could be impacted if recreation areas, local businesses, or residential homes cannot be rebuilt or restored to their original condition.
Radon	People	*Vulnerability:* There are a significant number of properties throughout Copperton that have high radon levels. Seventy-seven percent of homes tested in the Copperton zip code have dangerous radon levels. *Impacts:* Radon increases risk of lung cancer for people exposed to it.
	Structures	Structures: Radon doesn't directly damage structures, but structural design or deterioration may contribute to radon accumulation. *Impacts:* Radon can seep through cracks in foundations or walls and accumulate in homes, putting occupants at risk of lung cancer. There are properties throughout Copperton with high radon levels. Radon kits are available through the state and other online services, but the cost may prevent people from purchasing them.
	Economic Assets	*Vulnerability:* Businesses and home values are vulnerable to high radon levels. *Impacts:* The cost of remediation for high radon levels and radon monitoring services may prevent people from reducing their radon levels. This can affect overall home prices and the local economy if it is known that the area has high radon levels.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Historical structures and the environment are vulnerable to radon exposure. *Impacts:* Local vegetation and wildlife can be impacted by radon. In addition, historical structures may be affected by radon, especially if it is not mitigated or they have poor ventilation. Older homes may have structural deterioration that contributes to radon entering the home.
	Critical Facilities and Infrastructure	*Vulnerability:* Fire station and community centers are vulnerable to radon. *Impacts:* Critical facilities and infrastructure may be impacted if there are high radon levels because remediation is required. Occupants may be exposed to radon. Radon may also impact access to critical facilities if people have existing health conditions.
	Community Activities	*Vulnerability:* Community activities have minimal vulnerability to radon exposure.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		Impacts: Radon poses a higher risk from long-term indoor exposure. Attendance at community activities, especially those held indoors, could be impacted if radon levels are high. Those who are immunocompromised or have existing health conditions may choose not to attend because of the health risks associated with radon.
Heavy Rain	People	*Vulnerability:* Heavy rain can occur anywhere in the city, and all individuals are potentially vulnerable. *Impacts:* Individuals may need rescuing from high waters. Waterborne hazardous materials from Kennecott Mine could pose an additional risk, especially if the Bingham Creek reservoir overflows. Unsheltered populations, young children, low-income individuals, and the elderly are a significant concern.
	Structures	*Vulnerability:* Structures near low-lying areas or impervious surfaces could be affected by ponding or high runoff during heavy rain. *Impacts:* Structures may be affected if they are exposed to localized flooding. This can include foundation damage, cracked pipes, damaged electrical systems, and mold. In addition, entire structures can be carried away if the water is moving very fast.
	Economic Assets	*Vulnerability:* All businesses in Copperton are vulnerable to heavy rain. *Impacts:* Heavy rain and localized flooding could interrupt commerce and cause major interruptions to Kennecott Mine. Repairs to damaged structures or infrastructure could be a significant cost if financial assistance is not provided or the homeowner does not have flood insurance.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Wildlife, vegetation, and waterways are vulnerable to heavy rain. *Impacts:* Flooding can impact local wildlife and flora/fauna with the sheer amount of water and debris that move into the area. Heavy rain can cause erosion and damage to habitats. Historical homes could also be damaged by flooding.
	Critical Facilities and Infrastructure	*Vulnerability:* Roads, utilities, and emergency response systems are vulnerable to heavy rain. *Impacts:* Localized flooding from heavy rain could damage roads and utilities, and carry hazardous materials. Access to emergency services, such as police, fire, and medical facilities, could be disrupted.
	Community Activities	*Vulnerability:* Outdoor events and recreation are vulnerable to heavy rain. *Impacts:* Outdoor events may be disrupted or canceled due to heavy rain. Local parks or businesses might not be able to operate. It may take significant time for the town to recover from damage caused by heavy rain.
High Wind	People	*Vulnerability:* All residents in Copperton can face risks during high wind events, especially those who are outdoors or near structures and trees. *Impacts:* Blowing debris, falling branches, and damaged infrastructure can cause injuries. Wind-related hazards may be especially dangerous for children, seniors, and individuals with mobility challenges, who may have limited ability to seek shelter quickly.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
	Structures	*Vulnerability:* Buildings in Copperton, particularly older homes, sheds, and fences, are vulnerable to wind-related damage. *Impacts:* Shingles can be lifted, windows shattered, and trees or utility poles may fall onto roofs or vehicles. Wind can also loosen signs and lightweight materials from commercial properties, creating additional hazards.
	Economic Assets	*Vulnerability:* Copperton businesses are vulnerable to high wind. *Impacts:* Storm damage can temporarily or permanently shut down small businesses, especially those without adequate insurance coverage. Clean-up costs and service disruptions can affect local commerce. Businesses that depend on consistent access to customers or transportation routes may experience revenue losses.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Copperton Park and historic homes are vulnerable to high wind. *Impacts:* Strong winds can damage trees, wildlife habitats, and park infrastructure in Copperton's green spaces. If historic landmarks or cultural sites are impacted and lack proper insurance or funding for repair, it may be difficult to restore them to their original condition.
	Critical Facilities and Infrastructure	*Vulnerability:* Power lines, roads, and emergency response systems are vulnerable to high wind. *Impacts:* Windstorms can down power lines, damage utility systems, and scatter debris across local roads, making emergency response more difficult. Disruptions to road access can delay fire, EMS, and law enforcement operations. Public infrastructure like water systems and electrical grids may also be affected, particularly in more remote parts of the community.
	Community Activities	*Vulnerability:* Outdoor events and recreation are vulnerable to high wind. *Impacts:* Outdoor gatherings, such as fairs or sporting events, may need to be canceled or delayed due to safety concerns during high wind events. Without proper shelter or medical staff on-site, the risk of injury during these storms increases.
Lightning	People	*Vulnerability:* Lightning presents a direct danger to anyone caught outside during storms, which potentially includes all Copperton residents. Those involved in recreation or outdoor work are most vulnerable. *Impacts:* Those in proximity to a lightning strike can be seriously injured or killed. Individuals may also be harmed by secondary effects of lightning, such as structure fires, electrical surges, or when lightning strikes water or conductive surfaces nearby.
	Structures	*Vulnerability:* Homes, barns, and outbuildings may be struck by lightning. *Impacts:* Lightning strikes can cause fires or electrical damage. Buildings without proper lightning protection systems are at higher risk, especially if they have outdated electrical infrastructure or are located in exposed areas.
	Economic Assets	*Vulnerability:* All Copperton businesses are vulnerable to lightning.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		Impacts: Fires or damage resulting from lightning strikes can cause costly repairs for local businesses. Prolonged closures may follow if critical systems are damaged. If such incidents are publicized, they may also impact the community's reputation for safety and deter new residents or business development.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Environment, wildfire risk, and risk to historic homes to lightning. *Impacts:* Lightning can ignite dry vegetation in Copperton, potentially sparking wildfires that damage ecosystems. Public safety and infrastructure, transportation, and other local resources may be overwhelmed by cascading effects like wildfires or medical surges. Historic buildings and cultural landmarks may be especially difficult to repair if they are not insured or if restoration resources are limited.
	Critical Facilities and Infrastructure	*Vulnerability:* Lightning can damage power infrastructure, communication towers, and electrical substations. *Impacts:* Damage to utilities can result in power outages or electrical surges. Medical responders could experience increased demand if lightning strikes cause injuries, and response efforts may be delayed if infrastructure is compromised.
	Community Activities	*Vulnerability:* Outdoor events, recreation, sports, and markets are vulnerable to lightning. *Impacts:* Outdoor events may be canceled due to lightning risks, particularly if shelter options are limited. Repeated interruptions during summer events could reduce attendance and engagement in community programs.
Severe Winter Storm	People	*Vulnerability:* All residents are potentially vulnerable. Cold snaps and snowstorms pose significant risks in Copperton, particularly for seniors, young children, low-income households, and unsheltered residents. *Impacts:* Individuals working outdoors, such as construction crews or service workers, are vulnerable to frostbite and hypothermia if safety precautions are not in place. Snow accumulation can also isolate residents who lack the means or ability to clear paths or driveways.
	Structures	*Vulnerability:* All structures are vulnerable to severe winter storms. *Impacts:* Buildings with flat or poorly maintained roofs are susceptible to collapse under heavy snow or ice loads. In older structures, pipes may freeze and burst during prolonged cold periods. Fluctuating temperatures can cause expansion and contraction of building materials, leading to gradual structural wear.
	Economic Assets	*Vulnerability:* All Copperton businesses to severe winter storms. *Impacts:* Local commerce may slow or halt altogether if roads remain uncleared or if facilities cannot maintain heat. Heating costs may rise for residents and businesses alike. Snow events may also interrupt operations for delivery services, contractors, and tourism-related businesses.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Parks, mature trees, and historic homes are vulnerable to severe winter storms. *Impacts:* Parks and trees can suffer from broken limbs and root damage due to ice buildup. Historical structures may also face

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		increased stress during severe weather, especially if roofs or foundations are not built to handle significant snow weight.
	Critical Facilities and Infrastructure	*Vulnerability:* Utilities, roads, and emergency response systems are vulnerable to severe winter storms. *Impacts:* Utilities in Copperton can be interrupted by ice or snow. If public works teams are unable to clear roads in a timely manner, emergency responders may be delayed. Extended exposure to cold can strain community infrastructure such as heating centers, water towers, and substations.
	Community Activities	*Vulnerability:* Community events are vulnerable to severe winter storms. *Impacts:* Outdoor events during the winter months may be canceled if snow removal and heating support are unavailable. Residents may be unable to attend community gatherings or access essential services if roads become impassable or cars fail to start in subzero temperatures.
Tornado	People	*Vulnerability:* Though rare, tornadoes remain a possibility in Copperton and all residents are at risk. *Impacts:* Tornadoes can cause serious injury or death. People in mobile homes or older, unreinforced structures are at greater risk. A tornado strike can disrupt transportation and limit access to hospitals, schools, and other essential services. Emergency responders may face increased demands due to injuries and displacement.
	Structures	*Vulnerability:* Homes, businesses, and public buildings are all vulnerable to tornadoes. *Impacts:* Structures may experience roof damage, shattered windows, or even full structural collapse during a tornado. Buildings without basements or safe rooms provide less protection. Recovery time can be lengthy, especially if damage is widespread.
	Economic Assets	*Vulnerability:* All Copperton businesses are vulnerable to tornadoes. *Impacts:* Businesses may close temporarily or permanently following a tornado, particularly if they lack insurance coverage or emergency funds. Job loss and economic disruption can follow, especially in small communities where businesses are tightly woven into local infrastructure and services.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Parks, natural plants and wildlife, and historic homes are vulnerable to tornadoes. *Impacts:* Tornadoes can damage vegetation, parks, and wildlife corridors in and around Copperton. Historical buildings made of older materials are especially vulnerable and may be difficult to restore. Loss of cultural spaces like community halls or public landmarks can have lasting emotional and economic effects.
	Critical Facilities and Infrastructure	*Vulnerability:* Utilities and emergency facilities, such as the fire station, are vulnerable to tornado damage. *Impacts:* Water and power services can be interrupted if distribution lines are affected. Blocked roads may prevent timely access for ambulances, fire trucks, or police vehicles. Re-establishing power and communications could take days, depending on the extent of destruction.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
	Community Activities	*Vulnerability:* Community centers and events are vulnerable to tornadoes. *Impacts:* Community centers and recreation facilities may be shut down for repairs, limiting access to programs and services. Outdoor events would need strong contingency plans or cancellations if tornado risks increase. Rebuilding efforts may take priority, reducing the availability of public spaces for months following a disaster.
Wildfire	People	*Vulnerability:* Copperton is located near the foothills of the Oquirrh mountains where wildfires are more likely than more urban areas. All residents are potentially at risk. *Impacts:* Urban interface wildfire areas can pose a health and safety hazard due to unpredictable or fast-moving fires. Residents may be evacuated from homes. Limited transportation routes to town could increase risk. There are health concerns about hazardous materials exposure if the fire starts at Rio Tinto and moves into Copperton. Wildfire smoke contributes to unhealthy air quality, which may impact Copperton residents even if the fire is not nearby.
	Structures	*Vulnerability:* All structures in Copperton are in close proximity to a moderate to high wildfire risk area and are at risk. Those closest to the foothills are at the highest risk. *Impacts:* Wildfire can damage structures and affect emergency services. If people do not have insurance, they may not be able to afford residential repairs.
	Economic Assets	*Vulnerability:* Local businesses could suffer if they do not have the funds to repair damage. If the area is prone to burning, there is also the reputational impact, where people do not want to visit if it is not safe or high risk.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Natural spaces and resources, such as vegetation and wildlife, as well as historic homes, are vulnerable to wildfires. *Impacts:* Wildfires can lead to the loss of natural spaces and wildlife habitats and may increase erosion. Historic buildings would need to be rebuilt. The extensive open space surrounding Copperton raises concerns about small brush fires that could grow. Nearby Rio Tinto land poses a risk, as any fire or chemical leak could impact Copperton's vegetation and wildlife.
	Critical Facilities and Infrastructure	*Vulnerability:* Fire station, utilities, and roadways are vulnerable to wildfires. *Impacts:* Interruptions to utilities and transportation are possible. Power could be turned off if it is deemed unsafe by Rocky Mountain Power. Road access and communications are concerns if emergency services cannot reach residents. Medical services would be impacted if they have to run on a generator or other limited power source.
	Community Activities	*Vulnerability:* Community activities and events are vulnerable to wildfires. *Impacts:* Events may be disrupted or possibly canceled, especially in outdoor areas like parks, if there is high wildfire risk. Areas with a lot of brush or natural vegetation present a high risk, which may deter people from engaging in recreation in those areas.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
Dam Failure	People	*Vulnerability:* There are three dams in Copperton, one ranked as high hazard and two rated as significant hazard—Kennecott Mine Bingham Creek, Kennecott Mine Small Reservoir, and Large Bingham Reservoir Distilling Basin. *Impacts:* The dams are located downslope of most residences and are not likely to directly impact people. However, access to emergency services, such as police, fire, or medical, support could be disrupted if the Kennecott Mine Bingham Creek Dam has a sunny day failure that spills into West Jordan. Public health could be impacted if there is no clean drinking water or if there is a power failure.
	Structures	*Vulnerability:* The Kennecott Mine Bingham Creek sunny day failure for dam inundation would impact surrounding jurisdictions. Direct vulnerability to Copperton structures is low. *Impacts:* Significant flooding could occur, impacting emergency vehicle access to and from Copperton.
	Economic Assets	*Vulnerability:* Business disruptions throughout Copperton are possible. *Impacts:* Flooding could cause substantial travel delays for residents and local businesses, which impacts the economy. Recovery efforts are tied to the amount of money or insurance people have to be able to rebuild after a dam failure. In addition, further inspections may be required for structures that are affected by a dam failure if there are any hazardous materials in the Rio Tinto-owned dams.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Vegetation, wildlife, and historic homes are vulnerable to dam failure. *Impacts:* Local vegetation and wildlife could be impacted if there is a dam failure. Historical buildings are at risk, especially if an insurance policy or adequate funds are not available to make repairs after flooding or other damage from a dam failure.
	Critical Facilities and Infrastructure	*Vulnerability:* Roads and downstream critical facilities are vulnerable to dam failure. *Impacts:* The Kennecott Mine Bingham Creek sunny day failure for dam inundation would impact surrounding jurisdictions. It could cause significant flooding and impact emergency vehicle access to and from Copperton.
	Community Activities	*Vulnerability:* All community events are vulnerable to dam failure. *Impacts:* Community activities would be affected, especially outdoor events, due to impacts on local vegetation, particularly if exposed to chemicals or other hazardous materials from the dam failure. Plants may not grow in certain areas, and it can also affect air quality.
Civil Disturbance	People	Possible risk to health or safety. A civil disturbance could overwhelm local resources and potentially impact access to emergency services if people are injured.
	Structures	Looting or damage to buildings is possible.
	Economic Assets	Theft or interruption of services/transportation. It can affect Copperton from a reputation standpoint if people are afraid to visit or live in the area after a civil disturbance. They may also be concerned about crime.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
	Natural, Historic, and Cultural Resources	Local business owners may be impacted if they cannot afford repairs associated with property damage.
	Critical Facilities and Infrastructure	Service/transportation interruption. Power and water service could be affected if they are struck or shut down. Police and fire could be impacted if roads are inaccessible.
	Community Activities	Outdoor community activities would be impacted if it is not safe or vandalism is likely.
Cyberattack	People	Communication interruptions or power failure is a concern for vulnerable populations.
	Structures	A cyberattack could impact the physical security of buildings or residential homes if the security system can be hacked into. In addition, a cyberattack could affect fire suppression systems or evacuation methods, which would exacerbate the issue.
	Economic Assets	Flow of commerce could be interrupted. This could impact payroll or other virtual systems for emergency services, local businesses, government services, or residential homes (like paying a mortgage or utility bill). If people cannot use the internet or are locked out a specific account, it is challenging to pay bills, complete projects, or access information.
	Natural, Historic, and Cultural Resources	Natural, historic, and cultural resources could be impacted if the cyberattack accesses critical infrastructure like water or power. This could disrupt the energy grid by manipulating data or overriding emergency systems. It could flood areas, redirect emergency services, or shut off power.
	Critical Facilities and Infrastructure	Delivery of utilities could be affected. In addition, critical infrastructure could be compromised if the hacker is asking for a ransom or the cyberattack cannot be resolved in a reasonable time for power/water infrastructure to come online. Shelters would have to be set up to provide essential services.
	Community Activities	Community activities can be impacted from a reputational perspective if there is no public trust. The public may not want to go to certain areas or visit local businesses in Copperton if they are affected by a cyberattack.
Hazardous Materials Incident (Transporta-tion & Fixed Facility)	People	High risk of exposure due to the proximity of the industrial mining operation. This can include respiratory illnesses or other health impacts from exposure.
	Structures	Could require people to evacuate or shelter in place. Structures would have to complete HazMat cleanup if they were exposed to hazardous materials or in the area affected by an incident.
	Economic Assets	Mainly would affect operations at Rio Tinto but could also affect small businesses in the town. Local businesses may not financially recover from business loss after hazmat clean up, whether that's from a reduction in customers or the amount of time they were closed.
	Natural, Historic, and	Could severely damage local vegetation. Natural, historical, and cultural resources would be affected by the exposure to hazardous materials. Remediation or ventilation may be needed.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
	Cultural Resources	
	Critical Facilities and Infrastructure	Possible interruption of essential services like fire, police, and EMS. Access to medical facilities could be impacted if there are significant road closures.
	Community Activities	Outdoor community activities could be impacted if the local vegetation was affected by the hazardous materials. Outdoor recreation may be a concern for vulnerable populations.
Public Health Epidemic/Pandemic	People	Direct risk due to contagious/severe illnesses. Vulnerable populations are especially at risk if they are exposed, which could overwhelm medical facilities or create a medical surge.
	Structures	If medical facilities are overwhelmed, additional local facilities or temporary structures may have to be identified to accommodate patients.
	Economic Assets	Interruptions of normal business operations, potential reduction in the workforce, and social distancing restrictions that can impact local businesses.
	Natural, Historic, and Cultural Resources	Increased use of outdoor spaces as seen with the COVID-19 pandemic. Restricted access to outdoor areas or historical buildings if social distancing is required. This can also impact the visitation to those areas if people do not want to socially distance or are afraid of the potential exposure.
	Critical Facilities and Infrastructure	Increased use of public health resources, leading to a medical surge. Illness for public safety or healthcare professionals if they are working with or exposed to patients experiencing symptoms.
	Community Activities	Community activities and events would be impacted by social distancing requirements. People may opt for virtual instead of in-person activities.
Terrorism	People	People could be scared to recreate outside due to previous terrorism events or could sustain injuries from a terrorism event.
	Structures	Structures could sustain damage from a terrorism event and the owner's financial situation could affect their ability to make repairs. If it is commercial property, they may be concerned about future terrorism events and choose to relocate.
	Economic Assets	The reputation of the area post-terrorism event could affect the local businesses, whether those are existing or new. A new business may not want to move into the area if the land or building was previously affected by a terrorism event. In addition, the terrorism event could be costly for a resident or local business to make needed damage repairs.
	Natural, Historic, and Cultural Resources	Historic buildings or cultural resources could be impacted if there is lower visitation by locals or tourists. Local wildlife may migrate into a different area if there is significant activity in where they typically go.
	Critical Facilities and Infrastructure	Critical facilities and infrastructure would be affected by a targeted terrorism event. Essential employees may not be able to perform their

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		job duties and water/power infrastructure could be shut down or damaged.
	Community Activities	Community activities could be affected by a terrorism event if the reputation of the area declines. If it is deemed unsafe or if there are multiple incidents in the same area, people won't want to recreate or attend events.

Hazards Not Profiled

Avalanche has been omitted from further discussion of hazard impacts and from mitigation actions. As shown in the description in Volume 1, avalanche risk is primarily in the Wasatch Mountains in SLCo. No previous occurrences of avalanche have impacted Copperton.

Jurisdiction-Specific Changes in Vulnerability

Hazard events can impact communities, infrastructures, and ecosystems. The severity of these impacts can be influenced by climate change, population patterns, and land use developments. Understanding these factors is crucial for the town of Copperton to develop a resilient community and minimize the impacts of hazards.

Table 8 displays the unique changes within the community and the related effects on each identified hazard affecting the town of Copperton.

Table 8: Jurisdiction-Specific Changes in Vulnerability in the Town of Copperton

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
Avalanche	N/A	N/A	N/A	N/A
Drought	Extreme or unusual weather, lack of rainfall, decreased snowpack	An increased population has led to greater need for water resources, such as for cooling, landscape maintenance, commercial businesses, and emergency services. Population has increased since 2019.	Increased development in Rio Tinto may also increase its water needs.	Increased due to climate change and population growth
Earthquake	Extreme or unusual weather patterns, increased greenhouse gas emissions, and	Increased road use with an increased population.	Increased development at Rio Tinto could increase the risk of seismic events in Copperton.	Same

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	rising sea levels can trigger seismic activity.			
Extreme Heat	Extreme or unusual weather, drought, less local vegetation, wildlife, and snowpack Increases in extreme heat can be closely related to increased impacts of drought and wildfire.	An increased population requires more water use for essential services, local businesses, and landscaping. In addition, resources like cooling facilities for vulnerable populations are needed.	There have been minimal changes in land use and development in Copperton since the previous hazard mitigation plan update.	Increased due to climate change and the increased population
Extreme Cold	Extreme or unusual weather, reduction in local vegetation and wildlife	The increased population may place a strain on local resources, such as power and water infrastructure to run essential services or the staffing needed at warming centers for vulnerable populations.	There have been minimal changes in land use and development in Copperton since the previous hazard mitigation plan update.	Increased due to climate change and the increased population
Flooding	Extreme/ unusual weather (like heavy rain events, preventing the soil from absorbing moisture), excess debris, contamination and disease	Vulnerable populations (the elderly, young children, and unsheltered) may be impacted by flooding if they cannot seek shelter or get out of the flood zone in time. The increased population can also impact essential services, creating a medical surge if people are injured.	There have been minimal changes in land use and development in Copperton since the previous hazard mitigation plan update.	Increased due to climate change and the increased population
Landslide/ Slope Failure	Drought, decreased snowpack, variable rain patterns can all contribute to changes in soil moisture and slope stability.	The number of workers at Rio Tinto could impact evacuation procedures and overwhelm Copperton if people are moving into the area. There could be a medical surge due to population growth in Copperton.	The increased development at the neighboring Rio Tinto site could impact Copperton through landslide and/or slope failure.	Increased due to climate change and population growth

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
Radon	Greater exposure to radon if we continue to see higher temperatures (permafrost thawing allows radon to seep through).	The continued activity in Rio Tinto as well and the population growth in Copperton places mores people at risk.	There have been minimal changes in land use and development in Copperton since the previous hazard mitigation plan update.	Same but population growth increases the number of people exposed to hazard
Heavy Rain	Extreme or unusual weather, flooding, landslides, soil or crop damage, water quality	Heavy rain could cause flooding which would impact residential areas and local businesses. It could also disrupt or prevent timely response from emergency vehicles if roadways are flooded or blocked by debris.	There have been minimal changes in land use and development in Copperton since the previous hazard mitigation plan update.	Increased due to climate change and population growth.
High Wind	Extreme or unusual weather, air quality, water quality, soil erosion	Vulnerable populations (the elderly, young children, and unsheltered) would be impacted if they cannot seek shelter. They would also be the most affected by poor air or water quality.	Materials from increased development at Rio Tinto could be pushed into Copperton, affecting water, soil, and air quality.	Increased due to climate change
Lightning	Extreme or unusual weather, increased likelihood of fires, air pollution, greenhouse gas emissions	Vulnerable populations (the elderly, young children, and unsheltered) may not be able to find or take shelter.	There have been minimal changes in land use and development in Copperton since the previous hazard mitigation plan update.	Increased due to climate change and population growth
Severe Winter Weather	Extreme or unusual weather, less outdoor recreation or investment in local economy (not going out to eat, attending community events, or commuting in/out of town)	The population growth places socially vulnerable groups at risk, especially if heavy snow is associated with a Code Blue alert where shelters must increase their capacity. Heavy snow can also place a strain on fire, police, and EMS if there are car accidents or falls.	There have been minimal changes in land use and development in Copperton since the previous hazard mitigation plan update.	Increased due to climate change and population growth

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
Tornado	Possible increase in severe thunderstorms; diminished quality of air, water, and soil	Vulnerable populations (the elderly, young children, and unsheltered) are most at risk of serious injury.	There have been minimal changes in land use and development in Copperton since the previous hazard mitigation plan update.	Same
Wildfire	Extreme or unusual weather, soil erosion, landslides, drought, lack of vegetation, higher temperatures	Rebuilding is a concern for local homeowners if they do not have the funds or an insurance policy.	There have been minimal changes in land use and development in Copperton since the previous hazard mitigation plan update.	Increased due to climate change and population growth
Dam Failure	Increased precipitation, soil erosion, air quality, water quality, reduction in local wildlife and vegetation	Dam failures could spill into surrounding jurisdictions, affecting access to and from Copperton. This can place a strain on emergency services (police, fire, and EMS)	There have been minimal changes in land use and development in Copperton since the previous hazard mitigation plan update.	Same
Civil Disturbance	N/A	A civil disturbance can overwhelm emergency services (police, fire, and EMS), and affect road access to and from Copperton, especially if there is debris.	There have been minimal changes in land use and development in Copperton since the previous hazard mitigation plan update.	Same
Cyberattack	N/A	In an increasingly digital world, Copperton is vulnerable to cyberattacks on critical infrastructure, which would impact water and power. In addition, police and fire systems could be disrupted. Payroll for local employees or businesses could be hacked into.	There have been minimal changes in land use and development in Copperton since the previous hazard mitigation plan update.	Same
Hazardous Materials Incident (Transporta-	N/A	Increased activity on roads presents a greater risk to the population. If roads are	Increased development at Rio Tinto could expose Copperton to	Same

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
tion & Fixed Facility)		inaccessible due to a hazmat incident, it prevents emergency vehicles from responding quickly.	hazardous materials, which would impact air, water, and soil quality.	
Public Health Epidemic/ Pandemic	N/A	Essential services could become overwhelmed, preventing timely medical response.	There have been minimal changes in land use and development in Copperton since the previous hazard mitigation plan update.	Same
Terrorism	N/A	If roads are blocked or inaccessible, it prevents timely public safety response.	There have been minimal changes in land use and development in Copperton since the previous hazard mitigation plan update.	Same

Additional Public Involvement

The town of Copperton provided several opportunities for public participation. Figure 1 and Figure 2 present examples of public outreach.

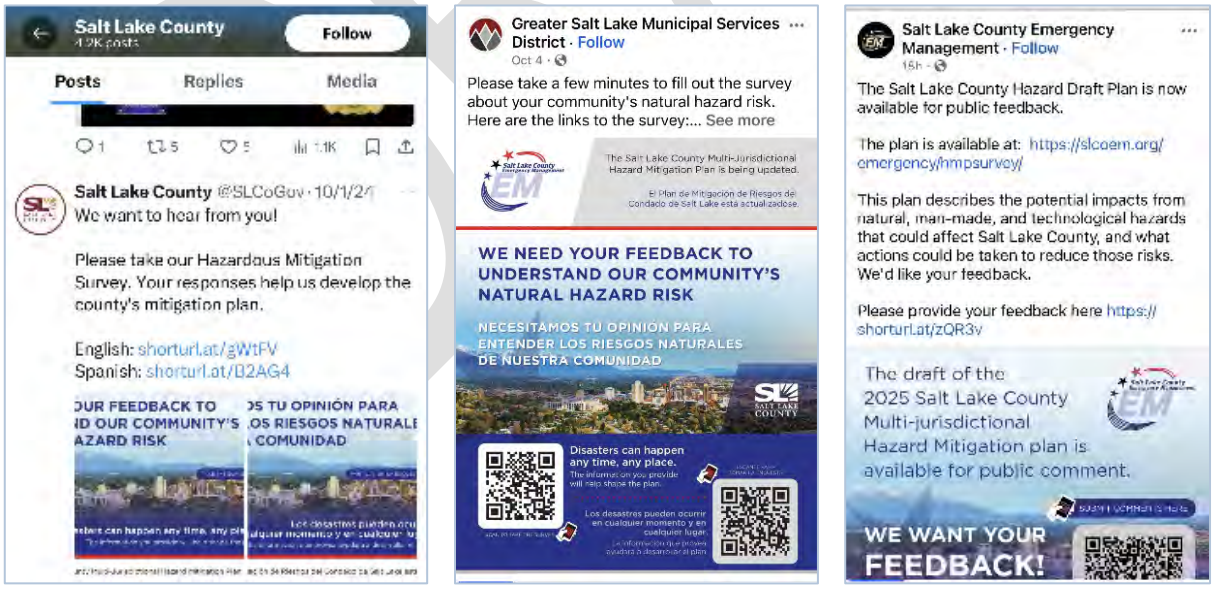

Figure 1: Social Media Posts for the Hazard Mitigation Survey (*left*), from the Municipal Services District (*middle*), and for the Draft Plan Review (*right*)

Figure 2: Mitigation Survey at Copperton Park Community Event

Plan Integration

Incorporating the underlying principles of the Hazard Mitigation Plan and its recommendations into other plans is a highly effective and low-cost way to expand their influence. All plan participants will use existing methods and programs to implement hazard mitigation actions where possible. As previously stated, mitigation is most successful when it is incorporated into the day-to-day functions and priorities of government and public service. This plan builds on the momentum developed through previous and related planning efforts and mitigation programs, and it recommends implementing actions where possible through these other program mechanisms. These existing mechanisms include the following:

- Regularity Capabilities
- Administrative Capabilities
- Fiscal Capabilities

Respective planning stakeholders will conduct implementation and incorporation into existing planning mechanisms and will be done through the routine actions of:

- Monitoring other planning/program agendas
- Attending other planning/program meetings
- Participating in other planning processes; and
- Monitoring community budget meetings for other community program opportunities.

The successful implementation of this plan will require constant and vigilant review of existing plans and programs for coordination and multi-objective opportunities that promote a safe, sustainable community. Regular efforts should be made to monitor the progress of mitigation actions implemented through other

DRAFT

planning mechanisms. Where appropriate, priority actions should be incorporated into planning updates. Table 9 lists existing planning mechanisms in which the Hazard Mitigation Plan has been integrated.

Table 10 lists the opportunities for integrating elements of this plan into other plans.

Table 9: Integration of Previous Plans by the Town of Copperton

Plan	Description
Community Wildfire Protection Plan	Addresses wildfire vulnerability and potential mitigation actions.

Table 10: Opportunities for Integration with Future Plans of the Town of Copperton

Plan	Description
CEMP – Comprehensive Emergency Management Plan	Framework to prepare for, mitigate, respond to, and recover from hazards
Copperton General Plan	This document guides future development for Copperton and sets goals for the community
Copperton Active Transportation Plan	Creating safe local and regional connections for people walking, biking, and rolling.

Capability Assessment

Local mitigation capabilities are existing authorities, policies, programs, and resources that reduce hazard impacts or could help carry out hazard mitigation activities.

Planning and Regulatory Capabilities

Planning and regulatory capabilities are the plans, policies, codes, and ordinances that prevent and reduce the impacts of hazards.

Table 11: Assessment of the Planning Capabilities of the Town of Copperton

Plan	Does it address hazards? (Y/N)	How can it be used to implement mitigation actions?	When was the last update? When is the next update?
General Plan	Y	Review the actions identified in the general plan and how they can be updated or incorporated into the hazard mitigation plan.	2020
Capital Improvement Plan	Y	Master storm drain plan study can inform hazards like flooding.	Updated in the MSD 2024 Strategic Plan
Climate Change Adaptation Plan	N	N/A	N/A

DRAFT

Plan	Does it address hazards? (Y/N)	How can it be used to implement mitigation actions?	When was the last update? When is the next update?
Community Wildfire Protection Plan	Y	Can inform wildfire mitigation actions.	2021
Economic Development Plan	N	N/A	N/A
Land Use Plan	Y	Provides an overview and historical context to inform future efforts and mitigation actions in the General Plan.	2020
Local Emergency Operations Plan	Y	The vulnerabilities and hazards identified can inform mitigation strategies.	Updated recently – Comprehensive Emergency Management Plan can be adopted
Stormwater Management Plan	Y	Can inform flooding-related mitigation actions.	2022
Transportation Plan	Y	Informs public safety.	2024
Substantial Damage Plan	N	N/A	N/A
Other? (Describe)			

Table 12: Assessment of the Regulations and Ordinances of the Town of Copperton

Regulation/ Ordinance	Does it effectively reduce hazard impacts?	Is it adequately administered and enforced?	When was the last update? When is the next update?
Building Code	Building codes ensure that structures are built to standard and brought up to code when remodeling occurs. Copperton has several commercial buildings. The town has adopted the International Building Code (IBC 2021) and International Residential Code (IRC 2021) as adopted by the state with amendments as well as Appendix C, Group U and Appendix K of the IBC.	Unknown	2023
Flood Insurance Rate Maps	Y	Yes	2022
Floodplain Ordinance	N	Yes	2023
Subdivision Ordinance	Varies	Yes	2024
Zoning Ordinance	Varies	Yes	2023

Regulation/ Ordinance	Does it effectively reduce hazard impacts?	Is it adequately administered and enforced?	When was the last update? When is the next update?
Natural Hazard-Specific Ordinance (Stormwater, Steep Slope, Wildfire)	Y – Wildfire & Stormwater No steep slopes in Copperton (outside copper mine)	Yes	Will be updated in 2025.
Acquisition of Land for Open Space and Public Recreation Use	Copperton is built out to its boundaries in all directions. New growth is only when land is rezoned or repurposed.	Yes	2023
Prohibition of Building in At-Risk Areas	Y	Yes	2023
Other? (Describe)			

Administrative and Technical Capabilities

Administrative and technical capabilities include staff and their skills. They also include tools that can help carry out mitigation actions.

Table 13: Assessment of the Administrative Capabilities of the Town of Copperton[3]

Administrative Capability	In Place? (Y/N)	Is staffing adequate?	Are staff trained on hazards and mitigation?	Is coordination between agencies and staff effective?
Chief Building Official	Y via MSD	Yes	Yes	Yes
Civil Engineer	Y (MSD)	Yes	Yes	Yes
Community Planner	Y(MSD)	Yes	Yes	Yes
Emergency Manager	Y, MSD-appointed	Yes; however, the appointee might have other job duties	Yes	Yes
Floodplain Administrator	Y, MSD	Yes	Yes	Yes
Geographic Information System (GIS) Coordinator	Y, MSD	Yes	Yes	Yes
Planning Commission	Y	Yes	Yes	Yes
Fire Safe Council	N – UFA is their fire department.	N/A	N/A	N/A

[3] LDS = Church of Jesus Christ of Latter-Day Saints, MSD = Municipal Services District, UFA = Unified Fire Authority.

Administrative Capability	In Place? (Y/N)	Is staffing adequate?	Are staff trained on hazards and mitigation?	Is coordination between agencies and staff effective?
CERT (Community Emergency Response Team)	N	N/A	N/A	N/A
Active VOAD (Voluntary Agencies Active in Disasters)	Y	No, more is needed. Work with LDS, Southern Baptist Disaster Relief, Salvation Army, and Habitat for Humanity.	Yes	Could be improved.
Other? (Please describe)				

Table 14: Assessment of the Technical Capabilities of the Town of Copperton[4]

Technical Capability	In Place? (Y/N)	How has it been used to assess/mitigate risk in the past?	How can it be used to assess/mitigate risk in the future?
Mitigation Grant Writing	Y, MSD	Copperton is part of the MSD. All services are currently contracted out – UFA, UPD, public works, or through the MSD.	Copperton can apply for hazard mitigation grant funding to complete projects or studies.
Hazard Data and Information	Y, MSD	Provide information for studies and inform Copperton, the MSD, and the general public of different hazards that affect the community to drive change.	Actions from the general plan that identified known hazards and issues can information mitigation actions in the hazard mitigation plan update.
GIS	Y, MSD	Maps were created to show different hazards in the General Plan and the stormwater master plan.	The maps and GIS data can inform mitigation actions for the hazard mitigation plan update to reduce risk.
Mutual Aid Agreements	Y, MSD and SLCo	Mutual aid agreements for police (UPD), fire (UFA), public works (SLCo PW)	Mutual aid agreements strengthen Copperton's resilience.
Other? (Please describe)			

Financial Capabilities

Financial capabilities are the resources to fund mitigation actions. Talking about funding and financial capabilities is important to determine what kinds of projects are feasible, given their cost. Mitigation

[4] MSD = Municipal Services District, SLCo PW = Salt Lake County Public Works, UFA = Unified Fire Authority, UPD = Unified Police Department.

actions like outreach programs are lower cost and often use staff time and existing budgets. Other actions, such as earthquake retrofits, could require substantial funding from local, state, and federal partners. Partnerships, including those willing to donate land, supplies, in-kind matches, and cash, can be included.

Table 15: Assessment of the Financial Capabilities of the Town of Copperton

Funding Resource	In Place? (Y/N)	Has it been used in the past and for what types of activities?	Could it be used to fund future mitigation actions?	Can it be used as the local cost match for a federal grant?
Capital Improvement Project Funding	Y	Yes, Master Storm Drain Plan	Yes	Unknown
General Funds	Y	Unknown	Unknown	Unknown
Hazard Mitigation Grant Program (HMGP/404)	N	Could apply for funding but have not in the past.	Yes	Unknown
Building Resilient Infrastructure & Communities (BRIC)	N	Could apply for funding but have not in the past.	Yes	Unknown
Flood Mitigation Assistance (FMA)	N	Could apply for funding but have not in the past.	Yes	Unknown
Public Assistance Mitigation (PA Mitigation/406)	N	Could apply for funding but have not in the past.	Unknown	Unknown
Community Development Block Grant (CDBG)	N	Could apply for funding but have not in the past.	Yes	Unknown

Private Sector or Nonprofit Programs	Wasatch Front Regional Council	Provided a $73,500 grant to fund an Active Transportation Plan and Connectivity Ordinance	Yes	Unknown
Other?				

Education and Outreach Capabilities

Education and outreach capabilities are programs and methods that could communicate about and encourage risk reduction. These programs may be run by a participant or a community-based partner. Partners, especially those who work with underserved communities, can help identify additional education and outreach capabilities.

Table 16: Assessment of the Education and Outreach Capabilities of the Town of Copperton[5]

Education and Outreach Capability	In Place? (Y/N)	Does it currently incorporate hazard mitigation?	Could it be used to support mitigation in the future?
Community Newsletter(s)	Y	Unknown	Yes
Hazard Awareness Campaigns (such as Firewise, Storm Ready, Severe Weather Awareness Week, School Programs)	Y	Yes	Yes
Public Meetings/Events (Please Describe)	Y	Yes	Yes
Emergency Management Listserv	Y, through MSD/UFA	Yes	Yes
Local News	Y	Yes	Yes
Distributing Hard Copies of Notices (e.g., public libraries, door-to-door outreach)	Y	Unknown	Yes

Education and Outreach Capability	In Place? (Y/N)	Does it currently incorporate hazard mitigation?	Could it be used to support mitigation in the future?
Insurance Disclosures/Outreach	N	N	N
Organizations that Represent, Advocate for, or Interact with Underserved and Vulnerable Communities (Please Describe)	Y	Yes	Yes
Social Media (Please Describe)	Y	Facebook and Instagram. Use Wireless Emergency Alert (WEA) for emergency alerts and coordinate with SLCo EM for an IPAWS.	Yes
Other? (Please Describe)			

Opportunities to Expand and/or Improve Capabilities

Actions that can expand and improve existing authorities, plans, policies, and resources for mitigation include budgeting for mitigation actions, passing policies and procedures for mitigation actions, adopting and implementing stricter mitigation regulations, approving mitigation updates, and making additions to existing plans as new needs are recognized. Table 17 lists the opportunities for the town of Copperton.

Table 17: Opportunities to Expand or Improve the Capabilities of the Town of Copperton[6]

Capability	Opportunity to Expand and/or Improve
Planning and Regulations	Copperton can adopt the CEMP created by the SLCo EM/MSD planners. In addition, the CEMP will have annexes added to it that address specific hazards. To address the unknowns in planning and regulatory capabilities, there are several opportunities for improvement and expansion. First, it is essential to conduct a detailed review of the General Plan, Capital Improvement Plan, Community Wildfire Protection Plan, and other relevant plans to update them. This will help in understanding how these plans can be better used to implement mitigation actions. For the Capital Improvement Plan, the integration of the master storm drain plan can be expanded to include broader flood hazard mitigation measures. This can help inform future infrastructure investments and improve overall community resilience to flooding. The Land Use Plan provides a historical context that can inform future efforts and mitigation actions. By updating the plan with recent data and trends, the community can better anticipate and manage future risks. Similarly, the CEMP should continue to be regularly updated, with the vulnerabilities and hazards identified being used to inform targeted mitigation strategies.

[6] CEMP = Comprehensive Emergency Management Plan, MSD = Municipal Services District, SLCo EM = Salt Lake County Emergency Management

Capability	Opportunity to Expand and/or Improve
	For the Stormwater Management Plan, which was last updated in 2022, regular reviews and updates are needed to ensure that it remains effective in addressing flooding-related hazards. The Transportation Plan, due for an update in 2024, should include considerations for public safety and mitigation actions related to transportation infrastructure. In terms of regulations and ordinances, assessing the Building Code's effectiveness in reducing hazard impacts and ensuring that it is adequately administered and enforced is crucial. This includes understanding the last update and planning for future updates. The same approach should be applied to the Flood Insurance Rate Maps, Floodplain Ordinance, Subdivision Ordinance, and Zoning Ordinance, with a focus on identifying and addressing any gaps in hazard mitigation.
Administrative and Technical	Many positions and technical capabilities that support effective mitigation action implementation are coordinated by the MSD on Copperton's behalf. One local opportunity to expand capabilities is through engaging community-based organizations, such as voluntary agencies active in disasters. By engaging the LDS, Southern Baptist Disaster Relief, Salvation Army, and Habitat for Humanity, Copperton can leverage volunteer resources to build safer homes, implement hazard awareness campaigns and increase community resilience.
Financial	To address the unknowns in financial capabilities, there are several opportunities for improvement and expansion. First, conducting a comprehensive assessment to identify existing funding resources and their past use is crucial. This will provide clarity regarding which resources have been used for specific activities and their potential to fund future mitigation actions. For instance, evaluating the use of Capital Improvement Project Funding and General Funds in past activities will help determine their effectiveness and how they can be leveraged for future mitigation efforts. Next, exploring opportunities to apply for various grant programs, such as the Hazard Mitigation Grant Program (HMGP/404), Building Resilient Infrastructure and Communities (BRIC), Flood Mitigation Assistance (FMA), Public Assistance Mitigation (PA Mitigation/406), and Community Development Block Grant (CDBG), can significantly enhance financial capabilities. These grants, although not previously used, can provide substantial funding for mitigation actions if successfully obtained. Engaging with state and federal partners, as well as private sector and nonprofit organizations, can open doors to additional funding resources. For example, partnerships with the Natural Resources Conservation Service (NRCS) and the U.S. Army Corps of Engineers (USACE) can be explored for studies and projects related to specific hazards, such as the Bingham Canyon Mine. Similarly, the Wasatch Front Regional Council's grant for the Active Transportation Plan and Connectivity Ordinance demonstrates the potential for securing funds from regional entities. For revenue-generating options, such as property, sales, income, or special purpose taxes, and fees for water, sewer, gas, or electric services, it is essential to evaluate their contribution to mitigation actions and their potential to serve as local cost matches for federal grants. Understanding the role of these resources in supporting mitigation efforts will help in planning and allocating budgets effectively. Regularly reviewing and updating the financial capability assessment will ensure that the community remains well-equipped to handle future challenges. By addressing these opportunities, the community can strengthen its financial capabilities, making it more feasible to implement a wide range of mitigation actions and enhance overall resilience to hazards.

DRAFT

Capability	Opportunity to Expand and/or Improve
Education and Outreach	Copperton can develop more hazard-specific public outreach and engagement programs. In addition, evaluating the effectiveness of methodologies of public outreach such as the distribution of hard copies of notices and exploring ways to enhance this method, such as increasing distribution points or collaborating with local organizations, can improve outreach efforts. Insurance disclosures and outreach are currently unknown, presenting an opportunity to collaborate with insurance companies to integrate hazard mitigation information into their communications with policyholders. This can help raise awareness and encourage proactive risk-reduction measures among residents. For social media, developing a comprehensive strategy that includes regular updates on hazard mitigation, interactive posts, and the use of analytics to measure effectiveness can enhance outreach capabilities. Expanding the use of social media platforms beyond Facebook and Instagram can also increase the reach and impact of mitigation messages.

Mitigation Strategy

Mitigation strategies provide proactive measures that are designed to minimize the impacts of hazards on the town of Copperton. Table 18 shows mitigation action alternatives, and

Table 19 shows the status of previous mitigation activities. Table 20 is the 2025 mitigation action plan for the town of Copperton.

Table 18: Mitigation Action Alternatives for the Town of Copperton

Action	Type of Action	Selected for inclusion in the plan?	If not selected, why not?
Continue social media engagement	Education and Awareness Programs		
Adopt new building codes as they are approved to bring some existing structures up to current codes	Structure and Infrastructure Projects		

Table 19: Status of Prior Mitigation Actions of the Town of Copperton

Conduct seismic retrofitting and implement a program for residents similar to the "Fix the Bricks" initiative.	Earthquake	Copperton	Municipal Services District (MSD)	Ongoing, not yet completed
Provide additional education and materials to the public regarding the earthquake risk and potential mitigation actions that can be taken.	Earthquake	Copperton	MSD	Ongoing

DRAFT

Table 20: 2025 Mitigation Action Plan for the Town of Copperton[7]

#	Action	Hazard(s)	Lead Agency	Potential Partners	Benefits (Losses Avoided)	Cost Estimate	Funding Source(s)	Timeframe	Priority	Comments
1	Enhance security at critical infrastructure locations to prevent potential terrorist acts.	Terrorism	MSD	Copperton, SLCo EM, UPD, UFA, SLCo IT, SLCo PW, SLCo Clerk's Office, SLCo Sheriff's Office	Increases security protocols (both in technology and policy) for staff/first responders, clarifies expectations/understanding for local jurisdictions and the public.	High	MSD General Fund–Copperton, SLCo EM General Fund, UPD General Fund, SLCo Sheriff's Office General Fund, UFA General Fund, SHSP grant	Short term	Medium	
2	Develop and implement public education programs on disaster awareness and mitigation.	Civil Disturbance, Dam Failure, Drought, Wildfire, Earthquake, Extreme Heat, Flooding, Hazardous Materials Incident, Heavy Rain, High Wind, Landslide, Lightning, Public Health Epidemic, Radon, Severe Winter Weather, Terrorism, Tornado, Wildfire	Copperton	MSD, UFA, UPD, SLCo Sheriff's Office, SLCo PW, SLCo EM	Improves understanding of local resources and strengthens relationships with the public and stakeholders. Outlines plans/SOPs for programs. Shares information digitally and in person on topics such as how to complete non-structural retrofits on homes to reduce the risk of earthquakes and home weatherization for extreme cold/severe winter weather events.	Low	MSD General Fund–Copperton, SLCo EM General Fund	Short term	Medium	
3	Integrate WebEOC, Crisis Track, GIS, and other technological enhancements.	Civil Disturbance, Dam Failure, Drought, Wildfire, Earthquake, Extreme Heat, Flooding, Hazardous Materials Incident, Heavy Rain, High Wind, Landslide, Lightning, Public Health Epidemic, Radon, Severe Winter Weather, Terrorism, Tornado, Wildfire	Copperton	MSD, SLCo EM, UFA, UPD, SLCo PW, SLCo Health Department	Provides a common operating platform for stakeholders, increases situational awareness, and improves response time.	Low	MSD General Fund–Copperton, SLCo EM General Fund, UFA General Fund	Medium term	Medium	Copperton already has this software; need to improve training and documentation.
4	Enhance and continue to promote the implementation of CERT and SAFE Hubs.	Civil Disturbance, Dam Failure, Drought, Wildfire, Earthquake, Extreme Heat, Flooding, Hazardous Materials Incident, Heavy Rain, High Wind, Landslide, Lightning, Public Health Epidemic, Radon, Severe Winter Weather, Terrorism, Tornado, Wildfire	Copperton	MSD, SLCo EM	Improves awareness of local resources.	Low	MSD General Fund–Copperton, SLCo EM General Fund, State of Utah DEM General Fund	Short term	Medium	SAFE Hubs, previously S.A.F.E. Neighborhoods, is going through a rebrand with a new public awareness campaign and information for all partners.
5	Establish access and functional needs registry and improve incorporation of those with access and functional needs in plans.	Civil Disturbance, Dam Failure, Drought, Wildfire, Earthquake, Extreme Heat, Flooding, Hazardous Materials Incident, Heavy Rain, High Wind, Landslide, Lightning, Public Health Epidemic, Radon, Severe Winter	Copperton	SLCo EM, MSD, UFA, UPD, SLCo Sheriff's Office	Improves situational awareness for the public and stakeholders, provides greater understanding of resources available for those with access and functional needs.	Low	MSD General Fund–Copperton, SLCo EM General Fund, State of Utah DEM staff time	Short term	High	The state of Utah's Access and Functional Needs Registry is dissolving in 2025. The county needs a way to account for those with access and functional needs, including

#	Action	Hazard(s)	Lead Agency	Potential Partners	Benefits (Losses Avoided)	Cost Estimate	Funding Source(s)	Timeframe	Priority	Comments
		Weather, Terrorism, Tornado, Wildfire								incorporation into plans/SOPs.
6	Bring deficient high hazard dams up to current industry standards.	Dam Failure	Dam owners	Water companies, SLCo EM, MSD, Copperton	Preserves life and safety (personal injuries, safety of first responders), reduces damage to critical infrastructure.	High	MSD General Fund- PW Operations Copperton, MSD Capital Projects Fund, SLCo PW Operations Fund, dam owners, water districts, State of Utah DWR General Fund and staff time, HHPD grant	Long term	High	
7	Procure generators and transfer switches for critical facilities.	Extreme Heat	MSD	Copperton, SLCo EM, SLCo Facilities Management, local public utilities, Rio Tinto	Provides backup generators for cooling centers and Code Blue centers. Ensures accurate inventory of what the county has to provide to other agencies or jurisdictions as needed.	Medium	SLCo PW General Fund, MSD General Fund– Copperton, HMA grant	Long term	Medium	
8	Increase the size of culverts and bridges.	Flooding	MSD	SLCo EM, SLCo PW, Copperton	Allows for larger runoff during spring melt season, reduces the amount of debris buildup.	High	SLCo PW General Fund, UDOT Operational Fund, MSD Capital Projects– Copperton, HMGP, FMA grant	Long term	Medium	
9	Procure Flood Mitigation Assistance (FMA) grants.	Flooding	SLCo EM	Copperton, SLCo PW, MSD	Improves understanding of grants available and how money can be used for mitigation efforts.	Low	HMGP, FMA grant, SLCo EM General Fund, MSD General Fund–Copperton, State of Utah DEM staff time	Long term	Medium	
10	Develop an enhanced emergency notification communication system for Copperton.	Civil Disturbance, Dam Failure, Drought, Earthquake, Extreme Heat, Flooding, Hazardous Materials Incident, Heavy Rain, High Wind, Landslide, Lightning, Public Health Epidemic, Radon, Severe Winter Weather, Terrorism, Tornado, Wildfire	SLCo EM	MSD, UFA, UPD, UDOT	Provides early notification of impending wildfires to decrease loss of life. Improves relationships with the public and stakeholders. Ensures faster delivery of information with templates and plans ready to go.	Medium	MSD General Fund– Copperton, SLCo EM General Fund, Next Generation Warning System grant, EMPG	Short term	Medium	
11	Promote the Firewise Initiative and regularly review/ update the Community Wildfire Protection Plan (CWPP).	Wildfire	UFA	SLCo EM, MSD, Copperton, FFSL	Increases awareness of plans (for the public and stakeholders), improves eligibility for grants or other funding sources, ensures regular review of CWPP.	Low	MSD General Fund– Copperton, SLCo EM General Fund CWDG grant, UFA General Fund	Short term	Medium	
12	Conduct public awareness campaign on Tier 2 reporting software for chemical reporting.	Hazardous materials incident	SLCo EM	LEPC, UFA, UPD, Copperton, SLCo Sheriff's Office, Rio Tinto	Improves understanding of Tier 2 reporting and how Copperton can find and submit information. Provides a common operating platform for hazardous materials reporting.	Low	MSD General Fund– Copperton, SLCo EM General Fund, LEPC, State of Utah DEM staff time, UFA General Fund	Long term	Medium	

DRAFT

#	Action	Hazard(s)	Lead Agency	Potential Partners	Benefits (Losses Avoided)	Cost Estimate	Funding Source(s)	Timeframe	Priority	Comments
13	Enact local regulations and codes for development to reduce landslide and slope failure damage to critical infrastructure and buildings.	Landslide and slope failure	MSD	SLCo EM, UFA, Copperton	Reduces the likelihood of landslides and critical infrastructure/building damage. Ensures that future development is up to code and follows policy to avoid repetitive loss properties.	Low	SLCo General Fund, MSD General Fund – Code Enforcement, MSD General Fund-Copperton, State of Utah staff time, HMGP	Long term	Medium	
14	Leverage WebEOC and GIS to track the spread of contagious disease.	Public Health Epidemic/Pandemic	SLCo Health Department	SLCo EM, UFA, MSD, UPD, Sheriff's Office, Copperton	Uses GIS and WebEOC software to maintain situational awareness and tracks illnesses throughout the county.	Low	SLCo EM General Fund, MSD General Fund–Copperton, SLCo Health Department General Fund, State of Utah DEM staff time	Short term	Medium	Copperton already has this software through SLCo EM and the MSD; need to improve training and documentation.
15	Create public awareness campaigns and public education programs on radon risks and provide home testing for radon.	Radon	SLCo EM	SLCo Health Department, SLCo Aging and Adult Services, Copperton, MSD	Decreases radon-caused cancer deaths. Increases engagement/ understanding with the public on what SLCo can do or help with.	Low	SLCo General Fund–Health Department, SLCo General Fund–Aging and Adult Services, MSD General Fund–Copperton, Utah Department of Environmental Quality General Fund	Short term	Low	
16	Develop road resurfacing project including permeable pavement for areas with rain-based flooding.	Severe Weather – Heavy Rain	MSD	UDOT, SLCo PW, Copperton	Reduces pollutants discharged in runoff, reduced maintenance time/costs on roads, improved traction on roads.	High	MSD Capital Projects–Copperton, MSD General Fund–Copperton, SLCo PW General Fund, UDOT Operational or Capital Fund, HMA grant	Long term	Low	
17	Create a public education program for property owners to learn about tree maintenance and high-strength windows.	Severe Weather – High Wind	MSD	SLCo EM, SLCo Aging and Adult Services, NWS, SLCo PW, Copperton	Reduces damage during high wind event to critical infrastructure. Prevents personal injuries (people driving on roads or walking in neighborhoods). Improves relationships with stakeholders and the public.	Low	SLCo PW General Fund, MSD General Fund–Copperton, SLCo EM General Fund,	Short term	Low	
18	Develop a severe winter weather mitigation program to maintain access to primary roadways and evacuation routes.	Severe Winter Weather – Heavy Snow, Blizzard	SLCo PW and Municipal Services	MSD, SLCo EM, Copperton, UDOT, NWS	Ensures emergency services like police, fire, and EMS can use roads to provide their services.	Medium	MSD General Fund–Copperton, NWS Operational Fund, SLCo EM General Fund, UDOT Operational Fund	Short term	High	A severe winter storm with heavy snowfall requires our operators and equipment to be used to clear roads and streets for the public and emergency vehicles to use. The primary efforts will be to keep the roads open by clearing snow.
19	Conduct public awareness campaign about lightning safety.	Severe Weather – Lightning	Copperton	SLCo EM, NWS, UFA, SLCo PW	Increases lightning strike awareness for the public.	Low	SLCo EM General Fund, MSD General Fund–Copperton, NWS	Short term	Low	

DRAFT

#	Action	Hazard(s)	Lead Agency	Potential Partners	Benefits (Losses Avoided)	Cost Estimate	Funding Source(s)	Timeframe	Priority	Comments
							Operational Fund, UFA General Fund			
20	Improve outreach for "see something, say something" QR code to deter terrorist acts.	Terrorism (including cyberattacks)	SLCo EM	UPD, UFA, MSD, Copperton, SLCo IT, SLCo Sheriff's Office	Ensures that residents and local agencies/jurisdictions are aware of local intelligence resources and ways in which they can report suspicious activity. Encourages QR code use/outreach at special events throughout the county.	Low	SLCo EM General Fund, MSD General Fund–Copperton, UPD General Fund, SLCo Sheriff's Office General Fund, SHSP grant	Short term	Medium	
21	Be a part of the countywide intelligence group/ division to monitor and analyze threats before an incident occurs.	Terrorism (including cyberattacks)	SLCo EM	Copperton, SLCo Sheriff's Office, SIAC, DHS, ATF, FBI	Increases situational awareness.	Low	SHSP grant, SLCo EM General Fund, MSD General Fund–Copperton, SLCo Sheriff's Office General Fund, SIAC General Fund	Short term	Medium	This would be a core group of stakeholders that meet on a regular basis to share and collaborate on intelligence data.
22	Code Enforcement – Review critical infrastructure facilities to ensure that building materials are up to code and are tornado resistant.	Tornado	MSD	Copperton, SLCo PW, SLCo EM	Ensures that critical infrastructure facilities are operational/functional in the event of a disaster. Preserves life and safety.	Medium	SLCo EM General Fund, MSD General Fund–Copperton, UFA General Fund	Short term	Low	
23	Enhance interoperable radio communications systems throughout the county.	Civil Disturbance, Dam Failure, Drought, Earthquake, Extreme Heat, Flooding, Hazardous Materials Incident, Heavy Rain, High Wind, Landslide, Lightning, Public Health Epidemic, Radon, Severe Winter Weather, Terrorism, Tornado, Wildfire	Copperton	MSD, UFA, UPD, SLCo Sheriff's Office, SLCo EM	Improves communication between different agencies and provides a common operating platform.	Medium	SLCo EM General Fund, MSD General Fund–Copperton, SLCo Sheriff's Office General Fund	Short term	Medium	
24	Develop a countywide single source of information sharing/gathering for intelligence.	Civil Disturbance, Terrorism	SLCo EM	Copperton, SLCo Sheriff's Office, SIAC, MSD	Improves coordination between local agencies/jurisdictions.	Medium	SHSP Grants, SLCo General Fund, MSD General Fund–Copperton	Short term	Medium	Have one common operating platform to be used by all agencies in SLCo to collect suspicious activity reports. Develop a public awareness campaign to educate the public on how and what to report.
25	Install xeriscaping on government-owned buildings.	Drought	Copperton	SLCo Facilities, Water companies/ districts, Copperton, MSD, state of Utah, SLCO EM	Decreases the cost of landscape irrigation and decreases water use.	High	SLCo General Fund-Facilities, MSD General Fund–Copperton	Short term	Low	
26	Improve communication to the public and stakeholders on	Severe Winter Weather	SLCo EM	Copperton, SLCo Office of Homeless and Criminal Justice Reform,	Prevents further damage to critical infrastructure, ensures that homeless individuals have warming resources available,	Low	SLCo EM General Fund, SLCo General Fund-Health Department, State of Utah General Fund–	Short term	Low

Executive Summary

Natural disasters, such as earthquakes, wildfires, and severe weather events, pose significant danger to life and property in Salt Lake County. Hazard mitigation planning is the process communities can use to identify and assess the risks posed by these hazards and implement measures to reduce the potential impacts of those hazards. It has been recognized that taking action before a natural disaster can substantially reduce the damage caused by these hazards and increase the overall resilience of the community to natural disasters.

Mitigation planning is a collaborative process that provides local governments a framework to reduce or eliminate long-term risk from hazards. Salt Lake County has joined with 23 cities and towns, 2 school districts, and 1 community college for this effort. The planning process includes establishing a planning team to review data on past hazard events and possible future events, evaluate current capabilities, and develop strategies to address hazards. To inform his process, participants from each jurisdiction have collaborated with local emergency managers, planning and development departments, floodplain managers, economic development staff, health and human services departments, public works, city administrators, and geographic information system (GIS) specialists. Participants also consulted existing planning documentation to integrate this plan with other community planning efforts.

Mitigation plans are updated every 5 years. This plan updates the 2019 Salt Lake County Hazard Mitigation Plan and reaffirms the participant's commitment to reducing hazard risk. It is organized in two volumes. Volume 1 contains comprehensive details on each step of the planning process, profiles of each hazard identified by the planning team as having the potential to affect the county, an evaluation of previous mitigation strategies, and the mitigation strategies for the next 5-year planning cycle. Because each community may face different hazards or have unique vulnerabilities to hazards, Volume 2 contains annexes for individual participating jurisdictions. These annexes describe jurisdiction-specific hazard histories and vulnerabilities, an evaluation of the status of previously identified mitigation actions, and new mitigation strategies that have been identified.

This document will describe each stage of the planning process, which includes building the planning team, creating an outreach strategy for identifying community stakeholders and seeking public input, conducting a risk assessment, documenting capabilities, developing and prioritizing mitigation actions, and establishing a strategy for implementing them. Once adopted, this plan makes communities eligible for various grant funding programs to implement identified mitigation actions. Twenty-seven jurisdictions participated in this planning update.

DRAFT

Promulgation

This plan is promulgated as “Salt Lake County’s Multi-Jurisdictional Hazard Mitigation Plan.” It is designed to comply with all applicable federal, state, and local ordinances and resolutions and provides guidance for preparing for and mitigating hazards that threaten the community.

This plan has been constructed using the best available information from a planning perspective. It is recognized that as new information becomes available, decisions and actions may differ from those envisioned when the plan was developed.

Salt Lake County fully supports the plan and urges all officials, employees, and others involved in the total emergency management effort, individually and collectively, to do their share in making Salt Lake County a disaster-resistant and resilient community.

This plan supersedes all previous hazard mitigation plans.

Promulgated this ____ day of _____, 2025.

Authority

Federal Authority

Public Law (PL) 93-288, as amended, established the basis for federal hazard mitigation activity in 1974. A section of this act requires identifying, evaluating, and mitigating hazards as a prerequisite for state receipt of future disaster assistance outlays. Since 1974, many additional programs, regulations, and laws have expanded on the original legislation to establish hazard mitigation as a priority at all levels of government. When the Stafford Act amended PL 93-288, several additional provisions were added that provided for the availability of significant mitigation measures in the aftermath of presidentially declared disasters. The current Stafford Act is the “Robert T. Stafford Disaster Relief and Emergency Assistance Act,” as amended in August 2016.

State Authority

- The Governor’s Emergency Operation Directive
- The Robert T. Stafford Disaster Relief and Emergency Assistance Act, amendments to Public Law 93-288, as amended
- Title 44, Code of Federal Regulations, Federal Emergency Management Agency Regulations, as amended
- State Emergency Management Act of 1981, Utah Code 53-2, 63-5
- Disaster Response Recovery Act, 63-5A

DRAFT

- Executive Order of the Governor, Executive Order 11
- Emergency Interim Succession Act, 63-5B

Utah State Code

In Utah Code 53-2-104, it is stated that the Utah Division of Emergency Management shall prepare, implement, and maintain programs and plans to provide for:

1. Prevention and minimization of injury and damage caused by disasters
2. Identification of areas particularly vulnerable to disasters
3. Coordination of hazard mitigation and other preventive and preparedness measures designed to eliminate or reduce disasters
4. Assistance to local officials in designing local emergency action plans
5. Coordination of federal, state, and local emergency activities; Coordination of emergency operations plans with emergency plans of the federal government; and
6. Other measures necessary, incidental, or appropriate to this chapter

Local Authority

Local governments play an essential role in implementing effective mitigation. For this plan, local governments include cities, counties, and special service districts with elected boards. Each local government will review all present and potential damage, losses, and related impacts associated with natural hazards to determine the need or requirement for mitigation action and planning. In the cities in Salt Lake County, the local executives are responsible for carrying out plans and policies, including the county Mayor and city or town mayors and administrators. Local governments must be prepared to participate in the post-disaster hazard mitigation team process and pre-mitigation planning as outlined in this document to effectively protect their citizens. All jurisdictions in Salt Lake County participated in the development of this plan.

DRAFT

Introduction

Purpose and Scope

The four purposes of this plan are:

1. To identify threats to the community
2. To create mitigation strategies to address those threats
3. To develop long-term mitigation planning goals and objectives
4. To fulfill federal, state, and local hazard mitigation planning obligations

Mitigation actions minimize conditions that have an undesirable impact on our citizens, the economy, the environment, and the well-being of Salt Lake County and surrounding municipalities. This mitigation plan is intended to enhance the awareness of elected officials, agencies, and the public of these hazards and their associated threats to life and property. The plan also details what actions can be taken to help prevent or reduce hazard vulnerability to each jurisdiction.

Hazard mitigation is often a neglected aspect of emergency management. When local governments place a low priority on mitigation implementation activities relative to the perceived threat, some important mitigation measures may be neglected in favor of higher-priority activities. Mitigation success can be achieved. However, if accurate information is conveyed through complete hazard identification and impact studies and followed by effective mitigation management. Hazard mitigation is the key to greatly reducing long-term risk to people and property from natural hazards and their effects.

Salt Lake County and all participating jurisdictions, coupled with their respective citizens, stakeholders, and partner agencies, prepared this local hazard mitigation plan intending to guide hazard mitigation planning in reducing the casualties and costs of natural disasters by providing comprehensive hazard identification, risk assessment, capability, and vulnerability analysis, mitigation strategies, and an implementation schedule. This plan demonstrates the community's commitment to reducing risks from hazards and serves as a tool to help decision makers direct mitigation activities and resources. This plan was also developed to make Salt Lake County and participating jurisdictions eligible for certain federal disaster assistance, specifically, the Federal Emergency Management Agency's (FEMA) Hazard Mitigation Grant Program, Building Resilient Infrastructure in Communities (BRIC), and Pre-Disaster Mitigation program, and to earn points for the National Flood Insurance Program's Community Rating System (CRS), which could lower flood insurance premiums in CRS communities.

This mitigation plan is a revision of the 2019 Salt Lake County Multi-Jurisdictional Multi-Hazard Mitigation Plan. The 2019 plan was reviewed to evaluate its strengths, weaknesses, and utility. The hazards, vulnerabilities, and risks were examined regarding their impact, severity, and how they may affect the population. Updates also describe hazard impacts that have occurred since the last plan revision. The planning team considered previously unidentified hazards including in the plan update. A capabilities

DRAFT

assessment was conducted to identify potential mitigation needs and further align the mitigation plan with other community planning efforts. The revision process included a review of proposed mitigation goals, objectives, and actions to determine their validity and how effective they have been or will be at reducing vulnerability in the county. New priorities have been set to support the identified changes. The mitigation plan was also evaluated to support the state mitigation plan goals and objectives and other local planning efforts. Finally, an implementation strategy and timeline will assign the responsibility and schedule for tracking the implementation of the identified mitigation actions. The mitigation plan will be adopted through the regular legal process and establish authority and guide all mitigation activities outlined in the plan.

This plan also used current county, city, and applicable private hazard mitigation, emergency operations plans, census data, and available GIS and assessor's data as resources for the planning team. Salt Lake County Emergency Management staff, planning team members, county, city, and applicable emergency managers/planners, subject matter experts, recruits from other jurisdictions, such as other local government units, the private sector, non-governmental organizations, academia, airports, and the military were consulted during this planning activity. This plan also demonstrates that the public and all community stakeholders have proactively offered opportunities for participation in the planning process. Examples of participation include relevant involvement in any planning process, attendance at meetings, contributing research, data, and other information, and commenting on drafts of the plan.

This plan was developed in accordance with the requirements of the FEMA Section 322 regulations, 44 Code of Federal Regulations Part 201, the Utah Division of Emergency Management (Utah DEM), and local planning agencies. FEMA regulations were followed during the development of this plan. Salt Lake County Emergency Management (SLCo EM) will conduct monitoring, evaluation, updates, and implementation annually or following any natural disaster. (Any changes made after the annual review will have to be promulgated by the county council. A major revision will occur every five years. Each adopting jurisdiction may also participate in annual or interim plan reviews, updates, and revisions and would also need changes to be promulgated by their local executive leadership.

Background

Salt Lake County is vulnerable to natural and technological (human-caused) hazards threatening our citizens' health, welfare, and security. Action taken to reduce or eliminate the long-term risk to human life and property from these hazards is known as mitigation. The losses of life and property and the cost of response to and recovery from potential disasters can be substantially reduced when attention is turned to mitigation of the impacts and effects before they occur or re-occur.

Hazard mitigation planning is identifying hazard risks and vulnerabilities and establishing goals, policies, and procedures to implement risk-reducing actions. This plan represents a collaborative effort of many participants in our community with the mission to engage community stakeholders in developing a comprehensive approach to reduce long-term hazard risk by identifying and implementing effective mitigation strategies.

DRAFT

Mitigation planning creates safer communities by reducing loss of life and property damage and protecting community assets from the negative impacts of hazards. Implementing mitigation strategies can also reduce the cost of disaster response and recovery by:

- Identifying cost-effective actions that reduce risk
- Focusing resources on the greatest vulnerabilities
- Building partnerships between jurisdictions
- Increasing public awareness of hazards and risk
- Communicating planning priorities
- Aligning risk-reduction efforts with other community plans and objectives
- Establishing eligibility for mitigation grant programs

Hazard mitigation is any cost-effective action that reduces, limits, or prevents the vulnerability of people, property, and/or the environment to potentially damaging, harmful, or costly hazards. Hazard mitigation actions, which can be used to eliminate or minimize the risk to life and property, fall into three categories:

1. Those that keep the hazard away from people
2. Those that keep people, property, and structures away from the hazard
3. Those that do not address the hazard but rather reduce the impact of the hazard on the victims, such as insurance

Local mitigation plans are required to be updated every five years. This plan will update the 2019 Salt Lake County Multi-Jurisdictional Multi-Hazard Mitigation Plan. This mitigation plan is a collaborative effort that will serve all of Salt Lake County, including each of the participating jurisdictions and special service districts in the county. The revision of this plan supports the State Hazard Mitigation Plan mission, which is “to permanently reduce the region’s vulnerability to natural hazards.”

The plan is intended to promote sound public policy and protect or reduce the vulnerability of the citizens, critical facilities, infrastructure, private property, and the natural environment in the region. The framework of this plan will now serve as a tool to guide, plan, and allocate resources across multi-jurisdictional boundaries. It will assist jurisdictions in assessing their resilience to disasters and disruptions. It will serve as a guide to prioritize mitigation and preparedness efforts, allocate funding, guide development in innovative ways, and effectively use and share scarce resources. It represents the county’s commitment to reducing risks from natural hazards.

How To Navigate This Plan

This plan has been set up in two volumes so that elements that are jurisdiction-specific can be easily distinguished from those that apply to the whole planning area:

- Volume 1 includes all federally required elements of a disaster mitigation plan that apply to the entire planning area. This includes the description of the planning process, public involvement strategy,

DRAFT

goals and objectives, countywide hazard risk assessment, countywide mitigation actions, and a plan maintenance strategy. The following appendices at the end of Volume 1 include information and explanations to support the main content of the plan:

  - **Appendix A**: List of Acronyms
  - **Appendix B:** Meeting Documentation
  - **Appendix C**: Public Outreach Survey Documentation
  - **Appendix D**: Plan Effectiveness Evaluation Form
- Volume 2 includes all federally required jurisdiction-specific elements in the annexes of each participating jurisdiction.

All planning partners will adopt Volume 1 in its entirety and their respective jurisdiction-specific annex in Volume 2.

DRAFT

Community Profile

Geography, Land Use, and Development

Geography

At approximately 807.37 square miles, including 65.09 square miles of water area, Salt Lake County is the fifth smallest county in Utah by land area. Tooele County borders Salt Lake County to the west, while Summit County borders it to the east. To the north lie Davis and Morgan Counties, with Utah County to the south. The Great Salt Lake occupies much of the northwest corner of the county. The Wasatch and Oquirrh Mountains form the eastern and western borders of the county, respectively (Figure 1).

Land Use and Development

Salt Lake County has 23 cities and towns: Alta, Bluffdale, Brighton, Copperton, Cottonwood Heights, Draper, Emigration Canyon, Herriman, Holladay, Kearns, Magna, Midvale, Millcreek, Murray, Riverton, Sandy City, Salt Lake City, South Jordan, South Salt Lake, Taylorsville, West Jordan, West Valley City, and White City. The Greater Salt Lake Municipal Services District (MSD) provides municipal services, such as staffing and administrative support for member communities, which include Brighton, Copperton, Emigration Canyon, Kearns, Magna, White City and Unincorporated Salt Lake County. The MSD also provides planning and zoning, business licensing, and code enforcement services to member communities. Animal Control Services, Parks Maintenance and operations, and Public Works Operations for the MSD are contracted with Salt Lake County. Salt Lake County's land ownership is approximately 79.4% private, 6% federal, and 10% state. 4.6% of this area is water. Figure 2 shows the locations of lakes, rivers, and canals in the county.

A significant portion of Salt Lake County is currently zoned for low-density residential development. Some higher densities are allowed in eastern Salt Lake City, while the southern areas of Salt Lake County are zoned for lower housing density. Industrial land uses are planned for West Salt Lake City, along the I-15 corridor, northern West Valley City, the western portion of North Salt Lake, and the west side of Salt Lake County. Areas primarily for commercial use include Salt Lake City's central business district and along primary transportation corridors, including I-15, I-215, State Street, 400 South, Highland Drive, 3500 South, 4500 South, and 7200 South.

Additional commercial land use nodes are dispersed throughout Salt Lake County to serve adjoining residential communities. Many public and private lands remain undeveloped because of specific environmental constraints, such as steep slopes and prime wetlands. Some areas currently used for industrial or mining activity may be redeveloped for commercial and residential purposes. Kennecott Utah Copper Corporation currently owns much of this land.

Climate and Weather

The Salt Lake City Climate Book is a long-term project that maintains historical climate records for the Salt Lake City Weather Forecast Office and the region it serves. It includes temperature, precipitation, and snowfall records, including averages, minimums, maximums and extremes. Table 1 summarizes the

records available through this source, including monthly average temperatures, normal monthly precipitation, and normal snowfall.[1]

Table 1: Temperature and Precipitation in Salt Lake City

	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec

Population

According to the United States Census, Salt Lake County continues to be the most populous county in Utah, with a population of 1,185,813 in 2023. It has grown steadily over the past 13 years (see Table 3).[5] The 2024 estimated population of Salt Lake County is 1,185,057, with a growth rate of -0.06% in the past

2014	1,090,340	10,679	0.99%
2013	1,079,661	15,521	1.46%
2012	1,064,140	16,438	1.57%
2011	1,047,702	14,705	1.42%
2010	1,032,997	0	0%

Salt Lake County's population increased in 10 of the 13 years between 2010 and 2023. The largest annual population increase was 2.4% between 2019 and 2020. The county's largest decline in growth was between 2020 and 2021, when the population growth rate saw no increase. Between 2010 and 2022, the county grew by an average of 1.2% per year (see Figure 6).[8]

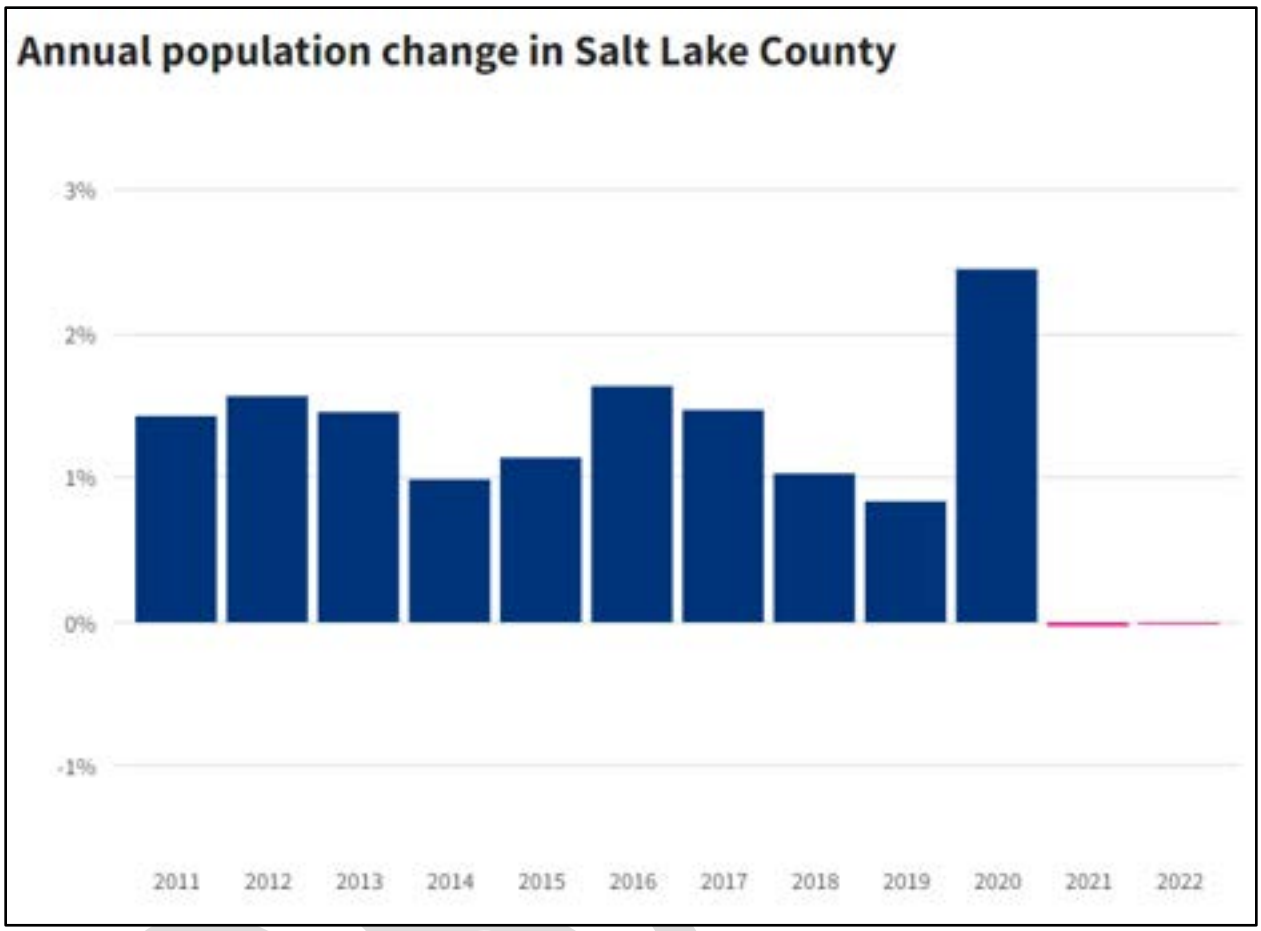

Figure 6: Population Growth Rates for Salt Lake County, 2011–2022[9]

City Populations

Salt Lake County contains two of the largest cities in the state: Salt Lake City, which has a population of approximately 209,593 (a 4.9% increase from 2020, when it was 199,723), and West Valley City, which has a population of approximately 134,470 (−4.1% decrease from 2020, when it was 140,238), according to the 2023 census data.[10] Figure 7 shows the current daytime population density in the county, followed by the nighttime population in Figure 8 based on LandScan data from Oak Ridge National Laboratory. LandScan data are the community standard for global population data. It is derived through the use of available data and satellite imagery to map geographic areas with superimposed layers of information to represent an "ambient" (24-hour average) population.

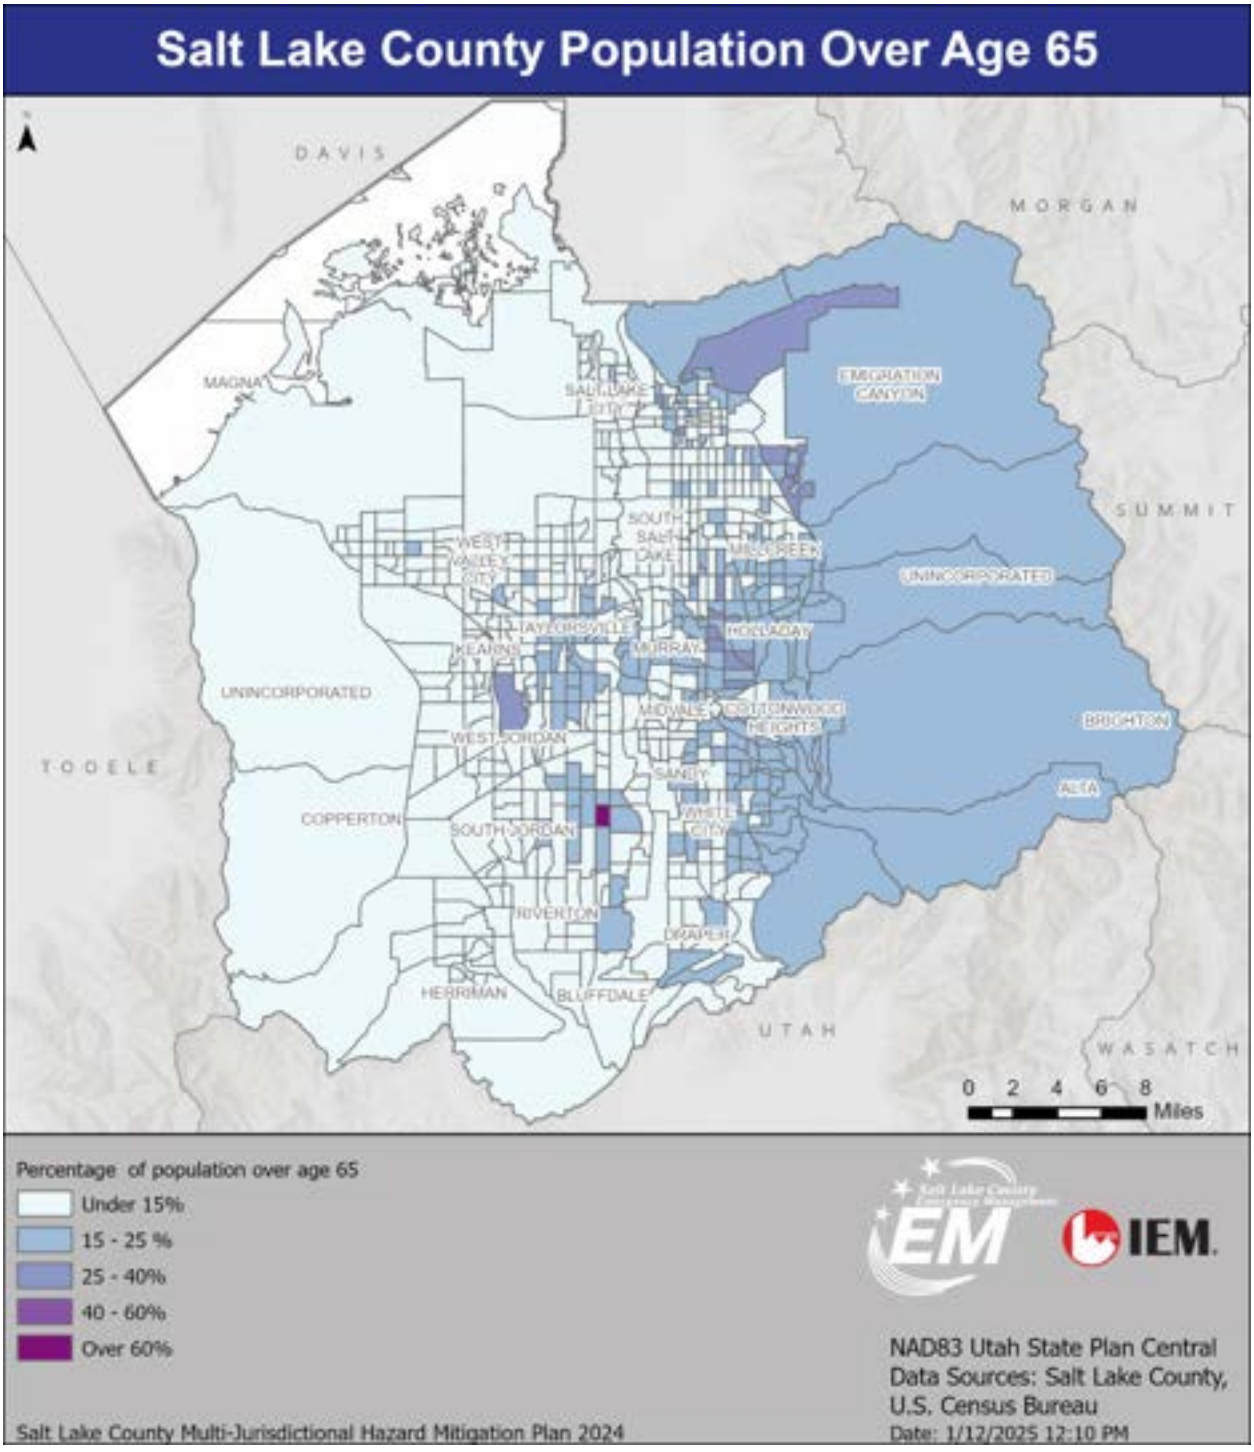

Figure 10: Population 65 Years Old and Older in Salt Lake County by Census Tract

Population by Race

Figure 11 illustrates the Salt Lake County population by race. Of the population, 880,344, or 74.56%, are white; 106,540, or 9.02%, identify as another race; 94,251, or 7.98%, identify as two or more races;

49,060, or 4.16%, are Asian; 21,531, or 1.82%; are Black or African American; 18,674, or 1.58%, are Native Hawaiian or Pacific Islander; and 10,243, or 0.87%, are Native American.

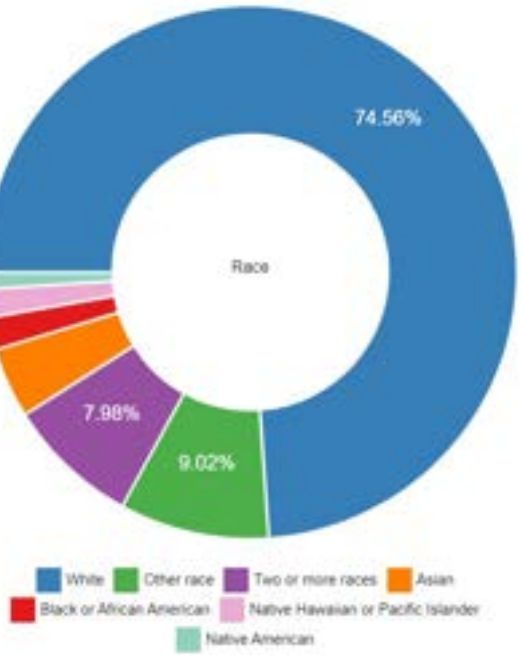

Figure 11: Population by Race of Salt Lake County[15]

Population by Educational Attainment

Figure 12 illustrates the educational attainment levels of the Salt Lake County population. For residents over 25 years old, 25,107 (3.33%) have less than a ninth-grade education, and 36,846 (4.88%) attained a ninth- to twelfth-grade education. High school graduates make up 22.34% of the population (168,538 individuals). Some college, associate degree, bachelor's degree, and graduate degree attainment totals 523,933, or 69.46%.[16]

[15] Ibid.
[16] Ibid.

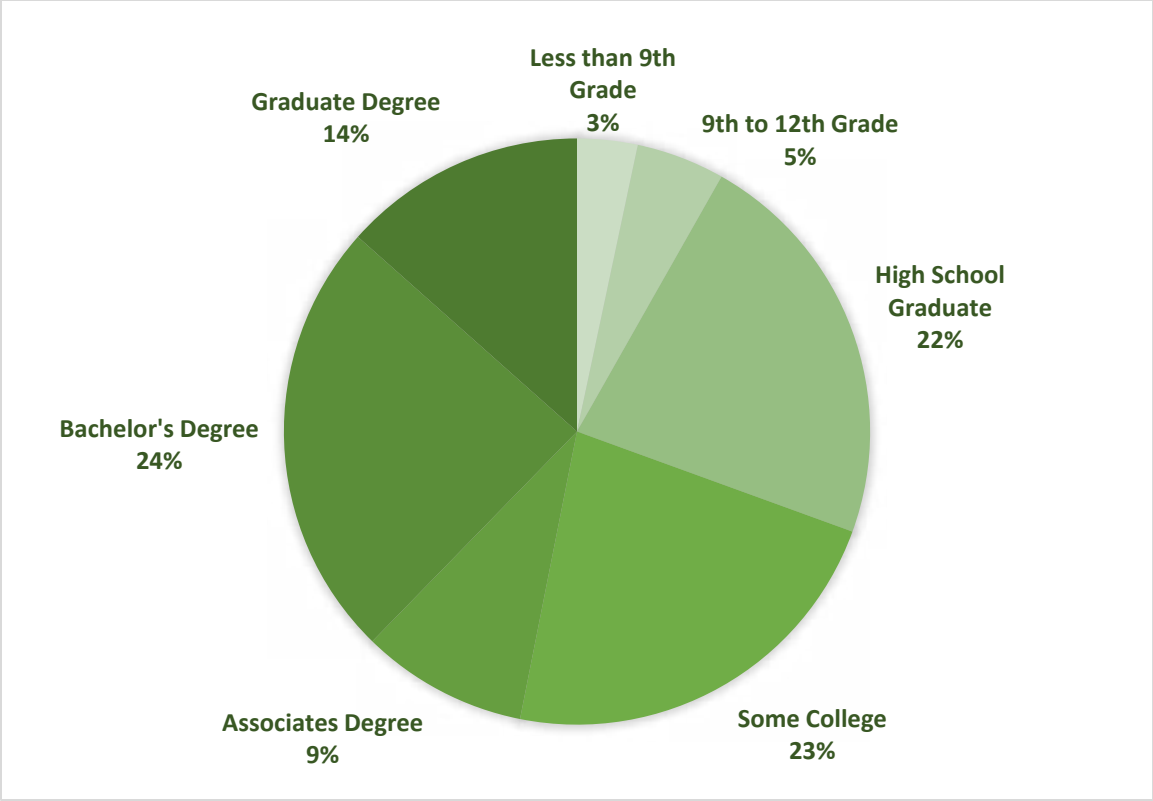

Figure 12: Educational Attainment in Salt Lake County[17]

Housing

For 2018–2022, the United States Census Bureau reports an owner-occupied housing unit rate for Salt Lake County of 67.1%, with 458,880 housing units, as of July 1, 2023. The median value of owner-occupied housing units for 2018–2022 was $440,400. The median selected owner costs for a monthly mortgage was $1,939, while the median gross rent was $1,394.[18]

Economy

Employment

Salt Lake County is the backbone of Utah's economy, making up approximately 39% of the labor force and 47% of the non-farming job market. The trade and transportation industry, the largest employment division in the county, supplies approximately 20% of the county's employment share. Trade is the second major source of employment, followed by government and education, health, and social services. Salt Lake is a regional center for the finance, healthcare, and high-tech industries. Major employers include the University of Utah, the state of Utah, Intermountain Healthcare, Granite School District,

The unemployment rate measures those people who reside in a county, are jobless and available to take a job, and have actively sought work in the past four weeks. The unemployment rate is a proxy for the availability of labor. An unemployment rate between 4.0% and 4.8% may be considered balanced in terms of excess, balance, and shortage.

According to the United States Bureau of Labor Statistics, the unemployment rate in Salt Lake County in July 2024 was 3.6%, up from July 2023 at 2.6%.[21]

Electricians	$29.38	$32.60
Paralegals and Legal Assistance	$28.20	$31.95

Poverty

A measure of poverty takes income and family size into account and has both immediate and long-lasting effects on health. Income assesses the financial resources available to individuals or families for necessities (e.g., food, clothing, and healthcare) to maintain or increase their well-being. Persons living in poverty are worse off than persons in more affluent households for many indicators tracked by the Utah Department of Health and Human Services Public Health Indicator Base Information System (PHIBIS). The Utah Public Health Data Resources reports poverty statistics based on the 2022 Model-based Small Area Income & Poverty Estimates (SAIPE) for school districts, counties, and states. The poverty threshold for a family of four, including two children, was $29,678 in 2022. Poverty thresholds are updated annually using the Consumer Price Index for All Urban Consumers (CPI-U) to allow for changes in the cost of living. They do not vary geographically. PHIBIS reports that the percentage of persons living in poverty in Salt Lake County is 7.7%. In addition, Utah has a lower percentage of children in poverty than the U.S. as a whole, 8.5% vs. 16.3% in 2022.[26]

Critical Facilities and Infrastructure

Critical facilities include structures from which public safety actions and other essential services are provided. Although not an exhaustive list of facilities that perform important community functions, this plan identifies critical facilities such as emergency operations centers, fire stations, hospitals, police stations, schools, and other county facilities. County facilities include community assets, such as recreation centers, libraries, public works, parks, cultural venues, public health facilities, justice centers, and senior centers.

STATE-OWNED FACILITIES

Salt Lake County has 1,463 state-owned facilities with an insured value of approximately $7.3 billion.

DRAFT

Transportation

As of 2023, the Salt Lake County International Airport was the 21st busiest airport in the United States, operating as a major hub for Delta Air Lines and SkyWest Airlines. Although not visible in Figure 14, the South Valley Regional Airport in West Jordan also is available for public use.

Salt Lake County can be traversed on several interstate highways, including I-15, I-80, and I-215. Numerous other freeways, expressways, and significant arterial routes interconnect in the county, including SR-68, SR-201, and SR-154. The county also contains many bike paths for active transportation.

The county is also heavily networked with bus and commuter rail lines operated by the Utah Transit Authority (UTA) (Figure 14 and Figure 15). The FrontRunner commuter rail line, TRAX light rail system, and many bus routes are all used for public transportation throughout Salt Lake County.

DRAFT

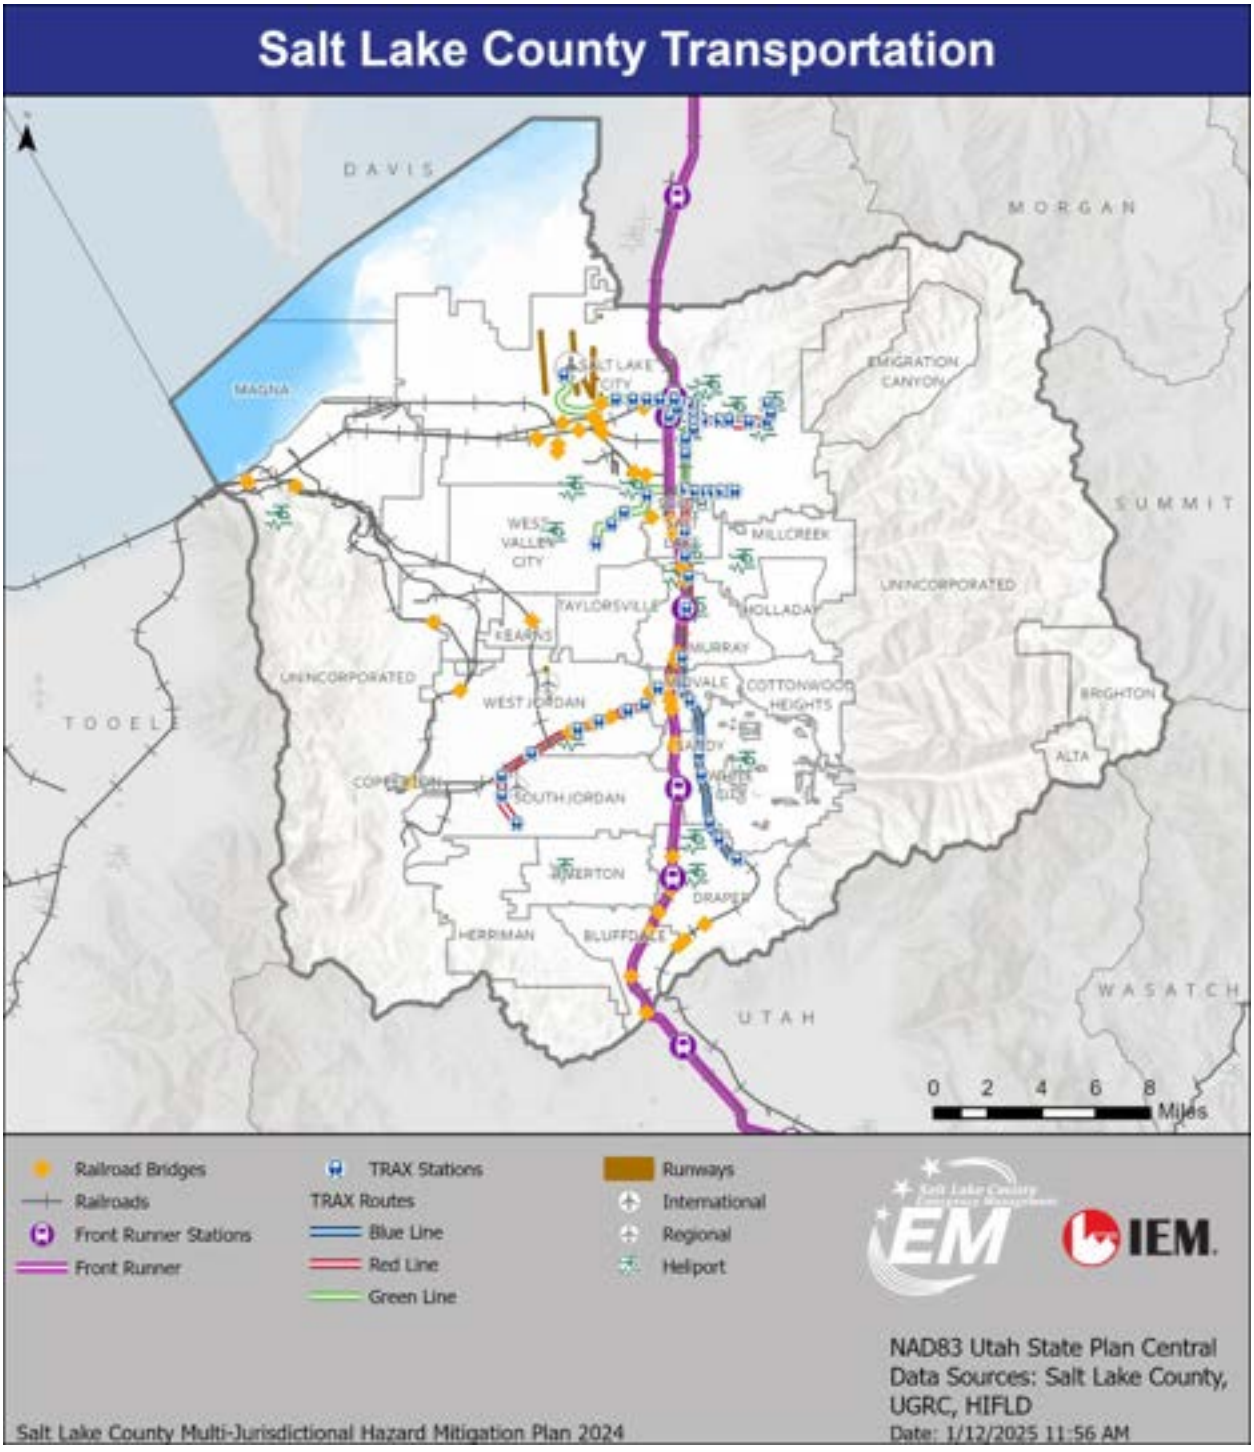

Figure 14: Railways in Salt Lake County

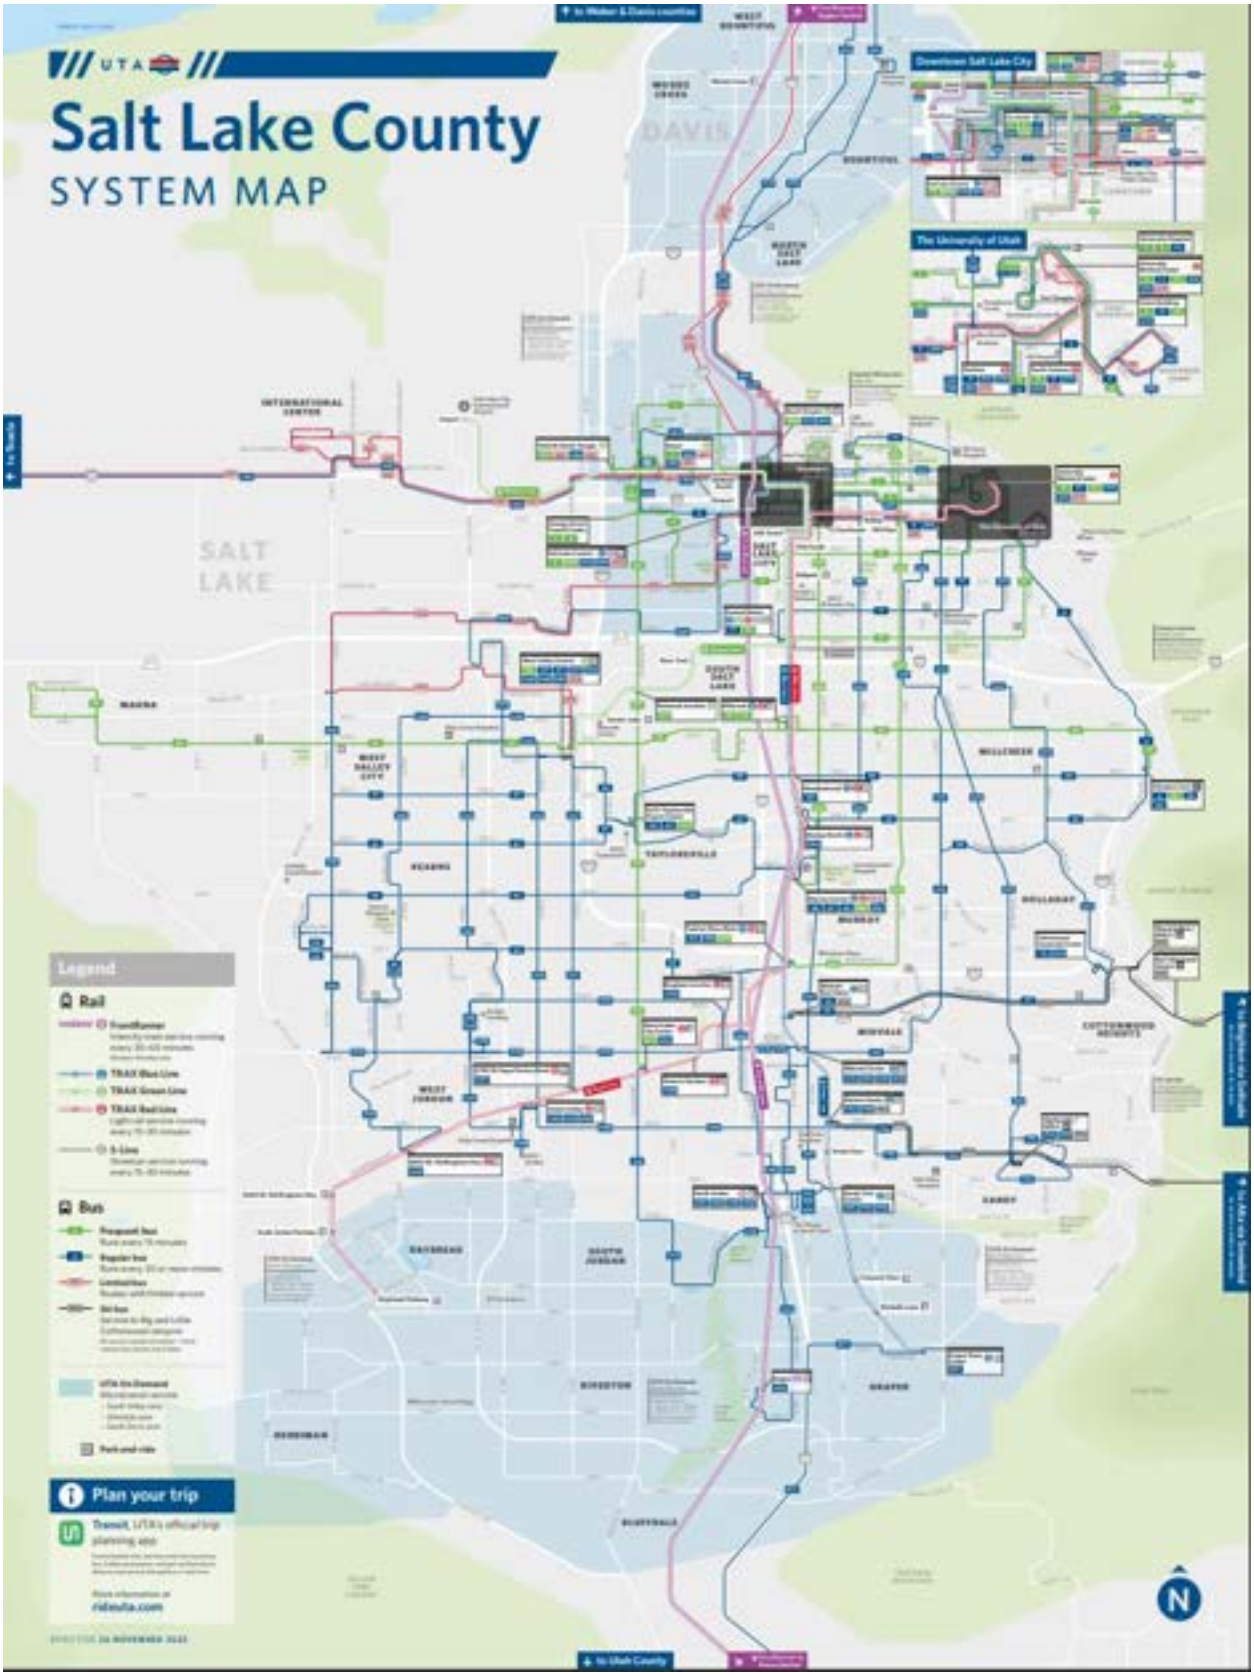

Figure 15: Map of the Salt Lake County Transit System

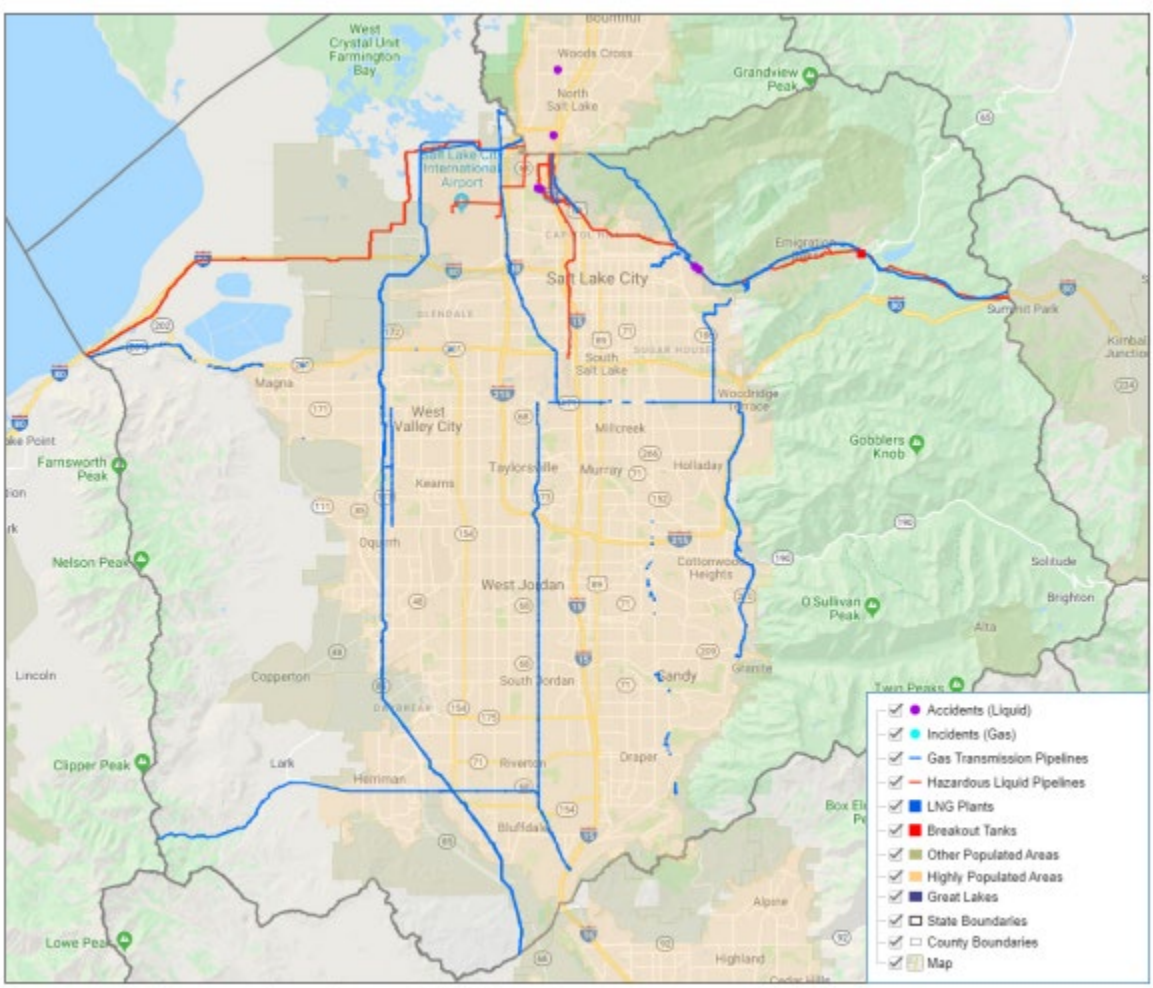
Water Control Structures

According to the 2024 Utah Enhanced State Hazard Mitigation Plan, there are approximately 266 High Hazard Potential Dams (HHPDs) in the state and 28 in Salt Lake County. The largest concentration of high and significant hazard dams is in the Wasatch Front counties, including the Salt Lake City metropolitan area. The Wasatch Front is a region in north central Utah of mostly contiguous cities and towns along the Wasatch Mountains. It stretches from Santaquin in the south to Pleasant View in the north. The Wasatch Front is the most highly populated region in Utah, with 80% of its residents in this area. The National Levee Database also maps five levee systems (160 levee structures) in the county.

Pipelines

The National Pipelines Mapping System has a public map viewer that can be used to view gas transmission and hazardous liquid pipelines in Salt Lake County (Figure 16).



Source: https://pvnpms.phmsa.dot.gov/PublicViewer/

Figure 16: Pipelines in Salt Lake County

Communications

The major newspapers in the county include the Salt Lake Tribune and Deseret News, although many others are in circulation in the county. There are approximately 17 full-power television stations in the Salt Lake City market. There are also approximately 30 trunked radio systems in Salt Lake County (Table 11).

DRAFT

Planning for the Future

Salt Lake County anticipates continued population growth over the next 30 years, expected to reach 1,385,240 by 2055. Salt Lake County is also influenced by growth in neighboring counties. According to the Wasatch Choice 2050 Plan, the Wasatch Front region could reach almost 5 million by 2050. This growth necessitates the development of key infrastructure guided by long-range planning. To that end, the Wasatch Front Regional Council (WFRC) is responsible for coordinating the transportation planning process for the region. WFRC is an association of governments comprised of elected officials from Box Elder, Davis, Morgan, Salt Lake, Tooele, and Weber Counties. The WFRC has facilitated the development of the Wasatch Choice 2050 Plan, which is the communities' shared vision for transportation investments, development patterns, and economic opportunities. The Wasatch Choice 2050 Plan envisions transportation investments and interrelated land and economic development decisions that achieve desired local and regional outcomes.[28]

Four key strategies represent the overarching themes in the Wasatch Choice 2050 Plan and help achieve the regional goals. The key strategies of the Wasatch Choice 2050 Plan are as follows.

- **Provide Transportation Choices:** Help us have real options for getting around and increase the number of easily reached destinations.
- **Support Housing Options:** Support affordable housing types and locations that work best for our lives.
- **Preserve Open Space:** Preserve sufficient and easily accessible open lands that provide recreational opportunities.
- **Link Economic Development with Transportation and Housing Decisions:** Create a synergy between these three key building blocks. Enable shorter and less expensive travel to afford us more time and money. Efficiently use infrastructure to save taxpayer dollars. Provide housing options and increase housing affordability. Improve the air we breathe by reducing auto emissions.

Wasatch Choice is implemented through the Comprehensive Economic Development Strategy, Local Planning, and Regional Transportation Plan (RTP). The following maps from the 2019–2050 RTP show the region's vision for future transportation and land use.

[28] Wasatch Choice 2050 Plan. "Goals and Strategies." https://wasatchchoice.org/.

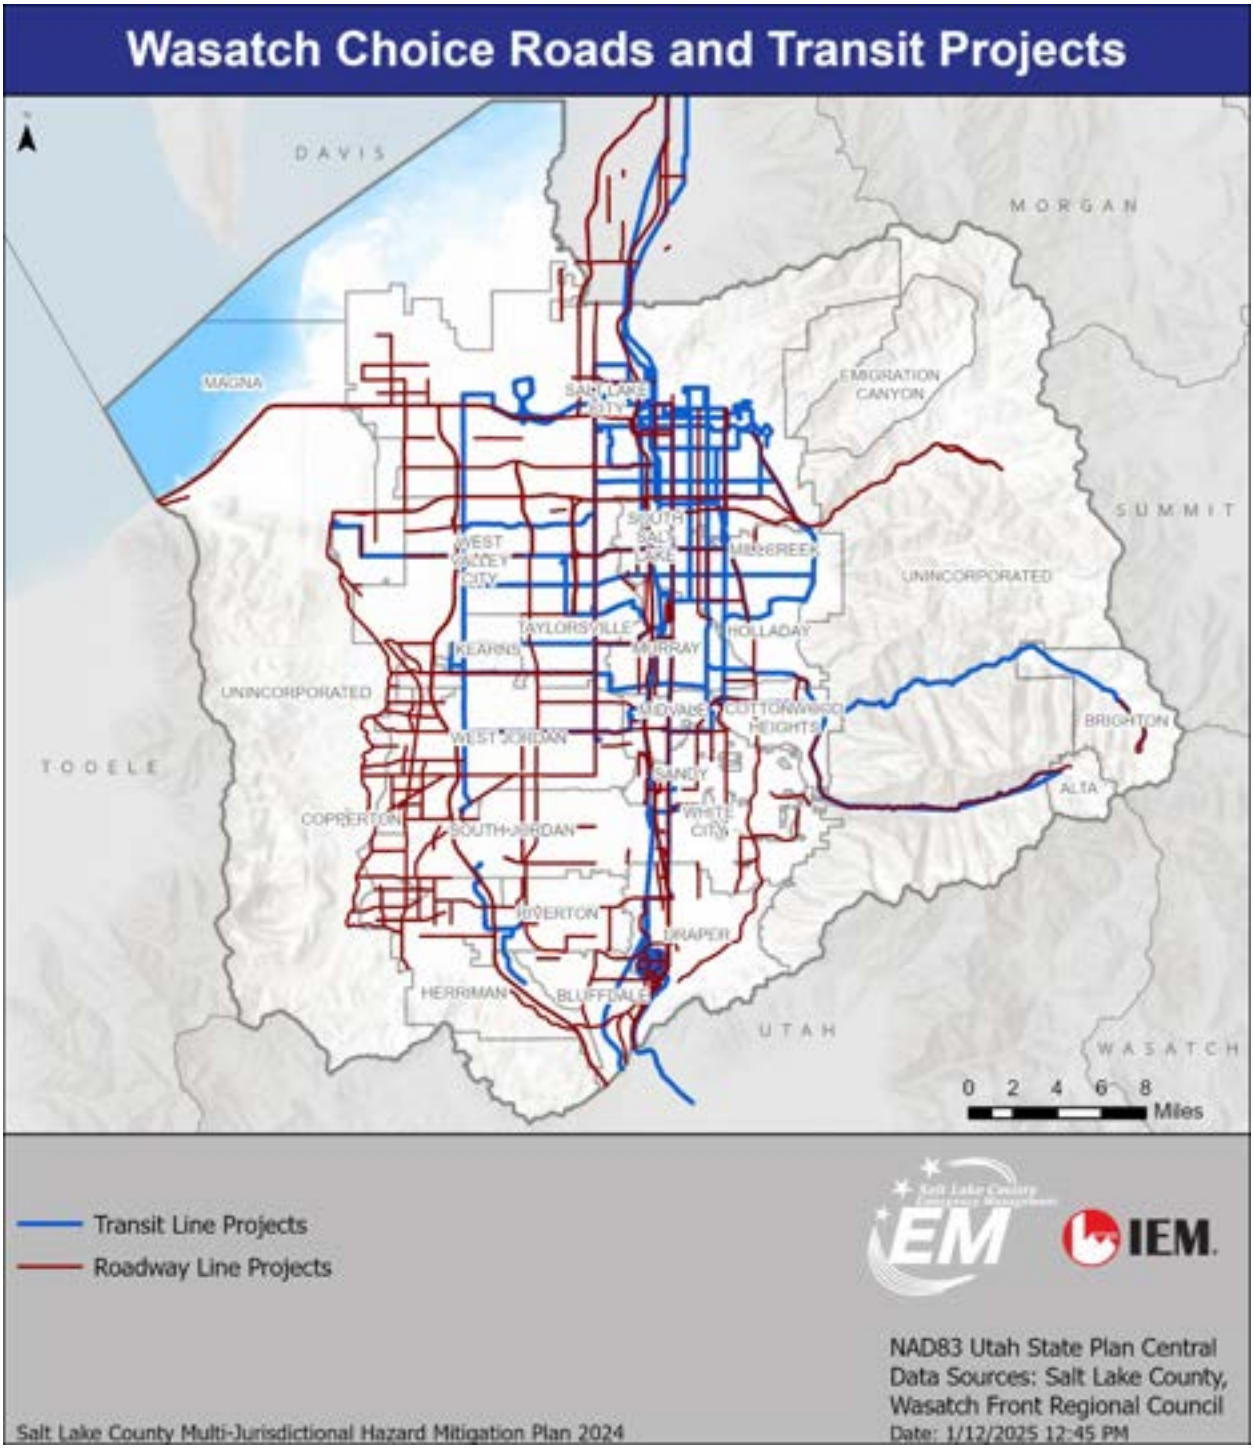

Figure 17: Map of Wasatch Choice Roads and Transit[29]

The regionally significant land uses include a hierarchy of centers (Figure 18). Centers are the hearts of a community and are locations where communities anticipate welcoming more buildings, even as they may

[29] Wasatch Choice 2050 Plan. "Transportation Map." https://wasatchchoice.org/vision-map/#mapList=vision.transportation.landuse.econdev.recreation.olympics&selectedMap=vision&sideBarClosed=false&x=-12450274&y=4979018&scale=288895.

maintain lower levels of density elsewhere. The locations vary in scale but, in all cases, are denser than their surrounding area, walkable, and offer a mix of uses. Because of these traits, residents in or near centers drive shorter distances and are likelier to walk, bike, and ride transit. Overall, this reduces traffic congestion and air emissions. In addition, they are typically good candidate locations for providing various housing options, including units that impact housing affordability.

DRAFT

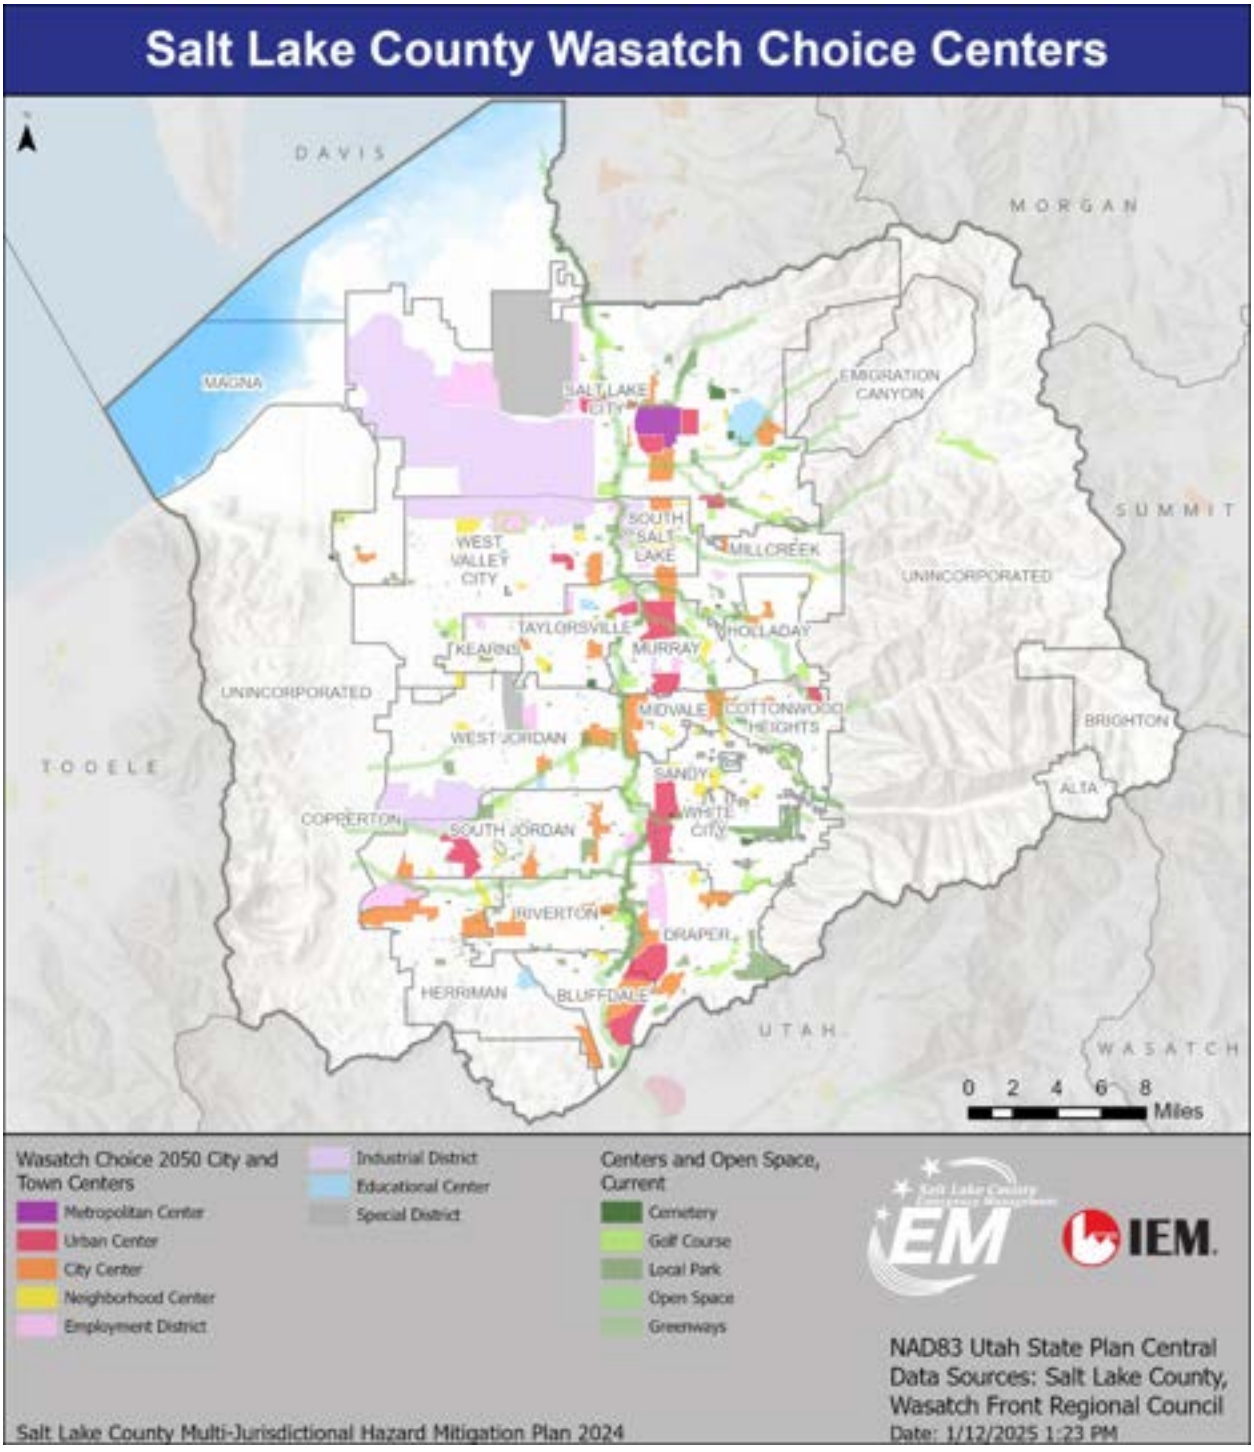

Figure 18: Map of Wasatch Choice Land Use[30]

The economic development map (Figure 19) shows several important regional policy and geographic considerations: Utah State Economic Clusters, Opportunity Zones, Community Development Areas

[30] Wasatch Choice 2050 Plan. https://wasatchchoice.org/vision-map/#mapList=vision.transportation.landuse.econdev.recreation.olympics&selectedMap=landuse&sideBarClosed=false&x=-12450274&y=4979018&scale=288895.

(CDA) and Regional Development Areas (RDA), and Transit-Oriented Developments (TODs). Utah's industry clusters are aerospace and defense, energy, financial services, life sciences, outdoor products and recreation, and software and IT. Nurturing industry clusters helps the state and Salt Lake County sustain a competitive business advantage. Opportunity Zones are areas determined by the U.S. Census Bureau as "low-income communities." Designated Opportunity Zones incentivize private sector investments in housing and economic development in these areas by providing tax incentives. CDAs and Community Reinvestment Areas (CRAs) are public financing tools. They temporarily use the increase in tax revenue spurred by land reinvestment to pay for infrastructure improvements. By doing so, they further encourage land reinvestment. TODs refer to housing, jobs, and commercial developments centered around transit. Development that is well integrated with transit choices provides additional transportation choices and positively impacts the economy through increased accessibility to jobs and housing. TODs help reduce household transportation costs, congestion, and air pollution.

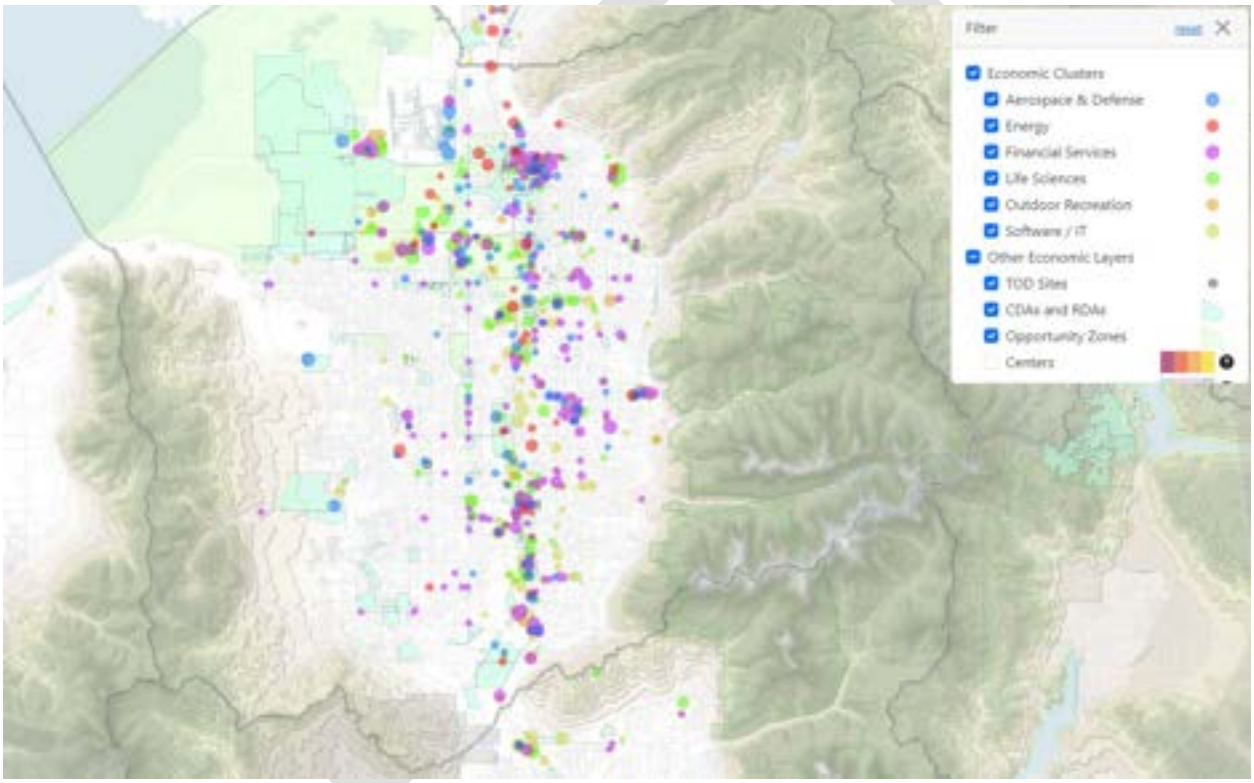

Figure 19: Map of Wasatch Choice Economic Development[31]

The Wasatch Front region is a stunning natural setting. As growth continues, one challenge is to ensure that residents have sufficient open space and recreational opportunities that are easy to access. Open space can manifest itself in several ways: natural, untouched landscapes; mountain trails; bird sanctuaries; rivers and lakes; places of solitude; playgrounds; paved urban trails; neighborhood pocket parks; regional urban parks; sports complexes; and community gathering places, among many more.

[31] Wasatch Choice 2050 Plan. "Economic Opportunities." https://wasatchchoice.org/vision-map/#mapList=vision.transportation.landuse.econdev.recreation.olympics&selectedMap=landuse&sideBarClosed=false&x=-12450274&y=4979018&scale=288895.

Besides the mental and physical health benefits for people using these spaces, open space is critical green infrastructure.

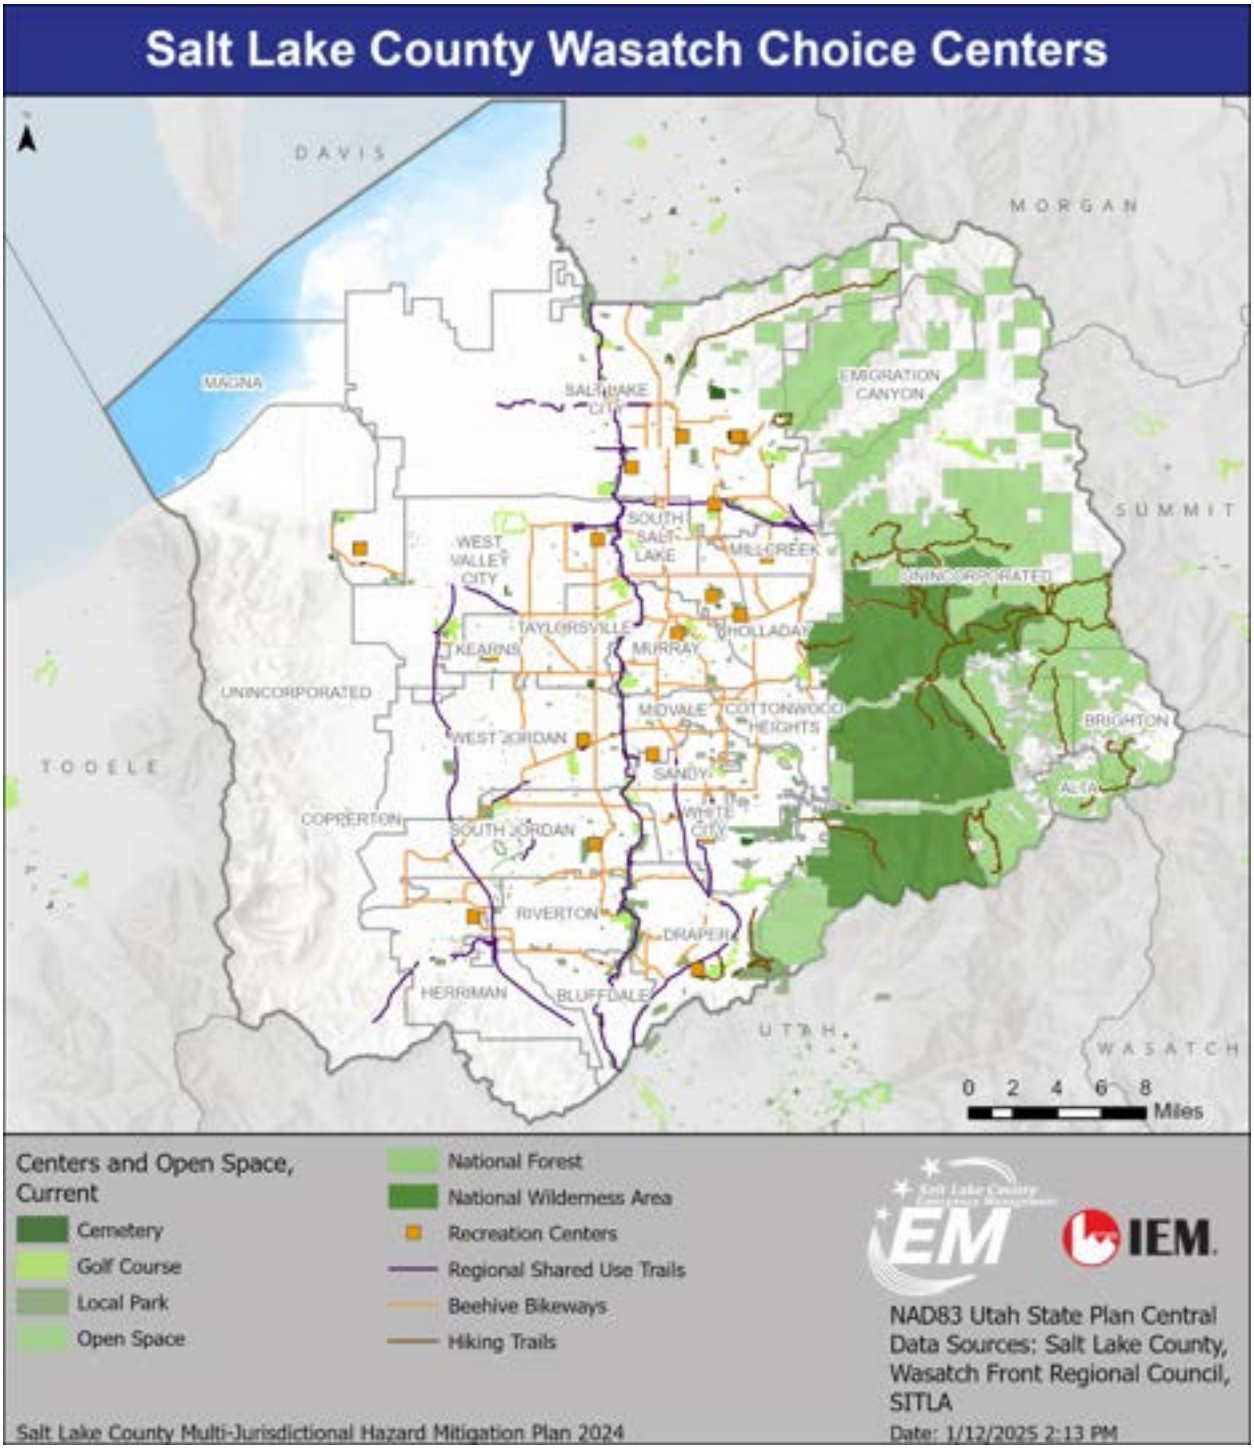

Figure 20: Recreation Centers in Salt Lake County

As the region grows, diverse open space and recreation opportunities must be planned to maintain the quality of life that many residents enjoy. Setting local goals for park space per household is one way to

focus attention on providing recreational spaces in growth areas. Parks are becoming even more important as the region densifies with high rates of multifamily residential development. Establishing goals and intentions is a great step, but energy and funding must also be put into making new parks become a reality.

In addition, recreation planning should look to enhance access to these spaces by walking and biking. This can be accomplished by linking these spaces through a biking and walking network, such as the 100-mile Golden Spoke network of off-street paved pathways consisting of the Provo River Parkway, Murdock Canal Trail, Jordan River Parkway, Legacy Parkway Trail, Denver & Rio Grande Western Trail, and Ogden River Trail.

DRAFT

Planning Process

Hazard mitigation plans serve as the foundation of an effective mitigation program. A robust whole-community planning process is important for gathering vital stakeholder input and building partnerships to implement mitigation actions. An inclusive planning process ensures that local jurisdictions and countywide participants are involved and can provide meaningful input. By soliciting information from a broad range of stakeholders, the plan update meets the requirements outlined by FEMA in the Local Mitigation Planning Policy Guide. It reflects the plan participants' unique risks, vulnerabilities, goals, and strategies.

This section describes each stage of the planning process used to develop the 2025 Salt Lake County Multi-Jurisdictional Hazard Mitigation Plan (MJHMP). This process provided a framework for document development. It included organizing resources, assessing risk, developing the mitigation plan, drafting it, reviewing and revising it, and adopting and submitting the plan for approval.

Plan Update Approach

Hazard mitigation planning in the United States is guided by the statutory regulations described in the Disaster Mitigation Act of 2000 (DMA 2000) and implemented through 44 Code of Federal Regulations (CFR) Part 201 and 206. FEMA's guidelines outline a four-step planning process for developing and approving hazard mitigation plans.

To develop the MJHMP, a planning process was created based on the various federal guidance documents and regulations, including FEMA's Local Mitigation Planning Handbook, which shows that the MJHMP planning process includes four core components: organizing resources, assessing risk, developing the mitigation action strategy, and adopting and implementing the plan.

Salt Lake County Emergency Management (SLCo EM) gathered letters of commitment from the participating jurisdictions during the summer of 2024. Once participating jurisdictions were identified, IEM facilitated the Kickoff Meeting with SLCo EM staff and jurisdictional planning partners to address the purpose of the mitigation plan and the planning process, establish a schedule for future meetings, and explain the importance of public and stakeholder involvement. In addition, they identified project objectives and data needs, refined plan boundaries, collected background information, identified project issues and challenges, discussed networking with essential partners, and facilitated discussion of the public outreach strategy and project management. This meeting also emphasized the need for public outreach, particularly to vulnerable populations.

Following the Kickoff Meeting, the SLCo EM staff facilitated two presentations with executive leaders of participating jurisdictions, one with the Salt Lake County Council on October 15 and another with the Council of Mayors on October 17. These meetings were an opportunity to introduce the purpose of the mitigation plan and the planning process and explain the importance of public and stakeholder involvement. SLCo EM also facilitated a meeting with the participating jurisdictions' Public Information Officers (PIOs) on September 30 to help engage them in outreach efforts.

DRAFT

Figure 21: Mitigation Plan Announcement in the Salt Lake County Government Center

The Risk Assessment Review Meeting gave plan participants an opportunity to provide input about past and potential hazard impacts on each jurisdiction. The Mitigation Strategy Meeting gave plan participants the opportunity to discuss the approach to mitigation across the planning area and included a brainstorming session to propose measures to reduce the current and future vulnerabilities described in the risk assessment stage of the plan. Plan participants were also invited to attend the Final Review and Plan Adoption Meetings and an Executive Leadership Meeting to conduct the closeout proceedings.

Figure 22: Salt Lake County Hazard Mitigation Plan Kickoff Meeting

Local Jurisdiction Plan Participation

The 2025 Salt Lake County MJHMP update was developed with support from many agencies, organizations, and individuals. SLCo EM is responsible for the plan update. Grant funding for the project was received by the Unified Fire Authority, which manages SLCo EM using a 50-year charter created with Salt Lake County in 2004. SLCo EM organized the planning participants and facilitated meetings and public outreach, and UFA provided additional staff, resources, and administrative support. SLCo EM hired IEM International, Inc. (IEM) to update the 2019 plan. IEM provided technical and outreach assistance throughout the planning process, including updating the base plan, facilitating meetings, and developing and incorporating forms to garner stakeholder input. Salt Lake County was joined by the Cities, Towns, and Special Districts listed in Table 12.

The IEM team worked with each participating jurisdiction throughout the planning process to identify hazards of concern and mitigation actions specific to each jurisdiction. The county representatives worked with available county staff outside meetings to obtain feedback and provide input about specific concerns, capabilities, and actions for each jurisdiction.

Many of the participating cities have a dedicated Emergency Manager or designee who serves as the primary participant in the mitigation planning process. As noted in the Community Profile, the Greater Salt Lake Municipal Services District provides municipal type services to the municipalities of Copperton, Emigration Canyon, City of Kearns, Magna City, White City, the Town of Brighton, and unincorporated areas in the county. The municipalities' emergency planning needs are such that they do not require a full-time emergency planner.

The MSD has a Municipal Emergency Management Services and Reimbursement agreement with the Unified Fire Authority (UFA) to hire emergency planning specialists who share the work of an emergency planner on a part-time, pro-rata basis. UFA has hired two emergency planning specialists who provide emergency planning services to the municipalities, the unincorporated county, and the MSD for an agreed-upon proportion of time. Midvale City also shares a municipal planner via contract with UFA. The UFA municipal planners performed the role of participating in the mitigation planning process on behalf of the municipalities, and coordinated with SLCo EM, the MSD, and other municipal executives or representatives as needed.

Table 12 outlines the schedule of activities for plan participation, detailing the levels of involvement from all participating jurisdictions. It indicates which jurisdictions aim to meet the optional High Hazard Potential Dam (HHPD) element. Those jurisdictions marked as pursuing this element are in areas designated as HHPDs. Special districts are labeled as N/A since they are encompassed in a specific city, and that city will fulfill the requirements for the HHPD element.[32]

[32] National Inventory of Dams, "Salt Lake County." https://nid.sec.usace.army.mil/#/dams/search/sy=@countyState:salt%20lake%20@hazardId:(4)&viewType=map&resultsType=dams&advanced=false&hideList=false&eventSystem=false.

Table 12: Participating Jurisdictions

Jurisdiction	Participant in the 2019 Plan	Participant in the 2025 Plan	Seeking to Meet Optional HHPD Element
Alta	Yes	Yes	No
Bluffdale	Yes	Yes	Yes
Brighton	Yes	Yes	Yes
Copperton	Yes	Yes	No
Cottonwood Heights	Yes	Yes	No
Draper	Yes	Yes	Yes
Emigration Canyon	Yes	Yes	No
Herriman	Yes	Yes	Yes

Canyons School District	No	Yes	N/A

Organizing Resources

As part of this step, the IEM team reviewed and incorporated, as appropriate, various existing plans, studies, reports, and other technical data/information into the MJHMP update. Suggestions for important data to include were collected from the participating jurisdictions and stakeholders. Table 13 lists the existing resources and how they were incorporated in the MJHMP update, especially in the hazard profiles.

DRAFT

Table 13: Existing Resources and Their Use in the Plan Update[33]

Existing Resource	Used in Plan
A Strategic Plan for Earthquake Safety in Utah	Identification of potential earthquake mitigation actions and statistical data added to various sections of the hazard profiles
Earthquake Safety in Utah	Identification of potential earthquake mitigation actions and statistical data added to various sections of the hazard profiles
Federal Emergency Management Agency	How-to Guidelines for each section of the plan
National Climate Data Center	Statistics and research information for each jurisdiction relating to drought and severe weather conditions as part of the hazard profiles' previous occurrence sections
National Weather Service (NOAA/NCEI)	Each natural hazard profile includes statistical data related to previous occurrences of disasters in the jurisdictions that were reported.
Salt Lake County 2019 Hazard Mitigation Plan	To update all sections of the plan
Salt Lake County and Municipalities Emergency Operations Plans/ Comprehensive Emergency Management Plans	Histories, mitigation actions, public input; GIS, assessor, transportation, property, and infrastructure data
Salt Lake County Wildfire Preparedness Plan 2019	Descriptions of communities at risk, access concerns, resources and values at risk, and potential mitigation actions.
State of Utah Drought Response Plan 2022	Prior drought mitigation action review.
University of Utah Seismic Station	Earthquake data and statistical data added to various sections of the hazard profiles
Utah 2024 State Hazard Mitigation Plan	Climate Change sections of Hazard Profiles, maps, and figures relevant to sections
Utah Avalanche Center	Snow and avalanche statistical data added to various sections of the hazard profiles
Utah Department of Transportation	Traffic, accidents, hazardous materials transportation information, and statistical data added to various sections of the avalanche and other hazard profiles
Utah Division of Emergency Management	GIS data, flood data, Hazus data for floods, and earthquake data added to various sections of the hazard profiles
Utah Division of Forestry, Fire, and State Lands	State wildfire information and statistical data added to various sections of the hazard profiles.
Utah Geologic Survey	GIS data, geologic information added to various sections of the hazard profiles
Utah Geospatial Resource Center	GIS data and statistical data added to various sections of the hazard profiles
Utah Natural Hazards Handbook	Identification of natural hazard risks for Salt Lake County and statistical data added to various sections of the hazard profiles

[33] GIS = geographic information system, Hazus = Hazards United States, NCEI = National Centers for Environmental Information, NOAA = National Oceanic and Atmospheric Administration.

Existing Resource	Used in Plan
Utah Seismic Safety Commission Report and Recommendations: 2024	Identification of potential earthquake mitigation actions.
Utah State University	Climate data and statistical data added to various sections of the hazard profiles
Utah Statewide Fire Risk Assessment Project	Evaluation of fire risk assessment for Salt Lake County and potential mitigation actions and statistical data added to various sections of the hazard profiles
Utah Wildfire Risk Assessment	Division of Forestry, Fire, and State Lands primary mechanism to deploy wildfire risk information. Provides baseline information needed to support mitigation and prevention efforts across the state.
Wasatch Front Unreinforced Masonry Risk Reduction Strategy	Identification of potential earthquake mitigation actions and reducing risks posed by URM buildings.

Identifying the Hazards

Hazard identification was initiated through an extensive process that used the following multi-disciplinary cross-sector representation:

- Salt Lake County Emergency Management
- Consulting Planning Team
- Local Emergency Managers
- Local Emergency Planning Committee
- Public Works Staff
- Community Stakeholders
- Public individuals
- Elected officials
- Special Service Districts
- Utah Division of Emergency Management
- Utah Geological Survey
- Utah Geospatial Resource Center

The hazard identification process was aided by FEMA's how-to guidance documents, FEMA 386-1,2,3,7, FEMA Post Disaster Hazard Mitigation Planning Guidance DAP-12, the Disaster Mitigation Act of 2000, 44 CFR Parts 201 and 206, the Interim Final Rule, and the Local Mitigation Plan Review Tool. The risk assessment process also drew on assistance from local Geographical Information Systems (GIS) departments using the best available data.

The identification process for each participating jurisdiction encompassed natural hazards that consistently affected each area before and during the planning process based on the history of occurrences, probability, and risk. These specific hazards were identified based on a hazard identification risk assessment that identified the natural hazards listed below as being the most prevalent and posing the most risk to the county. Although it is recognized that dam failure is not a natural hazard, the potential impact on Salt Lake County from a catastrophic dam failure would likely be so severe that inclusion into the Plan was warranted. Municipal jurisdictions contributed to the risk assessment analyses performed for the county when in an identified hazard boundary. Upon initial review of this plan, specific hazards

DRAFT

associated with severe weather were renamed and split into separate hazards to identify better and address their unique considerations per Utah DEM and FEMA recommendations.

The 2025 MJHMP addresses the 19 natural and human-made hazards most applicable to Salt Lake County and includes the following:

NATURAL HAZARDS

- Avalanche
- Drought
- Earthquake
- Extreme Cold
- Extreme Heat
- Flooding
- Heavy Rain
- Severe Winter Weather
- High Wind
- Landslide/ Slope Failure
- Lightning
- Public Health Epidemic-Pandemic
- Radon
- Tornado
- Wildfire

MAN-MADE AND TECHNOLOGICAL HAZARDS

- Civil Disturbance
- Dam Failure
- Hazardous Materials
- Terrorism and Cyberterrorism

Changes in Priorities

Since the approval of the 2019 Salt Lake County Hazard Mitigation Plan, Salt Lake County, its jurisdictions, and its special districts have experienced several federally declared disasters, including the COVID-19 pandemic, the September 2020 high wind event, and the 2020 Magna earthquake. As part of this Plan update, additional emphasis is included in the risk assessment on how the identified hazards may be impacted by changes in climate conditions, including an increasing number of extreme heat events and the subsequent effects on wildfire and drought hazards. The effects of long-term drought on the Great Salt Lake has drawn the attention of various sectors statewide and is also a priority.

An additional change in priority is the passing of Utah House Bill 48 (Wildland Urban Interface Modifications), which became law in March 2025 and takes effect in January 2026. This law aims to mitigate wildfire risks through homeowner education, lot assessments, risk-based fees, and defensible space and home-hardening requirements. Fees from lot assessments will be used to cover assessment costs and support mitigation efforts. This program demonstrates the prioritization of mitigating wildfire risk.

These and other changes in priorities were considered during the vulnerability assessment and in the development of mitigation strategies and apply to the county, jurisdictions, and special districts. The other plan participants did not identify any additional priority changes from the last plan update.

Assessing Risk and Vulnerabilities

Each hazard identified was profiled with the most current available information and data, including the occurrence and probability ranking of future hazard events and a summary of each jurisdiction's vulnerability to each hazard. In profiling hazards, IEM researched hazards with the plan participants to

DRAFT

review all-natural and community-identified hazards and occurrences. All possible resources for information and data were considered, such as the current MJHMP, Master/General/Comprehensive Plans, Community Wildfire Protection Plans, Comprehensive Emergency Management Plan (CEMP), Strategic Plans, and similar sources. IEM provided Hazus models for the risk assessment.

IEM developed hazard profiles of each jurisdiction's vulnerability to specific hazards based on hazard assessments. This assessment identifies critical facilities and infrastructure by type and hazard area, describes land use and development trends to inform future land use policy and decisions, and explains how potential climate variation may impact the jurisdiction's current and future vulnerability for each hazard.

Evaluating Participant Capabilities

This update documents the effectiveness of the county's efforts to integrate mitigation into other planning efforts since the previously approved plan. IEM conducted a capability assessment to inventory existing plans, policies, procedures, programs, and other initiatives that are currently in place to support hazard mitigation. Jurisdictional participation in the NFIP was analyzed by working with local and state floodplain managers and NFIP administrators to collect information. Collecting and assessing this information identifies high-risk areas, properties, and populations and allows jurisdictions to determine mitigation actions that will most efficiently and effectively protect the community. The plan participants formulated and wrote a community description for the plan, using past plans, current and past studies, and the institutional knowledge of stakeholders, municipalities, and the public.

Developing Mitigation Goals and Actions

The Mitigation Strategy was evaluated, and updated goals and objectives were outlined in existing mitigation plans. This step is particularly important as Salt Lake County has experienced changes in risk severity and increased frequency of hazard events.

Maintaining the Plan

The plan implementation section identifies ways to incorporate mitigation strategies into existing planning practices, policies, and programs to institutionalize hazard mitigation in Salt Lake County's program. The plan maintenance process will also clearly indicate the method and schedule to be used over the next five years to monitor, evaluate, and update the plan, including timelines and responsibilities.

DRAFT

Stakeholder Engagement

One of the first steps in the planning process was to identify and invite key agencies and stakeholders to participate in the plan update. Per the Local Mitigation Planning Policy Guide, stakeholders were categorized in the following ways:

4. Local and regional agencies involved in hazard mitigation activities.

   Examples include public works, emergency management, local floodplain administration, and GIS departments.

5. Agencies that have the authority to regulate development.

   Examples include zoning, planning, community, and economic development departments, building officials, planning commissions, or other elected officials.

6. Neighboring communities

   Examples include adjacent local governments, including special districts, such as those affected by similar hazard events or that may share a mitigation action or project that crosses boundaries. Neighboring communities may be partners in hazard mitigation and response activities or where critical assets, such as dams, are located.

7. Representatives of businesses, academia, and other private organizations.

   Examples include private utilities or major employers that sustain community lifelines.

8. Representatives of nonprofit organizations, including community-based organizations, which work directly with and/or support underserved communities and socially vulnerable populations.

   Examples include housing, healthcare, and social service agencies.

Another factor that was considered while developing the list of participants to engage in this plan update was community lifelines. Community lifelines are the most fundamental services in the community that, when stabilized, enable all other aspects of society to function (Figure 23). A thorough understanding of lifelines allows decision makers to identify key priorities, understand the root causes of the issues, and implement effective measures to reduce risk and respond to a catastrophic incident.

DRAFT

Figure 23: FEMA Community Lifelines[34]

For this plan update, each jurisdiction was asked to identify internal and external stakeholders who could support the plan update. The IEM team also helped identify stakeholders, including those representing underserved and vulnerable populations. These stakeholders were given multiple opportunities to participate through meetings, e-mails, phone calls, and reviewing the draft plan. When appropriate, IEM conducted meetings directly with the participating jurisdictions to ensure that all information included in the plan was identified. A list of stakeholders that were given the opportunity to participate in the plan update is included in Table 15. The stakeholder types have been adapted to preserve space and/or increase clarity.

Table 15: Stakeholders Given the Opportunity to Participate

Jurisdiction/Agency/ Organization	Type of Stakeholder	Description
Alta	Local Emergency Management	Local and regional agencies involved in hazard mitigation activities
American Red Cross	Disaster Nongovernmental Organization	Nonprofit organization serving underserved populations
Big Cottonwood Canyon Improvement District	Water Utility Company	Representatives of businesses, academia, and other private organizations
Bluffdale	Local Emergency Management	Local and regional agencies involved in hazard mitigation activities
Brighton	Local Emergency Management	Local and regional agencies involved in hazard mitigation activities
Canyons School District	Higher Education	Representatives of businesses, academia, and other private organizations
Town of Copperton	Local Emergency Management	Local and regional agencies involved in hazard mitigation activities

West Valley City	Local Emergency Management	Local and regional agencies involved in hazard mitigation activities
White City	Local Emergency Management	Local and regional agencies involved in hazard mitigation activities
White City Water Improvement District	Water Utility Company	Representatives of businesses, academia, and other private organizations

Furthermore, IEM and Salt Lake County met with Amy Van Horn, the Bureau of Reclamation's (BOR) Emergency Management Coordinator, to discuss the dam failure hazard profile. Data sources and current draft maps were evaluated, and BOR's feedback was considered when determining how best to profile this hazard.

Coordination with Other Agencies, Partners, and Stakeholders

A major priority was updating the plan to meet the mitigation planning requirements outlined in FEMA's Local Mitigation Planning Policy Guide. This included an increased emphasis on stakeholder engagement, evaluating the impacts and potential mitigation measures for community lifelines, addressing climate change, and expanding mitigation actions to address all hazards profiled in the plan.

The following agencies and partners were instrumental in the update process:

- American Red Cross (vulnerable population engagement)
- VOAD, Salvation Army Region 2 (disadvantaged and underserved population engagement)
- Federal Emergency Management Agency (How-to Guides)
- National Weather Service (hazard profile)
- National Centers for Environment Information (hazard profile)
- Sewer Districts
- Utah Division of Emergency Management (GIS data, flood data, Hazus data for floods and earthquakes)
- Utah Geological Survey
- (GIS data, geologic information, various hazard reports)
- Utah Division of Forestry, Fire, and State Lands (fire data)

DRAFT

- Salt Lake Valley Emergency Communications Center (Emergency Alert Systems)
- Salt Lake County Departments and municipalities (Emergency Operations Plans, histories, mitigation actions, public input, GIS, assessor, transportation, property and infrastructure)

Although a multitude of stakeholders were given the opportunity to participate, not all could. The stakeholders listed in Table 16 participated directly in the plan by attending meetings, completing the digital stakeholder survey, and/or reviewing the draft plan. This stakeholder outreach was considered a success because of the broad range of stakeholders that participated and their active engagement and participation in the planning process.

Table 16: Stakeholders That Participated in the Planning Update[35]

Name	Title	Agency/ Jurisdiction	Type of Stakeholder
Yasmin Abbyad	EM Coordinator	City of South Salt Lake	Local and regional agencies involved in hazard mitigation activities
Brent Adamson	Emergency Manager	Herriman	Local and regional agencies involved in hazard mitigation activities
Maridene Alexander	Communications Manager	MSD	Local and regional agencies involved in hazard mitigation activities
Tess Alexander	EM Community Preparedness	Salt Lake City	Representatives of nonprofit organizations, including community-based organizations, which work directly with and/or provide support to underserved communities and socially vulnerable populations
Greg Anderson	Manager	Kearns Improvement District	Local and regional agencies involved in hazard mitigation activities
Isaac Astill	Executive Director of Auxiliary Services	Salt Lake City School District	Local and regional agencies involved in hazard mitigation activities
Molly Austin	Emergency Manager	Town of Alta	Local and regional agencies involved in hazard mitigation activities
Dean Ayala	District Engineer	Mt. Olympus Improvement District	Neighboring communities; Representatives of businesses, academia, and other private organizations
Tim Bachman	Community Emergency Response Team Coordinator	Millcreek	Representatives of nonprofit organizations, including community-based organizations, which work directly with and/or provide support to underserved communities and socially vulnerable populations

[35] EM = Emergency Management, JIC = Joint Information Center, MSD = Municipal Services District, PIO = Public Information Officer, SLCo = Salt Lake County, SLCo EM = Salt Lake County Emergency Management, UDEM = Utah Division of Emergency Management, UFA = Unified Fire Authority, UPD = Unified Police Department.

*Indicates a person who replaced someone previously in that position during the planning process

Neighboring counties (Davis, Utah, Tooele, and Summit) had an opportunity to review the plan and provide feedback. In addition, hazard mitigation plans for the adjacent counties (Davis County, Tooele County, and the Mountainland Pre-Disaster Hazard Mitigation Plan) were reviewed to identify region-wide risks and mitigation opportunities.

Public Outreach

Public participation is a vital planning requirement for a FEMA-approved hazard mitigation plan. The public outreach strategy engaged the whole community throughout the planning process. It gave decision makers access to diverse perspectives, knowledge, and individual lived experiences to incorporate during the drafting stage and before final approval of this MJHMP. IEM developed and shared the public outreach strategy with the county planning working groups that engaged the public and assessed their understanding of the identified risks and their interest in mitigation opportunities.

The IEM planning team drafted and shared a public survey in English and Spanish. Each participating jurisdiction reviewed and shared the survey on multiple occasions in different venues and in-person and online formats (see Figure 24). Besides posting links to the survey on county and city websites and sharing on social media, the survey was also announced on KUER radio on October 19, 2024. A news article was published by KSL.com on October 30 that also announced the mitigation plan to the public

and provided a link to the survey.[36] A half-page announcement about the plan update and a link to the survey were included in the City Journal Community Newspaper, which was mailed to residents in 14 participating cities, including 2 printed in Spanish.

Figure 24: Social Media Graphic for Public Outreach Survey

The public survey asked the public about their hazards of concern, assessed their understanding of the assets at risk, solicited information on what areas or community assets are more vulnerable, what they are doing in terms of mitigation, what mitigation actions they would support the community undertaking and any specific suggestions for mitigation actions. The feedback insight into what community assets are of concern to the public and suggestions of mitigation actions the public would support.

SLCo EM and IEM facilitated a meeting with the participating jurisdictions' Public Information Officers (PIOs) to help engage them in the public outreach efforts. The PIOs helped post the survey on city social media pages, which significantly boosted community engagement with the survey. More details on outreach can be found in the jurisdictional annexes.

Vulnerable Populations

Engaging socially vulnerable populations and disadvantaged communities was an important component of the public survey process. The public outreach strategy provided opportunities for vulnerable populations and underserved communities to be involved in the plan's development. Each survey participant selected the any groups they identified themselves as being a member of, demonstrating that non-English speaking populations, the elderly, parents of youth, persons with disabilities, low-income individuals and other vulnerable or disadvantaged groups were engaged by the survey. Offering the survey in Spanish was essential for reaching non-English speaking residents of the county. The County

[36] KSL.com. "Utah residents need to prepare for these 5 kinds of emergencies." October 30, 2024. https://www.ksl.com/article/51160262/utah-residents-need-to-prepare-for-these-5-kinds-of-emergencies.

Office for New Americans shared the survey with immigrant and refugee communities and feedback from those responses were considered during the drafting of the mitigation strategy for each jurisdiction.

SLCo EM participated in the Salt Lake County Senior Expo on October 11. This was a key opportunity to engage with one of the county's vulnerable populations. SLCo EM staff discussed the planning process and hazard concerns with attendees, and they also provided reference materials and access to the public survey. Information was also shared at a community event in Copperton (see Figure 26).

Figure 25: Public Outreach at Salt Lake County Senior Expo

Figure 26: Public Outreach at Copperton Town Days

Draft Plan Review

Besides efforts to inform residents and stakeholders about the Hazard Mitigation Plan update and public survey, a draft of the updated mitigation plan was made available for the public to review it and provide feedback. An announcement of the draft plan (Figure 27) and link to a feedback form was shared by Salt Lake County Emergency Management and Salt Lake County government and was also reshared by Bluffdale, South Salt Lake, Millcreek, Midvale, East Millcreek Community Council, and Association of Community Councils Together. The draft was made available on December 19, 2024, and public comment was open through January 15, 2025.

Figure 27: Announcement of Public Comment Period for Draft Plan

Table 17 summarizes the public outreach for each jurisdiction during the planning process. Additional documentation of public outreach can be found in **Appendix C** and in the individual jurisdictional annexes in Volume 2.

Table 17: Public Outreach Conducted by Jurisdiction

Jurisdiction	Description of Outreach Efforts
Salt Lake County (SLCo)	Posted notification of Hazard Mitigation Plan update and access to survey on County website and social media page. Shared on SLCo Emergency Management (EM) social media pages and website. SLCo EM also promoted awareness of the plan update on local news media, including a televised report and written article on KSL News and public service announcement on KUER radio. SLCo EM also placed posters at the county government building and hosted a table at the Salt Lake County Senior Expo.
Alta	Shared notification of plan update and access to survey in Town of Alta Newsletter by email in October 2024. Flyer was posted in town office.
Bluffdale	Posted link to Draft Plan for public review on city social media page.

Jurisdiction	Description of Outreach Efforts
Brighton	Municipal Services District (MSD) and County social media posts.
Copperton	Table with survey flyers at community event. Also shared on MSD social media.
Cottonwood Heights	Posted notification of Hazard Mitigation Plan update and access to survey on city social media page.
Draper	Reposted Salt Lake County Emergency Management social media posts of Hazard Mitigation Plan update and access to survey. Announcement and link to survey in City Journal mailed to residents.
Emigration Canyon	Shared on MSD social media, which serves the city.
Herriman	Posted notification of Hazard Mitigation Plan update and access to survey on city social media page and city website. Announcement and link to survey in City Journal mailed to residents.
Holladay	Shared notification of plan update and access to survey by an email blast to residents. Posted a flyer in Senior Center and Recreation Center. Announcement and link to survey in City Journal mailed to residents.
Jordan School District	Posted notification of Hazard Mitigation Plan update and access to survey on social media page and on the school district website.
Kearns	Posted notification of Hazard Mitigation Plan update and access to survey on city social media page. Also shared on MSD social media, which serves the city.
Magna	Shared on MSD social media, which serves the city.
Midvale	Posted notification of Hazard Mitigation Plan update and access to survey on city social media pages and website. Also posted notification of draft for public comment. Announcement and link to survey in City Journal mailed to residents.
Millcreek	Posted notification of Hazard Mitigation Plan update and access to survey on city social media page. Also posted notification of plan draft for public comment. Announcement and link to survey in City Journal mailed to residents.
Murray	Announcement and link to survey in City Journal mailed to residents.
Riverton	Posted notification of Hazard Mitigation Plan update and access to survey on city social media pages. Announcement and link to survey in City Journal mailed to residents.
Salt Lake City	Reposted Salt Lake County Emergency Management social media post of Hazard Mitigation Plan update and access to survey. Also included announcement and link to survey in community newsletter.
Sandy City	Announcement and link to survey in City Journal mailed to residents.
South Jordan	Announcement and link to survey in City Journal mailed to residents.
South Salt Lake	Posted notification of Hazard Mitigation Plan update and access to survey on city social media pages and website. Also posted announcement of draft for public comment on social media. Posted notification of Hazard Mitigation Plan update and access to survey in CivicAlerts notification. Announcement and link to survey in City Journal mailed to residents.
Taylorsville	Posted survey in lobby of City Hall. Announcement and link to survey in City Journal mailed to residents.
West Jordan	Announcement and link to survey in City Journal mailed to residents.

DRAFT

Jurisdiction	Description of Outreach Efforts
West Valley City	Posted notification of Hazard Mitigation Plan update and access to survey on city social media page. Announcement and link to survey in City Journal mailed to residents.
White City	Shared on MSD social media which serves the city.

Feedback from the Public Survey

After several months of public outreach in Salt Lake County, approximately 564 community members responded to the Salt Lake County MJHMP Public Survey. The following summarizes the responses and comments received. A copy of the full survey and additional summary results are available in **Appendix C**.

LEVEL OF CONCERN ABOUT SPECIFIC HAZARDS

When participants were asked about specific natural hazards that may impact Salt Lake County, they were most often very concerned about earthquakes and drought.

Among the technical and human-made hazards identified, 327 respondents were somewhat or very concerned about radon, 156 were somewhat or very concerned about dam failure, 346 were somewhat or very concerned about terrorism, 478 were somewhat or very concerned about cyberterrorism, and 424 were somewhat or very concerned about a potential hazardous materials (HAZMAT) incident.

DRAFT

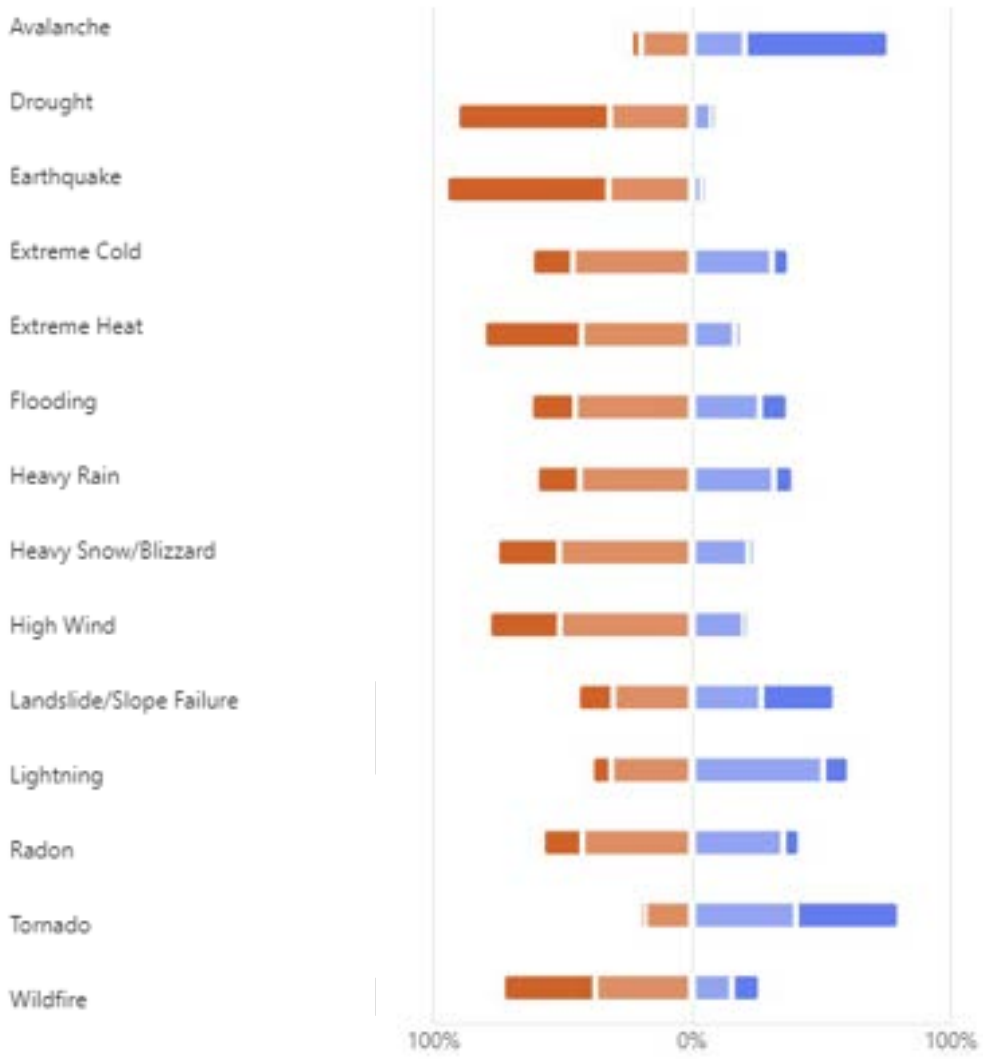

Figure 28: Survey Results on Concerns About Specific Hazards

HAZARD INSURANCE COVERAGE

Question #10 asked respondents what residential insurance coverage they currently have for natural hazards; 286 stated they have fire insurance, 131 have windstorm insurance, 173 have earthquake insurance, 89 have flood insurance, and 20 have landslide insurance.

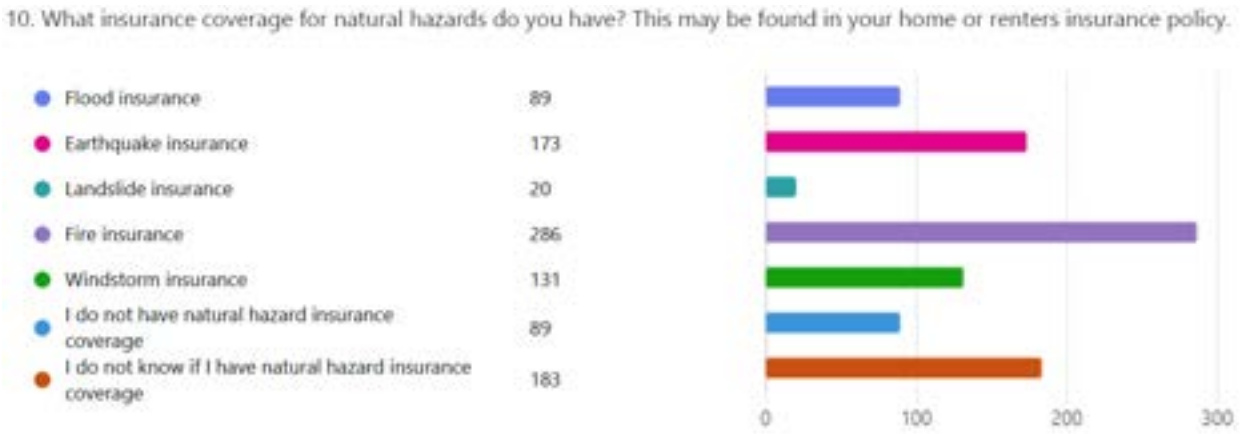

Figure 29: Survey Results on Hazard Insurance Coverage

WHERE RESPONDENTS LIVE OR WORK

Question #14 asked where respondents lived or worked at the time of the survey. Results can be sorted to determine whether there are geographic trends in responses to the other questions.

DRAFT

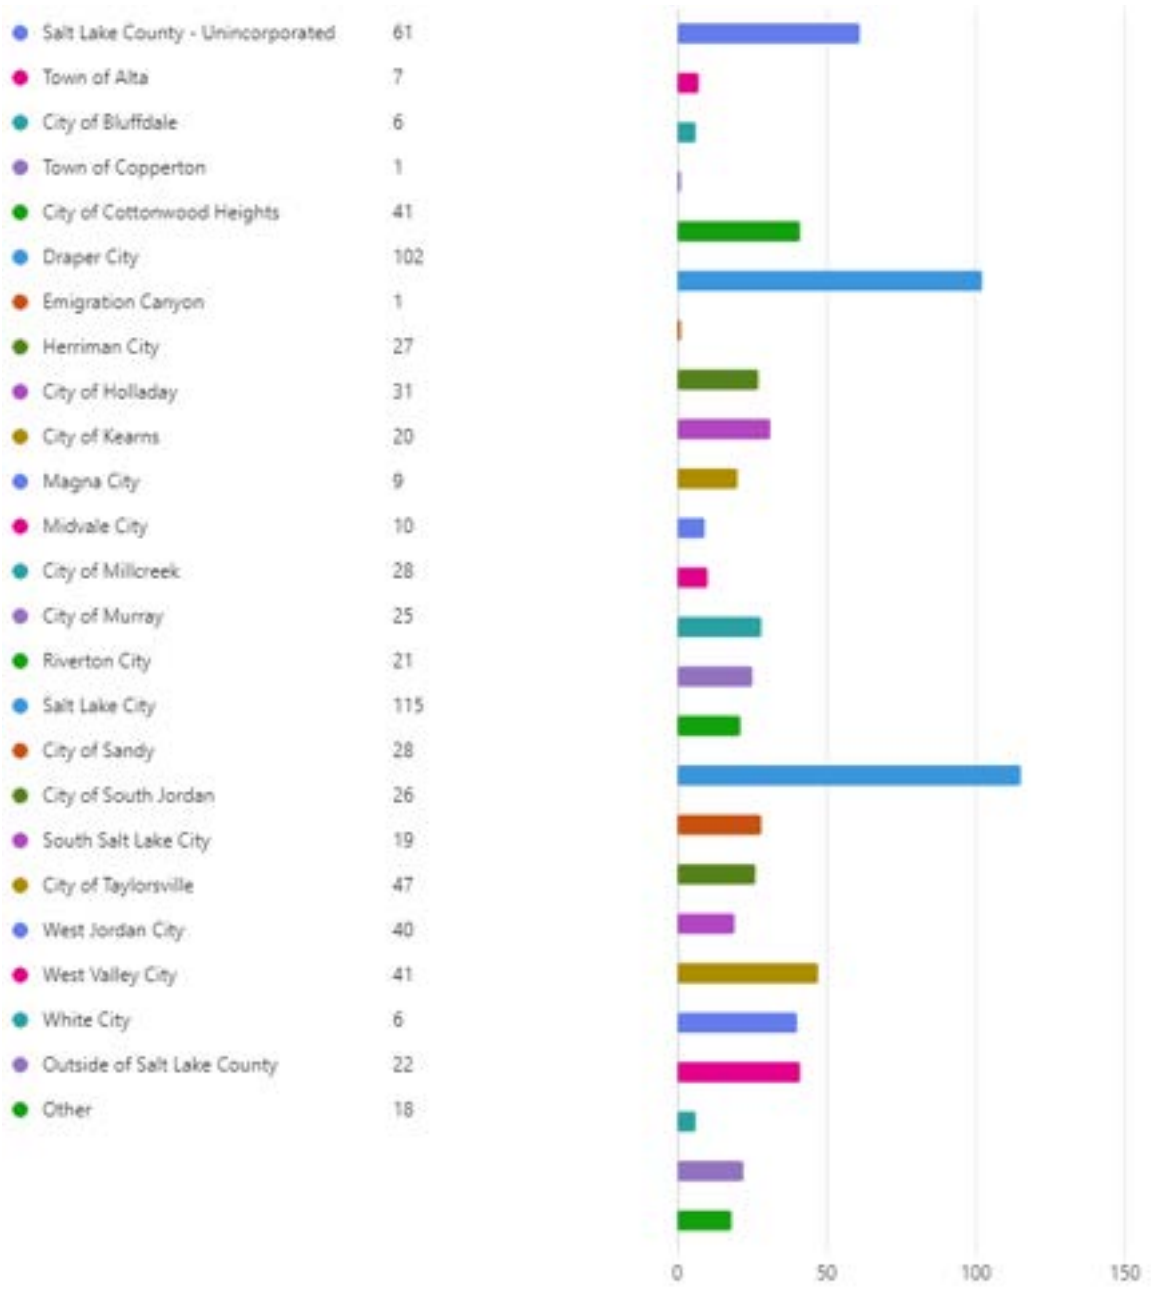

Figure 30: Survey Results on Where Respondents Live and Work

VULNERABLE POPULATIONS

Question #13 invited respondents to identify if they belonged to one or more vulnerable population categories. The intent of this question was to determine whether vulnerable populations were reached by the survey and had an opportunity to voice their unique concerns about natural hazards.

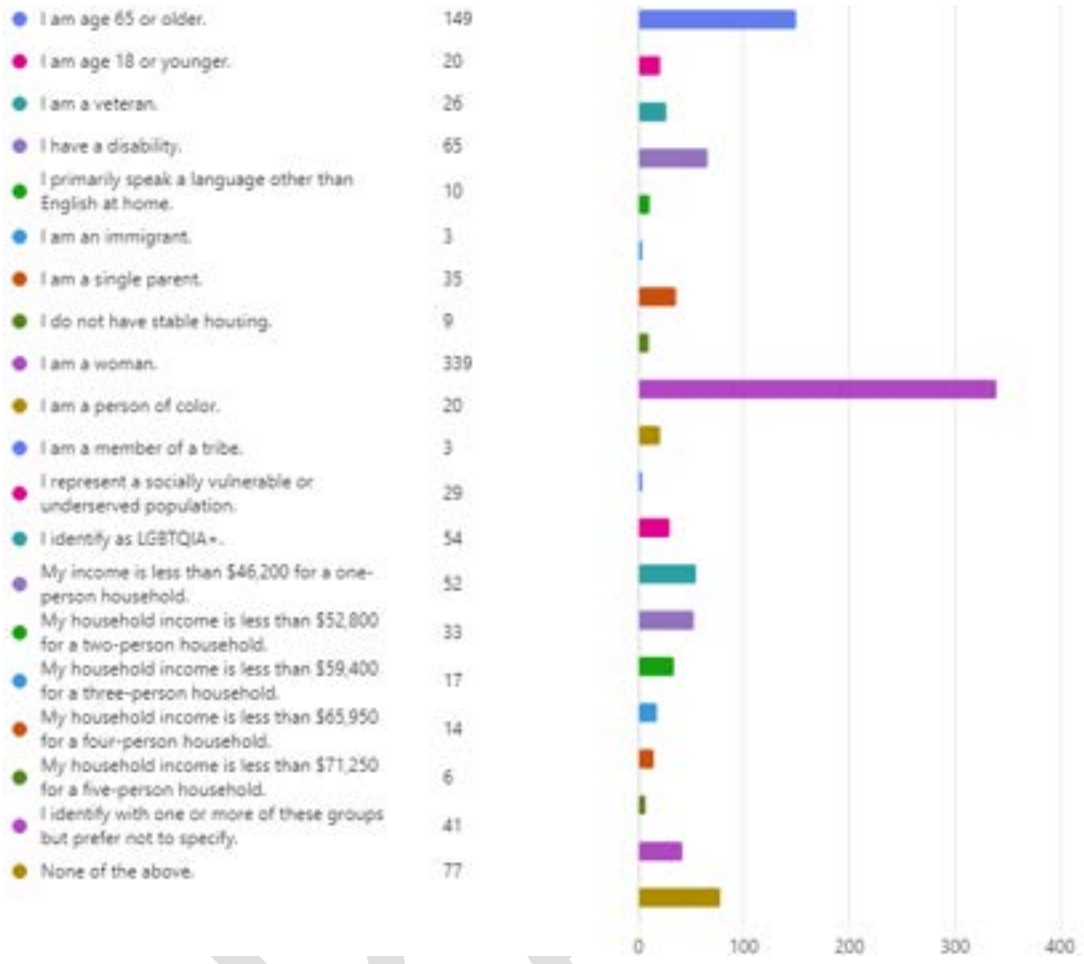

Figure 31: Survey Results on Vulnerable Populations

PARTS OF THE COMMUNITY MOST AT RISK

Question #4 asked, “What parts of your community (including buildings, people, economic activities and events, and natural areas) are most at risk of these hazards?” Of the 563 respondents, 101 identified “people” as most at risk, with buildings and homes also frequently selected.

MITIGATION IDEAS

Question #8 asked, “What other types of hazard mitigation activities would you support your community in taking? Be specific if you know an area or structure that needs mitigating.” Of the 558 respondents, 43 said they would support “community activities” and water and earthquake mitigation activities.

PROTECTION FROM FUTURE DISASTERS

Question #5 asked, “What at-risk areas (including structures, infrastructures, and natural areas) or people in your community would you like to see protected from future disasters? Be specific, if known.” Of the 560 response respondents, 78 answered protecting natural areas from future disasters and homes and buildings.

Risk Assessment

The Hazard Identification and Risk Assessment (HIRA) measures the potential impact of hazards on life, property, and economic activity. It intends to identify, as much as practicable, given the existing or available data, a community's qualitative and quantitative vulnerabilities. The risk assessment provides a clearer understanding of the impacts of natural hazards on the community. They also serve as a foundation for developing and prioritizing mitigation actions aimed at reducing damage from areas that might have significant impacts (see the section on **Mitigation Strategy**). This includes increased preparedness, faster response times, and improved allocation of resources to the most vulnerable areas.

This risk assessment followed the methodology described in the FEMA Local Mitigation Planning Handbook 2023, which outlines a five-step process:

1. **Identify Hazards:** This step helps clarify the hazards that may occur in the planning area.
2. **Describe Hazards:** This step includes gathering more information about the hazards, including where they can happen, the impact of past occurrences, and the potential frequency and intensity of future occurrences.
3. **Identify Community Assets:** This step evaluates which assets are most vulnerable to loss during a disaster, considering any development changes since the previous plan was created.
4. **Analyze Impacts:** This step describes how each hazard could affect the assets of each community.
5. **Summarize Vulnerability:** This step synthesizes all the analyses and uses the risk assessment to draw conclusions. Based on these conclusions, the planning team can develop a strategy to increase the resilience of residents, businesses, the economy, and other vital assets.

Methodology

The information gathered during the Multi-Jurisdictional Hazard Mitigation Plan (MJHMP) planning process related to the five steps has been incorporated into the following discussions in this chapter:

- **Hazard Identification:** This involves identifying and prioritizing the natural hazards that threaten Salt Lake County, including assets in other jurisdictions, such as levees and upstream dams, which can also affect your area. The reasoning for omitting some hazards from further consideration also is given in this discussion.
- **Hazard Profiles:** Each natural hazard that threatens Salt Lake County has a separate hazard profile that includes its location, extent/magnitude/severity, previous occurrences, and likelihood of future events. The previous plan identified severe weather as a hazard. This plan has broken this category into separate hazards—heavy rain, high wind, extreme heat, and lightning—to provide more detail on each and additional information on events since the last plan update. Extreme cold has been separated from severe winter weather and is now presented as a stand-alone hazard profile. No other new hazards have been added since the last plan.

DRAFT

- **Identify Assets:** Identify the assets in Salt Lake County at risk of hazards. Information includes people, structures, community lifelines, and other critical facilities; natural, historic, and cultural resources; and the economy and other activities that have value to the community.
- **Analyze Impacts:** Determine where hazards overlap with assets identified in the previous step, including descriptions of the assets' vulnerabilities and describing potential impacts.
- **Summarize Vulnerability:** Information from hazard profiles, vulnerability assets, changes in development, potential impacts, and losses are summarized to help Salt Lake County understand the most significant risks and vulnerabilities.

Identifying Hazards

According to FEMA guidance, identifying hazards is the first step in developing a risk assessment. Salt Lake County plan participants reviewed previously prepared hazard mitigation plans and relevant documents to identify natural hazards that could affect the county. Based on a review of the prior plan and consideration of recent events, 19 different hazards were identified.

Table 18: Hazards Identified for 2025 Hazard Mitigation Plan

Avalanche	Flooding	Public Health Epidemic/Pandemic	Dam Failure
Drought	Heavy Rain	Radon	Civil Disturbance
Earthquake	High Wind	Severe Winter Storm	Hazardous Materials Incident
Extreme Cold	Landslide/ Slope Failure	Tornadoes	Terrorism/ Cyberterrorism
Extreme Heat	Lightning	Wildfire	

The following information is provided for each hazard:

- **Hazard Description:** A brief introduction of the mechanisms behind the hazard.
- **Location:** An indication of geographic areas most likely to experience the hazard.
- **Magnitude/Extent:** A description of the potential magnitude and extent of the hazard, accompanied by the likelihood of the hazard occurring (or a time frame of recurrence, if available).
- **Historical Events:** Similar to location, a chronological summary of recent hazard occurrences, including extent or damage cost, if available.
- **Probability of future occurrences:** Likelihood of this event occurring in Salt Lake County, based on return intervals or past annual frequency.
- **Climate Change Considerations:** When applicable, a brief overview indicating how the hazard profile may change over time due to climate changes.
- **Secondary Hazards/Cascading Impacts:** A brief overview of secondary hazards often associated with the hazards.

DRAFT

- **Vulnerability Analysis:** A description of which assets—including structures, systems, populations, and other assets as defined by the plan participant—are at risk from each hazard. Vulnerability may be expressed in quantitative terms, such as replacement cost, or qualitatively, such as type of structure value, depending on available data. This section also discusses the impacts of hazards, which are the potential consequences of a hazard event, including land use and development changes. These impacts can include the following:
  - Modeled estimates of potential structural and economic losses, including values of community assets exposed to the hazard
  - Impacts on vulnerable populations
  - Changes in development and whether these changes represent a change in vulnerability since the 2019 plan
  - Effects on FEMA Community Lifelines

Hazard descriptions were based on information from local, state, and federal agencies that study these hazards. These sources were also used to identify the locations and extent of hazards that could impact people, structures, or other assets in Salt Lake County. These sources were identified in the

DRAFT

Planning Process section of this plan.

For each hazard profiled, a review of past events was conducted. This involved examining historical records of hazards that have previously affected the county and/or cities and towns, such as the National Centers for Environmental Information (NCEI) Storm Events Database. Hazards that may affect the county in the future were identified by gathering information from local, state, and federal agencies; accounts from newspapers or local media; state and regional weather records; conversations with the public and local officials; surveys; and meetings with personnel in the planning area. Information about federal Disaster Declarations in Salt Lake County was updated and compiled into Table 19, which provides a baseline for consideration in the hazard prioritization process.

Each participating jurisdiction considered these 19 hazards and evaluated which consistently affected its area based on the history of occurrences and probability. The jurisdictions used forms to identify the hazards they wished including in their risk assessment and briefly explained any that they decided to omit. They also identified community assets, critical facilities, or infrastructure in the community that are at risk from each hazard. Participants also described changes in development, such as changes in population or land use, which could affect their vulnerability to hazards. Details of these jurisdiction-specific hazards and an analysis of the vulnerabilities and potential impacts of each are described in the annexes in Volume 2 of this plan.

Past Disaster Declarations

Table 19: Past Disaster Declarations

Disaster Declaration Code	Incident Period	Date Declared	Description
FM-5408-UT	08/14/2021–08/18/2021	08/14/2021	Parleys Canyon fire

DRAFT

Prioritization of Hazards

Each plan participant completed a Calculated Priority Risk Index (CPRI) based on the following criteria to identify how each plan participant is uniquely at risk of the hazards profiled.

Table 20: Calculated Priority Risk Criteria

Risk Index Factor	Degree of Risk Level		Criteria	Factor Weight for Degree of Risk Level
Probability of Future Events	1	Unlikely	Less than 1 percent probability of occurrence in the next year or a recurrence interval of greater than every 100 years.	30%
	2	Occasional	1 to 10 percent probability of occurrence in the next year or a recurrence interval of 11 to 100 years.	
	3	Likely	11 to 90 percent probability of occurrence in the next year or a recurrence interval of 1 to 10 years.	
	4	Highly Likely	91 to 100 percent probability of occurrence in the next year or a recurrence interval of less than 1 year.	
Spatial Extent	1	Limited	Less than 10% of the planning area could be impacted.	10%
	2	Small	10%–25% of the planning could be impacted	
	3	Significant	25%–50% of the planning area could be impacted.	
	4	Extensive	50%–100% of the planning area could be impacted.	
Severity of Life/Property Impact	1	Negligible	Less than 5% of the affected area's critical and non-critical facilities and structures are damaged/destroyed. Only minor property damage and minimal disruption of life. Temporary shutdown of critical facilities.	30%
	2	Limited	More than 5% and less than 25% percent of property in the affected area is damaged/destroyed. Complete shutdown of critical facilities for more than one day but less than one week.	
	3	Critical	More than 25% and less than 50% of property in the affected area was damaged/destroyed. Complete shutdown of critical facilities for over a week but less than one month.	
	4	Catastrophic	Over 50% of critical and non-critical facilities and infrastructures in the affected area are damaged/destroyed. Complete	

Risk Index Factor	Degree of Risk Level		Criteria	Factor Weight for Degree of Risk Level
			shutdown of critical facilities for more than one month.	
Warning Time	1	Self-defined	More than 24 hours	10%
	2	Self-defined	12 to 24 hours.	
	3	Self-defined	6 to 12 hours.	
	4	Self-defined	Less than 6 hours.	
Duration	1	Brief	Up to 6 hours.	10%
	2	Intermediate	Up to one day.	
	3	Extended	Up to one week.	
	4	Prolonged	More than one week.	
Response Capacity	1	High	Significant resources and capability to respond to this kind of event; staff are trained, experienced, and ready.	10%
	2	Medium	Some resources and capability to respond to this kind of staff; some staff may be trained, experienced, and ready while others may need additional support.	
	3	Low	Limited resources and capability to respond to this kind of event; additional staff or staff training needed.	
	4	None	No resources and capability to respond this kind of event; additional outside support would be required.	

RISK FACTOR (RF) EQUATION

RF Value = [(Probability x 0.30) + (Spatial Extent x 0.10) + (Severity of Life/Property Impact x 0.30) + (Warning Time x 0.10) + (Duration x 0.10) + (Response Capacity x 0.10)]

The Calculated Priority Risk Index for Salt Lake County

The following represents the overall risk of each hazard in Salt Lake County. Those with a risk factor value greater than or equal to 2.5 are considered high risk. Risk factors ranging from 2.0 to 2.4 are considered moderate risk, and those below 2.0 are considered low risk. The highest possible risk factor value is 4.

Table 21: Calculated Priority Risk Index for Salt Lake County

Terrorism	2	1	3	4	2	1	2.3

Vulnerability Assessment

A vulnerability assessment evaluates the assets potentially at risk from the identified hazards, including structures, populations, infrastructure, and other assets in hazard-prone areas. Impacts are the consequences or effects of each hazard on each community's assets and the losses a community may incur in the event of a disaster. Evaluating the assets at risk and potential impacts provides the foundation for determining where hazard mitigation resources are most needed. The FEMA Local Mitigation Planning Handbook provides a framework for conducting a vulnerability assessment.[37]

[37] FEMA. "Local Mitigation Planning Handbook." May 2023. https://www.fema.gov/sites/default/files/documents/fema_local-mitigation-planning-handbook_052023.pdf.

ASSET IDENTIFICATION

The vulnerability assessment relied on asset data from the county to provide a measure of the potential impacts of hazards on community assets. Assets refer to people, critical facilities, infrastructure, or other resources of value in the county and cities. When local data were unavailable, state or federal sources were consulted. Geospatial data are indispensable in determining which assets might be exposed to specific hazards. Geospatial analysis can be conducted by overlaying the community's assets on a map of the spatial extent of a natural hazard to determine areas of exposure and potential losses. For hazards without a defined spatial extent, maps of past occurrences can provide a reference for general risk in the county.

COMMUNITY LIFELINES

Lifelines are essential services in a community that, when maintained, allows all other aspects of society to function effectively. Community lifelines are essential for the well-being of any community, providing support and assistance to individuals who need help, especially during times of crisis. FEMA Community Lifelines are a critical component of emergency management in the United States. These lifelines are designed to address the essential needs of a community during and after a disaster. Community Lifelines help create a sense of safety and security in a community. They provide a safety net for individuals who may be struggling and offer comfort and reassurance that help is available when needed. Without these lifelines, communities would be significantly more vulnerable to crises and emergencies. There are eight lifelines, each with a specific focus.

Figure 32: FEMA Community Lifelines[38]

LOSS ESTIMATES

Hazus is a standardized risk modeling tool that estimates potential damage, economic losses, and other impacts from earthquakes, floods, tsunamis, and hurricanes. Hazus software relies on Esri's ArcGIS for Desktop technology. It includes nationwide datasets for general building stock, critical facilities,

[38] FEMA. "Community Lifelines." https://www.fema.gov/emergency-managers/practitioners/lifelines.

transportation, and other infrastructure data. The models estimate the potential damage to various assets based on a defined hazard scenario.

For this plan update, Hazus 6.1 was used to model 100-year (1% annual chance) and 500-year (0.2% annual chance) flood scenarios and an earthquake scenario based on a USGS ShakeMap scenario of a 6.2 magnitude earthquake on the Warm Springs Fault. Salt Lake County Division of Emergency Management (SLCo EM) provided GIS data for critical facilities, including 68 fire stations, 36 police stations, 16 hospitals, 18 emergency operations centers (EOCs), 218 county facilities, and 422 schools. These locations are shown in Figure 33–Figure 38. For the Hazus models of earthquake and flood scenarios, data on the county critical facilities were used to augment the default Hazus facility data. Other economic, transportation, utility, and building loss estimates were based on the default inventory data from Hazus 6.1.

NATIONAL RISK INDEX

The National Risk Index (NRI) is an online dataset developed by FEMA and its partners that defines a baseline understanding of risk of all communities across the United States. This interactive online tool can compare risks across the countywide planning area with the rest of the United States regarding expected annual loss, social vulnerability, and community resilience. Figure 39 illustrates how these three factors contribute to a composite score. The data for each hazard are pulled from different datasets. Dollars are in terms of 2022 dollars. Images in each hazard profile are screen captures taken directly from the NRI.

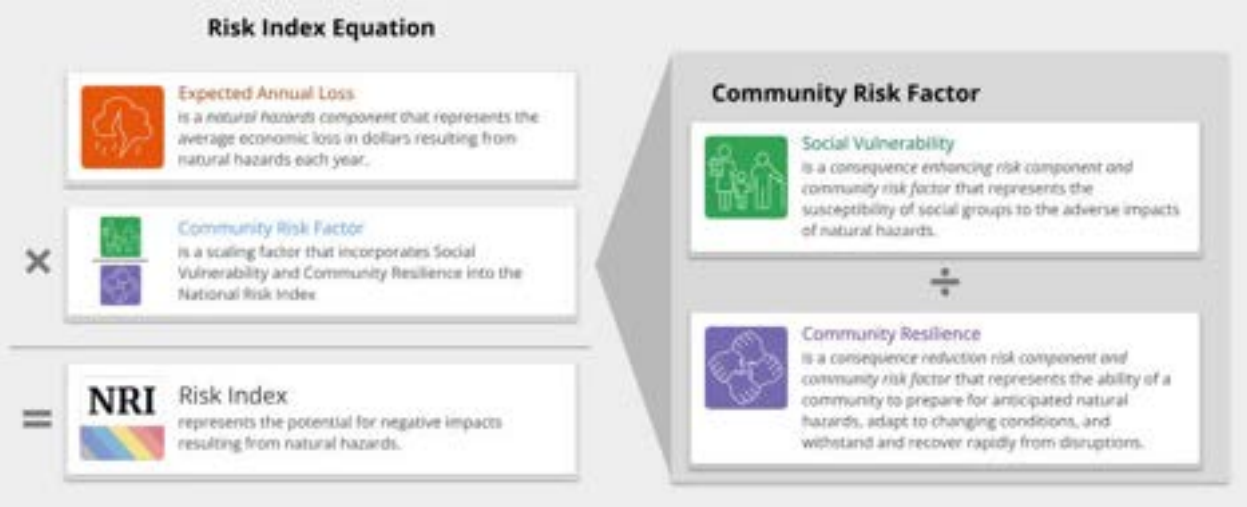

Figure 39: FEMA National Risk Index Equation

Ratings are described using qualitative terms ranging from "Very Low" to "Very High." No specific numeric values determine the rating, as scores are relative.[39] The following defines the NRI categories at a national level:

- **Very High:** 80th to 100th percentiles
- **Relatively High:** 60th to 80th percentiles
- **Relatively Moderate:** 40th to 60th percentiles
- **Relatively Low:** 20th to 40th percentiles
- **Very Low:** 0 to 20th percentiles

Ratings do not always reflect the local experience, including Salt Lake County. However, this tool can serve as a baseline to understand risk and see how risks in Salt Lake County differ from those in the rest of the United States.

Vulnerable Populations

Some social groups are more susceptible to the impacts of natural hazards, which affects their capacity to prepare for, respond to, and recover from hazard events. Historically, people in these groups have

[39] FEMA, National Risk Index. "Determining Risk." https://hazards.fema.gov/nri/determining-risk.

experienced disproportionate losses or economic impacts, disruption of livelihood, injuries, or death. Characteristics of socially vulnerable groups might include age, gender, income, race, ethnicity, language, or disabilities. For each hazard, care was given to identify populations that might be more susceptible to the effects of that hazard.

Several tools were referenced to help identify socially vulnerable populations in Salt Lake County. Social vulnerability is included in the NRI overall risk rating equation. This is based on the Social Vulnerability Index (SVI) from the Centers for Disease Control and Prevention (CDC). The SVI is a place-based index, database, and mapping application that provides a reference for understanding which areas are most likely to experience social vulnerability. It uses 16 variables from the U.S. Census 5-year American Community Survey to identify communities needing additional support. These are grouped into four themes and combined into a single measure of overall vulnerability, as shown in Figure 40.[40] The maps in Figure 41–Figure 45 show the areas in Salt Lake County with high percentages of socially vulnerable populations based on the four themes.

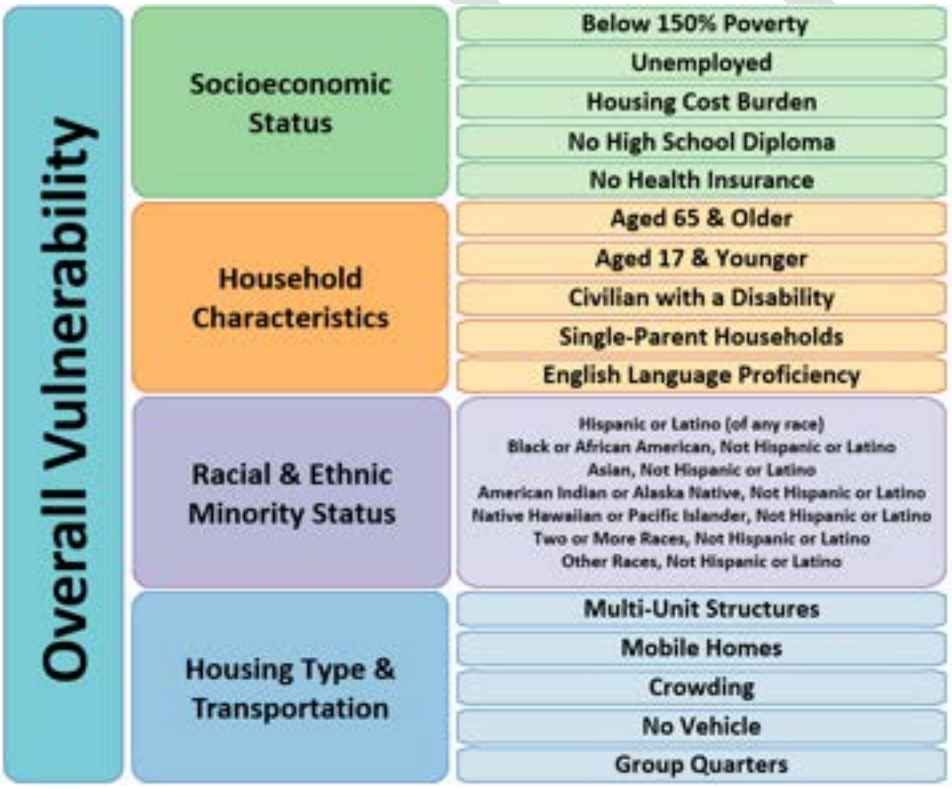

Figure 40: Themes and Variables in the Social Vulnerability Index

[40] CDC/ATSDR. "Social Vulnerability Index." 2022. https://www.atsdr.cdc.gov/place-health/php/svi/index.html.

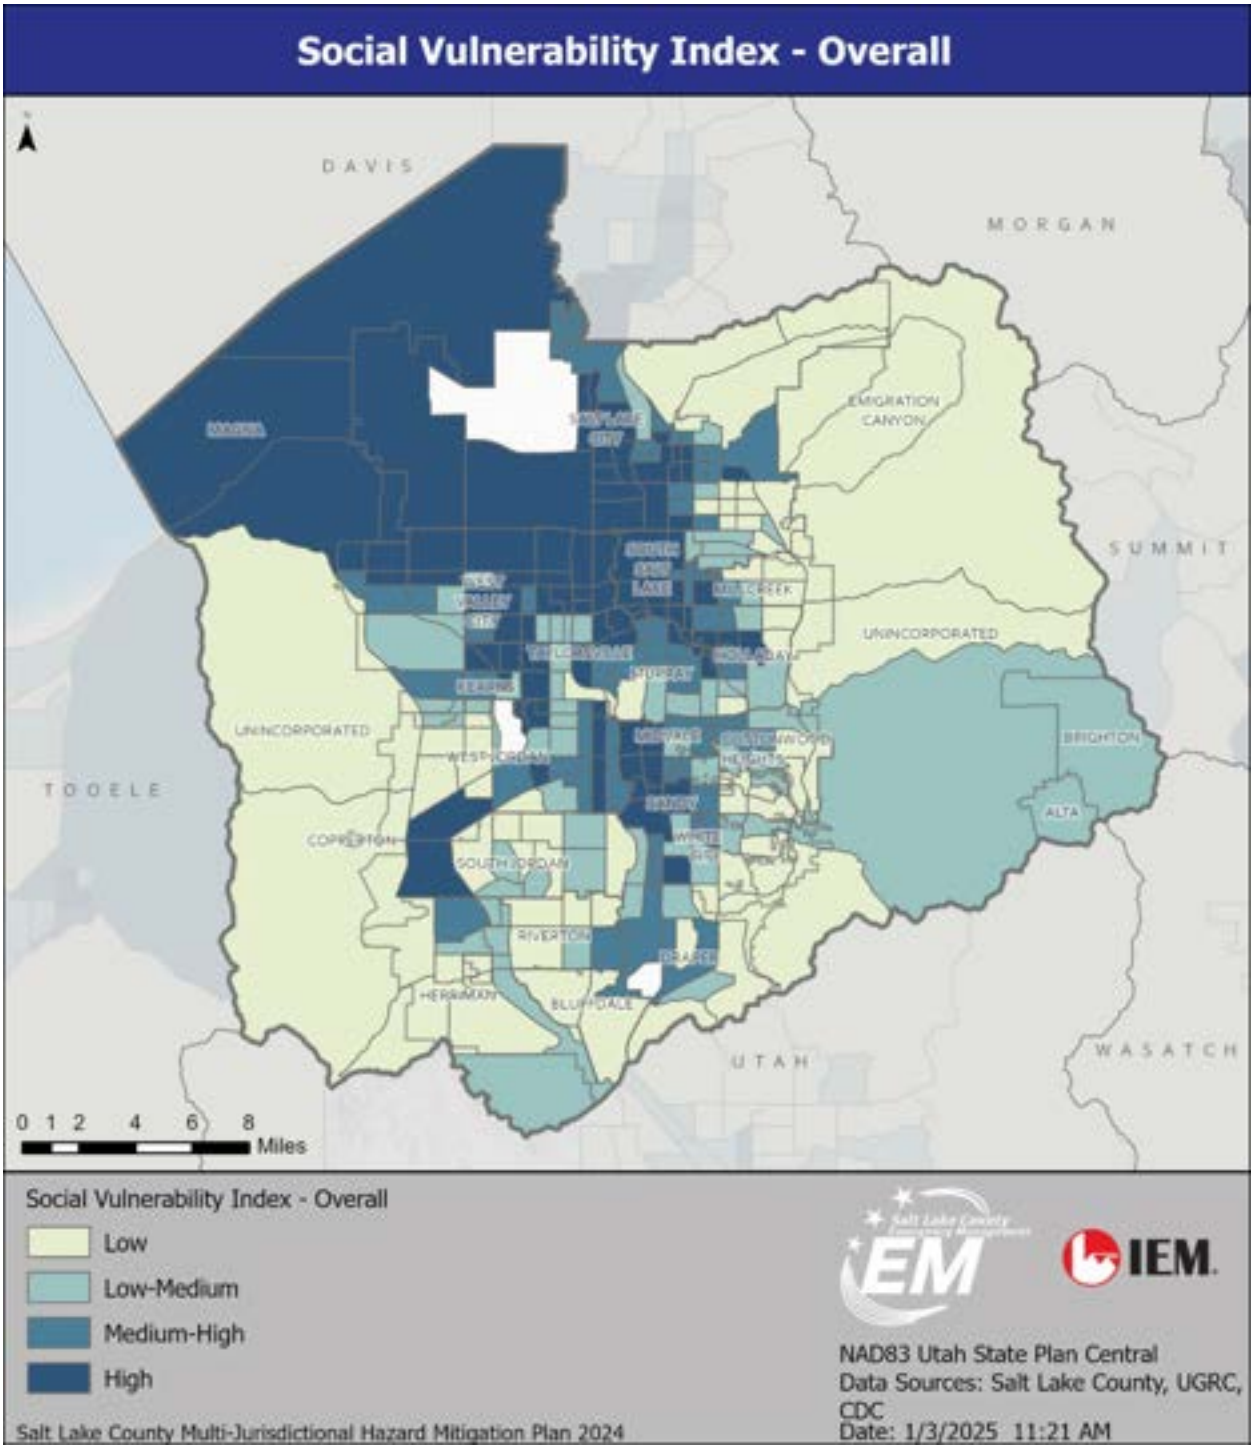

Figure 41: SVI – Overall Vulnerability Score by Census Tract for Salt Lake County

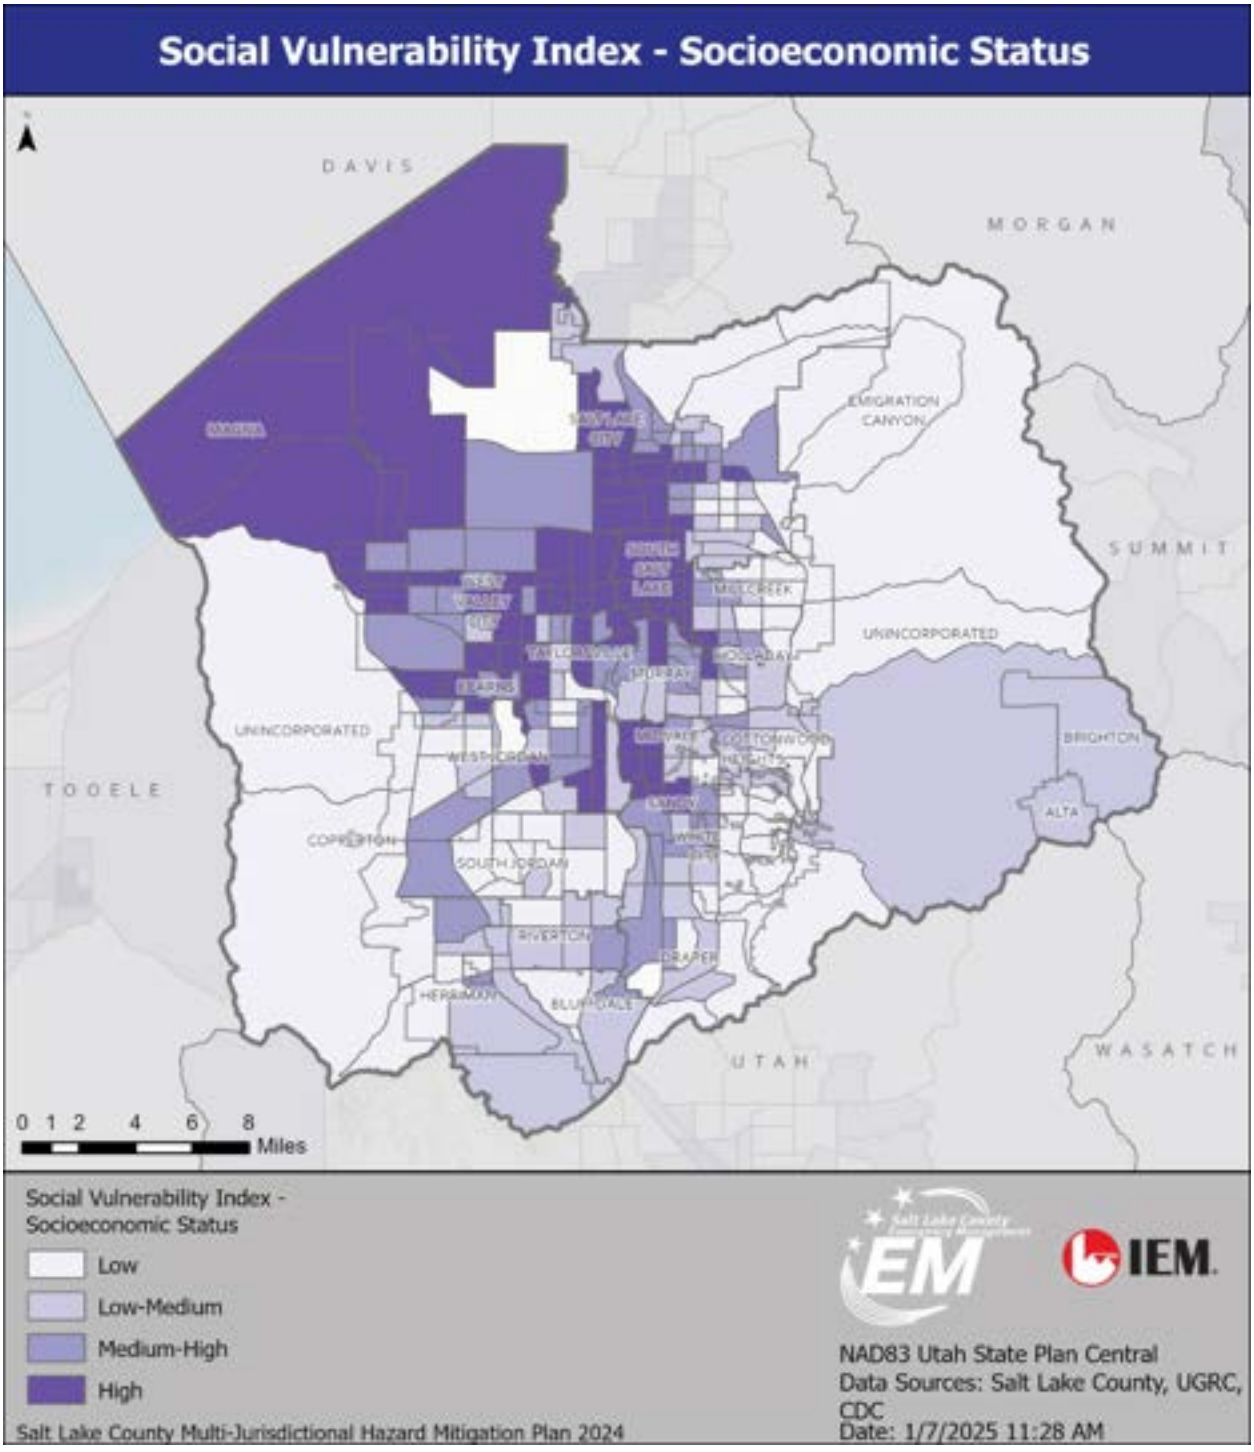

Figure 43: SVI – Socioeconomic Status by Census Tract for Salt Lake County

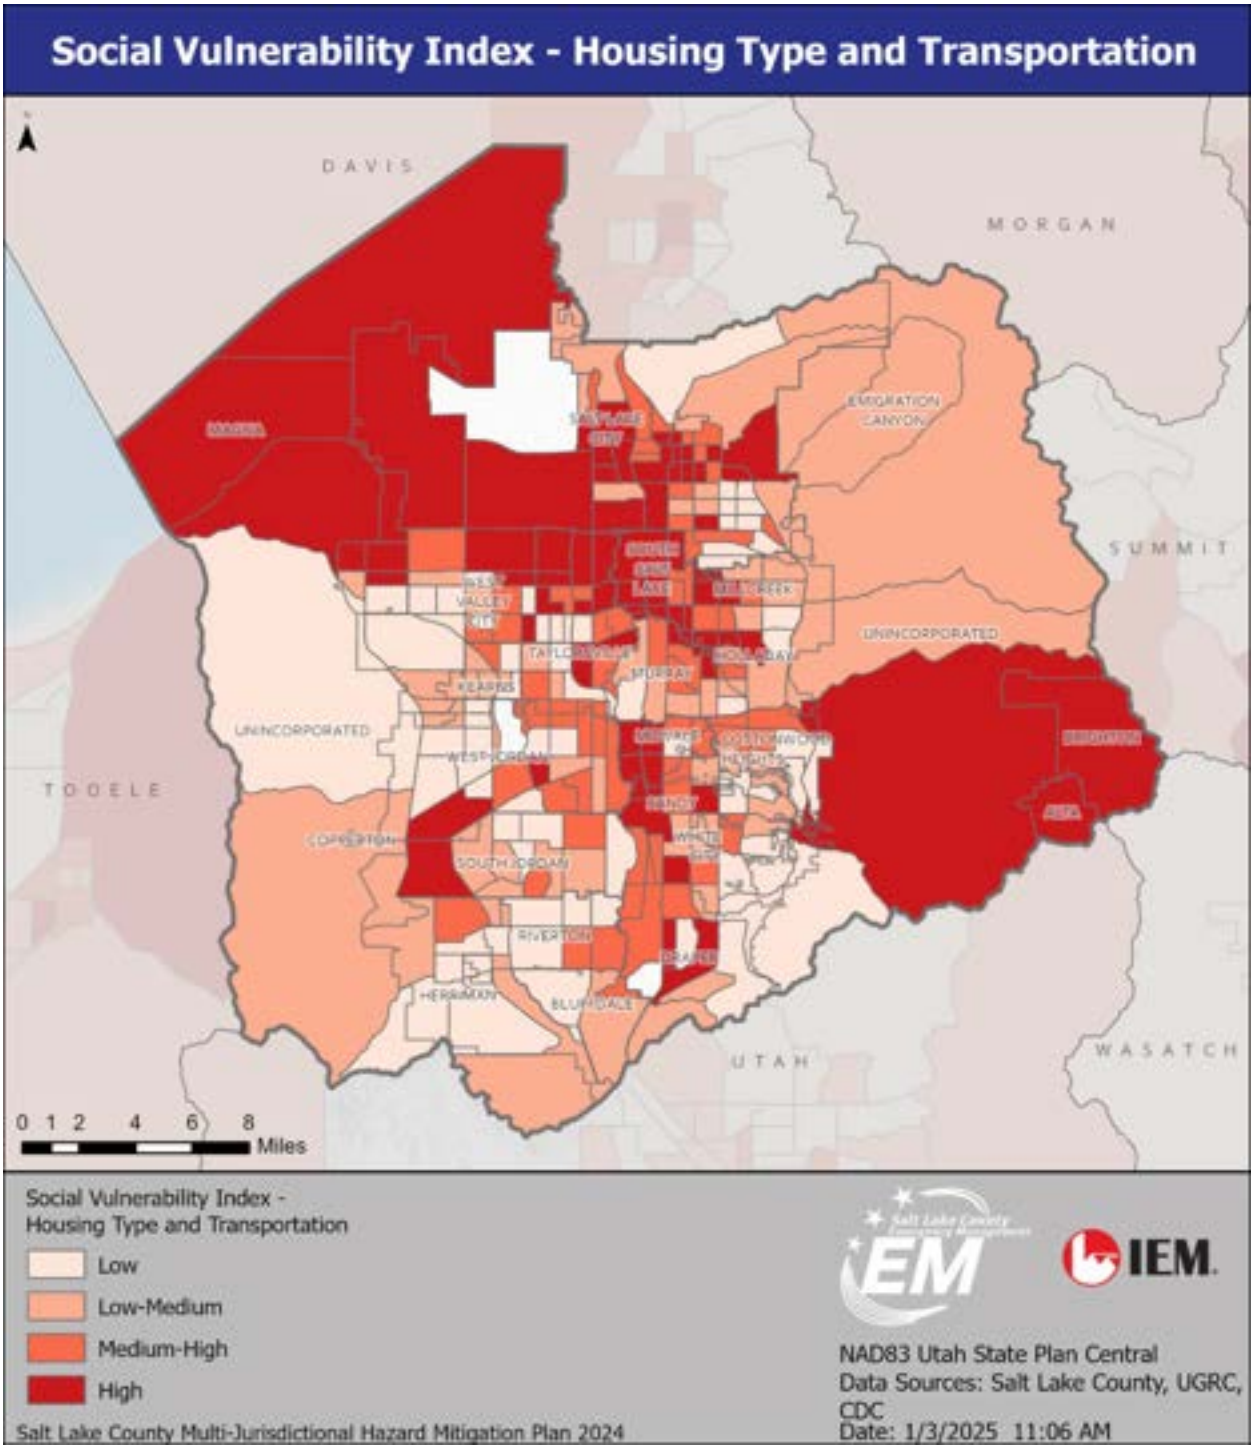

Figure 44: SVI – Housing Type and Transportation by Census Tract for Salt Lake County

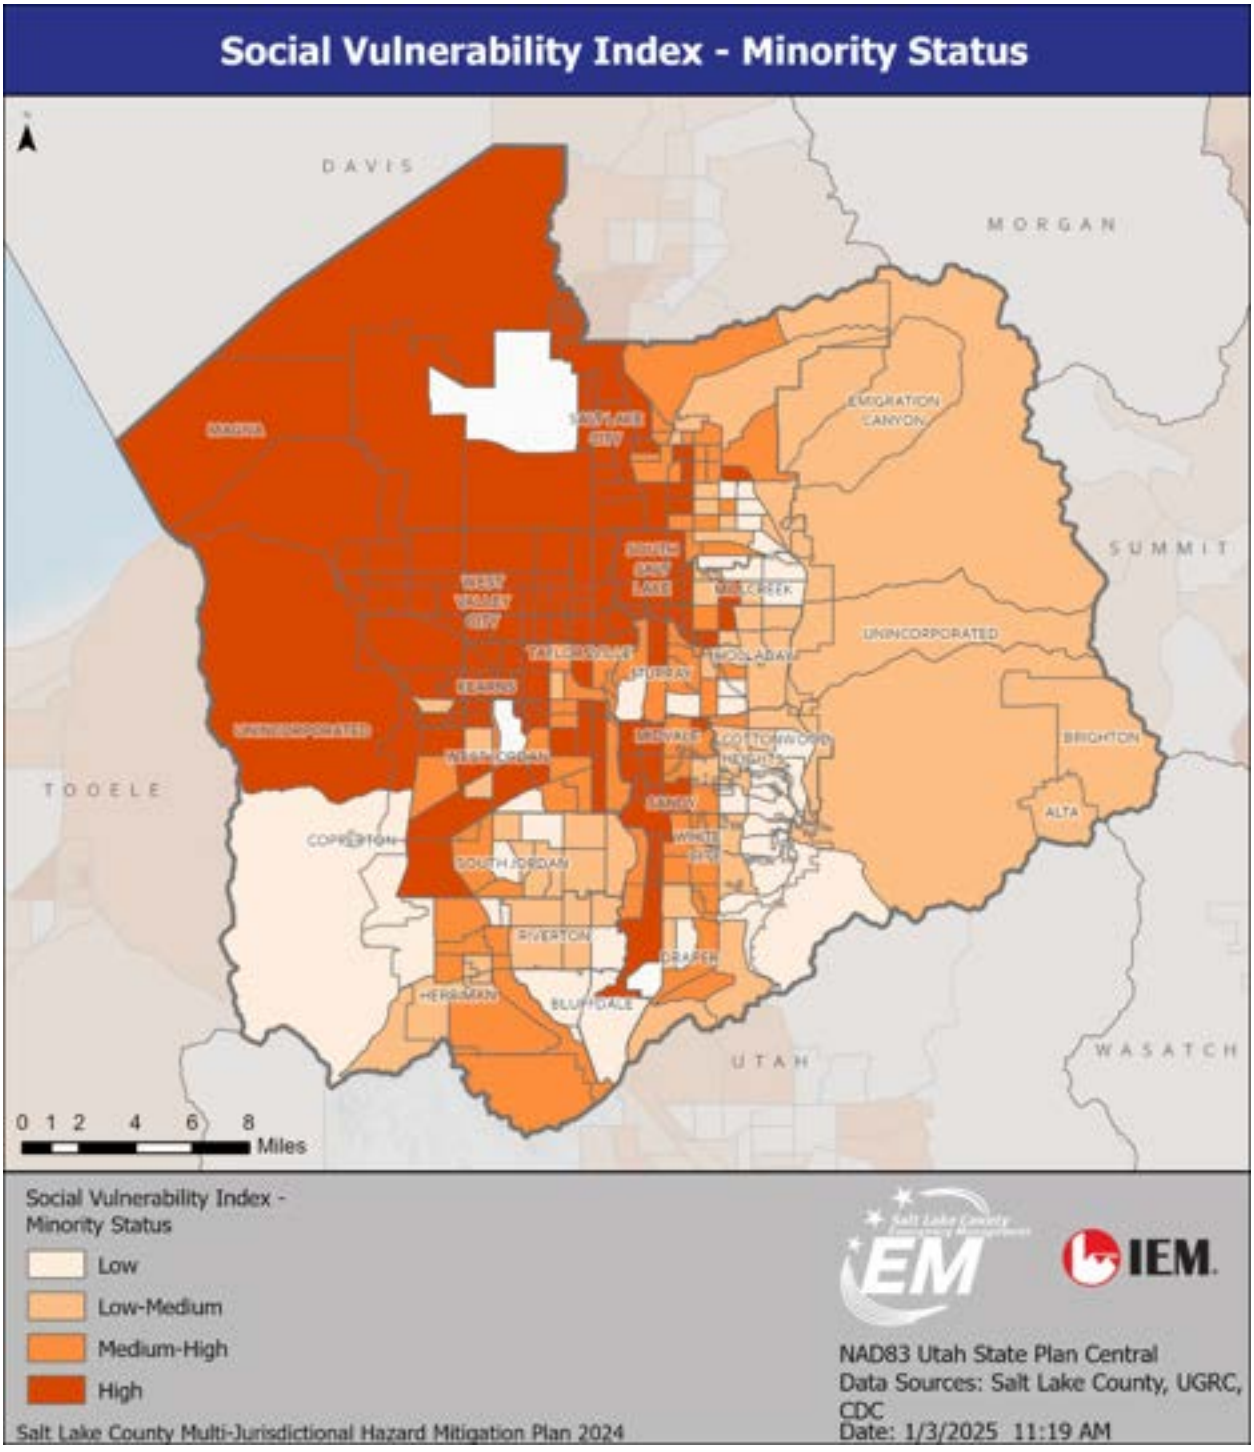

Figure 45: SVI – Minority Status by Census Tract for Salt Lake County

The Climate and Economic Justice Screening Tool is another method for identifying vulnerable populations. This interactive mapping tool identifies overburdened and underserved census tracts that are considered disadvantaged. Tracts that meet one or more categories of burden and the associated socioeconomic threshold are identified as disadvantaged. Figure 46 shows disadvantaged tracts in Salt Lake County.

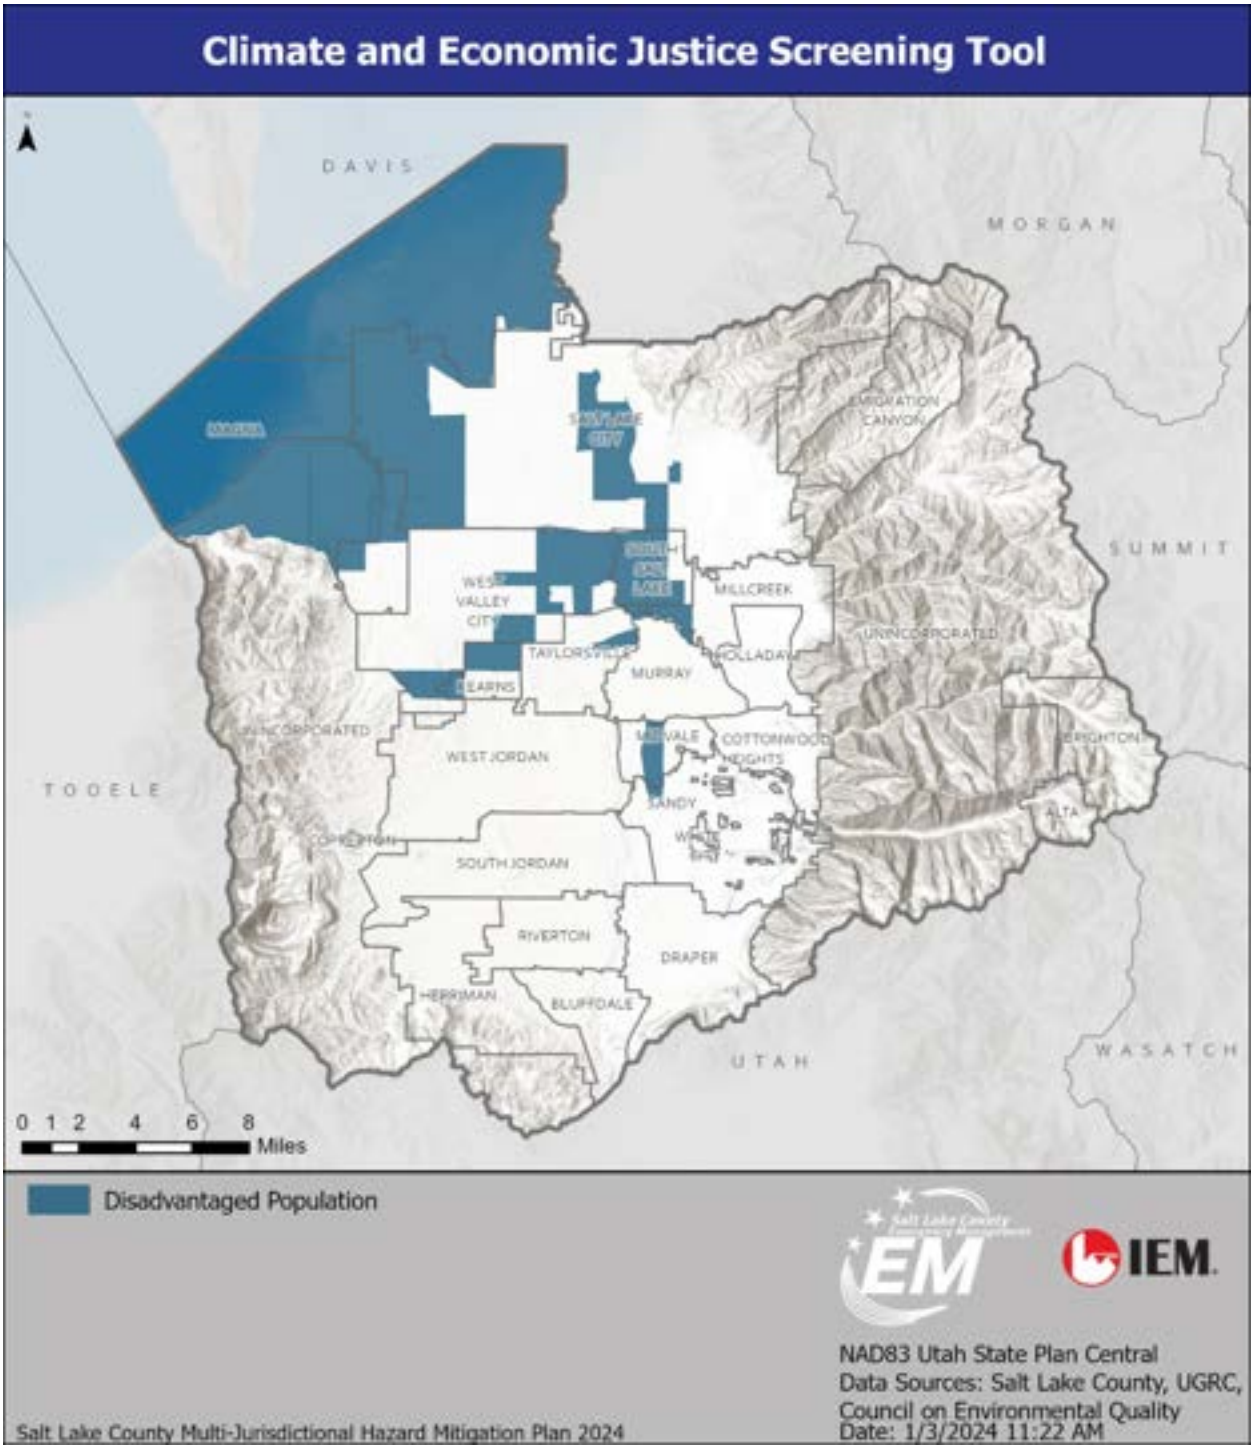

Figure 46: Disadvantaged Populations by Census Tract in Salt Lake County[41]

Indicators of disadvantaged status in one or more census tracts in Salt Lake County include the following:

[41] As determined by the Climate and Economic Justice Screening Tool, https://www.arcgis.com/home/item.html?id=b82df3b058204ccea64619efcd8065d2#.

- Projected wildfire risk
- Projected flood risk
- Expected population loss rate from natural hazards
- Asthma
- Low life expectancy
- Formerly used defense sites
- Proximity to hazardous waste facilities
- Proximity to risk management plan facilities
- Proximity to Superfund sites
- Underground storage tanks and releases
- Toxic concentrations in wastewater discharge
- Diesel particulate matter exposure
- Traffic proximity and volume
- Historic underinvestment in home loans
- Housing cost
- Lack of green space
- Homes containing lead paint
- Linguistic isolation
- Percentage of people with less than a high school diploma
- Low median income (comparison of median income in the tract to median incomes in the area)
- Low income (household income is less than or equal to twice the federal poverty level)

DRAFT

Avalanche

Hazard Description

A snow avalanche is the rapid downslope movement of a mass of snow, ice, and debris. Snow avalanches occur in the mountains of Utah during the winter and spring due to snow accumulation and unstable snowpack conditions. Avalanches can be extremely destructive due to the forceful energy of rapidly moving snow and debris and the resulting burial of areas in run-out zones. Avalanches can damage property, interrupt communication, and block transportation routes and streams. They often lead to injury and death, causing more fatalities than any other natural hazard in Utah. Over the past 25 years, an average of four people have been killed by avalanches in the state each year.

Although most avalanches occur in undeveloped areas, recreational endeavors—hiking, hunting, mountain climbing, skiing, snowboarding, snowmobiling, and other wintertime activities—bring the population into avalanche-prone areas. Due to the immense popularity of these activities, avalanches are actively mitigated in well-traveled areas. People venturing into the backcountry are at higher risk. Homes and businesses along the foothills and in mountain areas have been damaged by avalanches. Avalanches can occur naturally or be triggered artificially by explosives or people, such as snowmobilers, backcountry skiers, or other outdoor recreationists. The weather and terrain are two main natural factors that affect avalanche activity.

Weather events create a layered snowpack. When strong layers or slabs of snow form on top of weak layers, the snowpack can become unstable. The amount of snow, accumulation rate, wind speed, direction, moisture content, and snow crystal type all contribute to snowpack stability conditions. Most natural avalanches occur during or within 24 hours after a storm. In Utah, the avalanche potential is greatest from December through April.

Terrain factors affecting avalanches include slope angle, elevation, aspect, shape, and roughness. The slope angle is the primary factor influencing avalanche probability, with most occurring between 30 and 45 degrees (the optimum angles). The elevation and aspect dictate the depth, temperature, and moisture characteristics of the snowpack. The slope shape and roughness contribute to stability. For example, bowl-shaped slopes are more prone to avalanches than ridges. Boulders, shrubs, and trees contribute to the roughness of the slope and provide some stability.

Types of avalanches include wet and dry slab. Wet-slab avalanches occur most often on south-facing slopes in warming conditions. Dry slab avalanches occur mostly on north-facing slopes in mid-winter. Wind can accelerate snow deposition, leading to larger or more frequent avalanches. The two primary factors impacting avalanche activity are weather and terrain. Large, frequent storms deposit snow on steep slopes, creating avalanche hazards. Other factors that contribute to slope stability are the amount of snow, accumulation rate, moisture content, wind speed and direction, and type of snow crystals.

Avalanche paths may not experience a serious avalanche for years or even decades, but the potential remains, especially during above-average snowfall years. In Utah, 100 avalanche deaths occurred from 1958 to 2022. By comparison, there have been 61 deaths from lightning since 1950.

Topography also plays a vital role in avalanche dynamics. As shown in Figure 47 and as reported by the Utah Avalanche Center (UAC), slope angles between 30 and 45 degrees are optimal for avalanches. The risk of avalanches declines on slope angles below 30 degrees. At 50 or more degrees, they tend to produce sluff or loose snow avalanches that account for only a small percentage of avalanche deaths and property damage annually.[42]

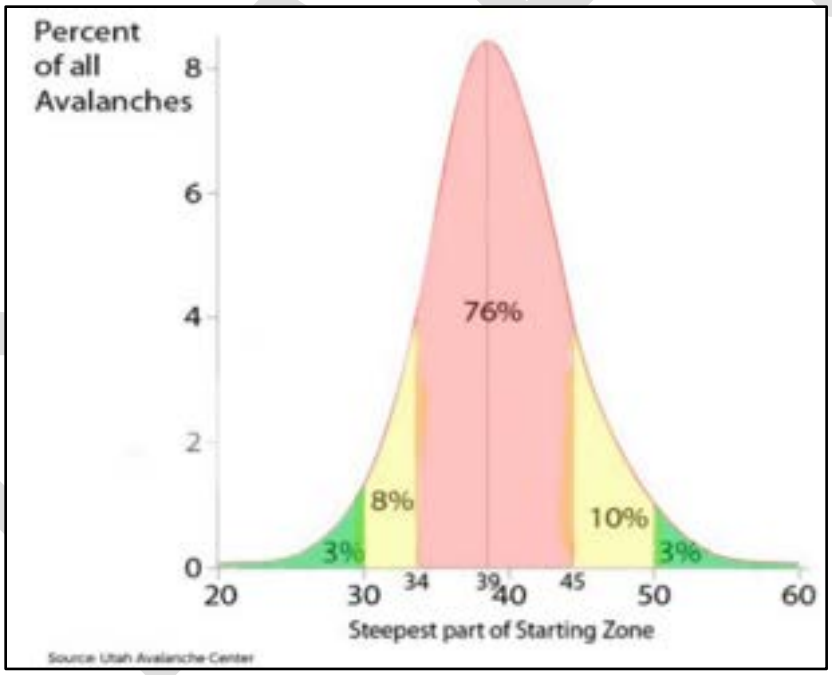

Figure 47: Factors Impacting Avalanche Activity[43]

[42] Ibid.
[43] Utah Avalanche Center, Utah Hazard Mitigation Plan. “Avalanche.” 2024. https://hazards.utah.gov/avalanche/.

Hazard Profile

Potential Impact		Catastrophic	**Probability**	X	Highly Likely
		Critical			Likely
	X	Limited			Occasional
		Negligible			Unlikely
Location	Occur in localized areas in canyons and foothills, primarily in the canyons of the Wasatch Mountains				
Seasonal Conditions	Winter, spring				
Conditions	Vary based on weather conditions, slope, aspect, and landform				
Duration	Initial impact seconds, possibly days, if avalanche impacts roads or structures				
Secondary Hazards	Traffic restrictions and limited access to and from canyon communities could disrupt emergency services in the canyon, mutual aid response to or from the canyon, or EMS transport out of the canyon				
Analysis Used	National Weather Service, Utah Avalanche Center, Utah Division of Emergency Management, local input, and review of historic events and scientific records				

Magnitude/Extent

Internationally, there is no standard method of evaluating avalanche size and magnitude. Different scales that have been proposed use various measures, such as the volume of snow transported relative to the avalanche path, potential or kinetic energy, deposit depth, or measures of other observable factors, such as the mass of the avalanche or water content of the debris.

Although all avalanche classification systems developed thus far have drawbacks, the Canadian system provides a compromise among the alternatives and is a practical tool for communication among most parties regarding avalanche magnitude.

Table 22: Canadian Snow Avalanche Size Classification System and Typical Factors[44]

Size	Description	Typical Mass (Tons "t")	Typical Path Length (Meters "m")	Typical Impact Pressure (Kilo-pascals "kPa")
5	Largest snow avalanches known; could destroy a village or a forest of 40 hectares	10^5	3000	1000
4	Could destroy a railway car, large truck, several buildings, or a forest with an area of up to 4 hectares (40,000 m^2)	10^4	2000	500
3	Could bury a car, destroy a small building, or break a few trees	10^3	1000	100
2	Could bury, injure, or kill a person	10^2	100	10

[44] Canadian Snow and Avalanche Center. "Snow and Avalanche Glossary." 2023. https://www.avalanche-center.org/Education/glossary/avalanche-size.php.

Size	Description	Typical Mass (Tons "t")	Typical Path Length (Meters "m")	Typical Impact Pressure (Kilo-pascals "kPa")
1	Relatively harmless to people	<10	10	1

The North American Public Avalanche Danger Scale is another tool forecasters use to communicate the potential for avalanches to cause harm or injury to backcountry travelers.

Table 23: North American Public Avalanche Danger Scale[45]

Danger Level	Travel Advice	Likelihood of Avalanche	Avalanche Size and Distribution
5 – Extreme	**Extraordinarily dangerous conditions.** Avoid all avalanche terrain.	Natural and human-triggered avalanches certain.	Very large avalanches in many areas.
4 – High	**Very dangerous avalanche conditions.** Travel in avalanche terrain not recommended.	Natural avalanches likely; human-triggered avalanches very likely.	Large avalanches in many areas, or very large avalanches in specific areas.
3 – Considerable	**Dangerous avalanche conditions.** Careful snowpack evaluation, cautious route-finding, and conservative decision-making is essential.	Natural avalanches possible; human-triggered avalanches likely.	Small avalanches in many areas; or large avalanches in specific areas; or very large avalanches in isolated areas.
2 – Moderate	**Heightened avalanche conditions on specific terrain features.** Evaluate snow and terrain carefully; identify features of concern.	Natural avalanches unlikely; human-triggered avalanches possible.	Small avalanches in specific areas or large avalanches in isolated areas.
1 – Low	**Generally safe avalanche conditions.** Watch for unstable snow on isolated terrain features.	Natural and human-triggered avalanches unlikely.	Small avalanches in isolated areas or extreme terrain.

The UAC forecasts include the overall danger rating using the scale in Table 23 and a "Danger Rose" (Figure 48), which provides additional information on avalanche danger based on aspect and elevation. This tool is used to inform the public, particularly outdoor recreationists, regarding avalanche danger.

[45] Avalanche.org. "North American Public Avalanche Danger Scale." 2010. https://avalanche.org/wp-content/uploads/2018/08/10_ISSW_Statham_etal_DangerScale.pdf.

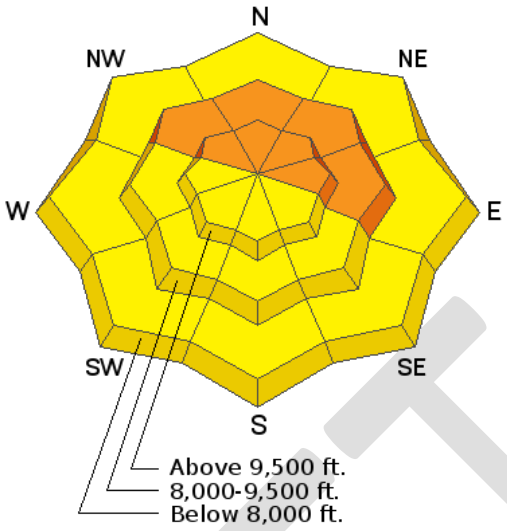

Figure 48: Avalanche Danger Rose[46]

Location

The risk of avalanches in Salt Lake County exists primarily in the Wasatch Range mountains—due to their high use for recreation and increasing development—although avalanches occur throughout Utah's mountainous areas. Avalanche risk in Salt Lake County is centered around the Big and Little Cottonwood Canyons. The town of Alta and the town of Brighton are especially at risk from the impacts of avalanches. The following maps from the UAC show the locations of known avalanche paths (Figure 49), and all reported avalanche events from 2009 to 2024 and the locations of all reported avalanche fatalities in the Salt Lake County Region (Figure 50).

DRAFT

[46] Utah Avalanche Center. "Danger Rose Tutorial." https://utahavalanchecenter.org/danger-rose-tutorial#:~:text=Avalanche%20Danger%20Rose%20We%20designed,make%20it%20easier%20to%20visualize.

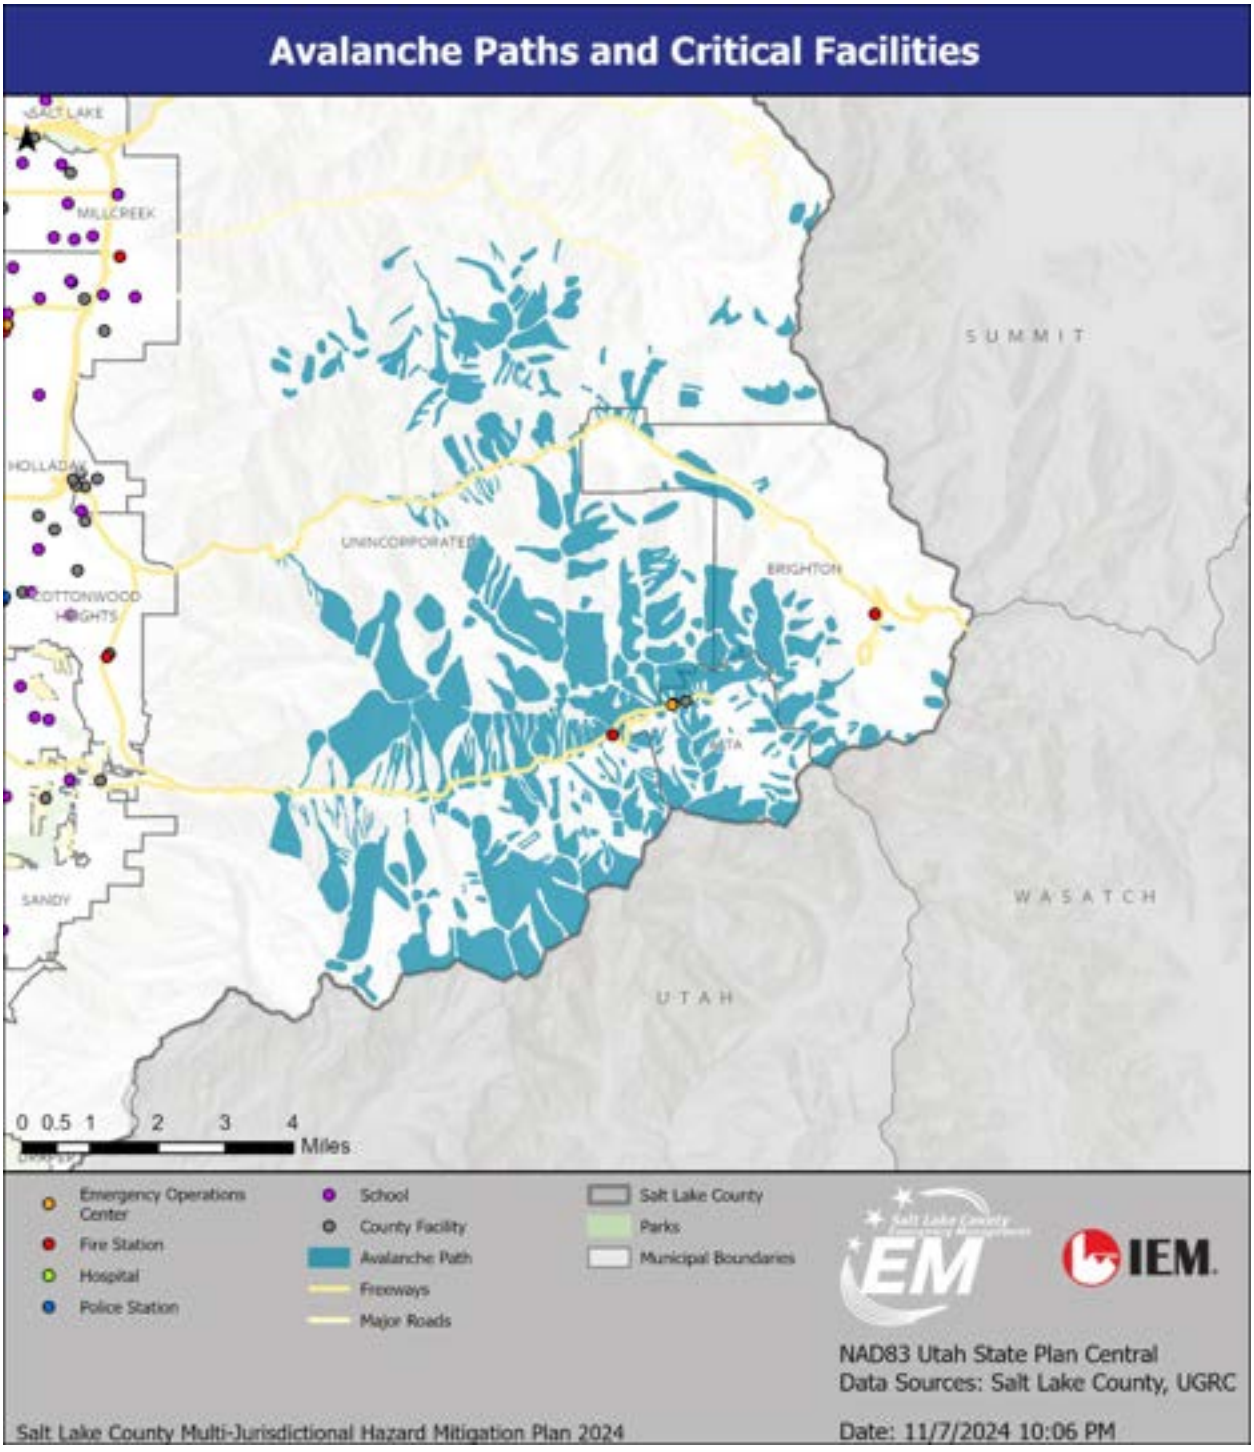

Figure 49: Historical Avalanche Paths in Salt Lake County

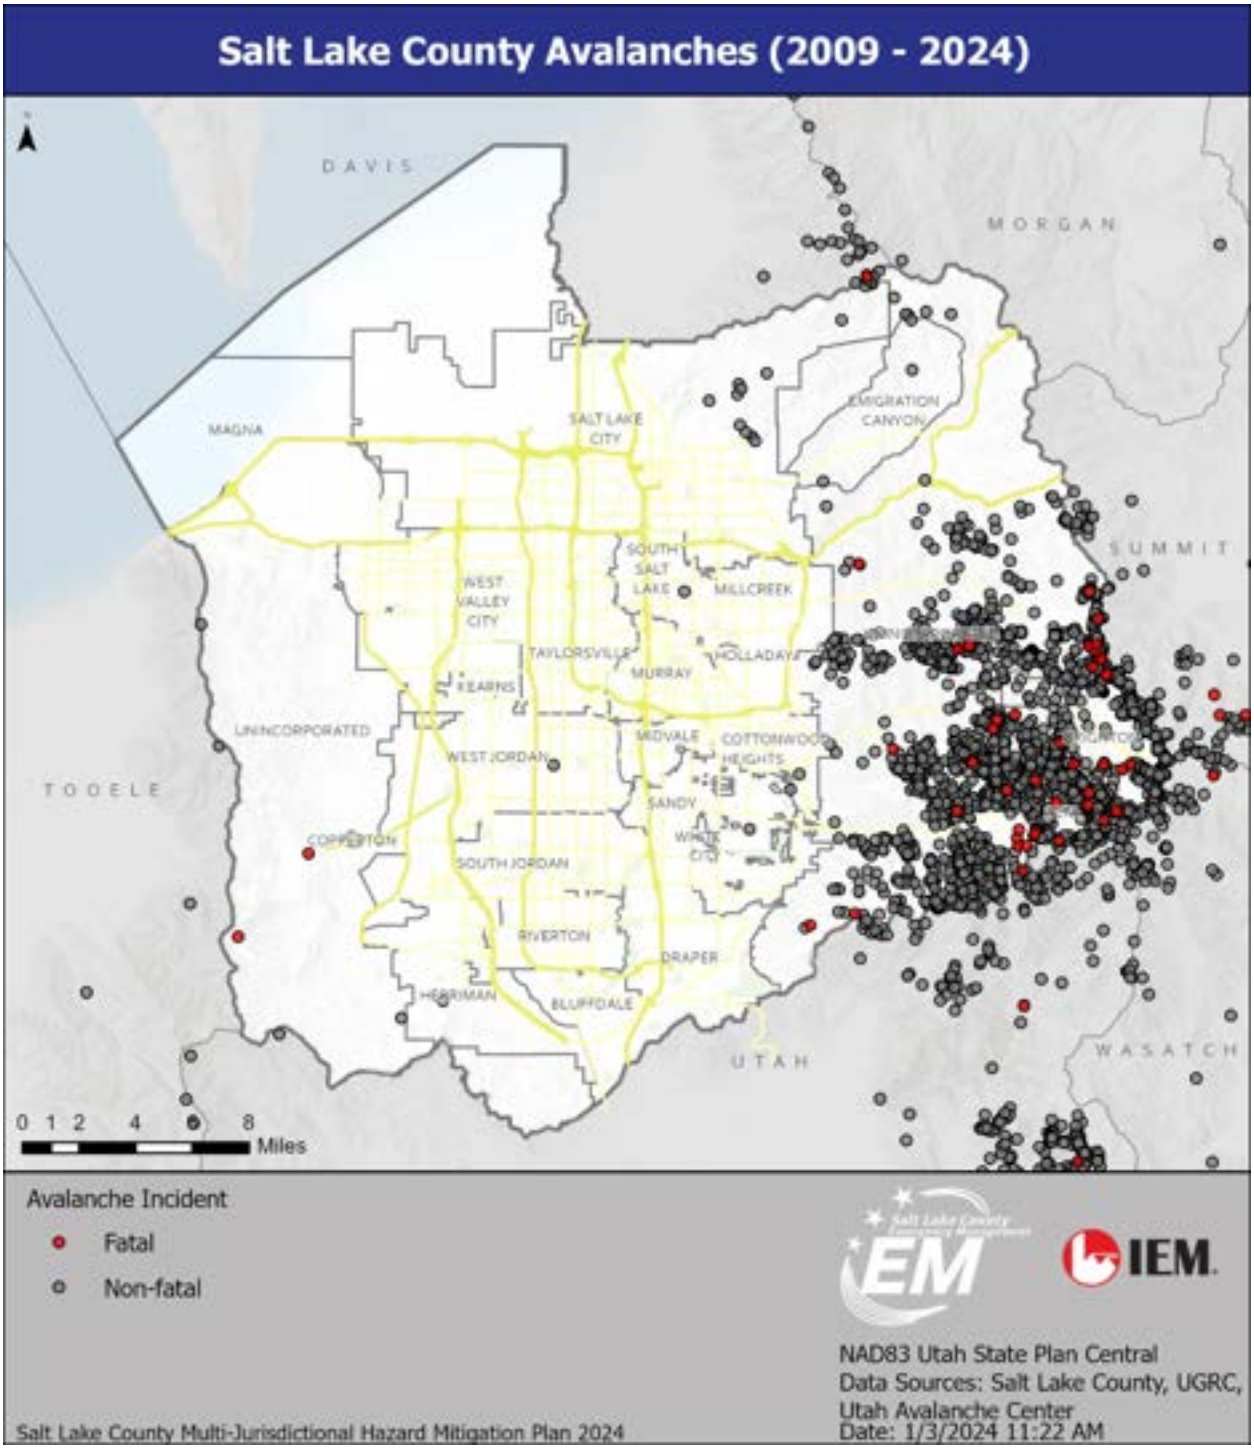

Figure 50: Locations of Avalanche Fatalities in and near Salt Lake County

Highway 210 in Little Cottonwood Canyon has the highest avalanche hazard-rating index of any major roadway in the country. When the Utah Department of Transportation (UDOT) and the town of Alta's Marshal agree that conditions are unsafe, the town goes into an Interlodge Alert. All occupants (including visitors and residents) must remain indoors until conditions are deemed safe. During large storm cycles,

an Interlodge Alert can last days until the storm cycle is over and proper avalanche control work has been performed.

The town's General Plan (dated November 2005, Updated 2013) covers Highway 210 access and possible mitigation activities to keep this critical road open. It also provides background on the Little Cottonwood Canyon Road Committee, a group consisting of representatives from Alta, Snowbird, Salt Lake County (including the Unified Fire Authority), UDOT, Utah Transit Authority (UTA), and U.S. Forest Service (USFS). It meets monthly to discuss access, use, and safety and security issues related to the canyon road.

The town of Brighton can also be affected by avalanche. Highway 190 could be deemed impassable due to avalanche or closed during UDOT avalanche control operations. Residents and skiers may become isolated from the rest of the county.

UDOT is responsible for managing the threat of avalanches on Utah's state and federal highways. The average daily traffic in Big and Little Cottonwood Canyons frequently exceeds the capacity of those roads, and slow-moving traffic conditions pose a significant threat to public safety if avalanche conditions are present. To address these safety concerns, the UDOT Avalanche Safety Plan establishes a process to develop avalanche hazard forecasts, conduct avalanche control and stability evaluations, and perform avalanche rescue.[47] When conditions are met, UDOT coordinates with the Unified Police Department (UPD) and the town of Alta to implement backcountry access closures where avalanche control work is planned. Following the complete evacuation of avalanche control areas, UDOT uses explosives and artillery to trigger avalanches that threaten public roads. Previously, UDOT used howitzers for avalanche control. In an effort to reduce the amount of artillery fired in the canyon and to enhance safety and efficiency, UDOT has installed remote-controlled avalanche mitigation equipment in Little Cottonwood Canyon. The Remote Avalanche Control System (RACS) uses wireless communications to Wyssen Avalanche Towers that deploy explosive charges that hang just over the ground to trigger an avalanche. These towers were expected to be operational for the 2024/2025 winter season.[48] Additional details on these procedures, maps of known avalanche paths, staging areas, and other details are available in the Safety Plan. Road and backcountry closures are announced on UDOT's Avalanche Safety webpage (see Figure 51) and social media sites.[49] Further details on backcountry closure zones are detailed in the Avalanche Safety Backcountry Policy, as shown in Figure 52.[50]

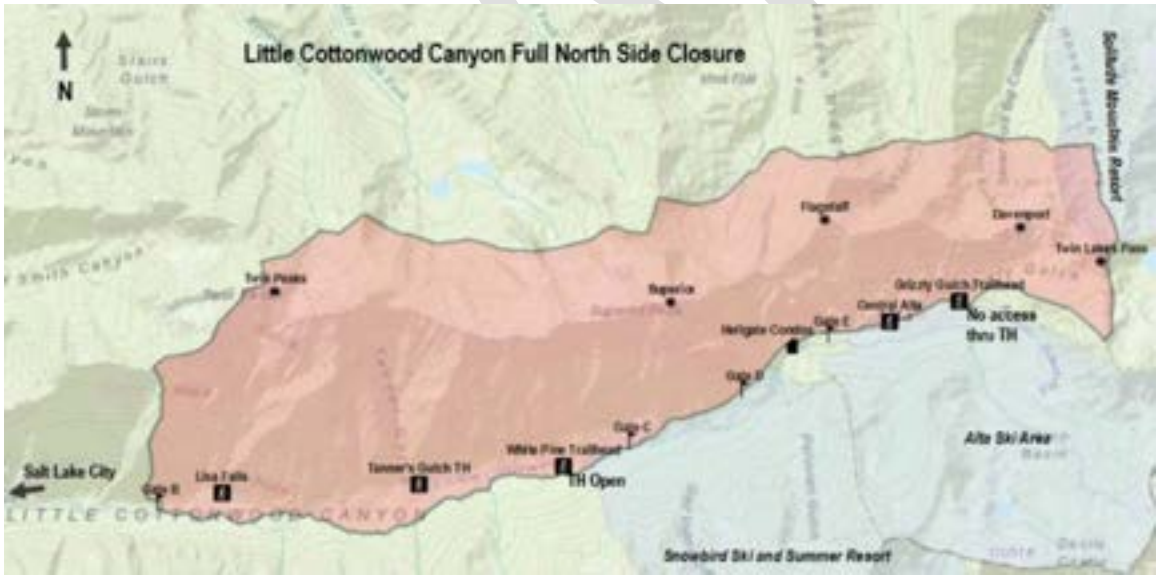

Figure 52: Example of Backcountry Closure Area[51]

Historical Events and Probability of Future Occurrences

Since January 1, 2019, the Salt Lake region has had over 2,400 avalanches. Avalanches are one of the deadliest types of natural disasters in Utah. According to the database of the National Centers for Environmental Information (NCEI) at the National Oceanic and Atmospheric Administration (NOAA),

[51] Ibid.

avalanches caused 128 deaths in the state between 1996 and 2022, accounting for 70% of severe weather-related deaths.[52]

According to data from the UAC, there have been 51 injuries and 57 deaths in the Salt Lake County region from all recorded avalanches since 1965. From 2009 to 2018, the region had approximately 2,151 reported avalanches, averaging approximately 215 reported events per year. According to NOAA, from 1996 to 2018, there have been only two events with significant recorded property damage, totaling $70,000.

According to FEMA, Disaster Declarations for States and Counties there were no Federally declared avalanche disasters from 01/01/2019 through 06/03/2025.[53] In addition, no state declarations have been made for the state of Utah due to an avalanche.[54]

On Thursday, May 9, 2024, two men died in an avalanche in the Big Willow drainage of the Wasatch Mountains. A group of 3 men were hiking toward Lone Peak following a significant, late-season storm. The avalanche broke around the lead hiker, who was partially buried but could dig himself out. The other two hikers were completely buried. The friend used a transceiver to locate the other two and worked to unbury them, but neither survived.

On Monday, April 17, 2023, a man died after being buried by a roof avalanche outside a cabin in the town of Brighton. It is believed he was attempting to clear or remove snow from the roof when the avalanche occurred. The following day, the UPD found him partially buried after they were called to perform a welfare check when the man failed to show up for work.

On Monday, March 27, 2023, a group of six snowmobile riders were recreating in Pole Canyon in the Oquirrh Mountains. Four left to return home while the other two continued toward the top of Flat Top mountain. An avalanche occurred while the two who had remained were descending. One could ride safely out of the path and the other was buried. The man called the rest of his party, contacted search and rescue, and began searching for his companion. He was eventually found deceased. It was noted that the UAC does not forecast avalanche conditions for the Oquirrh Mountains and has minimal data for that range.

On February 6, 2021, eight people in two groups went skiing in the Wilson Glades area, beginning at the Butler Fork Trailhead in Big Cottonwood Canyon. The two groups were ascending when the avalanche was triggered. Six people were caught and fully buried. Two survived, while the other four did not.

On January 21, 2016, a group of skiers were skiing along Gobblers Knob between Big Cottonwood and Millcreek Canyons. An avalanche, about 600 feet wide, was triggered, and two of the skiers were caught. One skier was partially buried and sustained minor injuries. The other skier, a 49-year-old male, was killed after being fully buried by the avalanche.

[52] “Avalanche.” Utah Hazard Mitigation Plan. 2024. https://hazards.utah.gov/avalanche/.
[53] FEMA, Disaster Declarations for States and Counties.” https://www.fema.gov/data-visualization/disaster-declarations-states-and-counties.
[54] Utah Department of Public Safety, “Utah Disaster History.” https://dem.utah.gov/utah-disaster-history/.

On March 14, 1998, Little Cottonwood Canyon had 6 avalanches. Vehicles were swept from the road, causing injuries to 5 people and $50,000 in property damage.

In 1983, a large avalanche completely covered Highway 210, buried several automobiles, and wiped out the first floor of the Peruvian Lodge. A Salt Lake City motorist was seriously injured in a 1998 avalanche in Little Cottonwood Canyon.

The number and severity of avalanches each year depend on many factors, such as previous snow conditions, amount of new snowfall, wind speeds, wind direction, snow density, and avalanche control work success, mostly occurring in the Wasatch Mountain range. It is reasonable to expect that avalanche occurrence frequency will continue to be in line with past events. Based on the average of 215 events occurring annually, the probability of future events is highly likely.

Table 24: Avalanche Fatalities in Salt Lake County, 2019–2023[55]

Date	Deaths	Region	Place	Trigger
12/15/2019	1	Salt Lake County	Dutch Draw	Snowboarder

04/17/2023	1	Salt Lake County	Brighton	Unknown
05/09/2024	2	Salt Lake County	Big Willow	Skier

Climate Change Considerations

The Utah State 2024 Hazard Mitigation Plan states that climate change will affect avalanche risk in Utah. Projections for higher temperatures suggest that the snowline will move to higher elevations, leaving less snow cover at lower elevations. As the snow cover declines, the spatial extent of possible avalanches will decline. The risk of impacts on roads and infrastructure will decline as the spatial extent declines. However, wintertime backcountry enthusiasts may follow the snowpack, and exposure may persist. The relationship between changing snowpack and avalanche deaths and injuries is likely complex.[56]

Climate change can have a significant impact on the natural hazard of avalanches related to the amount or timing of snowfall events and the variability in temperatures. Snowpack can become less stable leading to an increase in frequency and intensity of avalanches as global temperatures increase. Melting and refreezing of snowpack can cause weaker layers that are prone to collapse while more intense and frequent weather events, such as heavy snow followed by rapid warming can trigger avalanches in the Wasatch Mountains. The changing climate could cause a shorter and more variable snow season which can lead to a higher likelihood of avalanches occurring outside the traditional winter months posing new

[55] Utah Hazard Mitigation. “Avalanche Fatalities 2019–2023.” Utah Avalanche Center. 2024. https://hazards.utah.gov/avalanche/.
[56] Utah Hazard Mitigation. “Climate Change Considerations.” Utah Avalanche Center. 2024. https://hazards.utah.gov/avalanche/.

challenges for communities on and around the Wasatch Mountains. Recreationists may not be accustomed to these changing conditions or may feel safer after higher temperatures and underestimate the avalanche risk.

Secondary Hazards

Avalanches tend to be localized events causing immediate injury or death but do not have secondary impacts affecting the rest of the county. Nonetheless, avalanche events can damage roadways and other transportation infrastructure, producing traffic restrictions and restricting access of essential and critical emergency services delivery for canyon communities. Radio or other communications towers could also be damaged. In addition, large avalanches can disrupt vegetation and soils along waterways, which can negatively impact the watershed.

Vulnerability Assessment

As previously mentioned, avalanche risk in Salt Lake County is primarily found in the Wasatch Mountains, particularly in Big and Little Cottonwood Canyons. The town of Alta and town of Brighton are particularly at risk. State Highway 210 follows Little Cottonwood Creek for the length of Little Cottonwood Canyon and serves as the primary access route to the town. Culvert blockages, bank erosion, landslides, and avalanches can all close the town's only arterial connection with the rest of the county. Although the town of Alta only has a population of 225,[57] it has a significant, fluctuating tourist population due to ski resorts and other mountain recreation sites, which would be greatly impacted if an avalanche blocks Highway 210. Resorts saw a record 7.1 million skier visits in the 2022–2023 season. Figure 53 illustrates the increase in ski recreation in the state in recent years. 44% of those skier days are from Utah residents, but the remainder are from outside the area.

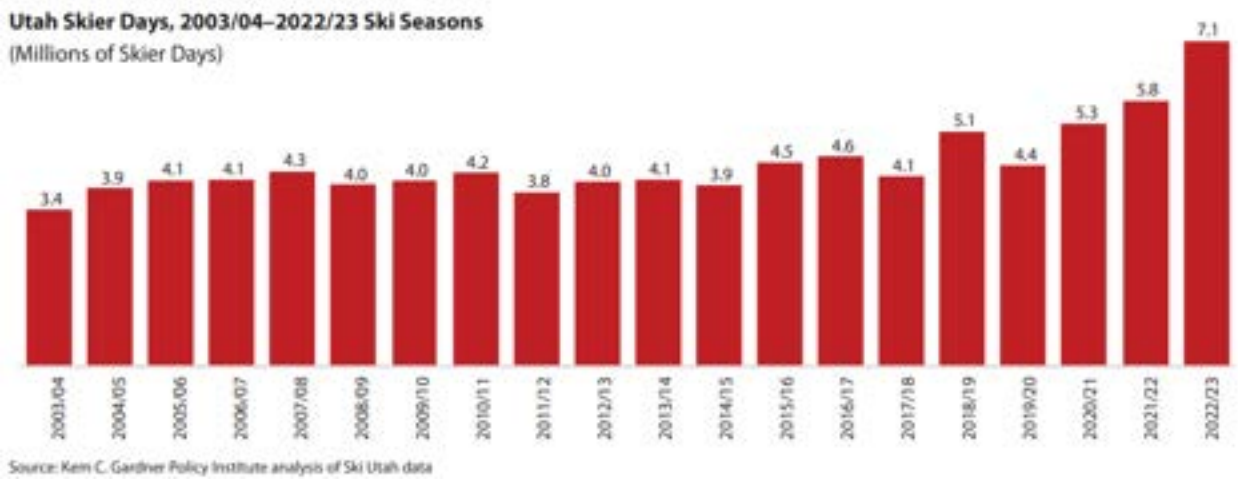

Figure 53: Skier Days in Utah, 2003–2023[58]

[57] World Population Review. Alta, Utah Population. 2024. https://worldpopulationreview.com/us-cities/utah/alta.

According to the 2019 Utah State Hazard Mitigation Plan, the following 95 structures are vulnerable to avalanche events: 56 commercial, 38 residential, and 1 government with a value of $57,700,210.

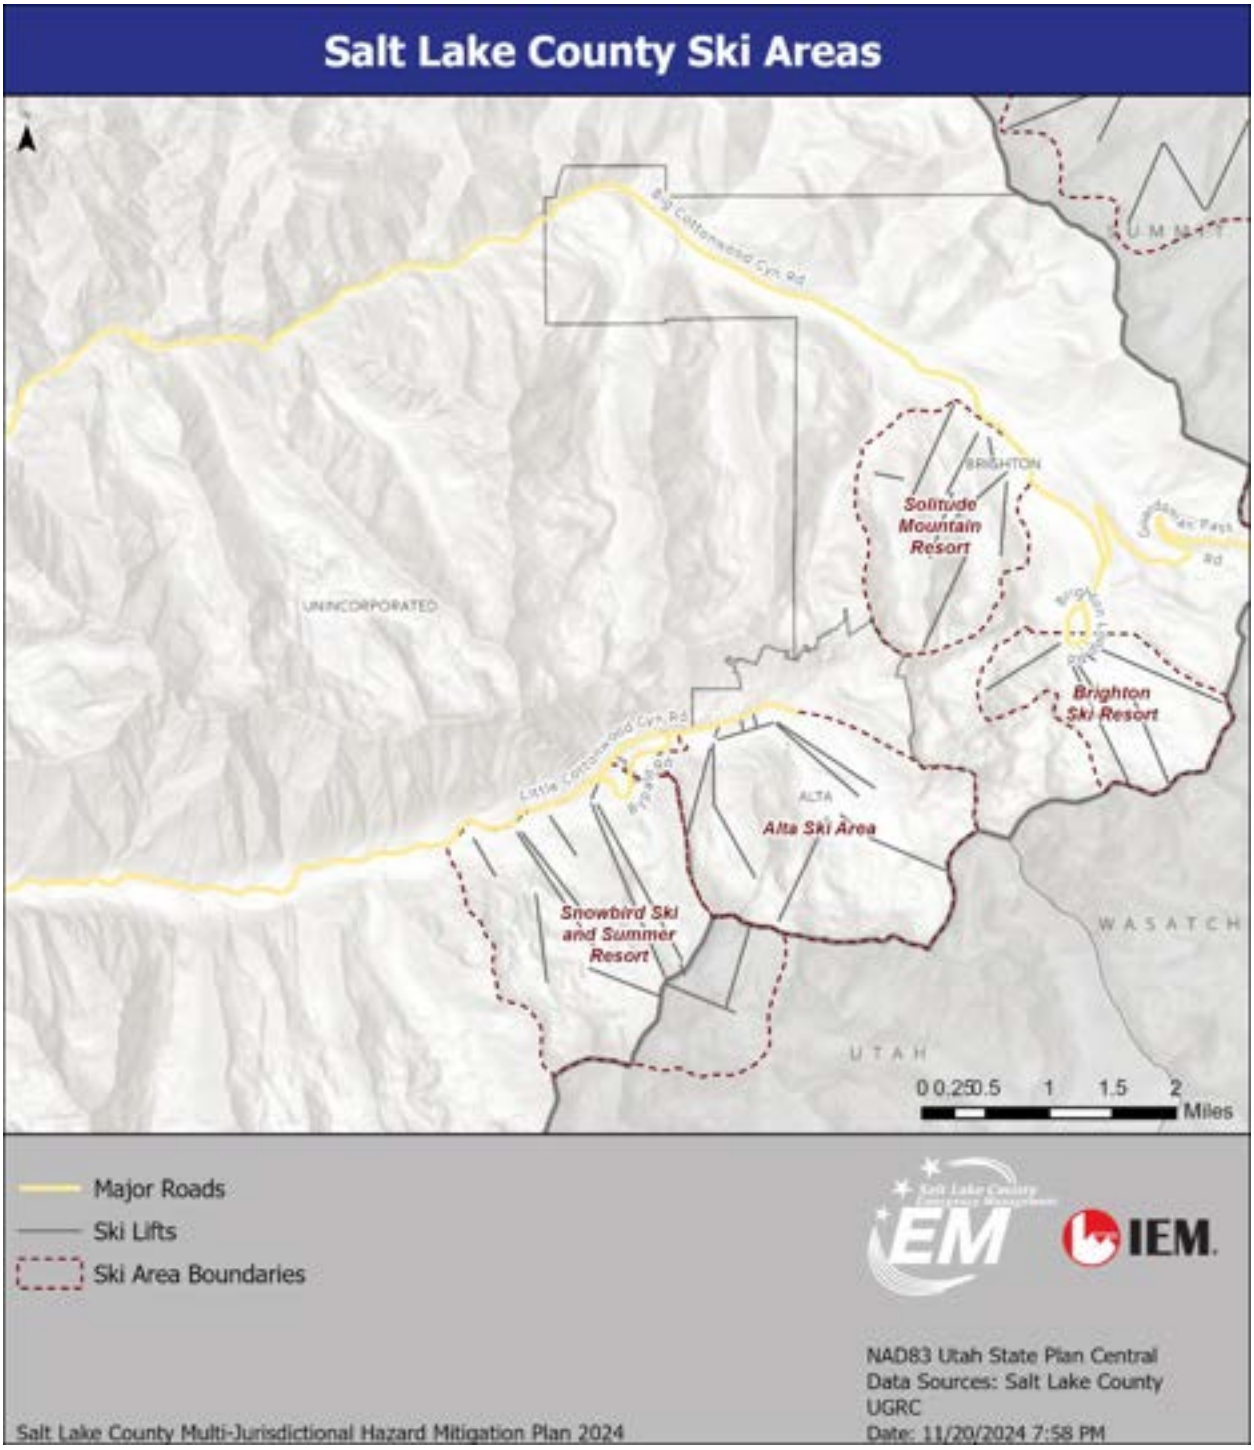

Figure 54: Ski Resort Infrastructure in Salt Lake County

ESTIMATED IMPACTS AND POTENTIAL LOSSES

In Salt Lake County, avalanche risks are concentrated in the Wasatch Mountains and more specifically in Big and Little Cottonwood Canyons. The towns of Alta and Brighton are especially vulnerable due to their geographic locations and routes to access the towns. The influx of tourists, especially during ski season, heightens the impacts avalanches have on human lives and the local economy. Population trends can significantly impact avalanche risks, as an increased population can lead to more people in mountainous areas for recreation or residence. An increased population density in mountainous areas leads to more infrastructure, such as roads and buildings, which can be impacted by avalanches. This increase in population density coupled with tourists and seasonal residents can strain local emergency response systems. The changes in land use due to development can also alter avalanche paths and potentially increase the risk to human life and property.

The most direct impacts on the populations in these avalanche prone areas is the risk of injury or death if caught in an avalanche. Structures in Big and Little Cottonwood Canyon could be damaged or destroyed by an avalanche. Transportation routes have been closed and damaged by avalanches in the past and will likely be impacted in the future. Road closures isolate people in the upper part of the canyons from emergency services and other resources they might typically access in the valley communities. It may also impede people from traveling to or from work. Avalanches can also impact services the community depends on, including communications towers, power distribution, and water systems in canyon areas. Furthermore, damage to facilities or road closures can have significant economic impacts on businesses dependent on winter recreation.

The National Risk Index (NRI) includes data on the expected annual losses (EALs) from individual natural hazards, historical loss, and overall risk at a county and Census tract level. Salt Lake County's EAL value due to avalanches is $2 million, with a risk score of 96.6 and a rating of Very High compared with the rest of the United States (Figure 55).

DRAFT

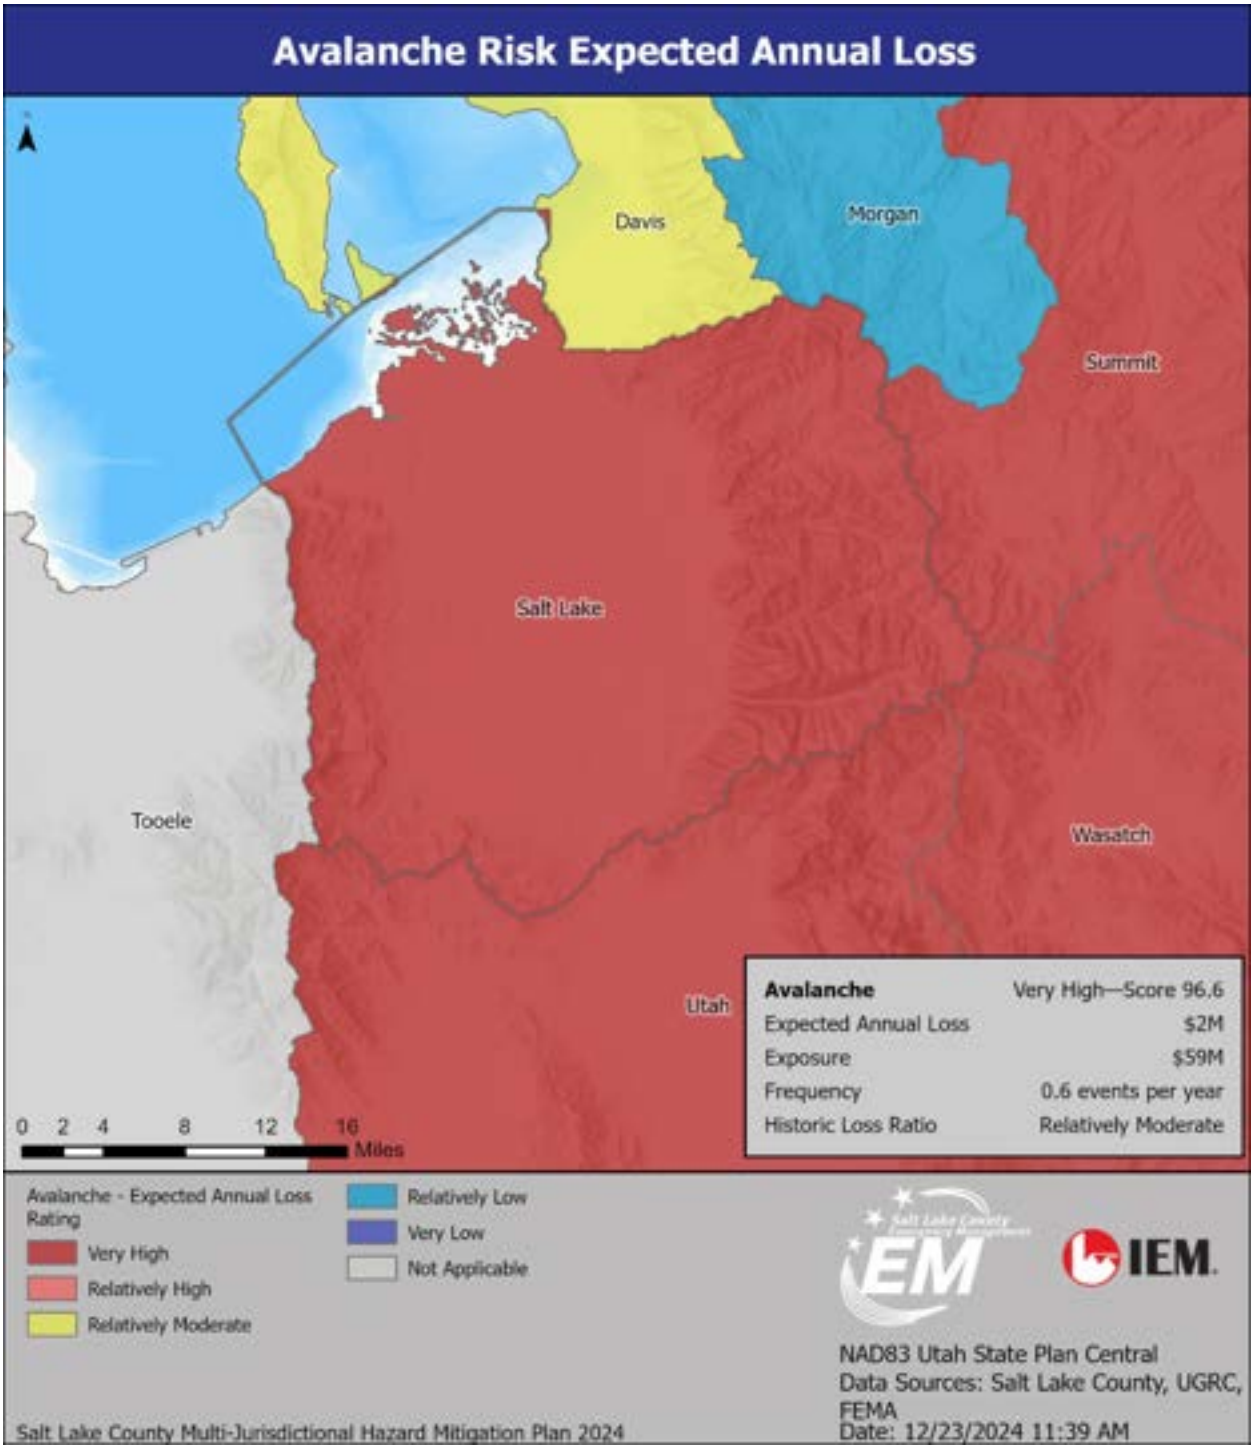

Figure 55: Expected Annual Loss from Avalanche in Salt Lake County[59]

[59] FEMA, National Risk Index. "Salt Lake County Expected Annual Loss Avalanche Risk Score, Map and Legend." https://hazards.fema.gov/nri/map.

VULNERABLE POPULATIONS

The Utah State 2024 Hazard Mitigation Plan states that victims of avalanche hazards are primarily backcountry skiing or snowmobile enthusiasts, who are often specially trained and equipped to avoid or survive the avalanche hazard and are typically undertaking a calculated risk of injury or death vs. the reward of fresh powder snow. However, outdoor recreation industries and destinations have seen significant increase in visitors since COVID-19. Those who are new to outdoor recreation might have less understanding or awareness of avalanche hazards and proper precautions.

Although ski towns, such as the town of Alta, might have a relatively small permanent population, they also often have significant, fluctuating tourist populations during the winter months, which increases the likelihood of population impacts. In addition, the American Institute for Avalanche Research and Education reports that 90 percent of avalanche victims die in slides triggered by themselves or a member of their group. Avalanche closures and mitigation in high-risk areas, such as Little Cottonwood Canyon are designed to limit risk to populations on roads and those staying at ski areas. Road closures can isolate these populations from critical support, including medical care, ambulances, food, fuel, and other supplies. Although the permanent residents in Alta and Brighton were not identified as vulnerable or underserved communities, tourists and other visitors to the canyon might have unique challenges. Visitors in the canyon may need to shelter in place during Interlodge Alert conditions with minimal resources. They might have few options for food, clothing, and shelter during Interlodge or canyon road closures. Some may not have access to their daily medications. Some could be visiting from other countries and may not speak English and might have difficulty understanding information regarding Interlodge Alerts or other safety information. The resorts and related businesses may also employ seasonal workers that might have limited access to resources, may live outside canyons, or have language barriers.

COMMUNITY LIFELINES

The main lifelines for avalanches are food, hydration, shelter, transportation, communications, and safety and security. A primary focus during times of high avalanche risk is ensuring that the safety of residents and recreationists. Emergency services provided by Unified Fire Authority and the town of Alta Marshal could be impeded by an avalanche. Road closures would prohibit transport of patients by EMS. Closures also may impede normal staffing/shift changes. Heavy snowfall and avalanches can damage communications equipment. During the 2022 season, communication to anyone outside the canyon was disrupted. Enforcement of Interlodge alerts and providing adequate food, hydration, and shelter for those in the affected area is a priority. During prolonged Interlodge conditions, food and water for people sheltering in the canyon may become scarce. Closure of roadways for avalanche control efforts when necessary, helps maintain the safety of motorists but limits egress and access to resources for those farther up the canyon.

CHANGES IN DEVELOPMENT

Although the residential populations of the town of Alta and the town of Brighton have not grown significantly, record numbers of visitors to the canyon ski resorts have been recorded since the last plan

DRAFT

update, which totaled 6.75 million skier visits between Utah's 15 ski areas in the 2023–2024 ski season.[60] The increased volume of recreationists represents an overall increase in vulnerability. No significant developments are underway in the area most at risk of avalanche, but future development, such as changes to road infrastructure, expansion or re-routing of ski infrastructure, or other modifications to the landscape, could affect avalanche risk. In 2022, UDOT announced plans to construct a gondola from the base of Little Cottonwood Canyon to the Snowbird and Alta ski resort areas. The gondola is intended to alleviate traffic congestion and will operate in a separate alignment from the road. However, this development has been controversial, and many residents have protested the gondola. It is not yet clear how construction of the gondola may affect vulnerability to avalanche.

An increase in avalanche vulnerability can increase loss of life and property and negatively affect the reputation of the ski resort area. Climate changes could affect snow levels and might decrease tourism, and businesses may move out of those areas. In addition, people may move to a different area that is less prone to avalanches if the likelihood continues to increase. New Wyssen avalanche towers installed near Alta may increase effectiveness of avalanche mitigation,[61] possibly reducing potential impacts of avalanches. Overall, due to an increased volume of visitation to avalanche prone areas, vulnerability to avalanches has increased since the last plan update.

VULNERABILITY SCORE

To analyze Salt Lake County's vulnerability to avalanches, the NRI was used as a primary tool during the 2024 update. The NRI defines risk as the potential for negative impacts due to a natural hazard. It determines a community's risk relative to other communities by examining the EAL and social vulnerability in a given community in relation to its resilience. Salt Lake County's NRI Avalanche risk rating is shown in Figure 56. Salt Lake County has a Relatively High Avalanche risk and a risk score of 92.8.

Dam Failure

Figure 57: Mountain Dell Dam[63]

Hazard Description

A dam is an artificial barrier that can store water, wastewater, or liquid-borne materials for many reasons—flood control, human water supply, irrigation, livestock water supply, energy generation, recreation, or pollution control.

Dams are usually human-made and, therefore, not inherently considered natural hazards; however, dam failures can occur because of natural events. The impacts of a dam failure can be like natural flood events, although they are often more sudden and violent than normal stream floods. Dam failure causes include breach from flooding, overtopping, ground shaking from earthquakes, settlement from liquefaction, slope failure, and slumping, internal erosion from piping, failure of foundations and abutments, outlet leaks or failures, and internal weakening caused by vegetation and rodents. Possible effects include flooding, silting, loss of water resources, and loss of property and life.

There are two types of dam failures: “rainy day” and “sunny day” failures. Rainy day failures occur because floodwaters overstress the dam, spillway, or outlet capacities. The floodwaters eventually flow over the top of the dam and erode the structure from the top down. The breach flows of the dam are added to the floodwaters from the rainstorm to produce a flood with a large proportion and destructive power. Sunny day failures are due to seepage and erosion inside the dam that removes fine material, creating a large void that can cause the dam to collapse or overtop and wash away. Sunny day failures

[63] https://www.wikiwand.com/en/articles/Mountain_Dell_Dam

can be the most dangerous because they can happen quickly without warning to owners or downstream residents.

Dam failures can also result from a combination of causes, including the following:

- Failure of upstream dams on the same waterway
- Improper maintenance
- Negligent operation
- Internal erosion caused by embankment or foundation leakage or piping, root growth, or rodent/wildlife activity
- Earthquake/seismic activity
- Prolonged periods of rainfall and flooding, which cause overtopping
- Improper design
- Inadequate spillway capacity resulting in excess overtopping flows
- Intentional structural attacks and cyberattacks

Hazard Profile

Potential Impact		Catastrophic	**Probability**		Highly Likely
	X	Critical			Likely
		Limited		X	Occasional
		Negligible			Unlikely
Location	Dams are located throughout the county, with most representing high and moderate hazards in the eastern and southern portions				
Seasonal Conditions	Rainy day failure: anytime Sunny day failure: spring and late summer				
Conditions	Rainy day failures happen mainly during heavy precipitation events and might have some warning time. By contrast, sunny day failures can happen anytime, without warning.				
Duration	Hours or days, depending on the spillway type and area, maximum cubic feet per second (cfs) discharge, overflow or breach type, and dam type				
Secondary Hazards	Raw sewage/health risks, electrical fires, and gas spills				
Analysis Used	Review of Bureau of Reclamation inundation maps and plans, Flood Insurance Study, and Utah Division of Water Rights				

Location

Salt Lake County Emergency Management (SLCo EM) provided data on dams from the Dam Safety Database Information Viewer maintained by the Utah Division of Water Rights.[64] Figure 59 shows the

[64] Utah Division of Water Rights. "Dam Safety Database Information Viewer." https://www.waterrights.utah.gov/cgi-bin/damview.exe?Startup.

location of all 72 dams in Salt Lake County. The county has 28 high-hazard, 34 significant-hazard, and 10 low-hazard dams (Figure 58), with an average age of 47 years.

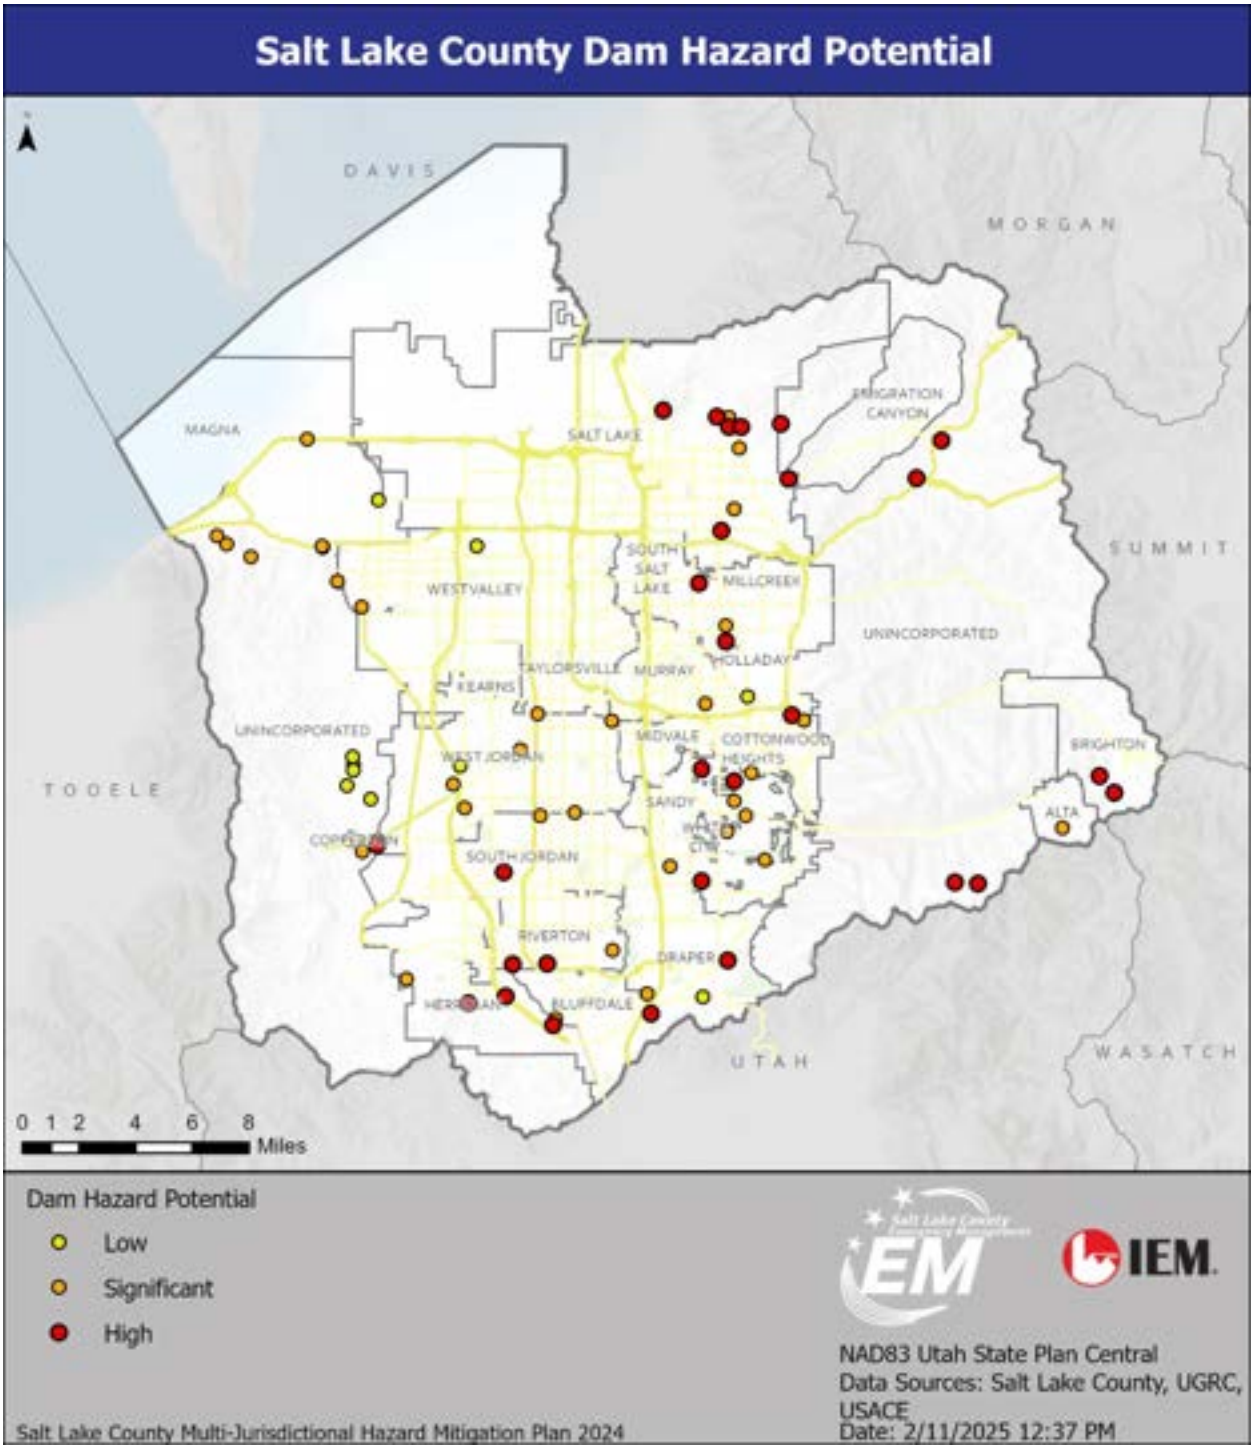

Figure 58: Location of Dams

Utah Division of Water Rights and Utah Geospatial Resource Center have mapped potential dam inundation areas for 32 high or significant hazard dams in Salt Lake County, shown in Figure 59. These

map features were generated using cross sections to model how water would flow if a dam were to fail. Dam inundation areas have not been delineated for all dams, particularly significant and low hazard dams. Community planners have to infer where flood hazard areas exist downslope of dams.

Floods, earthquakes, ground shaking, surface faulting, and landslides all pose a concern for causing a dam incident. A special concern of dam safety is not only the safety of dams to the community but also the safety of dams themselves in case of other hazards or failures of upstream dams. A GIS overlay analysis of the 28 high-hazard dams and potential inundation areas was conducted and revealed that 14 dams are in the inundation areas of other dams (Figure 59).

DRAFT

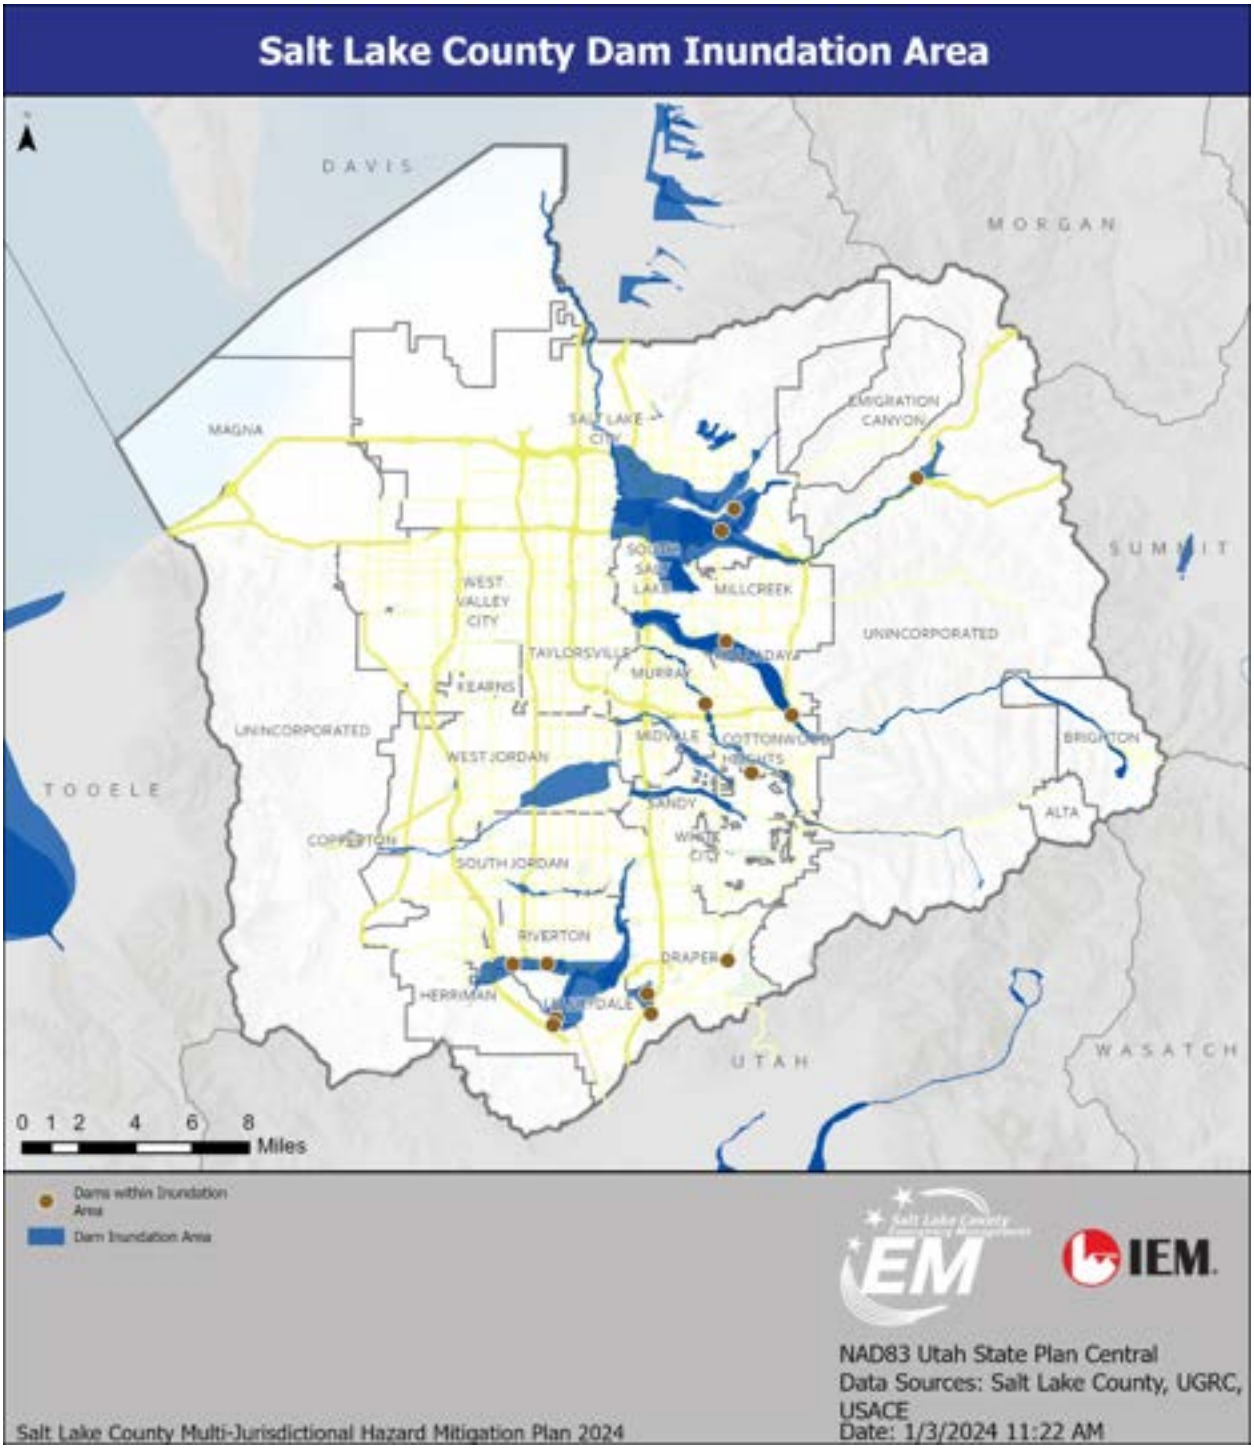

Figure 59: Dams in the Dam Inundation Area of Salt Lake County

Levees can experience failures under similar conditions to dam failures. Figure 60 shows the location of levees in Salt Lake County.

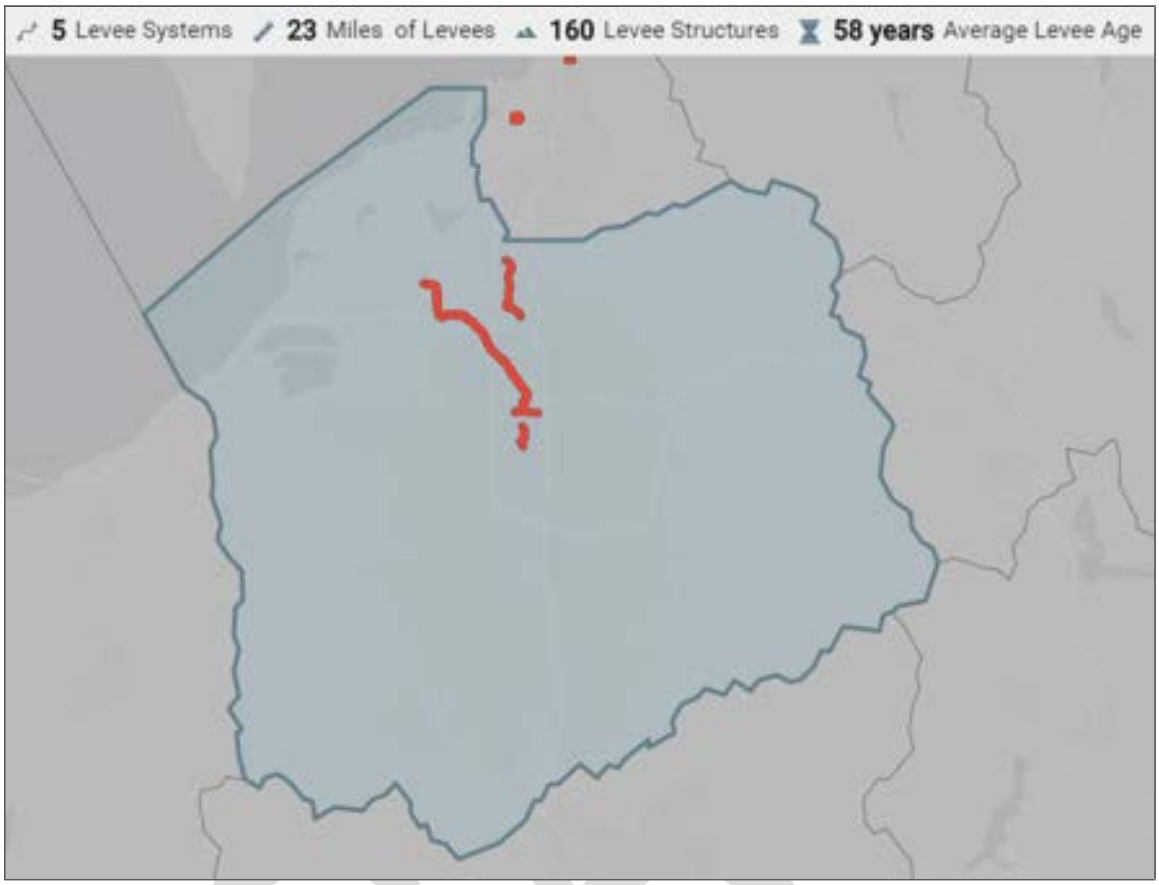

Figure 60: Levees in Salt Lake County[65]

Magnitude/Extent

The severity of a dam or levee failure depends on the area protected by the dam or levee, the volume and velocity of water that breaches the structure, and the structures and population in the protected area. A dam or levee breach will usually flood protected areas, generating impacts like those seen in areas in the floodplain and not generally protected by a levee. Table 25 provides dam failure classifications.

Table 25: Army Corps of Engineers Hazard Profile Classification

Hazard Category (a)	Direct Loss of Life (b)	Lifeline Losses (c)	Property Losses (d)	Environmental Losses (e)
Low	None (rural location, no permanent structures for human habitation)	No disruption of services (cosmetic or rapidly repairable damage)	Private agricultural lands, equipment, and isolated buildings	Minimal incremental damage
Significant	In rural locations, only transient or day-use facilities	Disruption of essential facilities and access	Major public and private facilities	Major mitigation required

[65] National Levee Database. 2024. https://levees.sec.usace.army.mil/search.

Hazard Category (a)	Direct Loss of Life (b)	Lifeline Losses (c)	Property Losses (d)	Environmental Losses (e)
High	Certain (one or more) extensive residential, commercial, or industrial development	Disruption of essential facilities and access	Extensive public and private facilities	Extensive mitigation cost or impossible to mitigate

- Categories are assigned to overall projects, not individual structures at a project.
- The loss of life potential is based on inundation mapping of the area downstream of the project. Analyses of loss of life potential should take into account the population at risk, time of flood wave travel, and warning time.
- Indirect threats to life caused by the interruption of lifeline services are due to project failures or operational disruption, such as the loss of critical medical facilities or access to them.
- Property losses include damage to project facilities and downstream property and indirect impacts due to the loss of project services, such as the loss of a dam and navigation pool or the loss of water or power supply.
- The environmental impact downstream is caused by the incremental flood wave produced by the project failure, beyond what would normally be expected for the magnitude flood event under which the failure occurs.

The hazard rating does not reflect the dam's condition or likelihood of failure; rather, it indicates the potential for loss of life or property damage from failure and should be prioritized for monitoring. Of the 72 dams in Salt Lake County, 28 are high hazard potential dams (HHPDs), meaning if they fail there is a high probability of loss of life and extensive property loss (see Table 26 for a breakdown of dam hazard ratings in Salt Lake County).

Table 26: Salt Lake County Dams by Hazard Rating

Low Hazard	Significant Hazard	High Hazard
10	34	28

The 2024 Utah Enhanced State Hazard Mitigation Plan provides an inventory of all high-hazard dams by county and owner type in Utah. In Salt Lake County, ownership of these high-hazard dams is distributed among local governments, private entities, public utilities, and the state (see Table 27).

Table 27: High-Hazard Dam Ownership in Salt Lake County

High-Hazard Dams	Local Government	Federal	Private	Public Utility	State
28	61%	–	36%	4%	–

Figure 61 shows dam failure rankings in Salt Lake County and the surrounding northern counties.

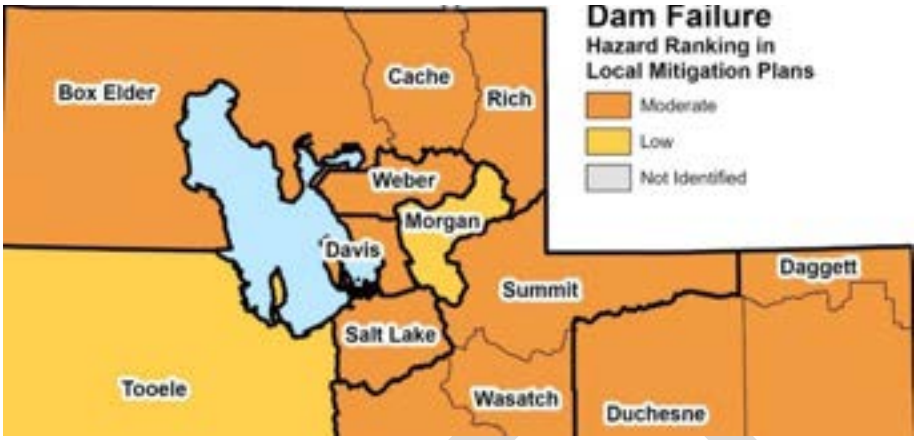

Figure 61: Map of Dam Failure Rankings for Salt Lake County and Surrounding Counties[66]

Table 28 provides a listing of all HHPDs in Salt Lake County with additional details about ownership, size, age, capacity, hazard classification, date of last inspection and whether an Emergency Action Plan (EAP) has been completed for each.

DAM SAFETY INSPECTION IN UTAH

The 2024 Utah Enhanced State Hazard Mitigation Plan declares that the Utah State Engineer has been charged with regulating non-federal dams since 1919. Utah started its Dam Safety Section in the 1970s in the State of Utah Engineer's Office to administer all non-federal dams in response to the Federal Dam Safety Act. In 1990, the legislature directed the State Engineer to regulate all dams in the state, including federally owned dams, except for those owned by the Bureau of Reclamation.

The frequency of dam inspection is designated based on the hazard rating: The Utah Division of Water Rights inspects high-hazard dams every year, moderate-hazard dams every two years, and low-hazard dams every five years.

Dams may be classified according to the type of construction material used, the methods employed in construction, the slope or cross-section of the dam, the way the dam resists the forces of the water pressure behind it, the means used for controlling seepage, the storage characteristics (on a watercourse, off-stream, above, or below ground level), and occasionally, their purpose. The materials used for building dams include earth, rock, tailings from mining or milling, concrete, masonry, and combinations.[68]

Dams may also have a safety condition rating assigned to them, based on a 4-tier scale. Table 29 provides descriptions of the safety condition ratings and a count of dams identified within each category in Salt Lake County. Three high hazard dams have been rated as "poor" and are also considered high hazard potential. These are Lake Mary-Phoebe, Red Pine, and Mountain Dell. Ten high hazard dams in Salt Lake County are rated "fair." The remaining 15 are considered "satisfactory." Most of the significant hazard dams do not have a condition rating, with the exception of one dam rated fair: Salt Lake County School Pond – 14.

Table 29: Dam Condition Rating Descriptions

Condition Rating	Definition	Dams in Salt Lake County
Satisfactory	No existing or potential dam safety deficiencies are recognized.	15
Fair	No existing dam safety deficiencies are recognized for normal loading conditions. Rare or extreme hydrologic and/or seismic events may result in a dam safety deficiency.	11
Poor	A dam safety deficiency is recognized for loading conditions that may realistically occur. Remedial action is necessary. Poor may also be used when uncertainties exist as to critical analysis parameters, which identify a potential dam safety deficiency. Further investigations and studies are necessary.	3
Unsatisfactory	A dam safety deficiency is recognized that requires immediate or emergency remedial action for problem resolution.	0
Not Rated or not available	A condition rating was not recorded or is otherwise unavailable	45

[68] Utah Hazard Mitigation. "Dam Failure." 2024. https://hazards.utah.gov/dam-failure/.

Historical Events and Probability of Future Occurrences

Based on the FEMA Disaster Declarations Database, Salt Lake County has received no designation for dam failure disaster declarations since the last plan update. No record was found of any historical dam failure incidents in Salt Lake County either; however, incidents have occurred in other parts of Utah, according to the 2024 Utah Enhanced State Hazard Mitigation Plan.

Dam failure incidents are infrequent and usually coincide with events that cause them, such as earthquakes, flooding, excessive rainfall, and snowmelt. There is a “residual risk” associated with dams and levee failures. Residual risk is the risk that remains after safeguards have been implemented. For dams and levees, the residual risk is correlated with events beyond those the facility was designed to withstand. However, the probability of any dam or levee failure in Salt Lake County is occasional in today’s regulatory environment.

Climate Change Considerations

Several recent and high-profile dam incidents related to an unexpected high runoff event have raised serious concerns about the impact of climate change on dam safety across the nation. More recently, evidence has mounted that climate change is making extreme weather events more frequent and extreme. The 2024 Utah Enhanced State Hazard Mitigation Plan[69] references studies that found climate change has already doubled the probability of an event sufficiently large enough to cause catastrophic flooding. In addition, changing the snow/rain regime could increase sudden runoff by another 200%–400%.

Extreme weather events, such as heavy rainfall and rapid melting of snowpack can become more frequent and intense as global temperatures rise. These events can lead to higher water inflows into reservoirs, which can exceed the capacity of dams, increasing pressure on the structure. Changes in precipitation patterns, along with more frequent severe storms, can cause erosion and sediment buildup around dam sites, potentially leading to dam failure.

Secondary Hazards

Dam failure can have a cascading impact on other hazards, including storms, seismic events, landslides, wildfires, and flooding. Given the relatively higher risk of an earthquake in Salt Lake County, this hazard is of particular concern for dams.

As mentioned previously, a dam failure can threaten downstream dams and may contribute to additional failures. If damage is caused to hazardous material storage facilities in the inundation zone, dam failure could also release hazardous materials.

Dam failure may cause extreme erosion along canyon waterways, resulting in steep, unstable slopes that may later be subject to landslides or other slope failure.

[69] Utah State Enhanced Mitigation Plan. 2024 https://hazards.utah.gov/state-of-utah-hazard-mitigation-plan/.

DRAFT

Vulnerability Assessment

Thirty-two dams in Salt Lake County have delineated dam failure inundation boundaries. This includes all but one of the high hazard dams: Juniper Canyon Detention Basin 3. These zones were used to determine potential exposure of community assets to dam failure. This includes a count of structures, population, and critical facilities within areas that may be flooded following a dam failure. This analysis does not account for depth or velocity of flooding, models of potential damage to structures based on construction or occupancy type, or estimated economic losses from flooding following a dam failure as used in the Hazus flood model.

Using the available dam inundation boundaries, and USA Structures building dataset from FEMA Geospatial Resource Center, an overlay analysis was conducted to determine which structures within Salt Lake County are potentially exposed to dam failure. Table 31 provides a count of structures that were identified within one or more inundation boundaries, grouped by jurisdiction. In addition, estimates of the number of people potentially affected by dam failure were also calculated using U.S. Census Bureau 2022 American Community Survey census block data (Table 32). For census blocks where only a portion overlaps a dam inundation boundary, a proportional percentage of the population of that block was included in the summarized population count.

For those dams that did not have dam inundation boundaries delineated, and for assets that were not included in the mapping analysis, a qualitative description of assets downstream of the dam and potential impacts was considered.

It should also be noted that there are limitations to the dam inundation boundaries. In addition to not having boundaries delineated for all dams, this dataset is based on hydraulic models that make assumptions regarding how water will flow following a failure, which may not capture all variables. Accuracy of input data, as well as changes in land use, soil characteristics, and other conditions, can affect the precision and accuracy of inundation maps. The nature of the dam breach is variable, and the size and cause of the breach can introduce uncertainty regarding the impacts. Although this analysis provides useful guidance for planning, it may not capture all potential vulnerabilities.

Table 30: Potential Dam Inundation Area in Salt Lake County[70]

Total Area	Potential Inundation Area	Potential Inundation Area Percent
805.18 sq mi.	38.67 sq mi.	4.80%

Using the list of critical facilities identified in the Community Profile, an overlay was also implemented to identify critical facilities that have potential exposure to dam failure. There are 73 critical facilities in the inundation boundaries of dams in Salt Lake County. A detailed breakdown of these facilities follows. Other city structures and government service facilities in the inundation areas also may be impacted, but these were not included in the mapping. Additional vulnerability is discussed within the jurisdictional annexes.

- **Three emergency operations centers (EOCs):** Bluffdale, South Salt Lake, and the Municipal Services District
- **Nine fire stations:** Murray Station #82, Bluffdale Station #91, Sandy Station #35, Salt Lake City Station #4, Salt Lake City Station #8, Salt Lake City Station #6, Salt Lake City Station #3, UFA Station #108, and South Salt Lake Station #42
- **Four hospitals:** Holy Cross Hospital Salt Lake, Holy Cross Hospital Jordan Valley, KPC Promise Hospital of Salt Lake, and Marian Center
- **Four police stations:** South Salt Lake Police Department, West Jordan Police Department, Bluffdale Police Department, and Granite School District Police Department
- **Fifty-two schools (count per city):** Bluffdale (1), Midvale (1), Murray (4), Riverton (2), Salt Lake City (36), Sandy City (3), and West Jordan (5)

DRAFT

- **Thirty-nine county facilities (count per city):** Cottonwood Heights (1), Holladay (2), Midvale (1), Murray (1), Riverton (1), Salt Lake City (13), unincorporated county (7), South Salt Lake (4), and West Jordan (9)

ESTIMATED IMPACT AND POTENTIAL LOSSES

The impact of dam failure hazards on people in Utah is similar to riverine flooding, but the potential magnitude and sudden onset of flooding can be especially catastrophic. Impacts range from death and physical harm to displacement and property damage to inconvenience. Homes, businesses, and other structures downstream of the failure can be damaged or destroyed. Road closures, congestion, and possible water supply and wastewater services loss are likely.

Dam failures can occur suddenly, but those downstream might have some warning to evacuate. Individuals living near or just downstream of dams, particularly in low-lying areas, are most vulnerable to dam failure and potential flooding. Homes may be damaged or destroyed, resulting in potential long-term displacement for residents. Some of these households may require public sheltering assistance.

Significant structural and infrastructural losses can result from a dam failure. Homes, businesses, and government service facilities can be damaged. Damage is often worst close to the dam site because of the volume and velocity of water released. Over 46,000 structures are located in potential inundation areas in Salt Lake County. Besides the costs of rebuilding structures, significant economic impacts are likely due to lost inventory or revenue during business closures. Employees may lose wages or experience long-term job loss, and financial hardship may exacerbate slow economic recovery. Businesses not directly impacted by a dam failure may incur losses due to transportation or other infrastructure interruptions or an inability for employees to return to work.

Besides the direct damage and loss of life that may occur from a dam or levee failure, there are many possible consequences for community assets. Disruption of a public water supply or wastewater treatment facility could lead to reduced water quality, water shortages, exposure to sewage, and other health hazards. Damage or disruption to major roads, railroads, power, communications, or other public utilities could delay vital services. Debris, sediment, and other material deposited following a dam failure can require extensive cleanup efforts. Natural environmental resources, such as wildlife habitat and recreation areas, can also be damaged. Historical structures and cultural resources such as community centers, recreation facilities, parks, and trails can also be damaged or destroyed. Community events and activities at these sites may be postponed or canceled.

Major transportation corridors that could be impacted include Little Cottonwood Canyon Rd, Big Cottonwood Canyon Rd, I-215 East Belt, I-80 through Parleys Canyon to the intersection with I-15, Bangerter Highway in the southern part of the county, Mountain View Corridor near Riverton and Herriman, and various segments of I-15. TRAX and FrontRunner lines are roughly parallel to the I-15 corridor and also may be affected. Other utility lines and infrastructure likely run along these transportation routes.

DRAFT

The Mitigation Planning Team identified additional significant community assets that may be impacted by dam failure. These include areas of particular concern, critical facilities, critical infrastructure, areas of future development, major employers, or economic sectors, cultural or historic facilities, and significant populations or natural resources. More detailed information on jurisdictional assets is presented in their individual annex in Volume 2.

VULNERABLE POPULATIONS

Individuals with access and functional needs, disabilities, elderly individuals, and those lacking access to reliable transportation might have difficulty evacuating even if given notice of a potential dam failure. Those who speak a language other than English might have difficulty understanding emergency alerts and the proper actions to take if a dam failure is imminent. Those with low household incomes might have significant difficulty finding alternative housing if displaced from their homes.

CHANGES IN DEVELOPMENT

Population growth has increased steadily in Salt Lake County, with an estimated 2.6% growth rate since 2020, according to the U.S. Census Bureau. Most of this growth has occurred in the south and western parts of the county, on the outer edges of urban growth. Since most of the significant and high hazard dams are in the central or eastern parts of the county, this growth has not increased the vulnerability of the county to dam failure.

Still, this growth puts a strain on emergency response systems, making it challenging to evacuate residents in a timely manner. Increased population density can also lead to many changes in land use, such as deforestation or urbanization, which can alter flow patterns and increase the likelihood of the overtopping of a dam or dam failure due to erosion.

According to the 2024 Utah Enhanced State Hazard Mitigation Plan, the largest concentration of high- and significant-hazard dams in the state is in the Wasatch Front counties, including Salt Lake County. The National Levee Database also maps 5 levee systems (160 levee structures) in the county. As the county's population grows and shifts, situations arise where development in areas downstream from dams causes the hazard potential for some of these structures to increase, such as from a significant hazard to a high hazard. The number of high-hazard dams should be monitored over time to determine whether this might be a trend. Localized changes in growth or development in parts of the county may indicate changes in vulnerability and are addressed in the jurisdictional annexes. The overall vulnerability to dam failure in the county has remained the same since the last plan update.

COMMUNITY LIFELINES

The 2024 Utah Enhanced State Hazard Mitigation Plan articulates that any and possibly all community lifelines will be impacted in the aftermath of a dam incident, such as a high-hazard dam failure. The immediate concern is for the safety and security of the people in inundation areas. It is reasonable to expect that access to food, water, shelter, and healthcare will be compromised for many people. Dam failures are notoriously destructive, and impacts on aboveground power distribution, if not generation, can be expected. The same can be said for transportation, especially due to damaged roadways and

railways. Cellular communications may fare better. Inundation zones are relatively narrow and elongated; thus, unaffected transmission towers may be able to service inundated areas. The release of hazardous materials is an area of uncertainty. What seems certain is widespread impact. Articulating precisely what these impacts mean and how to mitigate them is a difficult-to-fill knowledge gap.

VULNERABILITY SCORE

The NRI does not include data on the relative risk of dam failure.

DRAFT

Drought

Hazard Description

According to the National Integrated Drought Information System, drought is a deficiency of precipitation over an extended period, resulting in a water shortage for some activity, group, or environmental sector.[71] Although yearly variations in recorded precipitation are normal, a drought exceeds these norms, marked by significantly low precipitation for an extended period or over a large area. Although most natural hazards are sudden and cause immediate impacts, droughts begin gradually and can last for extended periods, often resulting in profound socioeconomic impacts. Figure 62 shows the effects of drought on the soil. [72]

Droughts can be categorized based on their unique characteristics and are often viewed as different phases of a single prolonged event (see Figure 63).

Figure 62: Effects of Drought on Soil

- **Meteorological Drought:** A measure of the departure of precipitation from normal for a particular location
- **Agricultural Drought:** Where the amount of moisture in the soil no longer meets the needs of a particular crop
- **Hydrological Drought:** When surface and subsurface water supplies are below normal

[71] Drought Basics. “Defining Drought.” https://www.drought.gov/what-is-drought/drought-basics.
[72] Photo credit: Underground Brittle Dry - Free photo on Pixabay.

- **Socioeconomic Drought:** Prolonged and severe dry conditions that impact sectors beyond the agricultural community, such as the community drinking supply and other social and economic enterprises

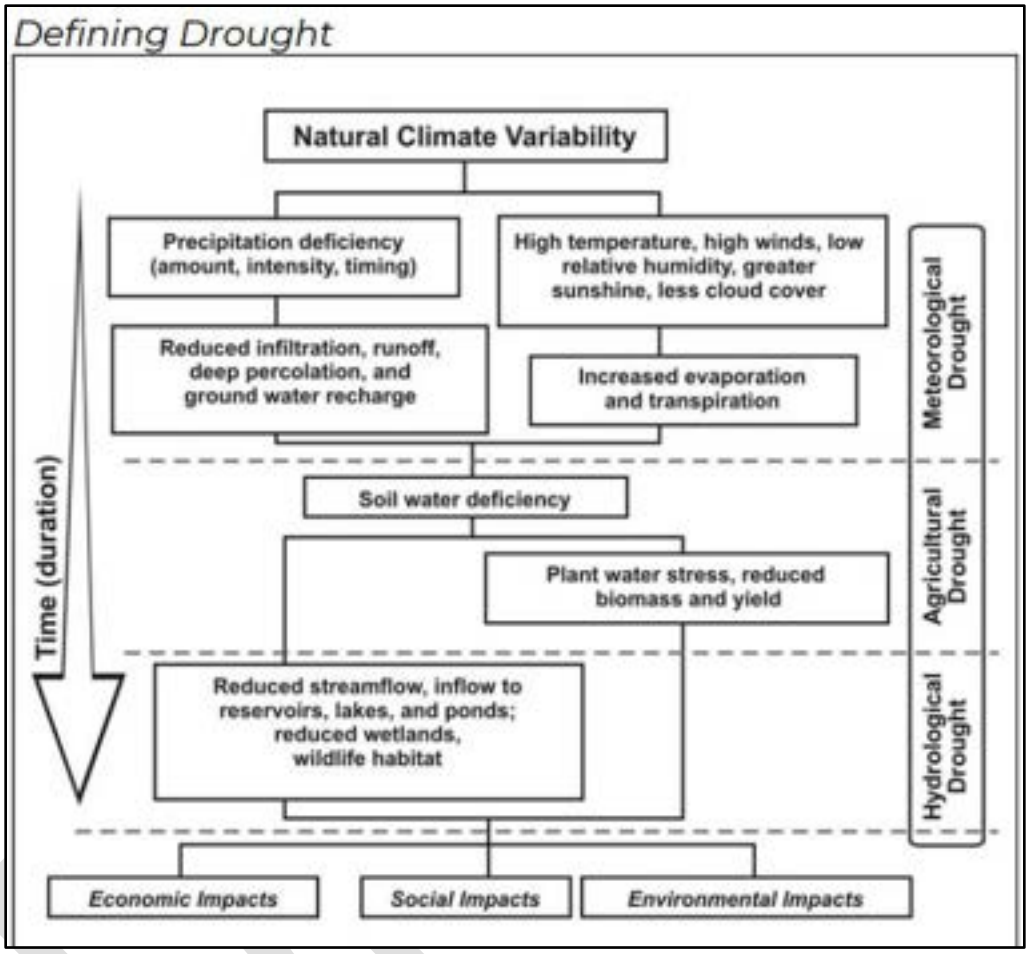

Figure 63: United States Drought Monitor Process for Defining Drought[73]

Hazard Profile

Although the agricultural community is usually the most heavily impacted by drought, extended droughts can also have direct and indirect impacts on economic, social, or environmental sectors. When drought begins to affect the general population, reservoirs, wells, and aquifers often reach low levels, necessitating conservation measures. These measures can include water-use restrictions, secondary water systems, water recycling, and xeriscaping. Additional conservation options include establishing emergency water agreements with neighboring water districts or transporting water from external sources (see Table 33).

[73] Utah Division of Water Resources. "Drought Response Plans: Triggers and Actions." June 28, 2022. https://water.utah.gov/wp-content/uploads/2022/07/Drought-Response-Plan-070822.pdf.

Table 33: Characteristics of Drought in Salt Lake County

Potential Impact		Catastrophic	**Probability**	X	Highly Likely
		Critical			Likely
	X	Limited			Occasional
		Negligible			Unlikely
Location	Countywide				
Seasonal Pattern	Impacts typically noticeable in summer, conditions can be year-round				
Conditions	Meteorological Drought: Lack of precipitation Agricultural Drought: Lack of water for crop production Hydrologic Drought: Lack of water in the overall water supply Socioeconomic Drought: Lack of water sufficient to support the population				
Duration	Months, years				
Secondary Hazards	Wildfires, dust storms, air quality				
Analysis Used	National Weather Service, Utah Climate Center, Utah Division of Water Resources, newspapers, local input				

Magnitude/Extent

The United States Drought Monitor provides a map that identifies drought-affected areas and classifies them by intensity, ranging from D1 (least intense) to D4 (most intense) (see Table 34). Drought is defined as a moisture deficit severe enough to have social, environmental, or economic effects. D0 areas are not in drought but are experiencing abnormally dry conditions that could develop into drought or are still recovering from a past drought and are not yet back to normal.

The Palmer Drought Severity Index (PDSI), developed by Wayne Palmer in 1965, measures drought severity based on temperature, precipitation, and soil moisture (Utah Division of Water Resources 2007a). The PDSI is considered the “semi-official” drought index due to its standardization across various climates. It uses zero to represent normal conditions, with values ranging from 6 to −6 (see Table 35). Negative numbers indicate dry periods, while positive numbers represent wet periods.

DRAFT

Table 34: Drought Classification[74]

			Ranges				
Category	Description	Possible Impacts	Palmer Drought Severity Index (PDSI)	CPC Soil Moisture Model (Percentiles)	USGS Weekly Streamflow (Percentiles)	Standardized Precipitation Index (SPI)	Objective Drought Indicator Blends (Percentiles)
D0	Abnormally Dry	Going into drought: • short-term dryness slowing planting, growth of crops or pastures Coming out of drought: • some lingering water deficits • pastures or crops not fully recovered	-1.0 to -1.9	21 to 30	21 to 30	-0.5 to -0.7	21 to 30
D1	Moderate Drought	• Some damage to crops, pastures • Streams, reservoirs, or wells low, some water shortages developing or imminent • Voluntary water-use restrictions requested	-2.0 to -2.9	11 to 20	11 to 20	-0.8 to -1.2	11 to 20
D2	Severe Drought	• Crop or pasture losses likely • Water shortages common • Water restrictions imposed	-3.0 to -3.9	6 to 10	6 to 10	-1.3 to -1.5	6 to 10
D3	Extreme Drought	• Major crop/pasture losses • Widespread water shortages or restrictions	-4.0 to -4.9	3 to 5	3 to 5	-1.6 to -1.9	3 to 5
D4	Exceptional Drought	• Exceptional and widespread crop/pasture losses • Shortages of water in reservoirs, streams, and wells creating water emergencies	-5.0 or less	0 to 2	0 to 2	-2.0 or less	0 to 2

Table 35: Palmer Drought Severity Index Classification and Range

Range	Palmer Classification
4.0 or higher	Extremely Wet
3.0 to 3.99	Very Wet
2.0 to 2.99	Moderately Wet
1.0 to 1.99	Slightly Wet
0.5 to 0.99	Incipient Wet Spell
0.49 to −0.49	Near Normal
−0.5 to −0.99	Incipient Dry Spell
−1.0 to −1.99	Mild Drought
−2.0 to −2.99	Moderate Drought
−3.0 to −3.99	Severe Drought
−4.0 or lower	Extreme Drought

Location

Utah is the second driest state in the United States, and drought has a significant impact on the region. The lack of water affects agriculture and industry, limiting economic activity and reducing the availability of water for irrigation and culinary purposes. Severe drought leads to the depletion of agricultural lands and soil deterioration. In the Wasatch Front Region, the risk of drought is particularly high.

[74] National Drought Mitigation Center, U.S. Drought Monitor. “Drought Classification.” 2024. https://droughtmonitor.unl.edu/About/AbouttheData/DroughtClassification.aspx.

Salt Lake County falls in two climatic regions: the North Central Region and the Northern Mountains Region. Although the two regions exhibit distinct characteristics, they often experience similar drought periods, experiencing mild drought (PDSI ≥ −1) every 2.6–3.3 years, moderate drought (PDSI ≥ −2) every 3.7–5.2 years, and severe drought (PDSI ≥ −3) every 6.9–8.5 years. The Northern Mountain Region typically experiences droughts less frequently (Utah Division of Water Resources 2007a). The Northern Mountain Region experiences more severe drought conditions at its peak than the Western Region. This may be because the Northern Mountains Region simply has more water to lose, as the Wasatch and Uinta Mountains receive significantly more precipitation on average. Figure 64 depicts a recent snapshot of the extent of drought in the State of Utah. Figure 65 shows a time series of drought conditions for Salt Lake County since January 2000. Extreme and exceptional drought conditions occurred from 2021 to 2023.

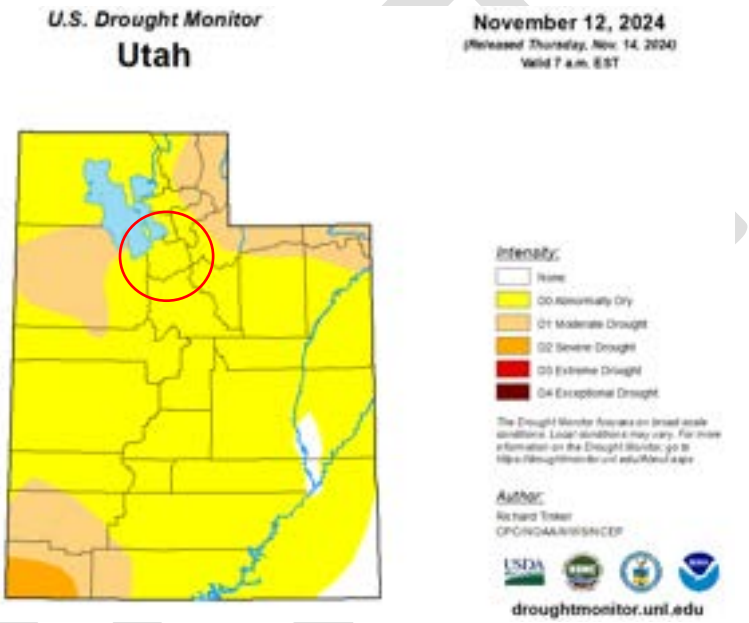

Figure 64: U.S. Drought Monitor Categories for the State of Utah, November 2024

Figure 66 shows precipitation between October 17, 2024, and December 13, 2024, as a percentage of the historical average (1991–2020) for the same period. Green/blue shades indicate higher than normal precipitation, while brown shades indicate lower than normal precipitation.

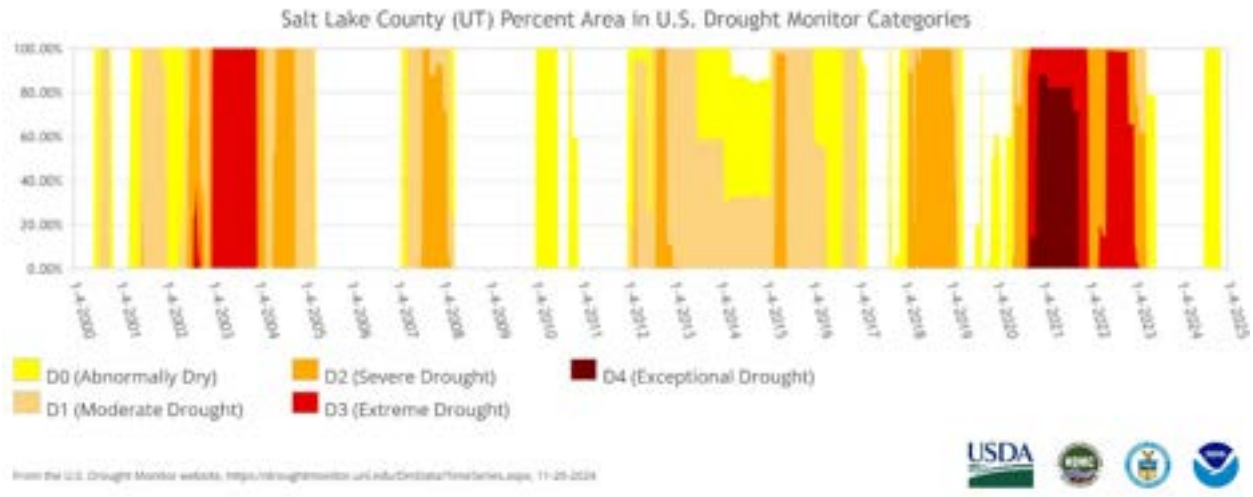

Figure 65: Percent of Salt Lake County in Drought Monitor Categories, 2000–2024

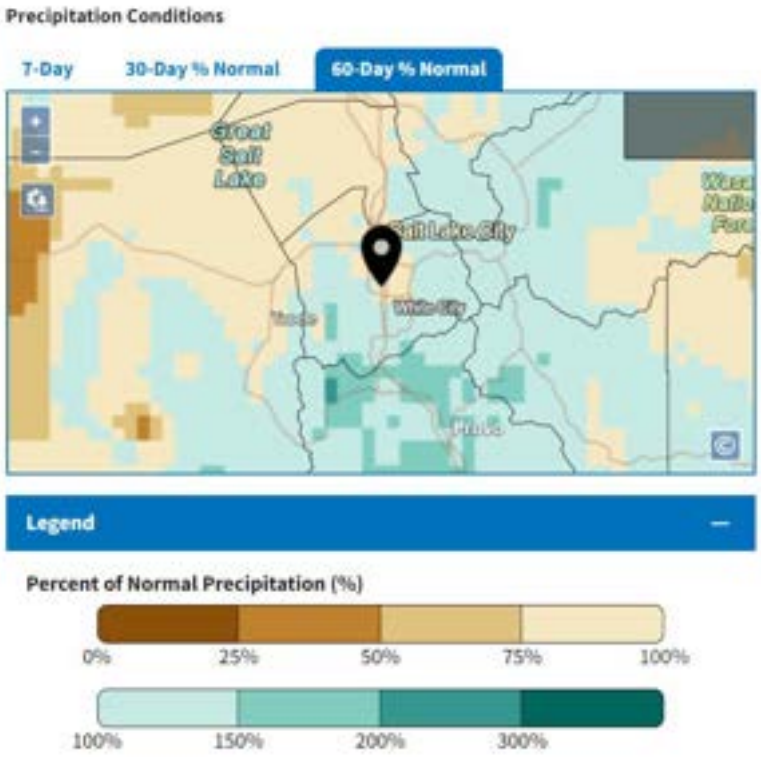

Figure 66: Precipitation for October–December 2024 Compared with the 60-Day Percentage of Normal Precipitation, 1991–2020[75]

[75] NOAA, National Integrated Drought Information System. "Drought Conditions for Salt Lake County." Drought.gov. 2024. https://www.drought.gov/states/utah/county/salt%20lake.

Historical Events and Probability of Future Occurrences

Based on the FEMA Disaster Declarations Database, Salt Lake County has received no designation for drought Disaster Declarations since the last plan update. However, Governor Spencer Cox issued an Executive Order declaring a State of Emergency due to drought on March 17, 2021, and again on April 21, 2022, due to drought conditions affecting the entire state. Since 2019, 14 USDA drought-related Disaster Declarations have been recorded for Salt Lake County.[76]

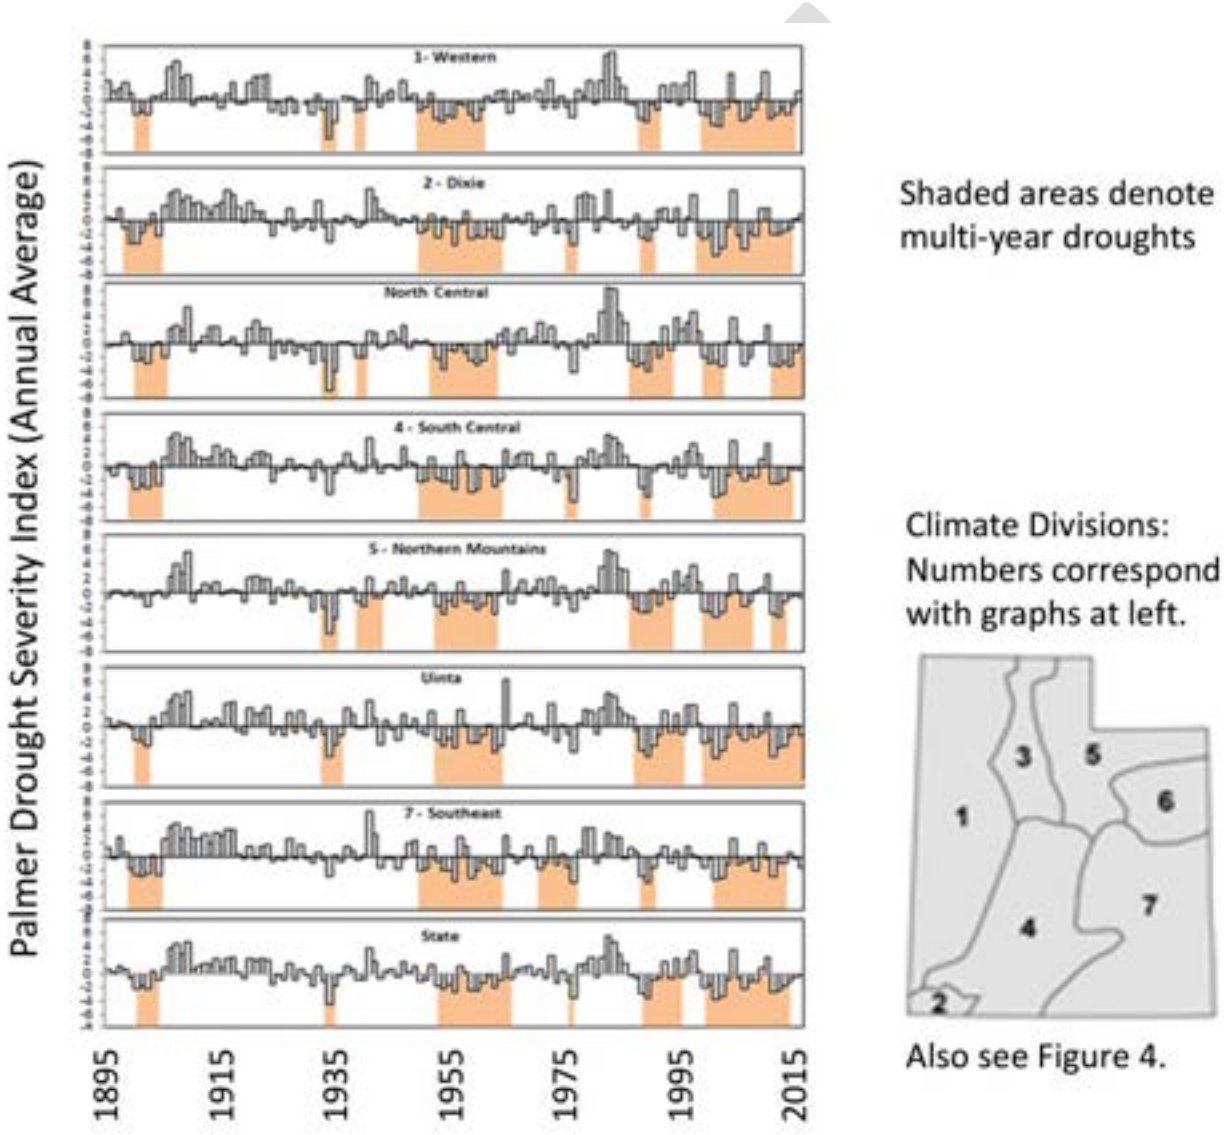

Figure 67: Palmer Drought Severity Index by Region[77]

Figure 67 provides a historical reference for multiyear droughts since 1895. The most severe drought in history for the North Central and Northern Mountains Regions occurred in 1934, during the height of the

[76] U.S. Department of Agriculture, Farm Service Agency. "Disaster Designation Information." https://www.fsa.usda.gov/resources/disaster-assistance-program/disaster-designation-information.
[77] Utah Hazard Mitigation, Utah Department of Public Safety. "Utah Enhanced State Mitigation Plan 2024." https://hazards.utah.gov/state-of-utah-hazard-mitigation-plan/.

Great Depression and coinciding with the same drought period (1930–1936) that caused the "Dust Bowl" on the Great Plains. The longest drought period ranged from 11 years for the North Central region (1953–1963) to 6 years for the Northern Mountains, which occurred twice, from 1900 to 1905 and from 1987 to 1992 (Utah Division of Water Resources 2007a). In 2018, a severe drought plunged virtually the entire state into moderate drought, with many areas in extreme drought. This drought peaked in September 2018 and reached −6.16 on the PDSI scale.

Droughts and water shortages will undoubtedly remain a significant concern for Salt Lake County in the future, particularly with the increasing public demand for water. The expected doubling of the population over the next 20 years makes water shortages a virtual certainty. New zoning ordinances, like the use of secondary water for irrigation and mandatory no watering days, are already in force.

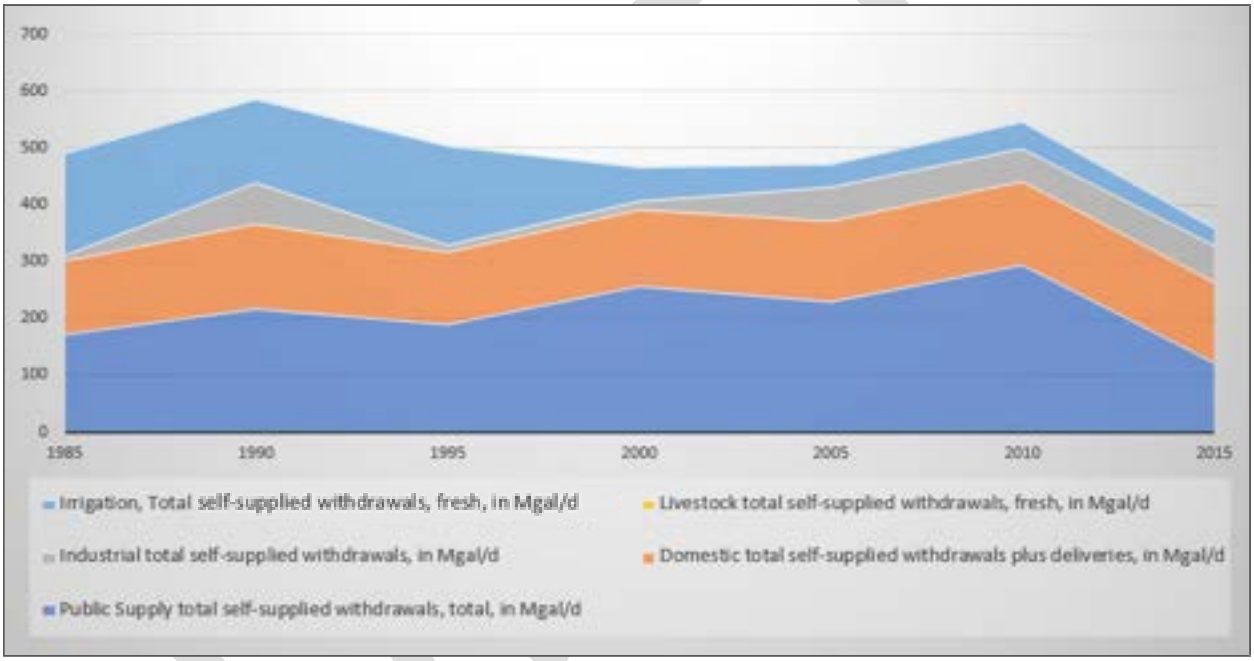

Figure 68: Annual Water Use by Category for Salt Lake County (Based on USGS data)[78]

2015	123.69	141.33	65.82	0.09	28.77

Salt Lake Valley is a largely urban area with a growing population. Most of its development uses municipal water sources, principally wells completed in the basin-fill aquifer system. The population growth and concomitant increase in municipal groundwater pumping could significantly decrease the amount of groundwater discharged from the principal aquifer system (where most wells are completed) to the shallow unconfined aquifer system.

The shallow unconfined aquifer overlies confining beds above the principal aquifer system in the central and northern parts of the valley and provides water to springs and approximately 58,000 acres (23,500 hm2) of wetlands in groundwater discharge areas. Decreased recharge to the shallow unconfined aquifer from the principal aquifer due to increased groundwater pumping could reduce water supply to these springs and wetlands. In addition, water supply to the springs and wetlands is affected by climatic conditions and the level of the Great Salt Lake. Drought conditions from 1999 to 2004 reduced groundwater aquifer recharge across the state, including in the Great Salt Lake area, which negatively impacted the Salt Lake Valley wetlands. In 2005 and 2008, the water levels of the Great Salt Lake dropped close to the historic low reached in 1963, causing some parts of the Salt Lake Valley wetlands to dry up.

To evaluate the potential impacts of drought and increased development on the Salt Lake Valley wetlands, researchers used existing data to estimate a water budget and develop regional, three-dimensional, steady-state, and transient MODFLOW models to evaluate changes in the water budgets for wetland areas. These efforts focused on wetlands around the margins of the Great Salt Lake, although the results may apply to all the wetlands in Salt Lake Valley. The modeling suggests that subsurface inflow into the wetland areas would be most affected by decreased subsurface inflow due to long-term (20-year) drought conditions. This decline would also cause changes in Great Salt Lake levels, with subsurface inflow also decreasing due to higher municipal and industrial well withdrawals over the same period. Therefore, the worst-case scenario for the wetlands would be a combination of those conditions. To meet the goal of the U.S. Environmental Protection Agency (EPA) of no net loss of wetlands, the Salt

DRAFT

Lake Valley wetland areas must be managed to maintain their current water budget, estimated at 52,420 acre-feet per year (65 hm3/yr) of recharge in 2010.[80]

The 2012–2016 drought, although less severe, impacted much of the state for 4 straight years. Another drought from 2018–2019 was short-lived but felt across the entire state.

From 2019 to 2023, Utah experienced a statewide record for dryness and warmth. The driest year on record was 2020, and by the end of the year, 90% of the state was in extreme or exceptional drought. Dry conditions since 2000 have resulted in record-low water levels in the Great Salt Lake. The most intense period of drought since 2000 occurred the week of January 26, 2021, where 69.99% of Utah land was categorized as D4.[81]

The drought that began in 2020 has broken many records for its severity, drawing attention not only from Utah's water managers but also the Governor, State Legislature, and the community at large. Drought conditions remained significant through the beginning of 2022, and the drought's impacts continue to be of grave concern.[82]

Figure 69 shows forecasts for total precipitation (left image) and abnormal precipitation (right image) from December 2023 to February 2024 in the Western United States.[83] The map legend indicates that Utah's total precipitation for the observed time frame was between 0 and 10 inches, with abnormal precipitation at 0–2 inches.

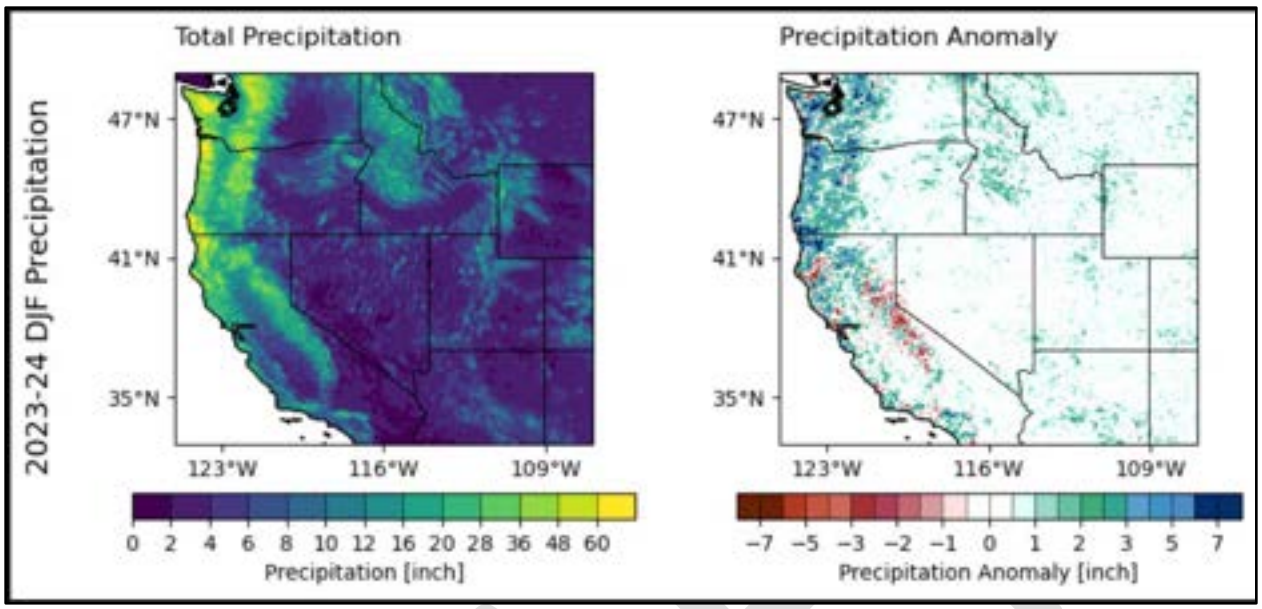

Figure 69: Seasonal Drought Forecast for the Intermountain West, 2023–2024[84]

The National Risk Index reports a frequency of 39.2 events annually for Salt Lake County. Based on these records, probability of future occurrences is highly likely.

Climate Change Considerations

Utah is unique in the amount of natural precipitation it receives. Because drought is an ever-present threat, resilience must be built into planning. Climate change has caused the state to become warmer and drier, highlighting the need to identify areas for improvement to better respond to the challenges and unmet needs caused by drought conditions.[85]

In Salt Lake County, climate change can have a significant impact on the natural hazard of drought. Rising temperatures and shifting precipitation patterns can lead to more frequent and severe droughts in the area. Average temperatures in Utah can rise and reduce snowpack and cause earlier snowmelt—further impacting the availability of water during the year. Higher temperatures can also cause more rain than snow to fall, further reducing the snowpack that many communities may rely on for water.

According to the 2024 Utah Enhanced Hazard Mitigation Plan[86] statement on climate, higher temperatures caused by climate change are expected to exacerbate drought conditions. Estimates of additional temperature changes by 2100 vary, largely depending on global emissions of greenhouse gases. However, temperature increases driven by climate change will almost certainly continue, along with the associated intensification of drought conditions. The Climate Mapping for Resilience and

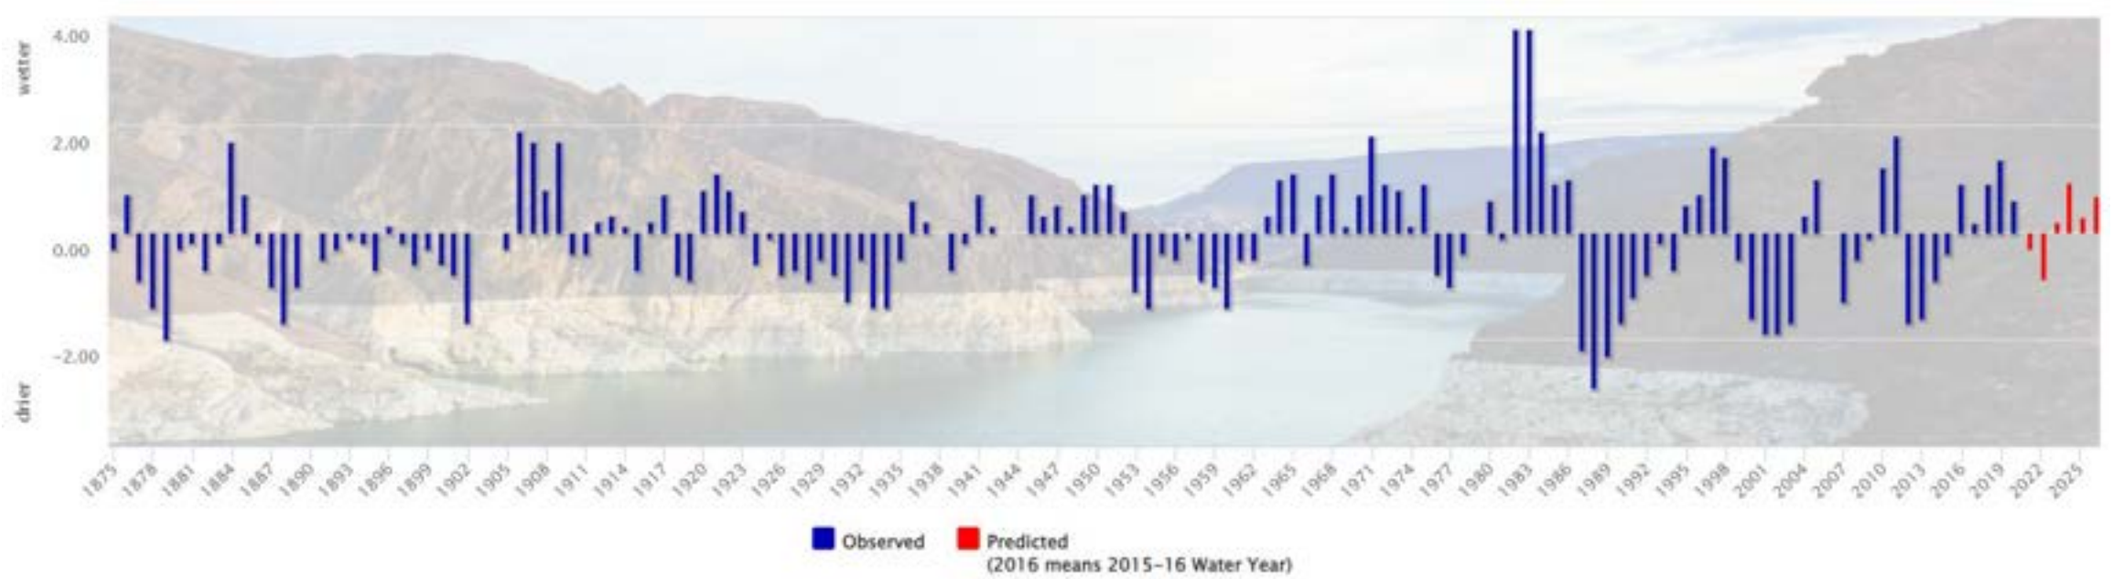

Figure 72: Climate Variability and Prediction for Northern Utah[90]

[90] Ibid.

Secondary Hazards

Wildfires are the most common secondary hazard associated with drought. Prolonged lack of precipitation dries out vegetation, making it increasingly susceptible to ignition and fueling more extreme fire behavior as drought conditions persist. This vulnerability also extends to crops. Loss of forests and trees exacerbates erosion, leading to heavy silting of streams, reservoirs, and rivers, which causes severe damage to aquatic life, irrigation, and power development. Droughts can also create optimal conditions for dust storms, significantly reducing air quality for both humans and animals. Low stream flows can lead to higher temperatures, oxygen depletion, disease, and loss of spawning areas for fish resources. Drought is often accompanied by extreme heat. Temperatures of 90ºF and higher increase the risk of sunstroke, heat cramps, and heat exhaustion in humans and heat-related injuries in pets and livestock.

The Great Salt Lake, partially in the northwest corner of the county, is a significant regional natural, economic, and cultural resource. The lake has lost over half its volume since the 1980s due to prolonged droughts along with variations in precipitation and water consumption. As more of the lakebed is exposed, severe dust storms and reduced air quality become more likely. Contaminants in the soil that may become airborne could also pose health risks to the populations of nearby cities.

Lower water levels in lakes and reservoirs can degrade water quality and promote the growth of harmful cyanobacteria, or algal blooms, which can be lethal to pets and pose health risks to humans.

Vulnerability Assessment

Droughts can have wide-ranging impacts that may affect large areas and cross jurisdictional boundaries. Droughts can last anywhere from a few weeks to several years, with impacts primarily experienced as water shortages and agriculture-related losses. More specifically, droughts can reduce municipal water supplies, lower agricultural yields, damage natural resources and wildlife habitat, and limit recreation opportunities. It is a hazard that can affect all populations, structures, and infrastructure.

Water is a critical resource for everyday household use, including drinking, cooking, and cleaning. It is also critical for day-to-day business operations in manufacturing and agriculture. Drought can lead to water supply shortages for various community activities, resulting in use restrictions or higher costs. These shortages may disproportionately affect low-income households, making it harder for them to afford the increased water expenses.

The 2024 Utah State Hazard Mitigation Plan conducted drought vulnerability rankings for each county in the state, based on local hazard mitigation plans (LHMPs). Each LHMP was reviewed to gather data on how each jurisdiction viewed their vulnerability to drought. The frequencies and severities of drought as reported in the LHMPs were gathered to establish a drought hazard ranking. This ranking is based on a combination of severity and probability/frequency, both categorized from 0 to 4. The numbers were then combined to calculate a ranking from 0 to 8. The map in Figure 73 shows the drought hazard ranking for each county as reported in the LHMPs.

DRAFT

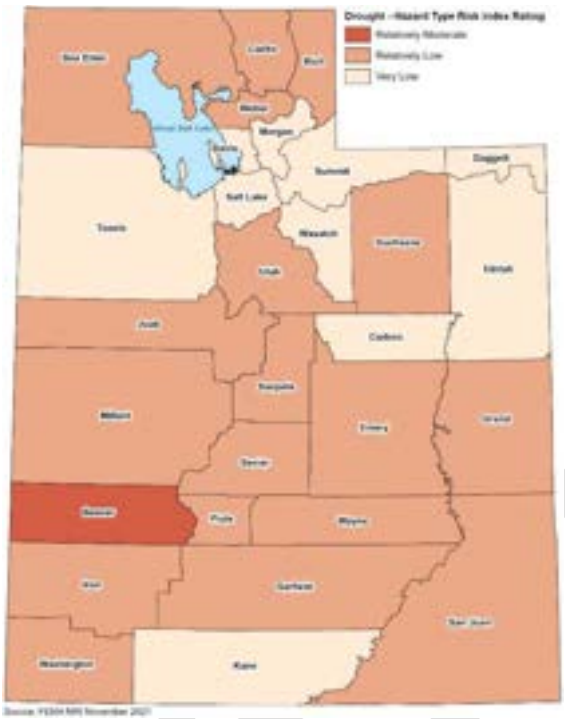

Figure 73: Risk Index Rating for Drought for Utah Counties

Table 37 lists the agriculture statistics for Salt Lake County from the 2023 Agriculture Census, the most current agriculture census data available.

Table 37: Salt Lake County Agricultural Statistics[91]

Farms	Total Acres	Market Value of Products Sold	Estimated Market Value of Land and Buildings (Average per Farm)
592	61,965	24,102,000	1,013,467

The 2019 Utah State Hazard Mitigation Plan also lists 1,463 state-owned facilities in Salt Lake County that are vulnerable to the effects of drought, with an insured value of $7,274,528,270.

ESTIMATED IMPACT AND POTENTIAL LOSSES

Population growth and land use can significantly impact drought conditions by placing a strain on water resources. The demand for water rises as the population increases, which can lead to the over-extraction of water from aquifers, rivers, and lakes. This can exacerbate drought conditions, especially when water is already scarce. Urbanization and agricultural expansion also can place a strain on water reservoirs

[91] National Agricultural Statistics Service Mountain Region, Utah Field Office. "2023 Utah Agricultural Statistics." USDA National Agricultural Statistics Service.gov. https://www.nass.usda.gov/Statistics_by_State/Utah/Publications/Annual_Statistical_Bulletin/2023-Agricultural-Statistics.pdf.

while reducing the natural capacity to retain water, further intensifying drought conditions. Residents and businesses could be affected by water shortages, restrictions, or increases in costs for water.

Drought is unpredictable, making it challenging to identify the areas most threatened and provide loss estimate values. However, historical drought records demonstrate that agriculture is typically the economic sector most impacted by drought. These losses can have repercussions throughout the county and neighboring jurisdictions. For example, the agriculture sector was the hardest hit during the 2002 drought, suffering a loss of 6,110 jobs and almost $120 million in income statewide. It also caused an estimated $100 million drop in livestock sales and $50 million in hay sales. Drought-related fires are thought to have contributed to the $50 million drop in tourism sales. The combined effects of the drought in these three sectors resulted in a loss of over 6,100 jobs and $120 million in income during 2002. Construction, manufacturing, and wholesale trade also were impacted by drought. In its drought report, the Utah Division of Water Resources notes that significant data gaps hinder the quantification of drought impacts in all sectors of the economy and society. It recommends monitoring tax revenues and other economic indicators at all levels of government to improve evaluation methods and gain a clearer understanding of drought impacts.

Drought can also affect local economies by reducing recreation opportunities. Lower stream level flows and declining reservoir and lake levels may limit access to recreation sites, while some have been closed entirely due to algal blooms. Changes in the appearance quality of recreation sites also may decrease demand, leading to fewer visitors and resulting in economic losses for tourism and recreation-related industries. The Great Salt Lake contributes to lake effect snow, which influences snow levels at Utah ski resorts. The lake's reduction in size may limit this lake effect, potentially reducing the snowpack in the nearby mountains. This could lead to less desirable ski conditions, resulting in a significant economic impact on these winter recreation sites.

Drought does not typically damage structures, critical facilities, or infrastructure; however, during severe or prolonged drought, soil may contract due to decreased soil moisture. This contraction could damage structural foundations or building walls.

Many natural systems can be negatively impacted by drought. It can cause higher concentrations of pollutants or other contaminants in water or increased nutrient concentrations and turbidity in the water supply. Algal levels also may increase, and when combined with warm temperatures, this can cause dangerous algal blooms. Reduced water supply and poor water quality also harm habitats for fish and other wildlife. Grass, trees, and other vegetation can dry out, which further alters ecosystems. Drier vegetation also poses wildfire risks, including ignition risk and rate of spread. Drought can also cause soil erosion and contribute to dust storms.

The NRI includes data on the EALs to individual natural hazards, historical loss, and overall risk at a county and census tract level. Salt Lake County's NRI EAL value for drought is $19 million, with a risk score of 40.6 and a rating of Very Low percentile compared with the rest of the United States (Figure 74). This low rating can likely be attributed to relatively low amounts of agricultural production in Salt Lake County, which is typically the source of most drought losses.

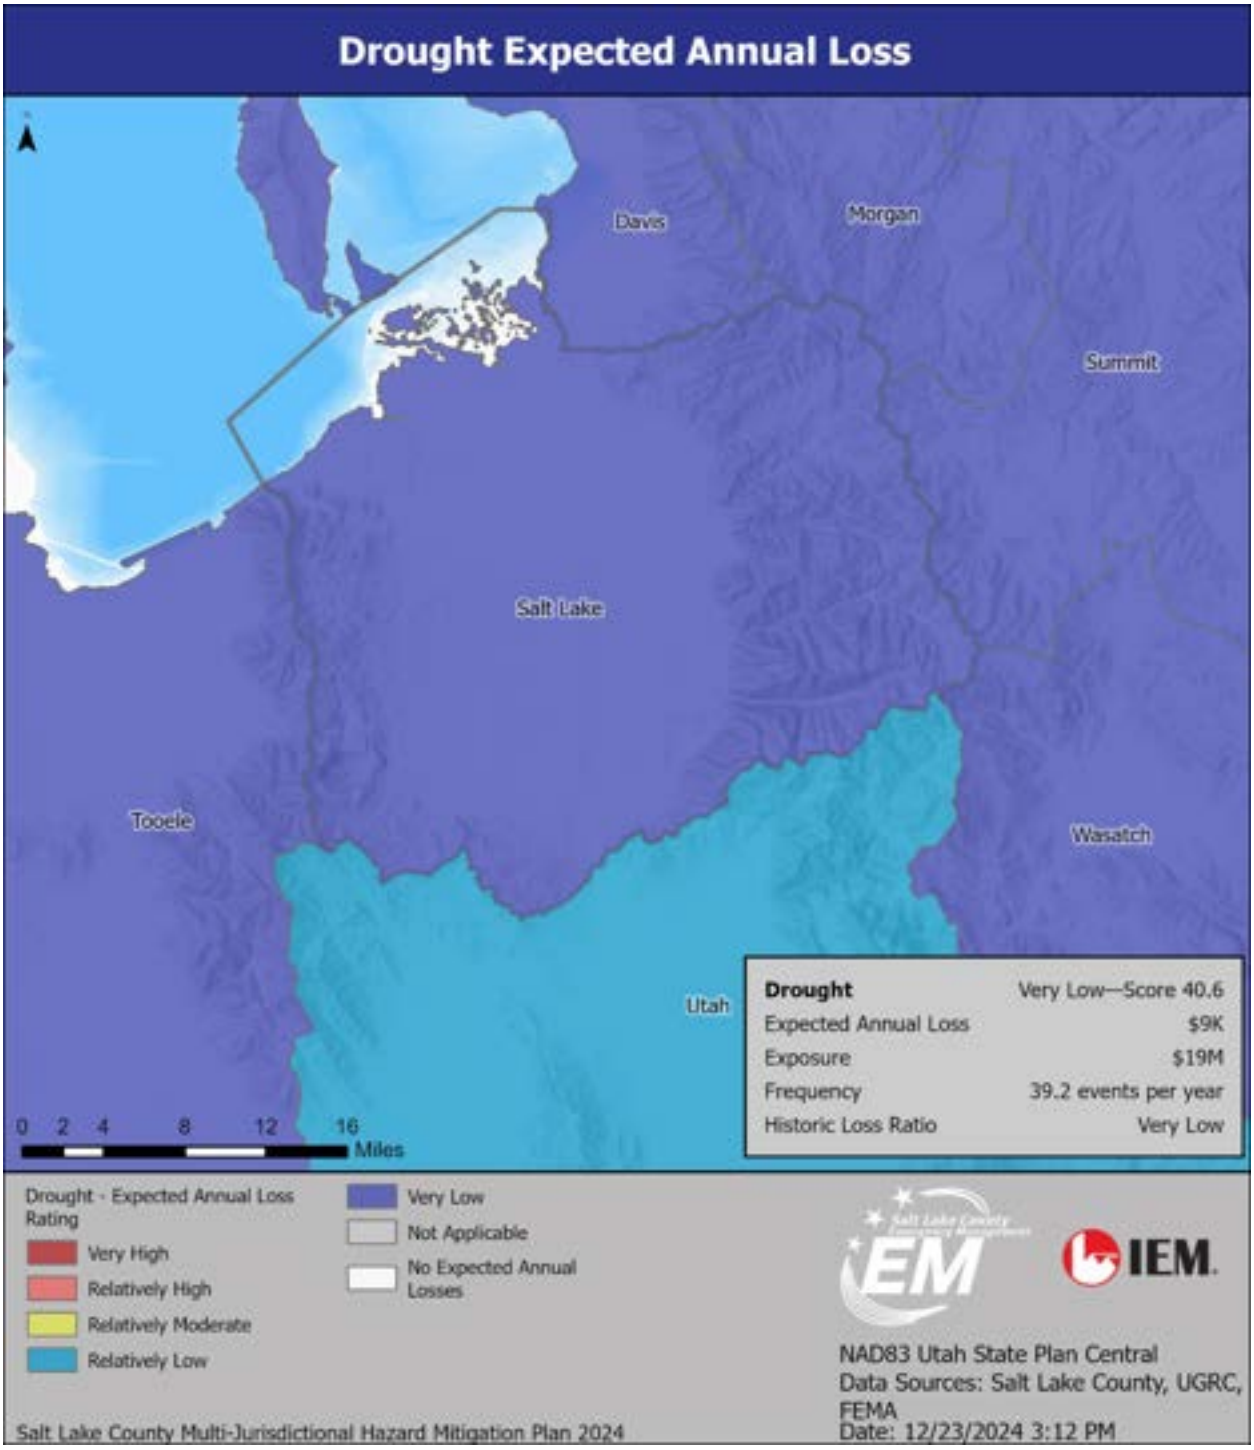

Figure 74: National Risk Index Expected Annual Loss from Drought in Salt Lake County[92]

[92] FEMA, National Risk Index. "Salt Lake County Expected Annual Loss Drought Risk Score, Map and Legend." https://hazards.fema.gov/nri/map.

VULNERABLE POPULATIONS

Drought can impact both surface water and groundwater availability and can have direct, disastrous effects on human populations. The indirect consequences of drought—such as unemployment, lower tax revenues, higher food prices, reduced outdoor recreation opportunities, higher energy costs as water levels in reservoirs decrease and consumption increases, and water rationing—are often not fully known. This complex web of impacts can affect people and economies well beyond the area physically experiencing drought. These impacts may be more significant for some populations, such as lower-income households who may be more strained by increased costs and economic losses. Individuals with underlying health conditions, the elderly, young children, and other medically vulnerable individuals may be more affected by drought-related poor air quality conditions and dust storms.

During a drought, all living organisms, including humans, animals, and crops, require access to essential resources like food, water, and shelter to survive and thrive. Without them, they become stressed and eventually die. Drought also affects shelter, as soil contractions can lead to structural damage in buildings, bridges, and other infrastructure.

COMMUNITY LIFELINES

The main lifelines for drought are food, hydration, shelter, and water systems. Crops and animals require water to thrive and grow; without it, they become stressed and ultimately die. Shelter is also affected, as drought can severely damage structural integrity as the soil pulls away from beams, buildings, bridges, and other structures. Mitigating future droughts will require conservation, creative solutions, and innovation to maintain the standard of living Salt Lake County has come to rely on.

CHANGES IN DEVELOPMENT

Experts agree that a long-term drought strategy is essential to securing Utah's water future, as water demand will continue to rise with population growth. Coupled with climate change, which acts as a magnifier, droughts can become more unpredictable and prolonged. The long-term record of reservoir levels, precipitation inputs, and projected population growth raises growing concerns about Utah's water supply, as shrinking resources face increased demand. In the last five years, Salt Lake County has seen 2.6% growth in population and significant residential and commercial development. New people and businesses put pressure on Salt Lake County's water supply on the demand side, but the county is also facing pressure on the supply side with state reservoirs reflecting wet and dry cycles. Although these fluctuations affect long-term water security and availability, residents may soon face mandatory water conservation measures, highlighting the growing vulnerability to drought.[93]

Potential impacts on the county include a decline in agriculture-related economic opportunities, food scarcity, loss of life or property, and worsened air quality. Changes in population patterns may occur as

[93] Jensen, Marcus. "State Climate Officer Explains the Winter Snow Surge and What it Means for Utah's Water Future." Utah State University, Utah State Today. January 17, 2023. https://www.usu.edu/today/story/?story=state-climate-officer-explains-the-winter-snow-surge-and-what-it-means-for-utahs-water-future.

people relocate seeking improved economic opportunities and quality of life. Changes in land use and development may also lead to changes in agriculture zoning.

VULNERABILITY SCORE

To analyze the county's vulnerability to drought, the NRI was used as a primary tool during the 2024 Hazard Identification and Risk Assessment (HIRA) update. The NRI defines risk as the potential for negative impacts from a natural hazard. It determines a community's risk relative to other communities by examining the EAL and social vulnerability in a given community in relation to that community's resilience. As shown in Figure 75, Salt Lake County has a very low NRI drought risk rating, with a risk score of 36.9.

DRAFT

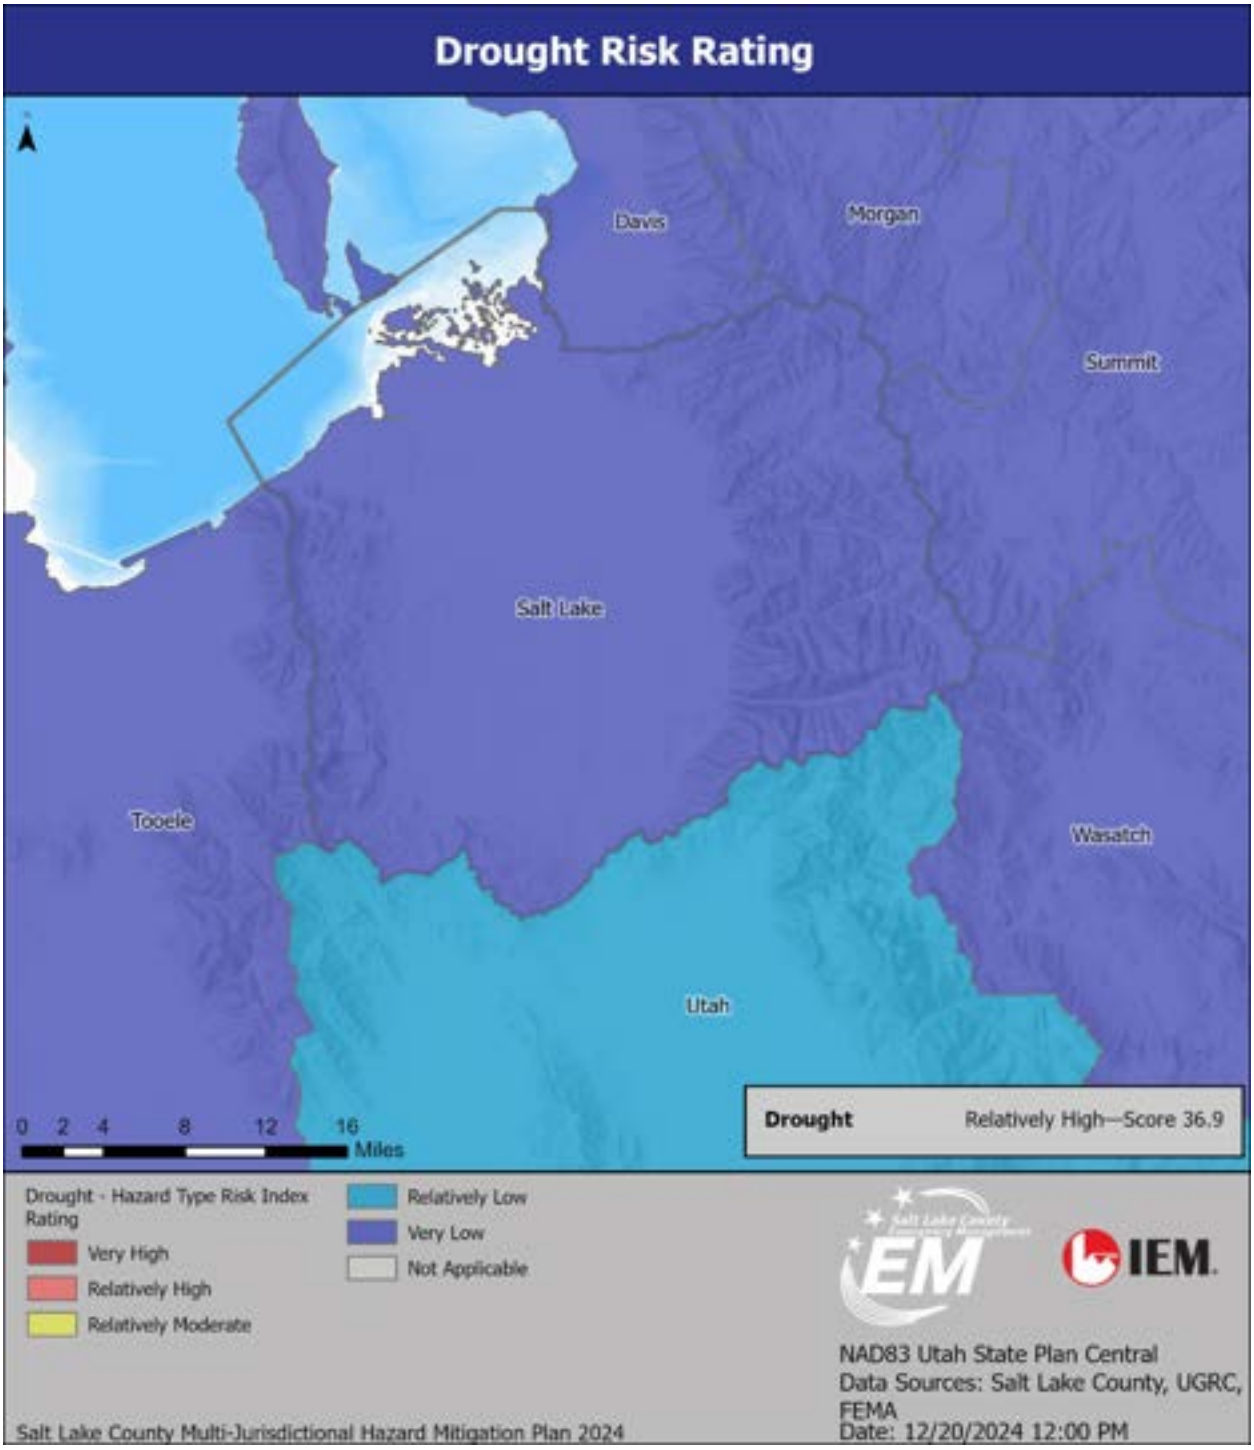

Figure 75: National Risk Index Drought Risk Map, Legend, and Score for Salt Lake County[94]

Earthquake

Hazard Description

The Utah Geologic Survey defines an earthquake as the abrupt, rapid shaking of the earth caused by sudden breakage of rocks that can no longer withstand the stresses building up deep beneath the Earth's surface. The rocks break along zones of weakness, called faults. Seismic waves are then transmitted outward, causing further ground shaking or vibrations.

The Richter scale measures the magnitude of earthquakes on a seismograph. Generally, an earthquake must be at least a magnitude 2.0 to be felt by humans, and about magnitude 5.5 before significant damage occurs. The amount of damage from an earthquake depends on soil type, rock type, groundwater depth, and topography. Other factors include the type of construction in an area and the population density. Figure 77[95] shows the effects of an earthquake on a market in the city of Magna.

Figure 76: Effects of the 2020 Magna Earthquake

GROUND SHAKING

Ground shaking is caused by the passage of seismic waves generated by an earthquake. Shaking can vary in intensity but is the greatest secondary hazard because it affects large areas and stimulates many other hazards associated with earthquakes. Moderate to large earthquake events generally produce trembling for about 10 to 30 seconds. Aftershocks can occur erratically for weeks or even months after the main earthquake event.

Seismic waves move the Earth's surface laterally and vertically and vary in frequency and amplitude. High-frequency, small-amplitude waves cause more damage to short, stiff buildings. Low-frequency, large-amplitude waves have a greater effect on high-rise buildings. The intensity depends on geologic features, such as bedrock and rock type, topography, and the location and magnitude of the earthquake. Other significant factors include groundwater depth, basin shape, sediment thickness, and the degree of sediment consolidation.

[95] Photo courtesy of SLCo EM.

SURFACE FAULT RUPTURE AND TECTONIC SUBSIDENCE

Surface fault rupture is caused by relative movement between blocks in the Earth's crust. In Utah, this results in the formation of scarps or steep breaks in the slope. The 1934 Hansel Valley earthquake resulted in a surface displacement of approximately 1.6 feet. Earthquakes with a magnitude of 6.5 or greater could cause surface faulting with heights of 16 to 20 feet and break segments ranging from 12 to 44 miles long. Surface displacement generally occurs over a zone hundreds of feet wide called the zone of deformation and can cause severe damage to building foundations or lifelines (roads, pipelines, communications lines) that cross the fault. Tectonic subsidence, or down dropping and tilting of the valley floor, generally depends on the amount of surface fault rupture and can cause flooding by tilting lakebeds or dropping the ground surface below the water table. The greatest amount of subsidence will be in the fault zone and will gradually diminish out into the valley.

Hazard Profile

Potential Impact	X	Catastrophic	**Probability**		Highly Likely
		Critical		X	Likely
		Limited			Occasional
		Negligible			Unlikely
Location	Ground shaking will be felt throughout the county. Surface fault rupture can be found in areas of known historic fault movements. Liquefaction can be expected in areas of high to moderate liquefaction potential.				
Seasonal Pattern	None.				
Conditions	Liquefaction potential in areas with shallow groundwater. Soil comprised of old lakebed sediments. Historic movement along faults. Intermountain seismic zone, Wasatch Fault.				
Duration	Actual ground shaking will be under one minute; aftershocks can occur for weeks or even months.				
Secondary Hazards	Fire, landslide, rock falls, avalanche, flooding, hazardous material release, transportation and infrastructure disruptions, essential service disruptions (communications, utilities)				
Analysis Used	Review of hazard analysis plans and other information provided by the University of Utah Seismograph Station, Utah Geological Survey, United States Geological Survey, FEMA, Hazus, Utah Division of Emergency Management, Utah Geospatial Resource Center				

Magnitude/Extent

Currently, the most-used magnitude scale is the moment magnitude (Mw) scale, with the following classifications of magnitude:

- **Great:** Mw > 8
- **Major:** Mw = 7.0–7.9
- **Strong:** Mw = 6.0–6.9
- **Moderate:** Mw = 5.0–5.9

- **Light:** Mw = 4.0–4.9
- **Minor:** Mw = 3.0–3.9
- **Micro:** Mw < 3

Estimates of moment magnitude roughly match the local magnitude scale (ML), commonly called the Richter scale. One advantage of the moment magnitude scale is that, unlike other magnitude scales, it does not saturate at the upper end. That is, there is no value beyond which all large earthquakes have about the same magnitude. For this reason, moment magnitude is now the most frequently used estimate of large earthquake magnitudes.

Another commonly used intensity scale is the Modified Mercalli intensity scale, with ratings defined as follows.[96]

Intensity	Shaking	Description/Damage
I	Not felt	Not felt except by a very few under especially favorable conditions.
II	Weak	Felt only by a few persons at rest,especially on upper floors of buildings.
III	Weak	Felt quite noticeably by persons indoors, especially on upper floors of buildings. Many people do not recognize it as an earthquake. Standing motor cars may rock slightly. Vibrations similar to the passing of a truck. Duration estimated.
IV	Light	Felt indoors by many, outdoors by few during the day. At night, some awakened. Dishes, windows, doors disturbed; walls make cracking sound. Sensation like heavy truck striking building. Standing motor cars rocked noticeably.
V	Moderate	Felt by nearly everyone; many awakened. Some dishes, windows broken. Unstable objects overturned. Pendulum clocks may stop.
VI	Strong	Felt by all, many frightened. Some heavy furniture moved; a few instances of fallen plaster. Damage slight.
VII	Very strong	Damage negligible in buildings of good design and construction; slight to moderate in well-built ordinary structures; considerable damage in poorly built or badly designed structures; some chimneys broken.
VIII	Severe	Damage slight in specially designed structures; considerable damage in ordinary substantial buildings with partial collapse. Damage great in poorly built structures. Fall of chimneys, factory stacks, columns, monuments, walls. Heavy furniture overturned.
IX	Violent	Damage considerable in specially designed structures; well-designed frame structures thrown out of plumb. Damage great in substantial buildings, with partial collapse. Buildings shifted off foundations.
X+	Extreme	Some well-built wooden structures destroyed; most masonry and frame structures destroyed with foundations. Rails bent.

PERCEIVED SHAKING	Not felt	Weak	Light	Moderate	Strong	Very strong	Severe	Violent	Extreme
POTENTIAL DAMAGE	none	none	none	Very light	Light	Moderate	Moderate/Heavy	Heavy	Very Heavy
PEAK ACC.(%g)	<.17	.17-1.4	1.4-3.9	3.9-9.2	9.2-18	18-34	34-65	65-124	>124
PEAK VEL. (cm/s)	<0.1	0.1-1.1	1.1-3.4	3.4-8.1	8.1-16	16-31	31-60	60-116	>116
INSTRUMENTAL INTENSITY	I	II-III	IV	V	VI	VII	VIII	IX	X+

The Intermountain Seismic Belt (ISB) contains the Wasatch Fault—one of the longest and most active normal faults in the world—with a potential for earthquakes with a magnitude up to 7.5. The largest earthquakes in Utah occur in the ISB, with at least 35 earthquakes of magnitude 5.0 or greater occurring since 1850.

According to the U.S. Geological Survey (USGS), the range of earthquake magnitude experienced in Salt Lake County since 1962 is .01 to 5.7.

Location

Utah's earthquake hazard is greatest in the ISB, which extends 800 miles from Montana to Nevada and Arizona, and trends from north to south through the center of Utah.[98]

The Wasatch Fault traces along the base of the Wasatch Mountain Range. It comprises 10 segments that act independently, meaning that a part of the fault ruptures separately as a unit during an earthquake. The Salt Lake City segment traverses Salt Lake County from north to south, roughly along the eastern foothills of the Wasatch Mountains. In the Salt Lake City segment of the Wasatch Fault are three smaller segments from north to south known as the Warm Springs Fault, the Virginia Street Fault, and the East Bench Fault. Other faults in Salt Lake County include the West Valley Fault zone and the East Great Salt Lake Fault zone. Each of these fault zones has a much longer return interval (2,500 years or more) and is not expected to produce a major quake in the near future. Table 38 describes the characteristics of these fault zones and Figure 78 shows the location of each in the county.

Table 38: Fault Zones in Salt Lake County

Name	Fault Type	Length (km)	Time of Most Recent Deformation	Recurrence Interval
East Great Salt Lake Fault zone, Antelope Island section	Normal	35	586 201/-241 cal yr B.P.	4,200 years
Wasatch Fault zone, Salt Lake segment	Normal	43	1,300 ± 650 cal yr B.P.	1,300 years
West Valley Fault zone, Granger segment	Normal	16	1,500 ± 200 cal yr B.P.	2,600–6,500 years
West Valley Fault zone, Taylorsville segment	Normal	15	2,200 ± 200 cal yr B.P.	6,000–12,000 years
Cal yr B.P.= calendar years before present				

[98] Utah Geological Survey, 1996. "The Wasatch Fault," Public Information Series 40, pi-40.pdf.

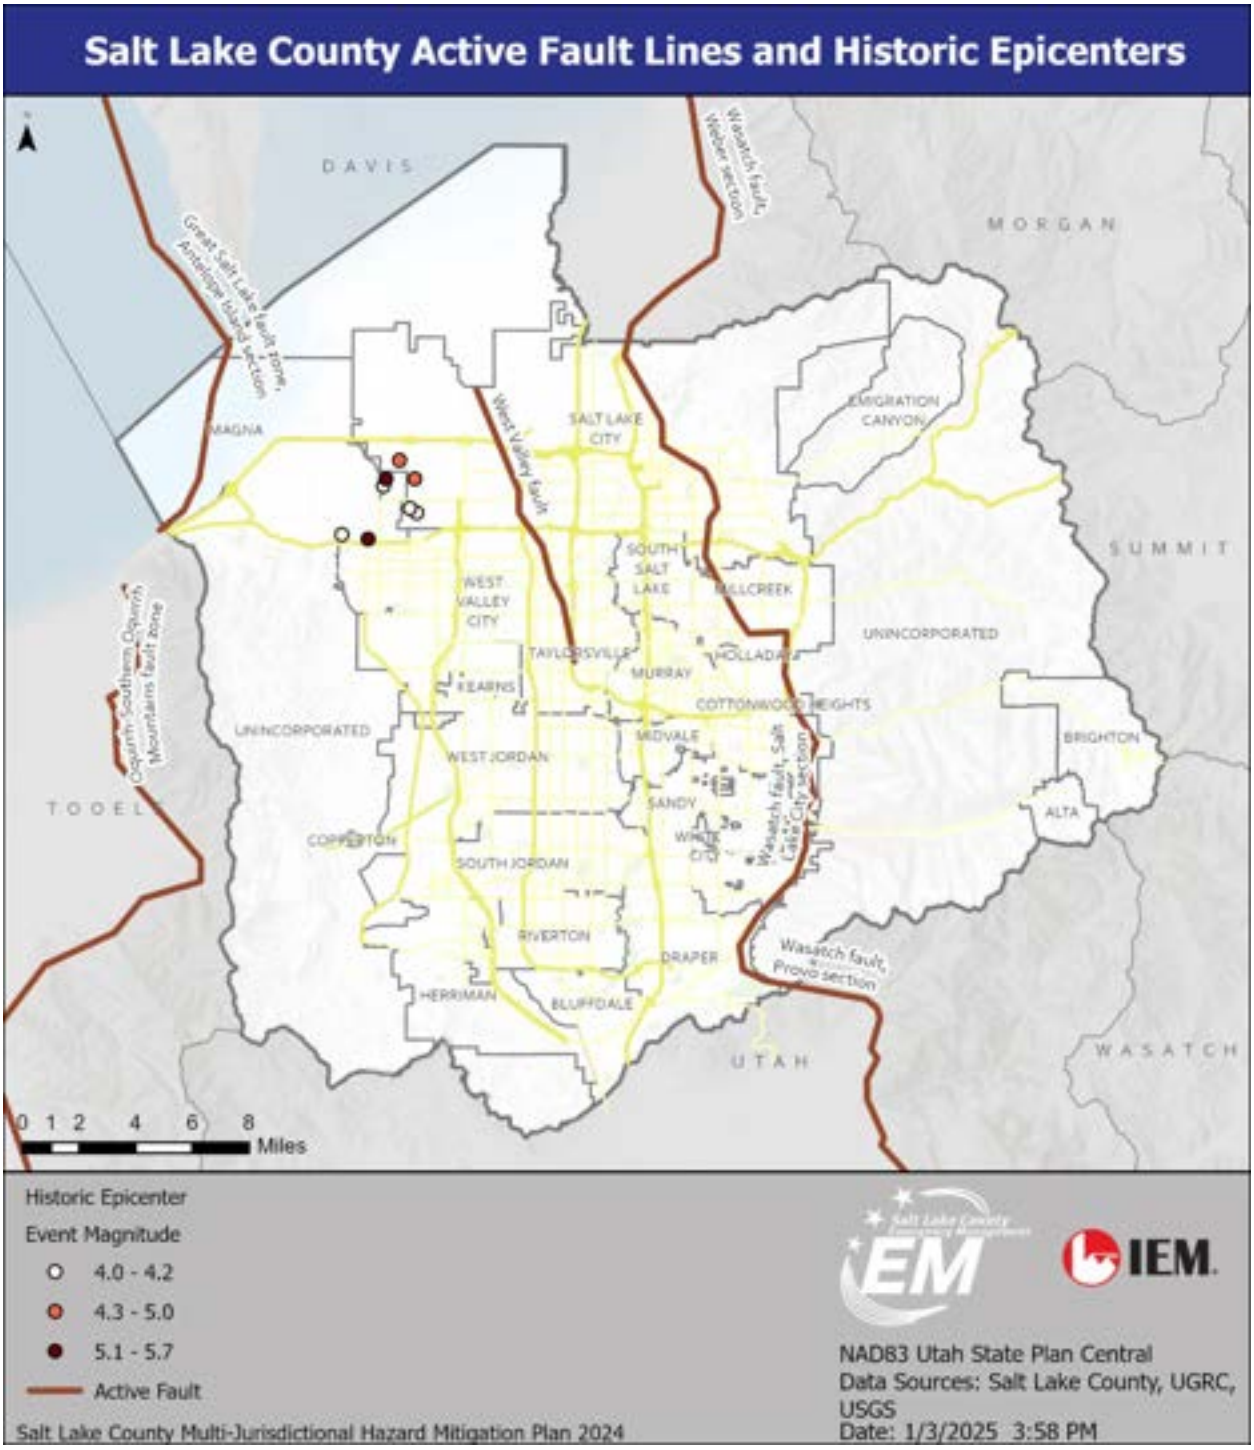

Figure 78: Active Fault Lines and Historic Epicenters in Salt Lake County

Liquefaction is a major hazard associated with earthquakes in Utah. It may occur when ground shaking causes water-saturated sandy soils to lose strength and soil to behave like a viscous liquid rather than a solid. Liquefaction can cause buildings to sink or tilt, underground storage tanks to rise, and other types of slope failures to occur. As shown in Figure 79, the Salt Lake Valley is located atop the ancient Lake Bonneville lakebed, which is made up of unconsolidated sandy soils. Much of the valley is also subject to

shallow groundwater. Both contribute to a large area of the north and central part of the county, where liquefaction potential is moderate to high.

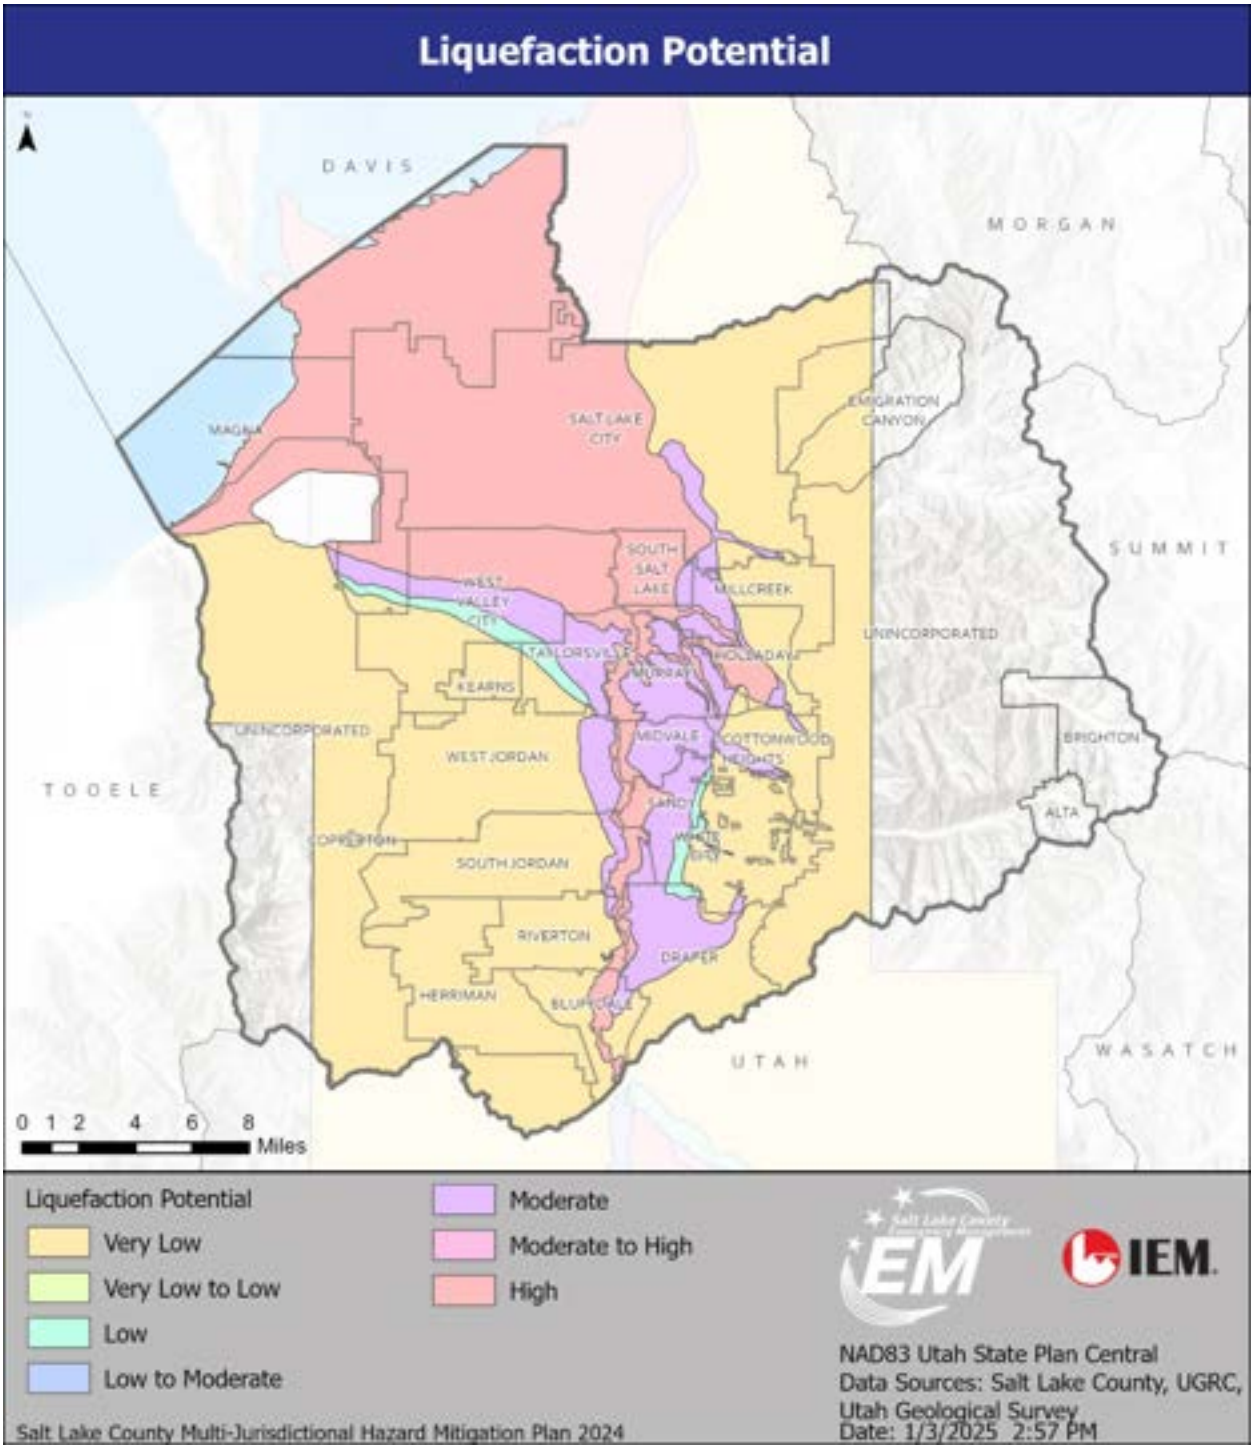

Figure 79: Liquefaction Potential in Salt Lake County

Historical Events and Probability of Future Occurrences

Utah experiences approximately 700 earthquakes each year, approximately six with a magnitude of 3.0 or greater. On average, a moderate, potentially damaging earthquake (magnitude 5.5–6.5) occurs in the state every 10 years. Large earthquakes (magnitude 6.5–7.5) occur on average every 50 years. Based on this recurrence interval, probability is considered to be likely. The history of seismic activity in Utah and along the Wasatch Front suggests that it is not a matter of *if* but *when* an earthquake will occur.

At least 26 large-magnitude (~6.5 or greater), surface-rupturing earthquakes have occurred in the past 6,500 years. On average, a large earthquake occurs every 300 years. The most recent large earthquake took place about 300 years ago in the Nephi segment. The Weber segment experienced a large earthquake about 500 years ago. The Salt Lake City segment has an average recurrence time of about 1,300 years between large earthquakes; however, the last major earthquake affecting most of the Salt Lake City segment occurred about 1,400 years ago. Enough energy has accumulated on the Salt Lake City segment to produce a magnitude 7.0+ earthquake.[99]

Magna Earthquake, March 18, 2020: A 5.7 magnitude earthquake rattled homes from southern Idaho to Millard County, causing significant damage to multiple buildings and displacing some residents. According to the USGS, the quake happened at 7:09 a.m., with the epicenter just north of Magna, between the city and Antelope Island near the edge of the Great Salt Lake. The quake forced the Salt Lake City International Airport to shut down operations for several hours, streets were closed, hazardous materials crews considered evacuating all of Magna due to a chemical leak at Kennecott, and damage was reported to structures in Magna, Kearns, West Valley City, and downtown Salt Lake City. Emergency officials called it the largest earthquake in Utah since a 5.9 magnitude quake hit St. George in 1992. An estimated 2.8 million people felt the shaking.[100]

Figure 80: Damage Following the Magna Earthquake[101]

Based on the FEMA Disaster Declarations Database, Salt Lake County received an Earthquake and Aftershocks Major Disaster Declaration on December 31, 2020, for the incident period March 18, 2020, to April 17, 2020, and the county was designated for individual and public assistance.

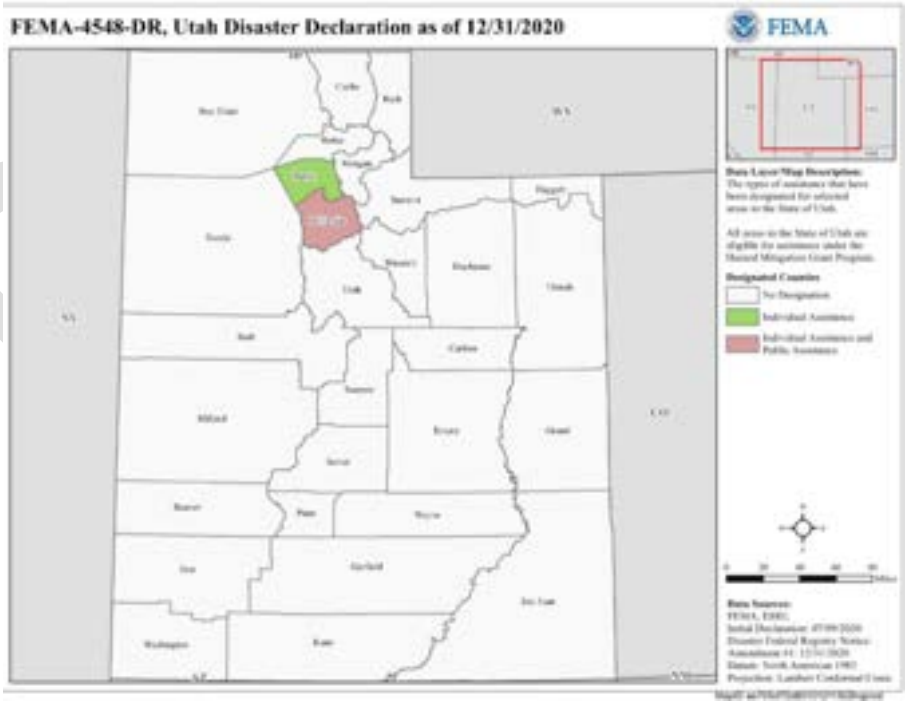

Figure 81: FEMA DR-4548 Utah Disaster Declaration for Earthquake and Aftershocks, December 31, 2020[102]

[101] Photo provided by SLCo EM.
[102] FEMA Disasters and Other Declarations. "Utah Earthquake and Aftershocks: DR-4548-UT." 2024. https://www.fema.gov/disaster/4548.

Figure 82 illustrates <M4 earthquake events occurring in and around Salt Lake County between 2010 and 2024, including the Magna earthquake in 2020.

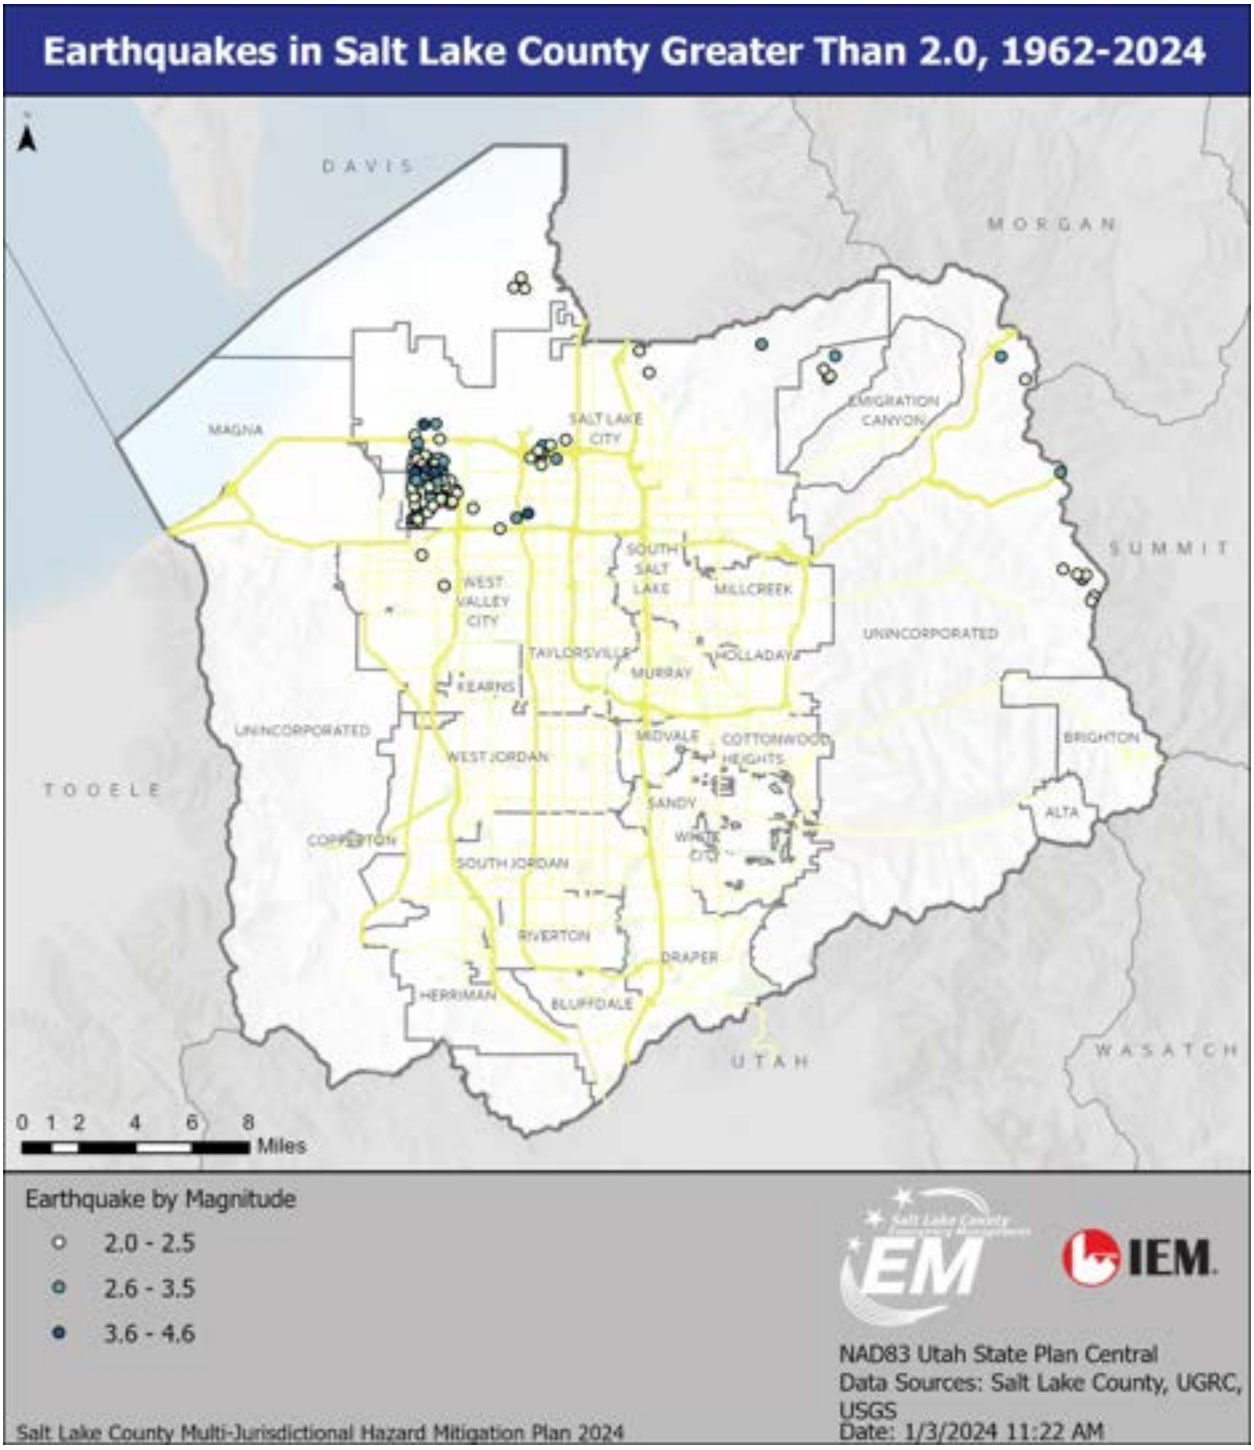

Figure 82: Earthquakes in Salt Lake County Greater than 2.0, 1962–2024

Although no surface-faulting earthquakes have occurred on the Wasatch Fault in recent history, evidence of many prehistoric events exists in the geologic record.[103] The segments between Brigham City and Nephi have a composite recurrence interval (average time between earthquake events) for large surface-faulting earthquakes (magnitude 7.0–7.5) of 300–400 years. The average repeat time on an individual segment is 1,200–2,600 years. The most recent surface-faulting earthquakes occurred about 500 years ago in the Provo and Weber segments, and about 350 years ago in the Nephi segment.

According to USGS records, more than 159 recorded earthquakes of 2.0 magnitude or greater occurred in or immediately around Salt Lake County from 1962 through 2024. Significant earthquakes have occurred in Salt Lake County in the last 50 years. In 1962, a 5.2 Richter magnitude quake jolted the Magna area. In 1992, a magnitude 4.2 quake shook the southern portion of the county.

The two largest measured earthquakes to occur in Utah were the Richfield earthquake of 1901, with a magnitude of 6.5, and the Hansel Valley earthquake of 1934, with a magnitude of 6.6. The Hansel Valley earthquake produced MM intensities of VIII in Salt Lake City, with many reports of broken windows, toppled chimneys, and structures twisted on their foundations. A clock mechanism weighing more than 2 tons fell from the main tower of the Salt Lake City County Building and crashed through the building. The only death that occurred during the event was caused when the walls of an excavation collapsed on a public works employee south of downtown Salt Lake City.

Utah's most damaging earthquake was of a smaller magnitude (5.7), occurring near Richmond in Cache Valley in 1962. This earthquake damaged over 75% of the houses in Richmond, as well as roads and various other structures. The damage was about $1 million (in 1962), which would be about $7,768,300 today with inflation.

The Working Group on Utah Earthquake Probabilities assessed the likelihood of large earthquakes in the Wasatch Front region. The assessment indicates there is an 18% probability of a M6.75 earthquake on the Wasatch Fault in the next 50 years, and a combined 43% probability in the next 50 years based on all faults in the region. For an M6.0 earthquake, the probability is 18% along the Wasatch Fault and 57% in the region.[104] The National Seismic Hazard model shows the potential for peak ground accelerations having a 2% probability of being exceeded in 50 years (Figure 83). The Wasatch Fault is the most active in the region.

[104] U.S. Geological Survey. "Fact Sheet 2016–3019: Earthquake Forecast for the Wasatch Front Region of the Intermountain West." April 2016. ussc.utah.gov/pages/download.php?direct=1&noattach=true&ref=1279&ext=pdf&k=.

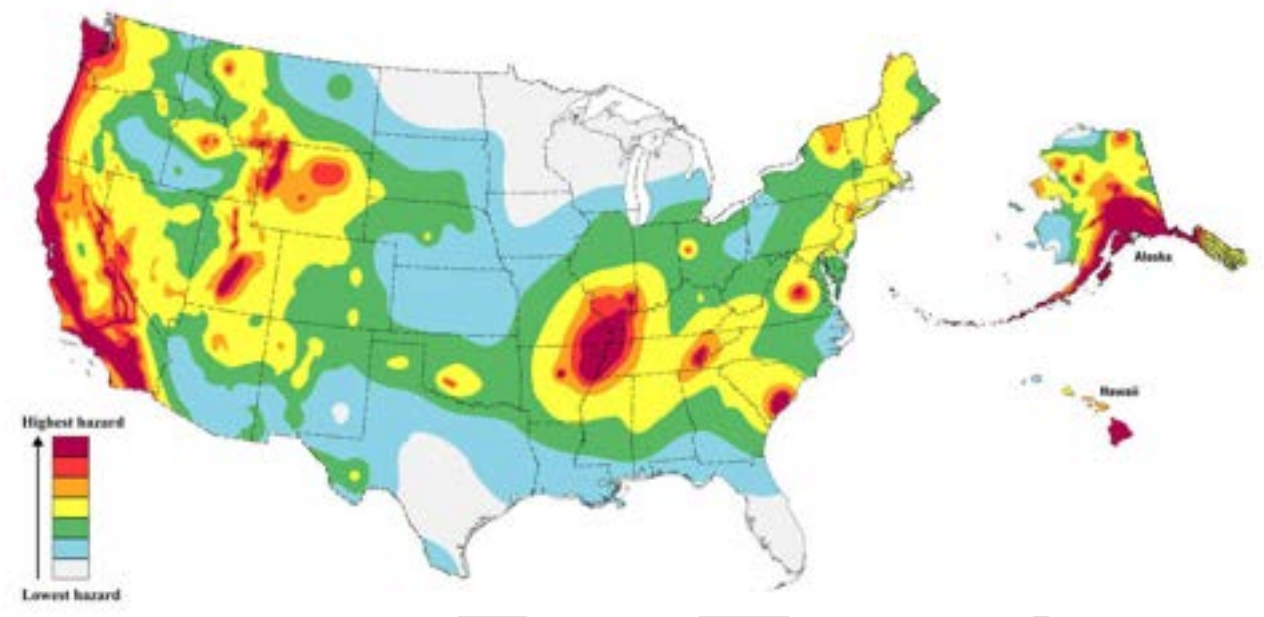

Figure 83: National Seismic Hazard Model[105]

Climate Change Considerations

Recent geological studies have shown that climate change, specifically rising rainfall rates and glacial melting, could exacerbate seismic activity, including earthquakes. Geologists have identified the correlation between the frequency of earthquakes and annual rainfall cycles. Changing climate conditions, such as a warmer atmosphere, can retain more water vapor, leading to higher levels of precipitation. As precipitation levels increase rainfall, the Earth's crust is compressed, both vertically and horizontally, stabilizing it. When this water disappears in the winter, the effective "rebound" destabilizes the region and increases the number of earthquakes that occur.[106]

Secondary Hazards

Secondary hazards from earthquake events can include liquefaction, slope failure, flooding, avalanches, sensitive clays, subsidence, and valley fever.

SOIL LIQUEFACTION

Liquefaction can occur when water-saturated, cohesionless, sandy soils are subjected to ground shaking. The soils "liquefy" or become like quicksand, lose bearing capacity and shear strength, and readily flow on the gentlest of slopes. Liquefaction is common in areas of shallow groundwater and sandy or silty sediments. Liquefaction can produce lateral spreading and flows, where surface soil layers break up and move independently. Displacement of up to three feet may occur, accompanied by ground cracking and

[105] Earthquake Hazards Program. "National Seismic Hazard Model." March 9, 2022. U.S. Geological Survey. https://www.usgs.gov/programs/earthquake-hazards/science/national-seismic-hazard-model.
[106] Blackett, Matthew and The Conversation. "Scientist Find a Possible Connection Between Climate Change and Earthquake Risk." Inverse. February 20, 2024. https://www.inverse.com/science/climate-change-volcano-earthquake-connection.

differential vertical displacement. Soil may move downhill, pulling apart roads, buildings, pipelines, and buried utilities. Bearing capacity will lessen and can cause buildings to settle or tip, while lightweight buoyant structures, such as empty storage tanks may "float" upward. Liquefaction can also cause the foundation materials beneath earthfill dams to liquefy and fail, the flooding of low-lying areas by groundwater, the backup of gravity-fed systems, and the formation of sand boils. Sand boils are deposits of sandy sediment ejected to the surface during an earthquake along fissures. Liquefaction can occur during earthquakes of magnitude 5.0 or greater.

SLOPE FAILURE

Ground shaking can cause rock falls and landslides in mountainous or canyon areas. Rock falls are the most common slope failure and can occur up to 50 miles away from a 6.0 magnitude earthquake. Landslides occur along steep slopes and benches in wet, unconsolidated materials. During a 6.0 magnitude earthquake, landslides typically occur within 25 miles of the source.

FLOODING

Flooding can occur due to tectonic subsidence and tilting, dam failure, seiches (waves generated in standing bodies of water) in lakes and reservoirs, surface-water diversion or disruption, and increased groundwater discharge.

AVALANCHES

Avalanches can be triggered by ground movement. The most vulnerable areas include those with steep terrain, high precipitation, high earthquake potential, high population density, and heavy backcountry use.

SENSITIVE CLAYS

Sensitive clays are a soil type that lose strength and are subject to collapse when shaken. The resulting type of ground failure is similar to liquefaction.

SUBSIDENCE

Subsidence involves a settling or sinking of loose granular materials, such as sand and gravel that do not contain clay. Ground displacement caused by surface fault rupture can cause tectonic subsidence. This is a broad, permanent tilting of the valley floor down toward the fault scarp. This can alter stream flows, cause flooding along lake and reservoir shorelines, and disrupt gravity-flow systems.[107]

VALLEY FEVER

Valley fever is an illness caused by the fungus *Coccidioides*, which grows in soils in areas with low rainfall, high summer temperatures, and moderate winter temperatures, such as the project site. It is found most often in the southwestern United States, especially Arizona, Utah, Texas, and California.

[107] Utah Geological Survey, Geologic Hazards, Utah Faults. https://geology.utah.gov/hazards/earthquakes/utah-faults/#toggle-id-2.

Exposure typically occurs in connection with ground-disturbing activities that release fungal spores, which are then inhaled. Earthquakes disturb soil-enabling spores, allowing them to spread into the air.

Most people who are exposed to the fungus do not develop symptoms or have relatively mild flu-like symptoms. Common symptoms include fever, cough, headache, rash, muscle aches, and joint pain. Symptoms of advanced coccidioidomycosis may include skin lesions, chronic pneumonia, meningitis, and bone or joint infection. Symptoms may appear between one and three weeks after exposure. Some patients have reported having symptoms for six months or longer, especially if the infection is not diagnosed early. Valley fever is not known to spread from person to person or between people and animals.

Vulnerability Assessment

Earthquakes can cause extensive damage to Salt Lake County. Moderate earthquakes have caused costly damage in the past, and there is the potential for stronger earthquakes with even more pronounced effects. A strong earthquake will cause significant structural damage and is likely to damage infrastructure, interrupt other services, and disrupt lives in this and neighboring counties. Structural damage can cause injury or death to building occupants. Widespread damage to buildings and infrastructure will disrupt businesses and other community activities and might lead to significant economic losses. Recovery will take substantial resources and costs and could take years.

The vulnerability of people and infrastructure to earthquake hazards in Salt Lake County was obtained from the modeling program Hazus 6.1. The Hazus earthquake scenario entails a magnitude 6.2 earthquake occurring in Salt Lake County with an epicenter on the Warm Springs Fault in the northern part of the county. The vulnerability and loss estimates in this section are based on this scenario. Hazus evaluates the probability of damage to buildings and infrastructure and impacts on the population based on models of earthquake ground-shaking intensity.

ESTIMATED LOSSES AND POTENTIAL IMPACTS

CRITICAL INFRASTRUCTURE

Critical infrastructure (i.e., schools, emergency operation centers, county facilities, fire stations, hospitals, and police stations) across most of the Salt Lake jurisdiction experienced severe peak ground acceleration based on the Hazus loss estimation model for a magnitude 6.2 earthquake. South Salt Lake and most of Millcreek, Magna, West Valley City, Holladay, Murray, Taylorsville, and Kearns experienced very strong peak ground acceleration in the same model. Areas experiencing strong peak ground acceleration in the Hazus model include western portions of Magna and South Jordan; northern portions of the unincorporated areas of the county, Riverton, and Draper; southern portions of West Valley City, Kearns, Taylorsville, Murray, and Holladay; eastern portions of Emigration Canyon, West Jordan, and Magna; and most of West Jordan, Midvale, Cottonwood Heights, Sandy City, and White City. The remainder of the county experienced moderate peak ground acceleration in the Hazus model. An examination of the building and contents loss scenario for a magnitude 6.2 earthquake shows that most losses will occur in the southern portion of Salt Lake City and the northern portion of West Valley City.

DRAFT

Figure 84–Figure 89 show the locations of the different categories of critical facilities in relation to peak ground acceleration values. Table 39 lists the number of facilities that may be damaged and how long they may lack functionality.

Table 39: Expected Damage to Essential Facilities

Classification	Total	Number of Facilities		
		At Least Moderate Damage > 50%	Complete Damage > 50%	With Functionality > 50% on Day 1
Hospitals	16	7	0	5
Schools	422	146	4	170
Emergency Operations Centers	18	6	0	8
Police Stations	33	16	0	11
Fire Stations	67	22	0	31

STRUCTURAL LOSSES

The economic loss estimated for the earthquake is approximately $13.7 billion, which includes building- and lifeline-related losses based on the region's available inventory. Hazus estimates that there are 360,000 buildings in the county with a replacement value of over $172 billion. An estimated 56,217

buildings will be at least moderately damaged in this scenario, which is over 16% of the buildings in the region. Over 6,000 will be damaged beyond repair. The following sections provide more detailed information about these losses, which can be broadly grouped into three categories: direct building, business interruption, and transportation and utility lifeline losses.

Direct building losses are the estimated costs to repair or replace the damage caused to the building and its contents. Business interruption losses are the losses associated with the inability to operate a business due to damage sustained during the earthquake, including temporary living expenses for individuals displaced from their homes by the earthquake. Table 40 shows the direct and indirect losses for the county based on different building occupancy types.

Table 40 summarizes the expected damage and loss. The building-related losses were $12,546,760,000, 22% of which were related to business interruptions in the region. By far, the largest loss was sustained by the residential occupancy category, accounting for 36% of the loss.

Table 40: Building-Related Economic Loss Estimates (in Millions)

Category	Area	Single Family	Other Residential	Commercial	Industrial	Others	Total
Business Interruption Losses	Wage	$0.00	$91.43	$386.44	$33.58	$91.23	$602.68
	Capital-Related	$0.00	$38.87	$344.99	$20.86	$17.44	$422.16
	Rental	$94.93	$176.80	$208.32	$24.11	$56.57	$560.73
	Relocation	$332.75	$98.55	$319.13	$123.22	$297.46	$1,171.10
	Subtotal	**$427.68**	**$405.65**	**$1,258.88**	**$201.77**	**$462.70**	**$2,756.67**
Direct Losses	Structural	$624.74	$209.17	$582.07	$339.12	$255.66	$2,010.76
	Non-structural	$1,445.45	$820.17	$1,334.90	$963.97	$780.28	$5,344.77
	Content	$388.33	$173.04	$641.09	$650.22	$326.17	$2,178.84
	Inventory	$0.00	$0.00	$152.95	$98.82	$3.95	$255.71
	Subtotal	**$2,458.52**	**$1,202.38**	**$2,711.01**	**$2,052.13**	**$1,366.06**	**$9,790.08**
Total		**$2,886.20**	**$1,608.03**	**$3,969.89**	**$2,253.90**	**$1,828.76**	**$12,546.75**

Table 41 shows the potential structural losses for each jurisdiction based on the Hazus model. Large cities and urban areas are the most financially affected by the effects of an earthquake. Major urban areas, such as Salt Lake City and West Valley City, can expect high structural and income losses. Jurisdictions, such as Millcreek, Murray, and Cottonwood Heights can expect structural and building losses with a need for extensive repairs, especially for businesses and residential sectors. Although the model did not project significant structural damage for Alta, Brighton, and Copperton, these communities may be affected by secondary hazards, such as earthquake-induced avalanches, dam failure, or landslides, leading to road closures and the disruption of power and communications services.

The table shows significant losses in the larger urban areas of Salt Lake County, with Salt Lake City experiencing the largest loss at $9,407,870,930, reflecting widespread damage in both the residential and

business sectors. West Valley City reports $851,62,700 in losses, with significant inventory and building losses resulting in a major loss of building assets. Other significantly impacted areas include the jurisdictions of Millcreek and Murray, with Millcreek experiencing significant structural and building losses ($435,019,240) and Murray experiencing a large income loss ($25,011,510).

Jurisdictions, such as Cottonwood Heights, Kearns, Sandy, South Jordan, and Taylorsville, can expect to experience moderate losses per the Hazus loss estimation model, with losses ranging from $35,964.36 to $78,365.44. Although these areas experience a substantial loss across various categories, it is not considered catastrophic. The unincorporated areas of the county experience the lowest total losses in the model, $5,827.50, with minor impacts in categories, such as inventory and wage loss. Unincorporated areas are typically less densely populated, leading to lower overall losses.

Figure 90 and Figure 91 show the areas in the county with the highest losses.

POPULATION IMPACTS

Hazus estimates the number of households that are expected to be displaced from their homes due to the earthquake and the number of displaced people that will require accommodation in temporary public shelters. The model estimates that 6,735 households will be displaced due to the earthquake, with 4,458 individuals seeking temporary shelter in public shelters.

Hazus also estimates the number of people that will be injured and killed by the earthquake. The casualties are broken down into four severity levels that describe the extent of the injuries:

- **Severity Level 1:** Injuries will require medical attention, but hospitalization is not needed.
- **Severity Level 2:** Injuries will require hospitalization but are not considered life-threatening
- **Severity Level 3:** Injuries will require hospitalization and can be life-threatening if not promptly treated.
- **Severity Level 4:** Victims are killed by the earthquake.

Table 43 provides a summary of the casualties estimated for this earthquake. The casualty estimates are provided for three times of day: 2:00 a.m., 2:00 p.m., and 5:00 p.m. These times represent the periods of the day when different sectors of the community are at their peak occupancy loads. The 2:00 a.m. estimate considers that the residential occupancy load is maximum, the 2:00 p.m. estimate considers that the educational, commercial, and industrial sector loads are maximum, and 5:00 p.m. represents peak commute time.

FIRE FOLLOWING EARTHQUAKE

Fires often occur after an earthquake. Because of the number of fires and the lack of water to fight them, they can often burn out of control. Hazus uses a Monte Carlo simulation model to estimate the number of ignitions and the amount of burned area. For this scenario, the model estimates five ignitions, burning about 0.02 square miles of the region, displacing approximately 157 people and causing $8 million in building damage.

DRAFT

DEBRIS GENERATION

Hazus estimates the amount of debris that will be generated by the earthquake. The model classifies the debris into two general categories: a) brick/wood and b) reinforced concrete/steel. This distinction is made because of the different types of material-handling equipment required to handle the debris. The model estimates that 2,258,000 tons of debris will be generated—70% reinforced concrete/steel and 30% brick/wood—requiring an estimated 90,320 truckloads (25 tons/truck) for removal.

VULNERABLE POPULATIONS

When buildings collapse, contents fall, or roads and bridges are damaged, people may be trapped or injured, with severe injuries potentially resulting in death. Entire communities may become displaced and emergency services may be strained beyond their capacity. This can cause lasting effects on people's physical and emotional well-being.

Long-term disruption of infrastructure and utility systems, interruption of government services, and lasting economic impacts are difficult for the entire community. However, vulnerable populations may experience more severe effects from these losses. Lower-income households may live in older or less well-maintained housing that may suffer more damage, placing residents more at risk of injury. They may struggle to find temporary housing and lack the financial reserves needed to sustain them through wage losses from business closures or other economic hardships. Elderly or other medically vulnerable populations and people with disabilities might have more difficulty receiving their normal care and services. Language barriers may make it more difficult for some to seek or access recovery services.

COMMUNITY LIFELINES

Any and possibly all community lifelines could be impacted by an earthquake. The immediate concern is for the safety and security of the people in the areas with the highest shaking intensity. It is reasonable to expect that access to food, water, shelter, and healthcare will be compromised for many people. Earthquakes are destructive to power distribution networks, water systems, roadways and railways, and communications systems. The release of hazardous materials is also a possibility.

CHANGES IN DEVELOPMENT

In Salt Lake County, development and population growth can have profound impacts on earthquakes, especially as more people and infrastructure are concentrated in areas prone to seismic activity with the potential for large earthquakes. Increased development will lead to more buildings and a denser population that will become vulnerable to the impacts of an earthquake. This is particularly true for areas located along the Wasatch Fault. Vulnerability to earthquakes partially overlaps with areas of high population growth and development in Salt Lake County. Downtown Salt Lake City and cities and towns in the northwest section of the county, like Magna, have seen large increases in population and are at significant risk of strong earthquakes. The development in southern Salt Lake County is at much lower risk.

DRAFT

Older buildings, typically those built before 1975, used different construction processes that will not hold up during an earthquake. Unreinforced masonry (URM) homes with brick walls and/or a brick chimney are common in Salt Lake County and are particularly susceptible to damage from earthquakes.

On December 22, 2020, FEMA announced an award of more than $3.7 million to Salt Lake City. The funds are the federal cost share for the "Fix the Bricks" mitigation project to address the threat of structural collapse of residential URM structures during an earthquake event.[108] The project funds the seismic retrofitting of 216 residential URM structures, including seismic wall-to-roof retrofits, URM chimney bracing, and marketing efforts to inform the public about the project. This project aims to reduce the likelihood of structural collapse, enabling occupants to escape and reducing injury and loss of life. FEMA is providing a 75% federal cost share for the $5 million project. Funding is provided through FEMA's Pre-Disaster Mitigation grant program, which is designed to assist states, U.S. territories, federally recognized tribes, and local communities in implementing a sustained pre-disaster natural hazard mitigation program. The goal is to reduce overall risk to the population and structures from future hazard events while reducing reliance on federal funding in future disasters.[109]

This program can reduce earthquake vulnerability. However, in 2024, the Fix the Bricks program currently has a three-to-five-year waiting list of homeowners seeking mitigation assistance funding. For these individuals, vulnerability remains the same.

Figure 92: Salt Lake County Building Earthquake Repair Project[110]

[110] SLC.gov. "Fix the Bricks – Salt Lake City Seismic Retrofit." 2024. https://www.slc.gov/housingstability/city-housing-programs/fix-the-bricks/.

VULNERABILITY SCORE

To analyze the county's vulnerability to earthquakes, the NRI was used as a primary tool during the 2024 update. The NRI defines risk as the potential for negative impacts from a natural hazard. It determines a community's risk relative to other communities by examining the EAL and social vulnerability in a given community in relation to that community's resilience. Salt Lake County's NRI earthquake risk rating is shown in Figure 93. Salt Lake County has a relatively high earthquake risk, with a risk score of 99.6.

DRAFT

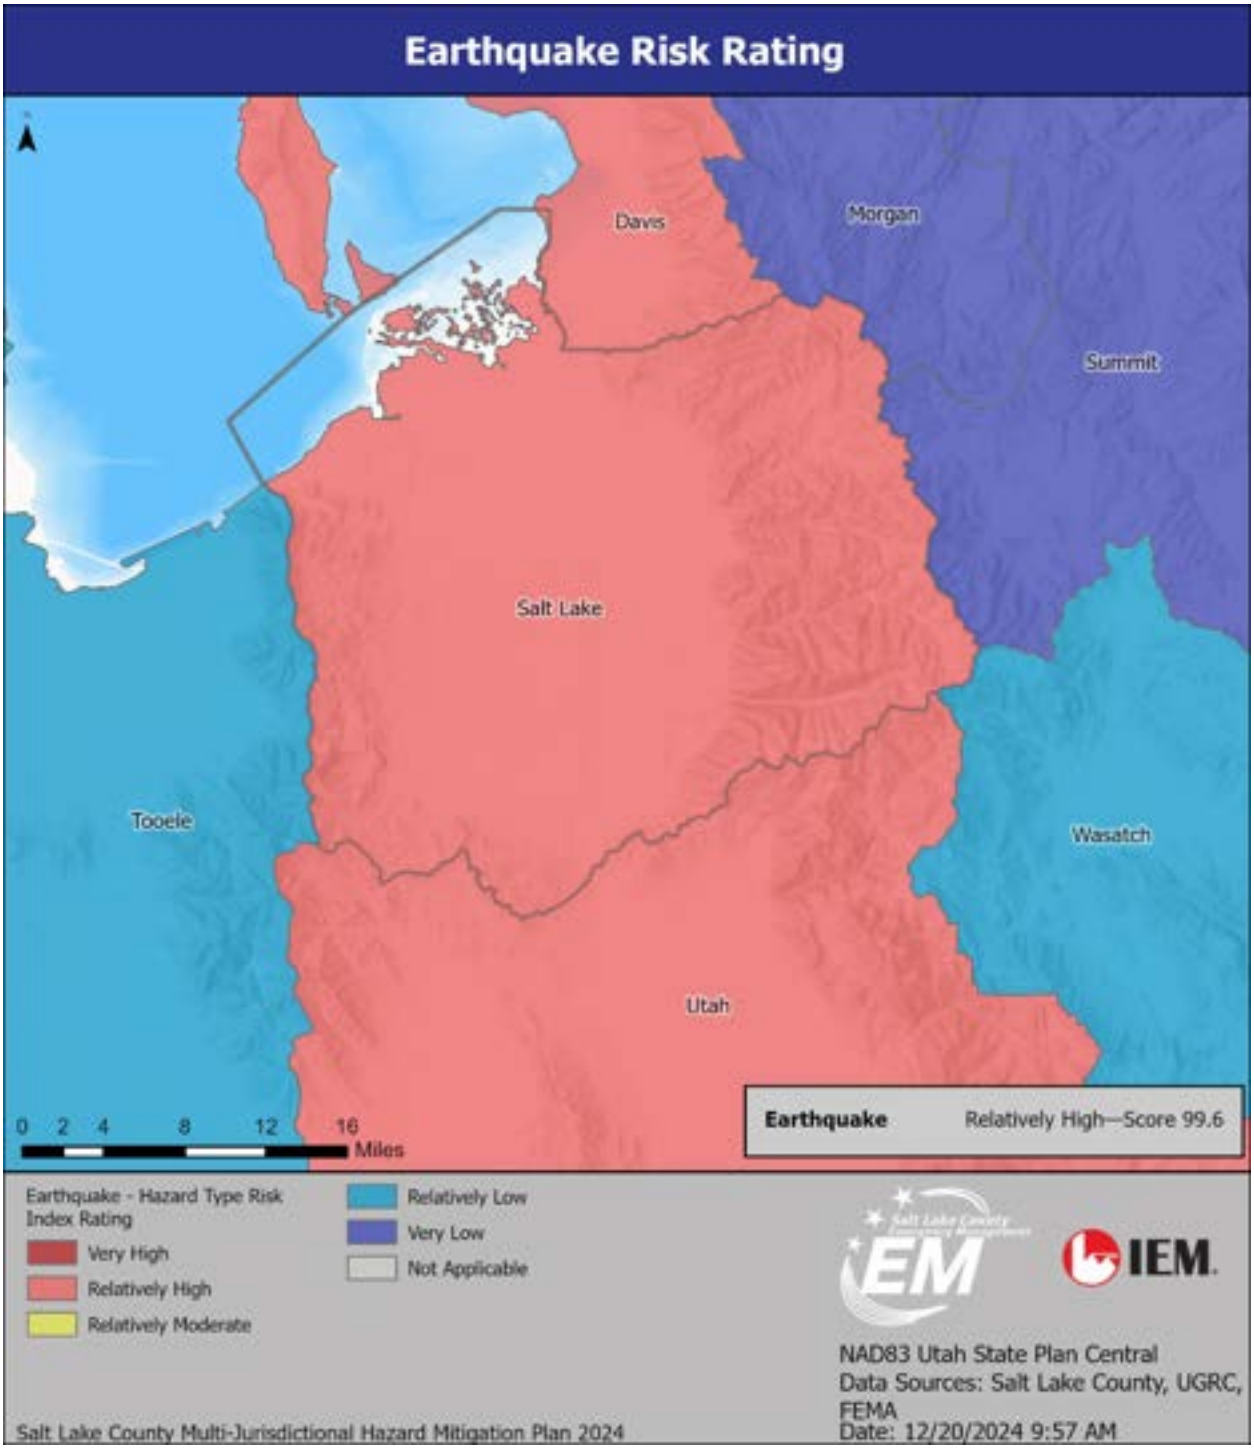

Figure 93: National Risk Index Earthquake Risk Map, Legend, and Score for Salt Lake County[111]

[111] FEMA, National Risk Index. "Salt Lake County Earthquake Score, Map and Legend." https://hazards.fema.gov/nri/map.

Extreme Cold

Figure 94: Image of Salt Lake County in Cold Weather[112]

Hazard Description

Utah frequently experiences extreme temperatures. Winter months often feature temperatures below zero degrees Fahrenheit; however, prolonged periods of extremely cold weather occur infrequently. An exception was January 2013, which was the coldest month on record for Salt Lake City since 1949. Extreme cold in the region can cause hypothermia and frostbite—with the young, elderly, homeless, and animals especially vulnerable—and can also disrupt agriculture, livestock, and crops. Wind chill can enhance the effects of extreme cold.

Hazard Profile

Potential Impact		Catastrophic	**Probability**		Highly Likely
	X	Critical		X	Likely
		Limited			Occasional
		Negligible			Unlikely
Location	Can occur in areas throughout the county				
Seasonal Pattern	Winter months				
Conditions	Vary based on latitude, elevation, aspect, and landforms				
Duration	Extreme cold conditions generally last for several hours; some conditions can persist for days.				
Secondary Hazards	Secondary hazards include transportation disruption and infrastructure damage and failure, including power outages.				
Analysis Used	National Centers for Environmental Information, National Weather Service, Utah Division of Emergency Management, local input, and review of historic events and scientific records				

[112] https://pixabay.com/photos/salt-lake-city-utah-wasatch-vista-4928290/.

Magnitude/Extent

The wind chill temperature is how cold people feel when they are outside based on the rate of heat loss from exposed skin. As wind speed increases, it draws heat from the body, driving down skin temperature and eventually internal body temperature, which makes people feel much colder. The wind chill chart (Figure 95) shows how cold temperatures feel at various wind speeds.[113]

The lowest temperature ever recorded in Salt Lake City was -22ºF on January 25, 1949; the average minimum temperature in January in the county is 23ºF. These temperatures were recorded at the local weather station at the Salt Lake City International Airport. Utah recognizes Code Blue Alerts, which counties issue when temperatures are expected to drop to 18ºF, including wind chill, for 2 or more hours during a 24-hour period.

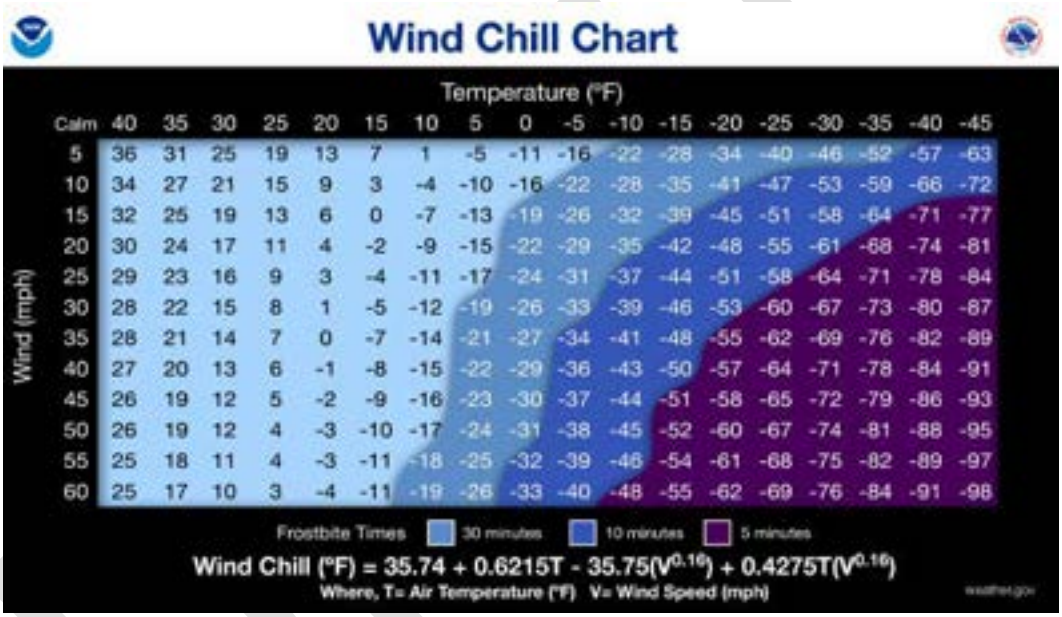

Figure 95: National Weather Service Wind Chill Chart

Location

The entire region of Salt Lake County can be affected by extreme cold events. Temperatures and wind chill conditions vary with elevation and other local differences.

Historical Events and Probability of Future Occurrences

As previously mentioned, the lowest temperature ever recorded in Salt Lake City was -22ºF in 1949. NOAA recorded three cold/wind chill events in Salt Lake County from 1996 to 2024; however, NOAA did not record any deaths, injuries, or property damage as a result of such events. Despite this, it is important to note that these data do not capture all possible deaths or illnesses related to extreme cold. For example, in 2023, a local news article reported that at least 8 unsheltered people had died during the

[113] National Weather Service. "Understanding Wind Chill." https://www.weather.gov/safety/cold-wind-chill-chart.

previous winter.[114] Future occurrences are considered to be likely based on a recurrence interval of one event approximately every 9 years.

According to FEMA's Disaster Declarations for States and Counties, there were no federally declared extreme cold events from January 1, 2019, through June 3, 2025.[115] In addition, no state declarations have been made for the state of Utah due to extreme cold.[116]

Utah Code 35A-16-703, which became effective in 2023, establishes conditions for the Utah Department of Health and Human Services to identify Code Blue events. Code Blue Alerts disseminate details to the public and provide information to assist individuals experiencing homelessness during the event. This may include information regarding expansions of shelter capacity, provisions of temporary shelter (warming centers), or distributions of clothing and blankets.

Climate Change Considerations

Evidence for increasing temperatures from climate change often focuses on extreme heat events. As noted in the Utah Enhanced State Hazard Mitigation Plan, there is also a possibility that future low temperatures may be less cold. Although this may reduce human health impacts from extreme cold, it could have other negative impacts. For example, warmer winters contribute to bark beetle infestations and tree die-off in forests. This is detrimental to various natural ecosystems and can also increase the risk of wildfire.

Climate change can cause higher temperatures which shorten the winter season, resulting in less snowpack for the year. This shift can affect water resources, local ecosystems that thrive on cold weather, and winter recreational activities. This ultimately results in shorter and less severe winters. Although this may reduce some of the health risks associated with extreme cold, it can drastically impact the economy, as Salt Lake County thrives on the ski industry.

Secondary Hazards

Freezing temperatures can lead to various infrastructure disruptions. They can cause insulators to fail and conductors to break. Extreme cold has the added effect of making people turn up their heaters, which can cause a circuit overload and a resulting power outage. People turning on their lights and heaters in anticipation of the power being restored may extend an outage. These activities create high-power demand on fusing that might not be able to handle the stress of the load. Extreme cold can also cause water in pipes to freeze, leading to burst pipes and water damage.

[114] Fredde, Ashley, "Utah Bill Aimed to Prevent Homeless Deaths in Winter Headed to Gov. Cox's Desk," KSL.com, March 8, 2023. https://www.ksl.com/article/50594793/utah-bill-aimed-to-prevent-homeless-deaths-in-winter-headed-to-gov-coxs-desk.
[115] FEMA, "Disaster Declarations for States and Counties." https://www.fema.gov/data-visualization/disaster-declarations-states-and-counties.
[116] Utah Department of Public Safety, "Utah Disaster History." https://dem.utah.gov/utah-disaster-history/.

Vulnerability Assessment

All residents and infrastructure systems in the planning area are vulnerable to extreme cold, which is likely to affect the entire county. Extremely cold conditions may last for hours or even days. People are particularly vulnerable to extreme cold. Prolonged exposure can lead to hypothermia, frostbite, and death. Windy conditions can increase these risks.

Structures are not typically directly affected by extreme cold but may be affected by secondary hazards. Extreme cold can freeze water in pipes, causing them to burst. This can damage water delivery systems and structures and roadways. Extreme cold can also impact power systems through increased demand.

Extreme cold can damage crops or harm livestock, resulting in economic losses. It can also be harmful to wildlife or other natural systems.

ESTIMATED IMPACT AND POTENTIAL LOSSES

Extreme cold can lead to health concerns, especially for the unhoused, outdoor workers, and those who are medically vulnerable due to preexisting conditions or disabilities. Extreme cold can contribute to infrastructure disruption including frozen pipes, damage to water systems, power outages, and disruption to transportation networks. Residents could face hardship from lack of water service or power. Older homes may be less energy efficient. Elderly residents or lower-income households may be more severely affected by service disruptions. Businesses, government offices, and schools might have to close due to power outages or transportation disruptions, which can cause economic losses. People might miss work or school.

The NRI includes data on the EALs due to individual natural hazards, historical losses, and overall risk at the county and Census tract levels. The NRI refers to extreme cold hazards as “cold wave risk.” Salt Lake County’s NRI EAL value for cold waves is $4,000, with a risk score of 32.9 and a rating of “very low” compared with the rest of the United States.

DRAFT

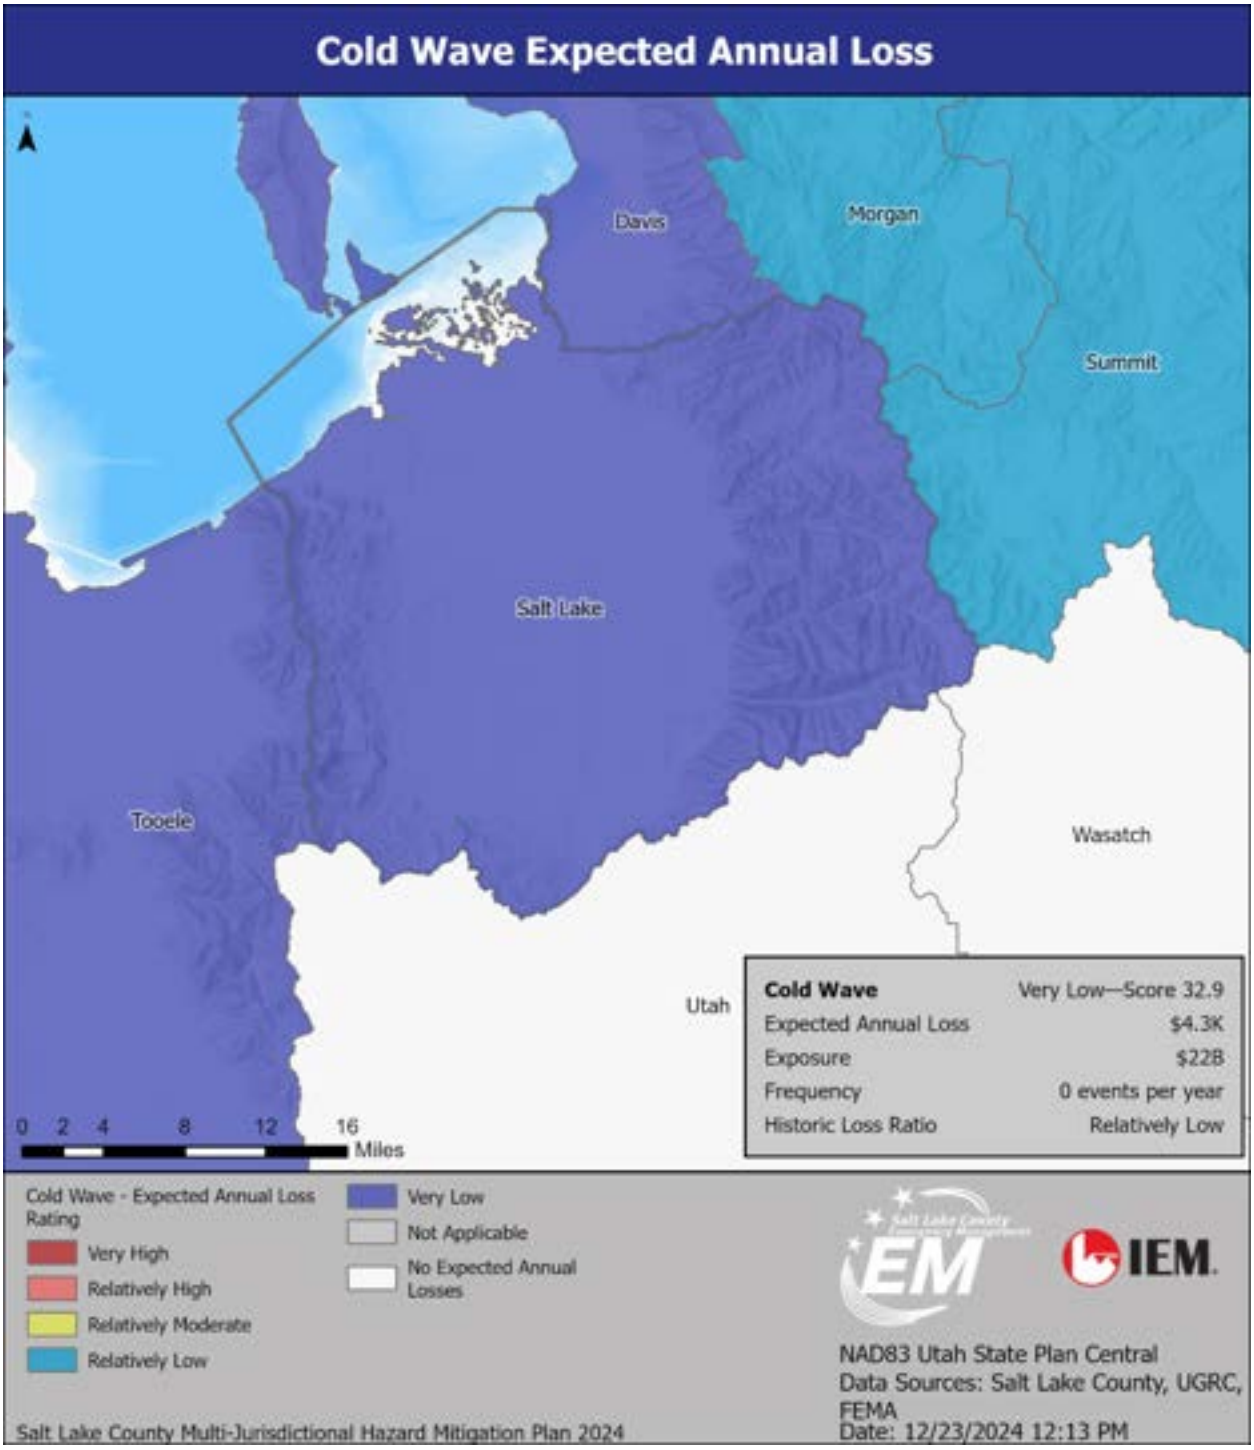

Figure 96: National Risk Index Expected Annual Loss from Extreme Cold in Salt Lake County[117]

[117] Federal Emergency Management Agency. "National Risk Index." 2023. https://hazards.fema.gov/nri/map.

VULNERABLE POPULATIONS

Unhoused populations face the greatest risk of illness or death from exposure to extreme cold. Code Blue Alerts seek to provide emergency shelter for these individuals.

Homebound individuals, such as the elderly or persons with disabilities, who rely on home health supplies or other caregiving services also may be at risk if the power supply or other services are disrupted.

Low-income households are more likely to experience the impacts of extreme cold. They may lack adequate housing or may live in older homes that might have poor heating systems or lack insulation. Residents may be reluctant to use heat systems due to high energy costs. They may also face greater risks from seeking alternative heat sources. About 20% of winter fatalities occur inside the home, primarily when space heaters catch fire or people suffer from carbon monoxide poisoning from using alternative heating devices without proper ventilation.[118]

COMMUNITY LIFELINES

Extreme cold can disrupt services across the safety and security, energy, transportation, and water sectors. The importance of these lifelines cannot be overstated. In a disaster, communities can be left without access to necessities, such as food, water, and shelter. The lifelines help ensure that these needs are met and that people have the resources they need to survive. By providing access to medical care, public health services, and transportation, the lifelines enable people to receive the care they need and safely evacuate if necessary. In addition, the hazardous materials lifeline helps to ensure that dangerous materials are managed safely, reducing the risk of further harm. Community lifelines help create a sense of safety and security in a community. They provide a safety net for individuals who may be struggling and offer comfort and reassurance that help is available when needed. Without these lifelines, communities would be much more vulnerable to crises and emergencies.

CHANGES IN DEVELOPMENT

Since the last plan update, there has been a significant rise in cost of living, coupled with inflation, which has contributed to an increase in the county's unhoused population and made more individuals at risk of homelessness and extreme cold. The overall population size in the county has increased, which represents a rise in the number of people potentially exposed to the hazard. Extreme cold particularly affects unhoused populations, and the Salt Lake County Point-in-Time Count Summary indicates that the overall number of people experiencing homelessness in Salt Lake County has risen since 2018.[119] This also represents an increase in vulnerability to this hazard.

In Salt Lake County, development and population growth can have profound impacts on extreme cold as the growing population is increasing the demand for energy during the winter months, and this might strain the system. This could lead to blackouts or brownouts during periods of extreme cold. The

[118] Utah Department of Public Safety, Division of Emergency Management. "Utah Enhanced State Hazard Mitigation Plan 2024." 2024. https://hazards.utah.gov/state-of-utah-hazard-mitigation-plan/.
[119] Smith, Alex. "Salt Lake County CoC Point-in-Time Count Summary, 2018–2022." End Utah Homelessness, Salt Lake Valley. 2022. https://endutahhomelessness.org/wp-content/uploads/2022/08/SLC-PIT-Summary-2018-2022.pdf.

increased density of buildings and infrastructure may also make it more difficult to clear accompanying snow and ice, impacting both transportation and emergency response times.

An increase in infrastructure due to population growth can exacerbate the negative air quality effects of temperature inversions in the Salt Lake Valley. During an inversion, cold air at the surface gets trapped under a layer of warmer air and pollutants can build up to unhealthy levels near the surface. These inversions are often strongest in winter months and often coincide with periods of extreme cold temperatures. The unique topography and meteorology of the valley are important factors in the formation of temperature inversions, an increase in population, transportation networks, and other development contribute to the levels of emissions and other pollutants in the air.

VULNERABILITY SCORE

In the 2024 update, the NRI was used as the primary tool for analyzing the county's vulnerability to severe winter weather. The NRI defines risk as the potential for negative impacts as a result of a natural hazard and determines a community's risk relative to other communities by examining the EAL and social vulnerability of a given community in relation to that community's resilience. Salt Lake County's NRI cold wave risk rating is shown in. The county has a "very low" cold wave risk rating, and a risk score of 30.2.

DRAFT

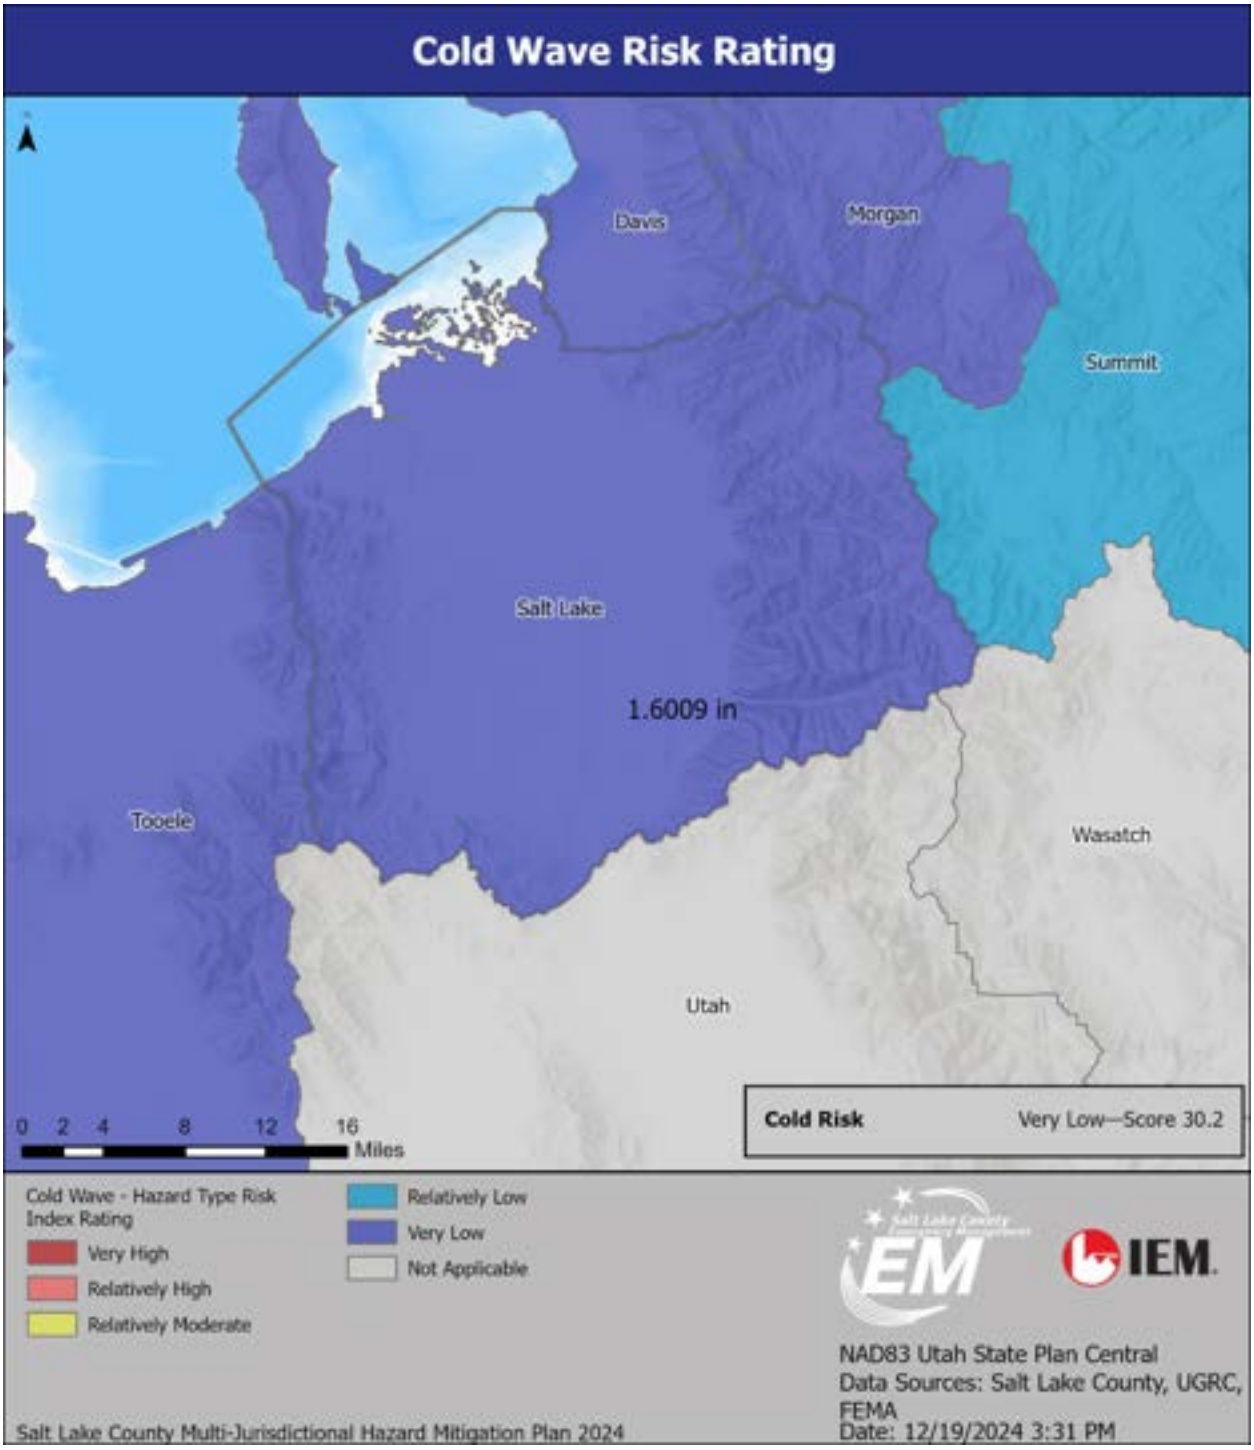

Figure 97: National Risk Index Cold Wave Risk Map, Rating, and Score for Salt Lake County[120]

[120] FEMA. "National Risk Index." 2023. https://hazards.fema.gov/nri/map.

Extreme Heat

Figure 98: Image of Hot Sun[121]

Hazard Description

Temperatures in Utah can be extreme. Summer temperatures are regularly in the 90s and exceed 100 degrees Fahrenheit on many days. Drastic temperature changes also occur, even in a matter of hours. Extreme heat can cause severe physical stress or illness in people.

Extreme heat is summertime weather that is substantially hotter and/or more humid than average for a location at that time of year. Extreme heat causes discomfort and can affect personal health through heat cramps, heat exhaustion, or heat stroke. This can particularly affect vulnerable populations, such as the very young, elderly, poor, and homeless. Extreme heat places a substantial burden on power grids through widespread use of evaporative coolers and air-conditioning. This strain can lead to brownouts or blackouts, leaving many without power.

Hazard Profile

Potential Impact		Catastrophic	**Probability**	X	Highly Likely
	X	Critical			Likely
		Limited			Occasional
		Negligible			Unlikely
Location	Can occur in areas throughout the county				
Seasonal Pattern	Summer months				
Conditions	Vary based on latitude, elevation, aspect, and landforms				
Duration	Extreme heat generally persists for days				
Secondary Hazards	Drought, wildfire, health conditions				

[121] https://pixabay.com/photos/sunset-sun-sky-clouds-orange-2180346/.

Potential Impact		Catastrophic	**Probability**	X	Highly Likely
	X	Critical			Likely
		Limited			Occasional
		Negligible			Unlikely
Analysis Used	National Climate Data Center, National Weather Service, Utah Division of Emergency Management, local input, and review of historic events and scientific records				

Magnitude/Extent

The heat index is a measure of what different temperatures feel like to the human body. It combines air temperature with relative humidity because humidity reduces the body's ability to cool itself through the evaporation of perspiration. Humidity is typically low in Salt Lake County.

The highest temperature ever recorded in Salt Lake City was 107ºF on July 17, 2022. This year also had the highest number of days in one month with a temperature of 100ºF or greater, and 29 days above 95ºF.[122] The average maximum temperature in July in the county is around 91ºF.

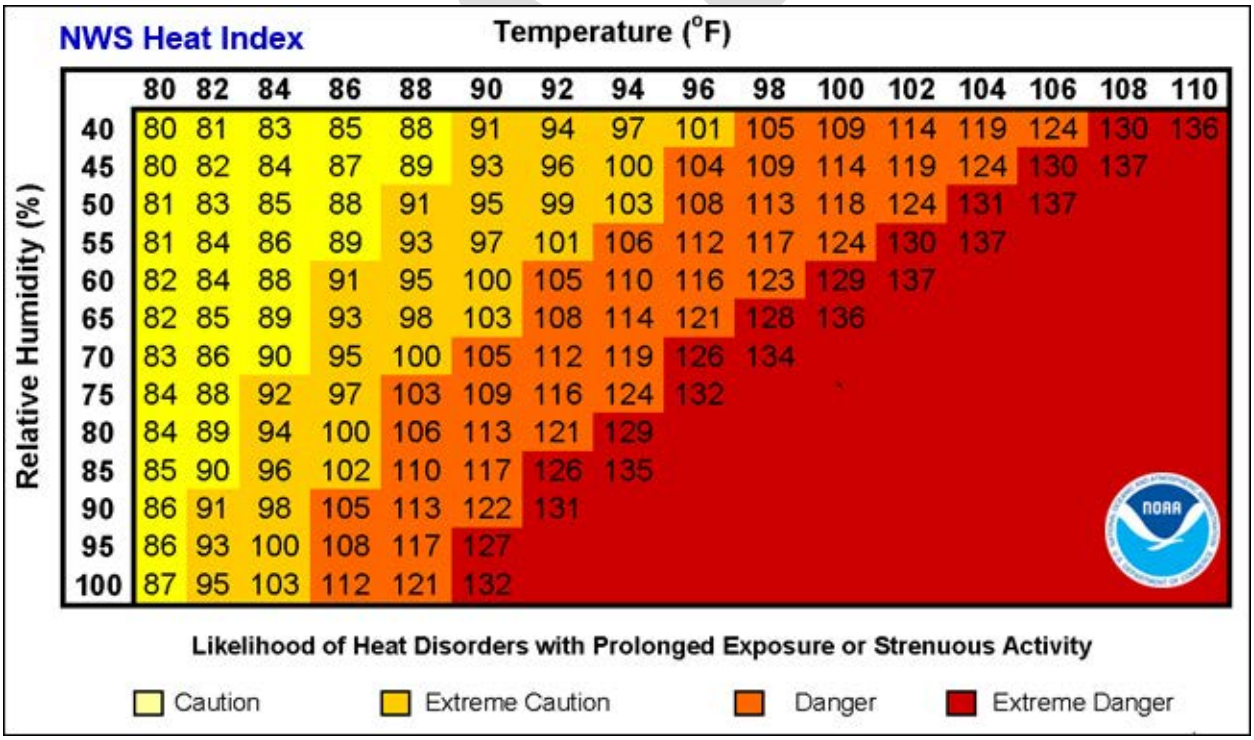

Figure 99: National Weather Service Heat Index Chart

Location

The entire county is at risk of extreme heat events. Most of the development in Salt Lake County has taken place in the central valley. Communities with dense development and with limited open green

[122] National Weather Service. "Salt Lake City Climate Book." 2024. https://www.weather.gov/slc/climatebook#PDFS.

space are at greater risk during extreme heat events. Urban areas tend to absorb more heat and release it slower during the evening than rural areas, leading to overall higher temperatures. This is known as the urban heat island effect. Temperatures tend to be lower at the higher elevations in the mountainous areas of the county, but these areas can be affected when temperatures exceed typical levels.

One cascading impact of extreme heat is wildfire risk. The Wildfire Urban Interface include communities, such as Hi-Country Estates One and Two and Mt. Aire in unincorporated Salt Lake County, Draper, and Emigration Canyon. These areas are at high risk of wildfires that result from drought related to extreme heat.

Historical Events and Probability of Future Occurrences

Based on the FEMA Disaster Declarations Database, Salt Lake County has received no designation for extreme heat disaster declarations since the last plan update. The NCEI Storm Events Database includes two excessive heat events in 2021 affecting the Salt Lake Valley and Great Salt Lake Desert areas. On June 6, 2023, average temperatures were 19 degrees above average.

As previously stated, the highest temperature ever recorded in Salt Lake City was 107ºF in 2022. NOAA has not recorded any extreme heat events or any corresponding deaths or injuries in Salt Lake County. However, mild events have occurred with moderate regularity and will continue to occur. The Climate Risk and Resilience Portal (ClimRR) Heat Index Explorer provides a visual overview of the projected increase in maximum summer heat index values (Figure 100).[123]

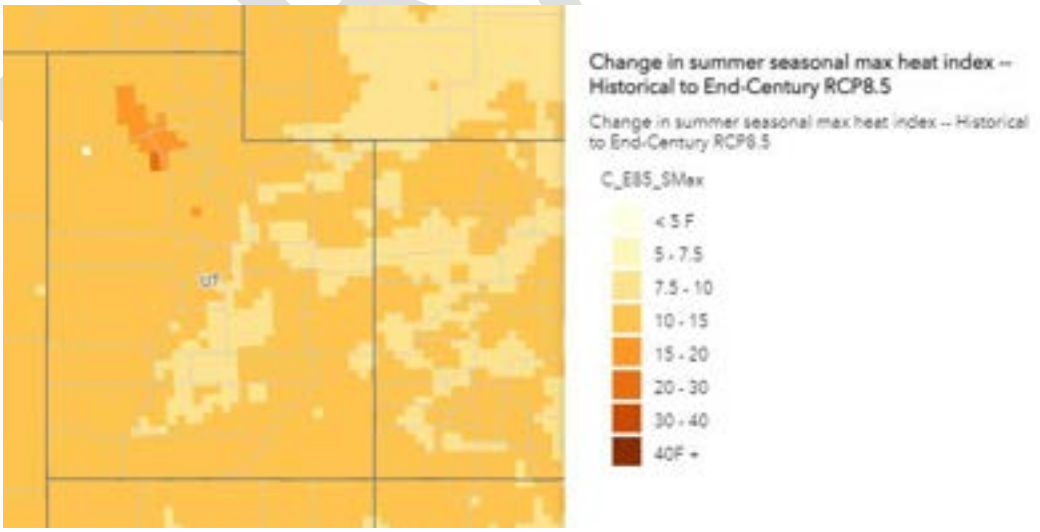

Figure 100: Projected Changes in the Heat Index for Utah Until 2021 by the Climate Risk and Resilience Portal

[123] Argonne National Laboratory. "ClimRR Heat Index Explorer." 2023. Climate change can also have a significant impact directly on the natural hazard of extreme heat. Climate change can cause warmer summer temperatures, which increases the hotter seasons while decreasing colder seasons resulting in less snowpack for the year. This shift can affect water resources, local ecosystems that thrive on cold weather, and winter recreational activities. This ultimately results in shorter and less severe winters, which can drastically impact the economy, as Salt Lake County thrives on the ski industry during the winter months.
https://disgeoportal.egs.anl.gov/portal/apps/webappviewer/index.html?id=06a52da514364cfab2eab106c247f6c3.

Salt Lake County experiences temperatures above 100˚F nearly every summer and 8 days each year on average. The record for the number of days over 100˚F was broken in 2022, with 34 days. The frequency of past events indicates that future probability is highly likely.

Climate Change Considerations

Climate change can also have a significant impact on the natural hazard of extreme heat. Climate change can cause higher summer temperatures, which lengthens the hotter seasons and shortens colder seasons resulting in less snowpack for the year. This shift can affect the availability of water in the summer months.

There is strong evidence that extreme heat will continue to increase with worsening climate change. The CMRA tool provides projections for future conditions of various hazards based on lower and higher emission scenarios for early, mid-, and late century. This tool projects a significant increase in the number of days with maximum temperatures exceeding 100ºF in mid- and late century for both emission models (Figure 101). It also projects an increase in the annual highest maximum temperature and in cooling-degree days, a measure of the energy needed for air-conditioning or refrigeration.[124]

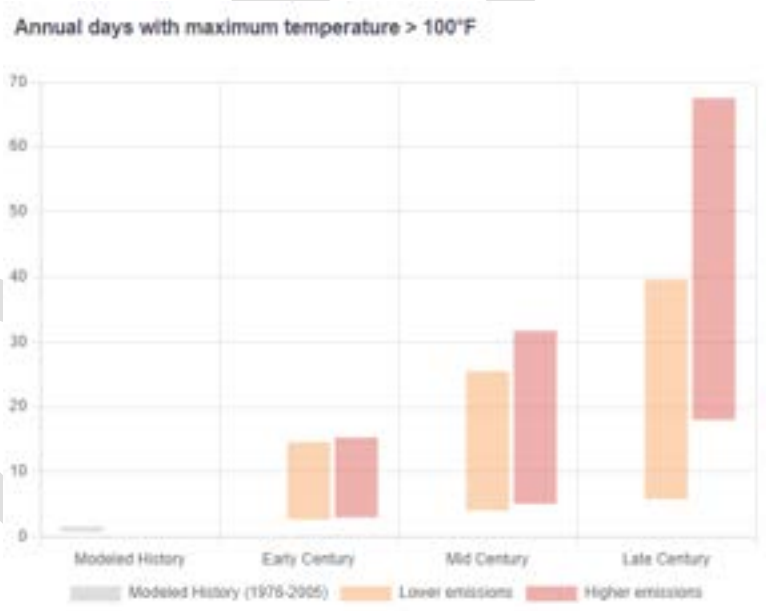

Figure 101: Projected Number of Days Each Year with Temperatures Exceeding 100ºF

Secondary Hazards

One of the most significant secondary hazards associated with excessive heat events is the failure of motorized systems, such as ventilation systems used to control temperatures inside buildings. In other parts of the country, extreme heat has contributed to widespread power outages. Heat can cause roads to buckle and may cause road closures for emergency repairs. Extreme heat can also raise the risk of

[124] NOAA. “Climate Mapping For Resilience and Adaptation.” 2022. https://livingatlas.arcgis.com/assessment-tool/explore/details.

wildfires as vegetation dries out, which allows fires to ignite and spread more rapidly. Furthermore, extreme heat can exacerbate drought conditions.

Vulnerability Assessment

The primary concern with extreme heat is heat-related illnesses, such as dehydration, heat exhaustion, and heat stroke. This is especially concerning for the county in the summer event season. There are many summer events in the county, and if temperatures continue to increase and there are not adequate resources (EMS staff, drinking water, restrooms, shade), it can pose significant health issues. The entire population may be at risk of the effects of heat, but extreme heat might have disproportionate impacts on some populations. Extreme heat can increase demand for power and water resources. Increased demand for healthcare services can put a strain on providers. In addition, the population may not contribute as much to the local economy (eating out, festivals, etc.) because of the heat.

ESTIMATED IMPACT AND POTENTIAL LOSSES

Extreme heat can have significant health impacts on the individuals, including severe sickness and possibly death. Individuals particularly at risk are discussed in the section on Vulnerable Populations.

Heat can cause spikes in energy use as demand for air-conditioning increases. This can strain power grids and may lead to outages during peak use. Increased energy use raises financial costs for residents and businesses. Damage to roadways from heat-related buckling can require costly emergency repairs and may cause secondary disruptions while transportation routes are closed.

Natural systems can also be impacted by extreme heat. Rising temperatures can affect wildlife habitats, diminish the health of vegetation, and disrupt ecosystems. Extreme heat can contribute to an increase in evaporation rates, reduce water availability for agriculture and recreation, and exacerbate the effects of drought. Therefore, heat can lead to agricultural losses.

The NRI includes data on the EALs attributed to individual natural hazards, historical losses, and overall risk at the county and Census tract levels. Salt Lake County's NRI EAL value for heat waves is $2.1 million, with a risk score of 95.3 and a rating of "relatively high" compared with the rest of the United States (Figure 102).

DRAFT

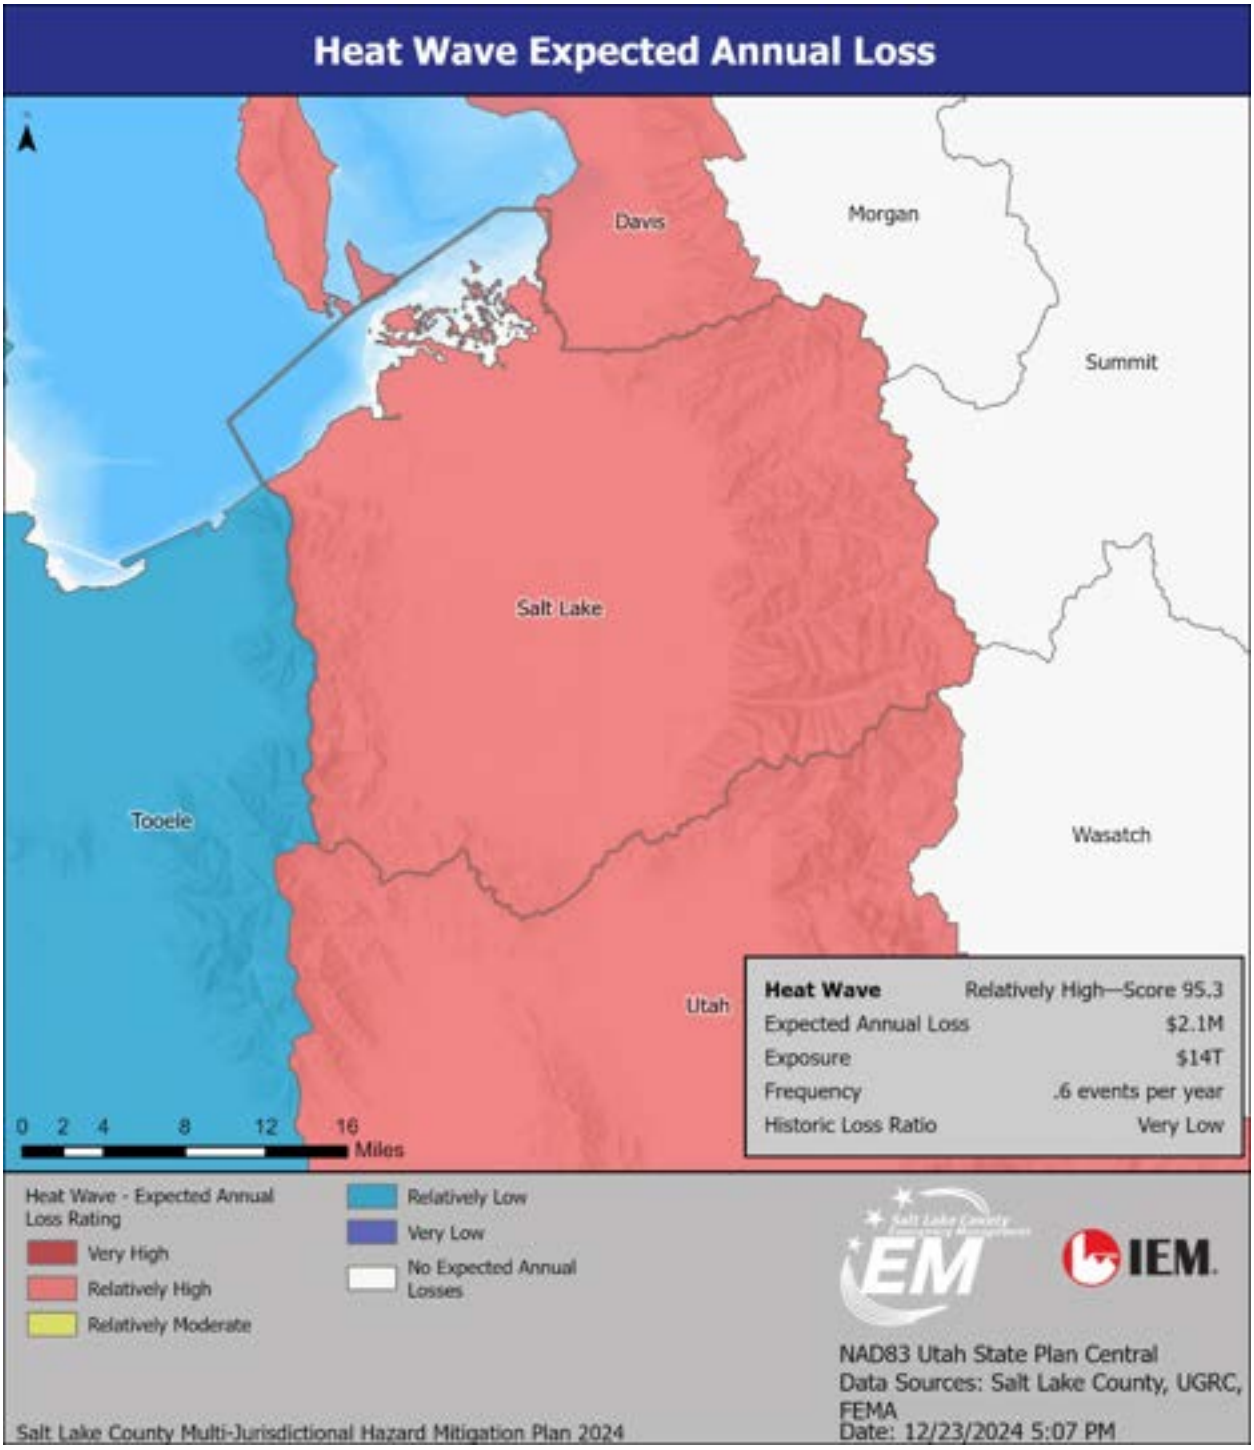

Figure 102: National Risk Index Expected Annual Loss from Heat Waves in Salt Lake County[125]

[125] FEMA. "National Risk Index." 2023. https://hazards.fema.gov/nri/map.

VULNERABLE POPULATIONS

Several populations are more vulnerable to extreme heat events, face isolation and exposure during extreme heat events, or can suffer more secondary effects of the hazard. Young children and the elderly are more susceptible to extreme heat due to their bodies' inability to regulate temperature as effectively. The chronically ill and elderly might have underlying health conditions or take prescription medications that interfere with the body's ability to dissipate heat. Even young and healthy individuals can succumb to heat if they participate in strenuous physical activities during hot weather. Males tend to experience a higher rate of dehydration than females. Outdoor workers may not have enough breaks, adequate hydration, or a place to adequately cool themselves.

Extreme heat can disproportionately affect people with socioeconomic disadvantages. Lower-income households may not have functioning air-conditioning or may be reluctant to use it due to energy costs. Unhoused populations are highly vulnerable to severe weather hazards. These individuals may seek access to public spaces to escape the heat.

COMMUNITY LIFELINES

Extreme heat primarily affects public health, which may impact demands on the health and medical lifeline, but it can also affect the energy and transportation lifelines. The importance of these lifelines cannot be overstated. In a disaster, communities can be left without access to necessities, such as food, water, and shelter. The lifelines help ensure that these needs are met and that people have the resources they need to survive. By providing access to medical care, public health services, and transportation, the lifelines enable people to receive the care they need and safely evacuate if necessary. Community lifelines help create a sense of safety and security in a community. They provide a safety net for individuals who may be struggling and offer comfort and reassurance that help is available when needed. Without these lifelines, communities would be much more vulnerable to crises and emergencies.

CHANGES IN DEVELOPMENT

In Salt Lake County, development and population growth can have profound impacts on extreme heat as the growing population is increasing the demand for energy during the summer months, and that may strain the system. This could lead to blackouts or brownouts during periods of extreme heat. An increase in infrastructure due to population growth can exacerbate the effects of extreme heat by creating urban heat islands, which can lead to more significant temperature fluctuations and more intense heat waves.

High levels of increased development and density, especially in outlying cities and towns like Herriman and South Jordan, can lead to increased temperatures during extreme heat events. Removing vegetation and increasing the amount of pavement and buildings traps heat at ground level, increasing the vulnerability of those who cannot find a place to cool off.

Potential impacts from extreme heat are loss of life/property, poor air quality, and power grid failure. As the population in Salt Lake County continues to grow, the potential for these negative impacts increases. Energy demands also may rise. In addition, the unhoused population has also grown in recent years, which creates more of a challenge to provide enough cooling centers in the county and the staffing

DRAFT

needed to adequately manage the cooling centers. Overall vulnerability to extreme heat has increased since the last plan update.

VULNERABILITY SCORE

In the 2024 update, the NRI was used as the primary tool for analyzing the county's vulnerability to severe weather. The NRI defines risk as the potential for negative impacts as a result of a natural hazard and determines a community's risk relative to other communities by examining the EAL and social vulnerability of a given community in relation to that community's resilience. Salt Lake County's NRI heat wave risk rating is shown in Figure 103. The county has a "relatively moderate" heat wave risk rating, and a risk score of 94.6.

DRAFT

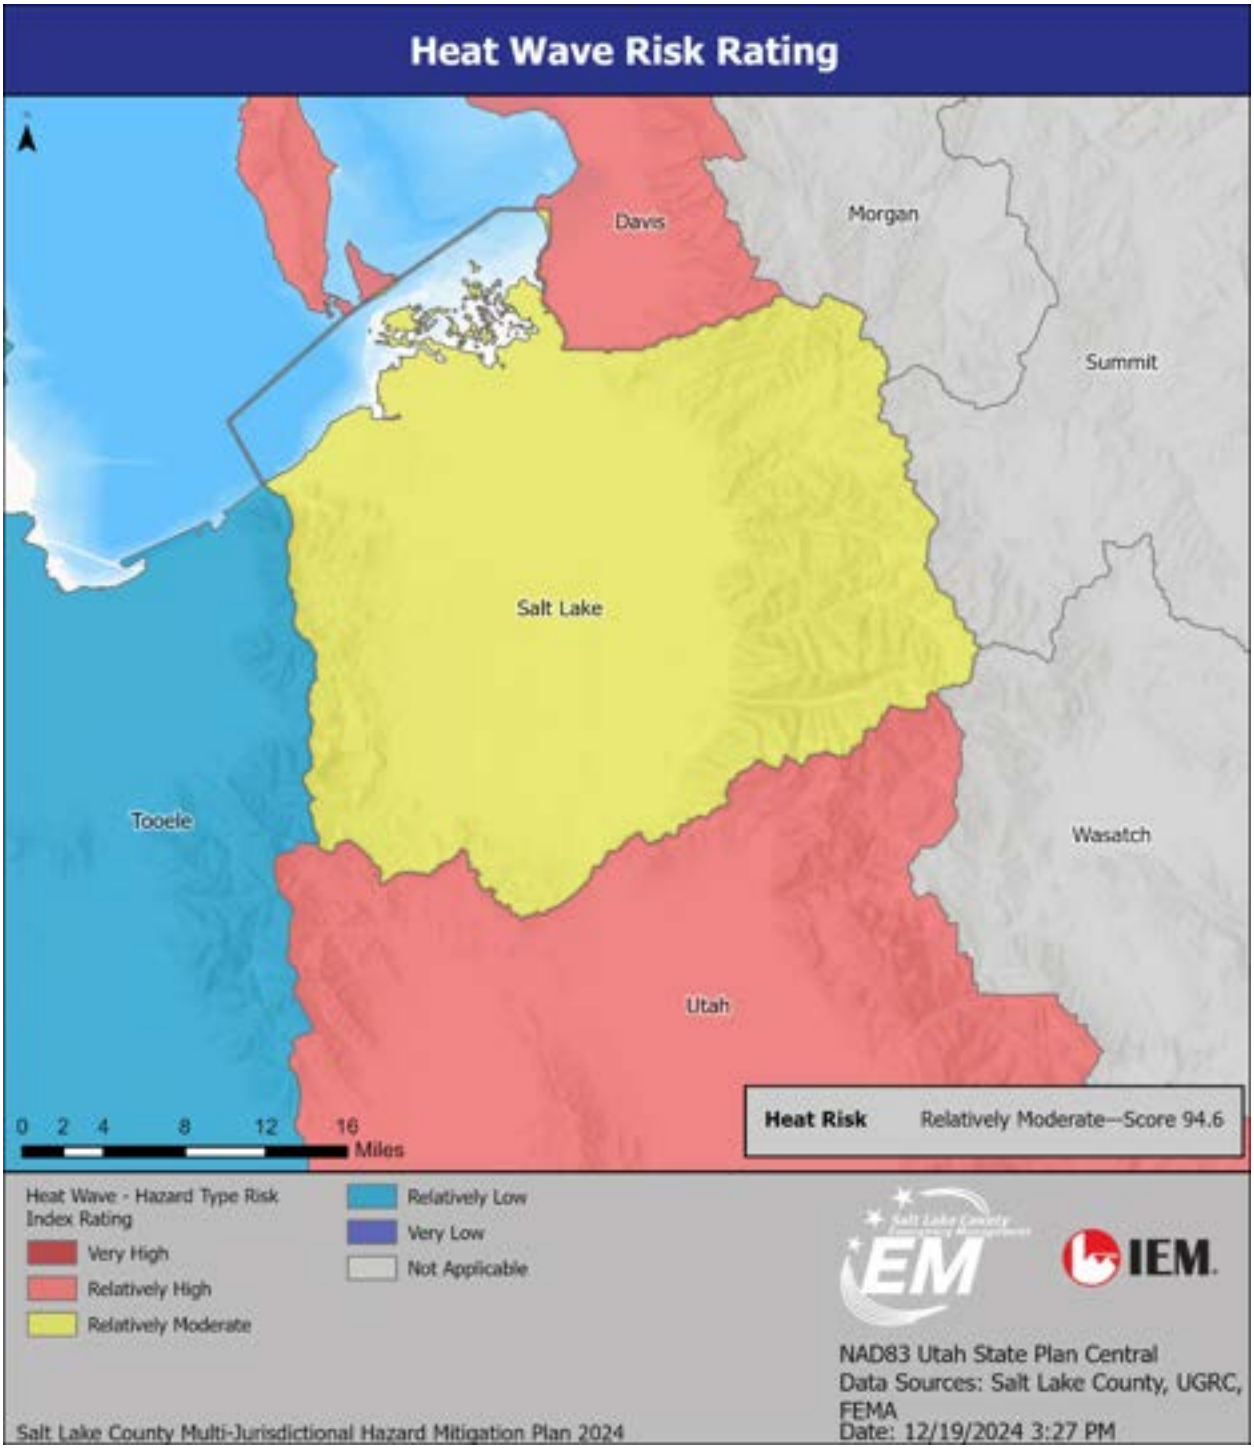

Figure 103: National Risk Index Heat Wave Risk Map, Rating, and Score for Salt Lake County[126]

[126] FEMA. "National Risk Index." 2023. https://hazards.fema.gov/nri/map.

Flooding (Urban/Flash Flooding and Riverine Flooding)

Hazard Description

Floods can be caused by fast snowmelt, heavy rainfall, or failure of natural or engineered impoundments onto riverbanks and adjacent floodplains. Floodplains are lowland areas near rivers, lakes, reservoirs, oceans, and low-terrain urban areas that are subject to recurring floods. Stream flooding occurs when the peak discharge, or rate of flow in cubic feet per second (cfs), is larger than the channel of the river or storm sewer capacity. In Salt Lake County, floods are typically localized events running out of mountain canyons. Urban areas are also prone to flooding because urban development, such as buildings, streets, and parking lots, prevent water infiltration into the soil and greatly increase runoff. Undersized piping, human-made drainage channels, or debris that obstructs passageways may further contribute to flooding. Flood damage includes saturation of land and property, erosion, deposition of mud and debris, and fast-flowing water. Most injuries and deaths occur from fast-moving floodwaters while most property damage results from inundation by sediment-filled water.

Figure 104: Image of Flooded Park[127]

SPRING RUNOFF/SNOWMELT FLOODS

These are caused by rapid spring snowmelt of mountain snowpack. Intense spring rainfall contributes to the flood scenario, causing additional rapid river rises. These events can last for weeks during the spring (generally April–June) and may cause loss of life and extensive damage affecting property owners and municipalities. Snowmelt risk is greatest when snowpack is at or above normal levels and/or accompanied by an abrupt warming trend.

[127] https://pixabay.com/photos/flood-park-bench-flooded-red-123222/.

FLASH FLOODS

Flash floods are caused by intense thunderstorms and the resulting heavy rainfall. Heavy rainfall may occur in areas of sparse vegetation, steep slopes, and impervious surfaces, and is then channeled into smaller waterways or conduits. Once runoff begins to accumulate across the basin, its volume and speed typically increase rapidly. Flash flood events, while often short-lived, are very dangerous for those caught in a confined area, such as a canyon, when the flood occurs. Flash flooding has caused 34 fatalities in Utah since 1950. In 2015, there were 20 fatalities, including seven at Zion National Park.

Areas of localized flooding may occur in urban areas not associated with existing waterways. Rain may accumulate in low-lying areas with no outlet or where storm drains have become overwhelmed. These types of floods and the resulting impacts are difficult to anticipate due to the uncertainty of when and where such storms will occur.

LONG-TERM RAINFALL EVENTS

These rain events typically occur in the fall or winter months. They are produced by large synoptic weather systems originating out of the south, southwest, or west that produce rainfall for an extended period. The rainfall may cause some snow to melt, potentially causing more significant runoff. This occurs mainly in the southern half of the state.

POST-FIRE DEBRIS FLOW FLOODING

Enhanced runoff conditions from a fire-damaged watershed can cause debris flow flooding. As fires burn, they destroy vegetation and leave soil in a hydrophobic state, resulting in greater peak flows. This issue is discussed further in the section on Wildfire.

Hazard Profile

Potential Magnitude		Catastrophic	**Probability**	X	Highly Likely
	X	Critical			Likely
		Limited			Occasional
		Negligible			Unlikely
Location	Largely in and along floodplains; debris flows can cause natural damming of water if nearby streams become blocked				
Seasonal Conditions	Spring, heavy rainfall, and spring snowmelt runoff				
Conditions	Thunderstorms with heavy rainfall, extended wet periods				
Duration	Flooding can last anywhere from hours to days and even months				
Secondary Hazards	Raw sewage/health risk, electrical fires, gas spills				
Analysis Used	Review of Flood Insurance Study, Flood Insurance Rate Maps, U.S. Army Corps of Engineers Flood Study, Hazus				

DRAFT

Magnitude/Extent

Floods can range in magnitude from minor to catastrophic. The frequency and severity of flooding are measured using a discharge probability, which is the probability that a certain river discharge (flow) level will be equaled or exceeded in a given year. Flood studies use historical records to determine the probability of occurrence for the different discharge levels. The flood frequency equals 100 divided by the discharge probability.

- **1% Special Flood Hazard Area – SFHA (1% annual chance of flooding, sometimes referred to as a 100-year flood):** Applies to an area that has a 1% chance, on average, of flooding in a given year. However, a 100-year flood could occur two years in a row, or once every 10 years. This flood hazard area is also referred to as the base flood. Some agencies use the term "1% annual exceedance probability."
- **0.2% Special Flood Hazard Area (0.2% annual chance of flooding, sometimes called a 500-year flood):** A 0.2% floodplain is an area at risk of flooding from a creek or other waterway overflowing during a 0.2% (500-year) flood. Structures in a 0.2% area have a minimum of a 0.2% chance of flooding in a given year.

Location

Flooding in Salt Lake County is typically the result of excessive snowmelt runoff and/or heavy rainfall. Snowmelt flooding is usually the result of rapid melting of snowpack, occurring from April through June along the major existing streams and waterways. High-intensity, short-duration heavy rainfall occurs over a relatively small area in the summer months. However, flooding can also occur due to non-thunderstorm rainfall events.

The major waterways in the county include the Jordan River, Big and Little Cottonwood Creeks, Parley's Creek, Emigration Creek, Red Butte Creek, City Creek, and Millcreek. Smaller waterways include Bingham Creek, Midas Creek, Rose Creek, Corner Canyon Creek, Dry Creek, Wood Hollow, Willow Creek, and Barney's Creek. All can flood. However, significant flood mitigation measures implemented following the major floods of 1983–1984 have greatly reduced the flood threat.

The flow of the Jordan River from Utah Lake into Salt Lake County is controlled, somewhat reducing the flood potential upstream of the major Jordan River tributaries. Parley's Creek has flood storage capacity at Mountain Dell and Little Dell Reservoirs and is routed through a retention basin in Sugarhouse Park. Big and Little Cottonwood Creeks have a number of smaller flood storage lakes and ponds providing some flood protection, such as Wheeler Historic Farm. In Salt Lake City, Emigration Creek and Red Butte Creek come together at 700 East and 1300 South and can be discharged in or bypass Liberty Park pond. Parley's Creek discharges to the 1300 South drain at State Street.

Areas to monitor include 1300 South between 700 East and State Street, 700 West, and North Temple Streets. Retention ponds are also used to store runoff from commercial and residential development areas.

DRAFT

Maps visually showing the probable boundaries of a 100-year (1% annual chance) and 500-year (0.2% annual chance) flood event can be found in the Vulnerability Assessment portion of this hazard profile.

Historical Events and Probability of Future Occurrences

Based on the FEMA Disaster Declarations database, Salt Lake County has received no designation for flooding Disaster Declarations since the last plan update.

According to NOAA data, there have been 44 flood/flash flood events in Salt Lake County since 1996. Property damage was approximately $31.627 million, with an additional $1,000 in crop damage.

Figure 105: Image of a Flooded Road[128]

The following flood events are of notable significance:

- **April 13, 2023:** A State of Emergency was declared for Salt Lake County over the spring runoff flooding that affected the Wasatch Front. The areas most affected by the flooding were along Red Butte Creek, Emigration Creek, City Creek, Big Cottonwood Creek, Little Cottonwood Creek, and Millcreek. Voluntary evacuations along Emigration Creek in downtown Salt Lake City included the evacuation of up to 40 homes.
- **2017:** Thunderstorms producing heavy rainfall moved into the Salt Lake Valley in the early morning hours of July 26 and persisted for three to four hours, producing widespread flash flooding.
- **2015:** Heavy rain caused road, parking lot, and basement flooding in the Sugarhouse and Foothill areas of Salt Lake City.
- **2014:** Heavy rain during the early morning hours of August 20 led to flooding in West Jordan and Murray.
- **2011:** Large snowpack meant larger resulting spring runoff flows.
- **2010:** Spring snowmelt combined with heavy rains caused several streams to overtop their banks.

[128] Pixabay. https://pixabay.com/photos/flooded-road-flood-flooding-storm-5330617/.

- **1987:** Great Salt Lake reached its all-time maximum water level (4,211.6 feet).
- **1983:** Large snowpack was coupled with a rain-on-snow event (City Creek diverted down State Street).
- **1983/1984:** Large snowpack overwhelmed Utah Lake and affected Jordan River downstream, causing the flooding of City Creek in downtown Salt Lake City.
- **1952:** Rapid melt of a large snowpack

Utah has received seven Presidential Disaster Declarations related to flooding: in 1983, 1984, two in 2005 (in Southern Utah), two in 2012, and one in 2017. Following the events of 1983–1984, an enormous amount of mitigation was completed along the urban areas of the Wasatch Front. An advanced water-monitoring network of stream gauges, snow telemetry (SNOTEL

) sites, and automated stream flow gates provided warnings of elevated flows. The State of Utah constructed a county flood control project that installed pumps on the Great Salt Lake to pump excess water into the west desert. Figure 106 shows the Salt Air Resort, now a concert venue called the Great Saltair, on the southeast shore of the Great Salt Lake during the flood years of the 1980s.

Figure 106: Flooding of the Great Salt Lake at the Saltair Resort

During the past 149 years, the Great Salt Lake peaked above 4,211 feet three times: 4,211.60 feet in June 1873, 4,211.50 feet in June 1986, and 4,211.60 feet in June 1987. Figure 107 shows statistical data on Great Salt Lake elevations from 2007 to 2024.

DRAFT

Figure 107: Elevations of the Great Salt Lake, 2007–2024[129]

Depending on the amount of snowfall in the winter and its melting speed, flows can vary dramatically from year to year. Nevertheless, flood mitigation is on every jurisdiction's mind each spring, and a myriad of mitigation plans are in place to prevent damage. There is no question that flooding will continue to occur in the future. As previously stated, NOAA data recorded 32 flooding events from 1996 to 2018, for an average of approximately 1.4 flooding events per year. Salt Lake County is highly likely to experience at least this average amount of flooding going forward.

Climate Change Considerations

Climate change can have a significant impact on flooding. Climate change can alter precipitation patterns and increase the intensity of severe storms. This combined with population growth and urbanization can lead to severe flooding. Higher temperatures can also lead to more precipitation falling as rain rather than snow, which can also cause higher runoff and increased risk of flood. All of these changes can lead to more frequent severe flash floods, especially in urban areas with impervious surfaces that prevent the natural absorption of water.

The 2024 State Enhanced Hazard Mitigation Plan states that for decades, climate change experts, government reports, and academic literature have predicted an increase in precipitation intensity. The theoretical basis for these predictions was strong, though studies of actual trends in precipitation records did not detect significant changes in precipitation in the state of Utah.

[129] Utah.gov, Utah Division of Water Resources. "Great Salt Lake Elevation Chart." 2024. https://greatsaltlake.utah.gov/current-conditions.

One clear trend in precipitation with implications for flooding is the change in snowpack. Since 1955, the snowpack has peaked earlier, with a reduced season length. These trends are expected to continue into the foreseeable future. Due primarily to increasing air temperature, the proportion of precipitation that falls as snow will continue to decline. Warmer conditions are simply less likely to produce snow. Also, warmer conditions cause the snow line, the lowest elevation at which snow falls, to recede. As the snow line moves upward, the area receiving snowfall is reduced.

Secondary Hazards

One of the most problematic secondary hazards for flooding is bank erosion, which in some cases can be more harmful than the flooding itself. This is especially true in the upper courses of rivers with steep gradients, where floodwaters may pass quickly without causing much damage but may scour the banks, edging properties closer to the floodplain or causing them to fall in. This may also occur in areas with soft soils that are prone to erosion. Hazardous materials spills are a secondary hazard of flooding if storage tanks rupture and spill into streams, rivers, or storm sewers. If flooding is severe enough, infrastructure failure can occur, delaying the delivery of vital services. If enough residential structures are impacted, this can put extreme stress on emergency housing and shelter capabilities, not to mention the social fabric of the community.

Vulnerability Assessment

The vulnerability of people and infrastructure to flooding hazards in Salt Lake County was obtained from the modeling program Hazus. The Hazus flooding scenarios, which are the basis for the vulnerability and loss estimates in this section, entail both a 100-year and a 500-year flood occurring in Salt Lake County (1% and 0.2% annual risk, respectively). Hazus uses FEMA FIRM boundaries and digital elevation model data to generate flood depth grids and then uses these depth grids, general building stock data, and damage functions to estimate the level of damage to structures and other social and economic impacts on the region.

Hazus estimates that there are 360,243 buildings in the region with a replacement value of $172 billion. Of the building exposure, 61% is from residential structures. There are 16 hospitals, 67 fire stations, 33 police stations, 18 EOCs, and 422 schools.

ESTIMATED IMPACT AND POTENTIAL LOSSES

ESSENTIAL FACILITY DAMAGE

Hazus estimates that there are 2 fire stations, 3 schools, and 4 county facilities in the area of the 100-year flood scenario (1% annual chance) for Salt Lake County. There is 1 EOC, 22 county facilities, three fire stations, and 13 schools in the 500-year flood scenario (0.2% annual chance). No essential facility is estimated to receive substantial or moderate damage from a 100-year event. For a 100-year event, 3 schools and 2 fire stations are estimated to receive at least moderate damage during the scenario, and 1 fire station and 3 schools are estimated to experience loss of use. For a 500-year event, 1 EOC, 3 fire stations, 2 police stations, and 9 schools are estimated to receive at least moderate damage during the

DRAFT

scenario; 4 schools are estimated to receive at least substantial damage; and 2 fire stations and 8 schools are estimated to experience loss of use.

Table 50 and Table 51 list the facilities in the 1% annual chance and 0.2% annual chance floodplain across various jurisdictions in Salt Lake County. For the 1% annual chance floodplain, most areas, such as Alta, Bluffdale, Brighton, and Copperton, have no facilities at risk. However, Herriman, Millcreek, Salt Lake City, and Sandy City each has one county facility in the 1% annual chance floodplain. Millcreek and Salt Lake City also have one fire station in the 100-year floodplain while West Valley City has three schools at risk.

Much like the 1% annual chance floodplain, the 0.2% annual chance floodplain contains very few jurisdictions with facilities in it. However, Salt Lake City has a significant number of facilities, including 1 fire station, 4 schools, and 6 county facilities. The South Salt Lake area also has a notable presence, with 1 EOC, 1 fire station, 3 schools, and 5 county facilities. Other areas at risk include Millcreek, with 1 fire station and 2 schools, and West Valley City, with 3 schools and 1 county facility. The areas of Cottonwood Heights, Herriman, Murray, Sandy, Taylorsville, and West Jordan each have at least one county facility in the 0.2% annual chance floodplain. Figure 108 to Figure 114 show the locations of these facilities.

School facilities were summarized in the jurisdictions where they are located. No Jordan School District facilities were identified in SFHAs. One school is in the 0.2% SFHA in Draper, which is in the Canyons School District.

ECONOMIC LOSS

For a 1% annual chance event, the estimated economic loss is $882 million, which represents 4.08% of the replacement value of the scenario buildings. Residential occupancies make up 21.82% of the losses. For a 0,.2% annual chance event, the estimated economic loss is $3.74 billion, which represents 12.10%

of the replacement value of the scenario buildings. Residences make up 22.46% of the losses for the 500-year scenario.

Economic loss is measured by building losses, which can be broken up into two categories: direct building loss and business interruption loss. Direct building losses are based on the estimated costs to repair or replace damage caused to the building and its contents by flooding. Business interruption losses are those associated with the inability to operate a business because of the damage from the flood. This includes income and wage losses, relocation losses, and rental losses, including temporary living expenses for people displaced from homes because of the flood. Of the estimated losses for the 100-year event, 57% were business-related losses.

The Hazus loss estimation for a 100-year flood shows West Valley City experiencing the highest loss at $240,346,000, with significant losses reported in Millcreek ($62,084,000), Brighton ($60,644,000), and Salt Lake City ($100,225,000). Several areas, such as Alta, Copperton, Kearns, and White City, experienced no losses in the 100-year Hazus loss estimation model. Other notable losses include Cottonwood Heights with $29,283,000, Holladay with $35,703,000, and South Salt Lake with $39,331,000. Less significant losses were noted in areas like Bluffdale ($3,080,000), Draper ($9,938,000), and Riverton ($5,885,000).

The Hazus loss estimation for a 500-year flood shows Draper and South Salt Lake experiencing the highest loss at $344,540,000 and $901,473,000, respectively, with significant losses in Millcreek ($737,529,000), Cottonwood Heights ($169,963,000), and Salt Lake City ($399,620). Much like the 100-flood loss estimation, areas such as Alta, Copperton, and Kearns experienced no losses in the Hazus model. Other notable losses included Bluffdale ($7,534,000) and Magna ($2,728,000).-

Table 52 and Table 53 show the estimated direct losses and business interruption losses for each jurisdiction in the planning area for the 1% annual chance (100-year) and 0.2% annual chance (500-year flood) scenarios, respectively.

DIRECT BUILDING DAMAGE AND LOSS

For a 100-year flood scenario, Hazus estimates that about 352 buildings will be at least moderately damaged and 30 will be completely destroyed. For a 500-year flood scenario, Hazus estimates that about 1,773 buildings will be at least moderately damaged and about 806 will be completely destroyed. Table

54–Table 57 show the number of buildings damaged by occupancy type and building type for both the 100-year and 500-year scenarios.

As shown in Table 58 and Table 59, the building-related losses for a 100-year flood event were $81.22 million. About 55% of the estimated losses were related to business interruptions in the region. Residential occupancies made up 39.74% of the loss. For a 500-year event, the building-related losses were $227.77 million. About 59% of the estimated losses were related to business interruptions in the region, and residential occupancies made up 36.39% of the loss.

Table 58: Building Related Economic Loss Estimates for a 100-Year Flood Event (In Millions)

Category	Area	Residential	Commercial	Industrial	Other	Total
Building Loss	Building	$94.28	$28.88	$15.64	$18.38	$157.19

DEBRIS REMOVAL

Table 60 shows how much debris would be generated by flooding and how many loads it would take to remove it, based on a capacity of 25 tons per load. One truck can likely haul one load per hour. A second debris removal issue is landfill space. At a weight-to-volume ratio of one ton per cubic yard, 50,000 tons would cover more than 10 acres to a depth of three feet.

For a 100-year flood, debris from finishes, structures, and foundations totals 12,464 tons. The debris significantly increases with all category types in a 500-year flood, resulting in 49,267 tons. This highlights the substantial increase in debris and the associated removal efforts required for more severe flood events in the county.

Table 60: Debris Generation and Removal

Category	100-year Flood	500-year Flood
Finishes	4,028	12,861
Structures	4,326	17,967
Foundations	4,110	18,438
Totals	**12,464**	**49,267**

SOCIAL IMPACT

Hazus estimates the number of households expected to be displaced from their homes due to the flood and the associated potential evacuation and how many displaced individuals will require accommodations in temporary public shelters. Displacement includes households evacuated from in or very near the inundated area. For a 100-year flood event, the model estimates that 3,119 households (9,356 individuals) will be displaced due to the flood. Of these, 2,043 individuals will seek temporary shelter in public shelters. For a 500-year flood event, the model estimates that 11,720 households (35,159 individuals) will be displaced due to the flood, with 4,089 individuals seeking temporary shelter.

Major flooding can impact the community by displacing residents and business owners; damaging and disrupting infrastructure, including roads and bridges, water treatment facilities, and wastewater treatment facilities; and causing health risks due to contaminated public water supplies and private wells. Heavy rains, severe flooding, or other types of emergency events could damage sewer systems and cause an overflow of untreated wastewater into communities and the environment. Severe flooding can put drinking water wells at increased risk of contamination from floodwater that may contain sewage. In addition, floodwater and standing water can be dangerous and expose vulnerable populations to infectious

DRAFT

diseases, chemical hazards, and injuries. Flooded homes may be contaminated with mold or sewage, which can cause health risks.[130]

Flooding can also lead to road closures. Banks can erode ground under roadways, which may cause long-term transportation disruptions while roads are rebuilt or repaired. Deaths and injuries typically occur when motorists become trapped in floodwaters. This can, though not always, occur when motorists ignore the advice of officials and drive through flooded areas. Flooding can also damage power, water, or communications infrastructure, causing further disruptions for residents and businesses.

NFIP PARTICIPATION

Salt Lake County and all cities participate in NFIP. Table 61 shows the number of NFIP policies in place for each jurisdiction in the county and the number of past losses and payments. 402 properties have experienced losses totaling $1,727,734.

Table 61: NFIP Policies for Salt Lake County and Jurisdictions

Community	Number of Policies	Total Coverage	Number of Losses	Total Net Payment

NATIONAL RISK INDEX

The NRI includes data on the EALs to individual natural hazards, historical loss, and overall risk at a county and census tract level. Salt Lake County's NRI EAL value for riverine flooding is $4.5 million, with a risk score of 92.7 and a relatively moderate percentile compared with the rest of the United States (Figure 119).

[131] Provided by the state floodplain program manager, citing the Utah 2024 State Enhanced Hazard Mitigation Plan. "Table 4-36-Flood Insurance Statistics for Utah Counties."

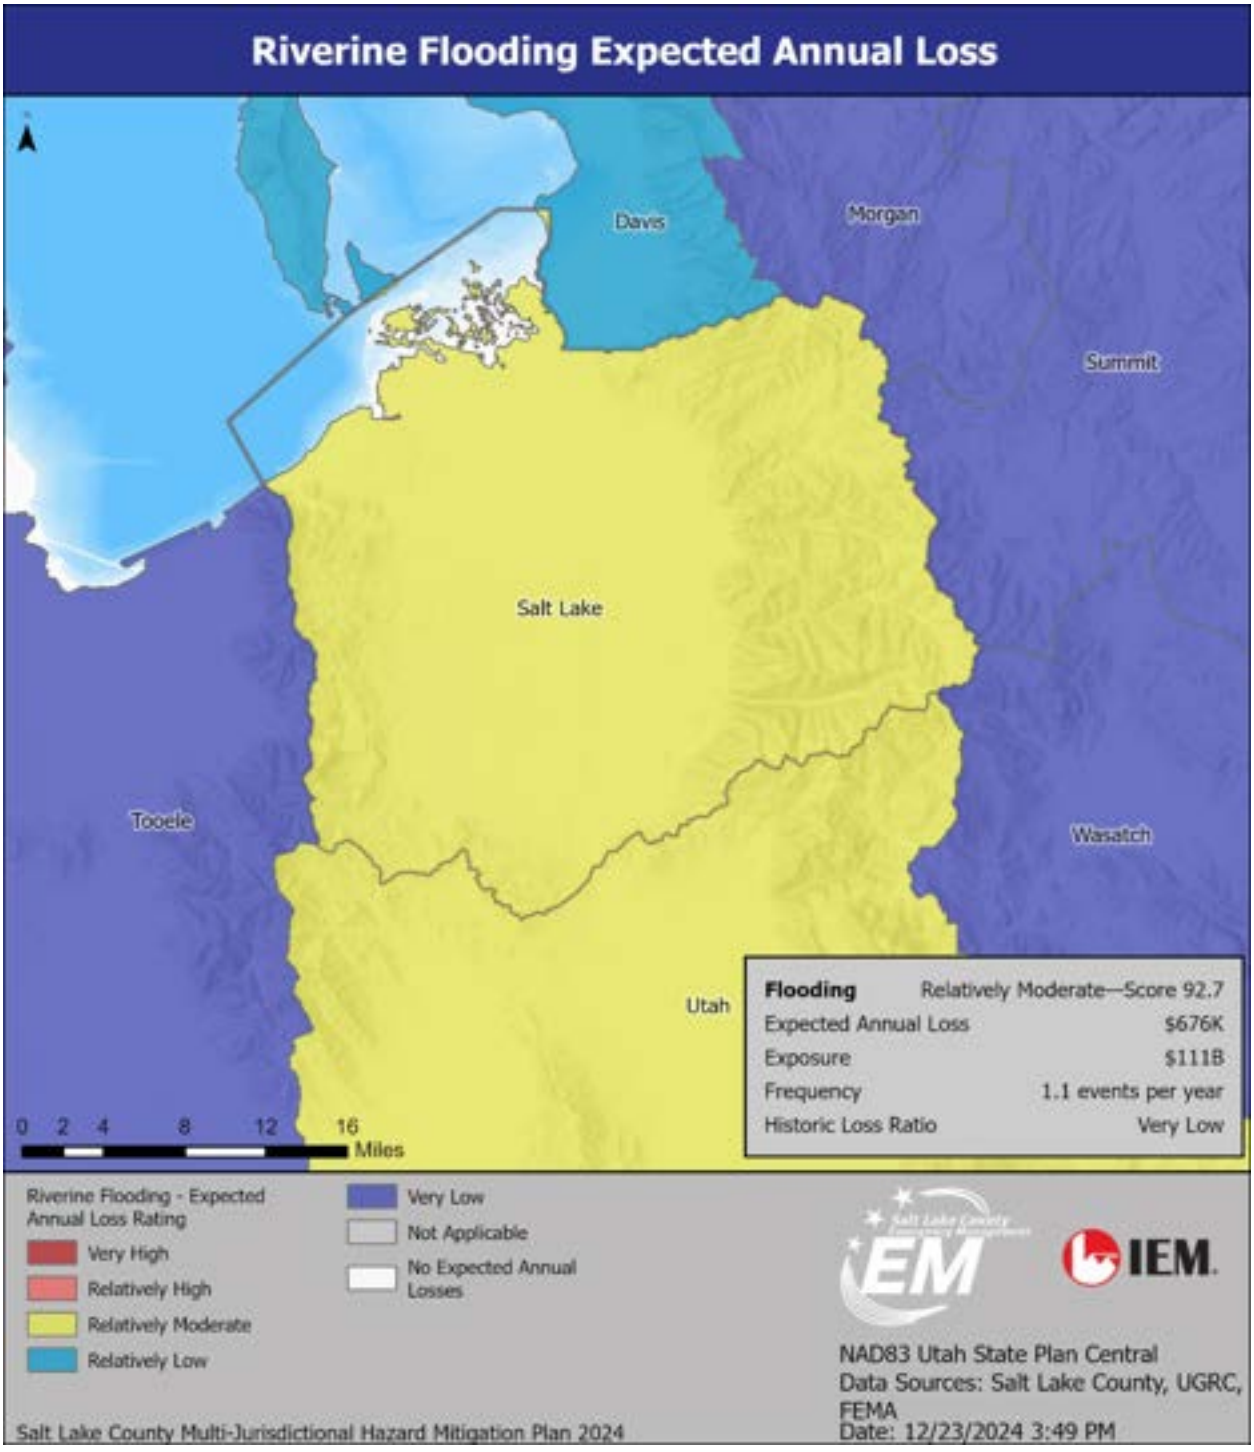

Figure 119: National Risk Index Expected Annual Loss from Riverine Flooding in Salt Lake County[132]

[132] FEMA, National Risk Index. "Salt Lake County Expected Annual Loss Riverine Flooding Risk Score, Map and Legend." https://hazards.fema.gov/nri/map.

VULNERABLE POPULATIONS

The 2024 Utah State Enhanced Hazard Mitigation Plan states vulnerability to the impacts of flooding is not distributed evenly across the population. People living in floodplain areas are most vulnerable to displacement. Perhaps the most extreme example of this is unhoused people taking refuge in floodplain areas. These people are both physically exposed to hazards and defined as socially vulnerable. In addition, the current housing availability crisis and increasing homelessness have exposed a growing number of underserved individuals to this hazard.

Where flood damage is especially severe, it can also disrupt livelihoods. This might have a more significant impact on low-income households with fewer financial resources to sustain them following a disaster. They may also have more difficulty finding temporary living arrangements if displaced by flooding.

Children are notoriously vulnerable to being swept away by floodwaters. Individuals with disabilities or access and functional needs also might have difficulty evacuating areas affected by flooding.

COMMUNITY LIFELINES

All lifelines are assigned to flooding because of the high impact of loss of life and property during these incidents. Law enforcement officers, emergency medical services, and rescue attempts may be delayed or impossible because of road flooding and blockage from debris. Due to these same problems, businesses and stores will be closed, causing food insecurities and preventing access to daily necessities. Power outages may make communication impossible, and some people will not be able to call for help. Hazardous materials may leak into the water and ground, causing current and future problems for people, crops, and livestock.

CHANGES IN DEVELOPMENT

In Salt Lake County, development and population growth can have profound impacts on flooding, as the growing population leads to the creation of impervious surfaces like roads and buildings. This reduces natural water absorption and increases runoff during storms. This can cause higher flood risks, especially in areas with inadequate drainage systems. In addition, an increased population may start to settle in areas that are highly prone to flooding, such as near rivers and streams. This increases the risk and impact of flooding on infrastructure and the population.

The Surplus Canal levee system provides protection for a large portion of Salt Lake City from approximately 2900 S to the Salt Lake City International Airport. The U.S. Army Corps of Engineers (USACE) conducted an inspection of this federally authorized levee system in 2019. Preliminary information suggests similar deficiencies found in the 2012 inspection. These deficiencies resulted in an unacceptable rating for the levee systems in Salt Lake County. Through the Surplus Levee Deficiency Rehabilitation Project, Salt Lake County Flood Control is working to bring the Surplus Canal levee systems back into USACE compliance. To do so, it must address the unacceptable encroachment violations, including those on privately owned property. The project is currently working to identify all encroachments on property owned by the county or other government entities, acquire property within 10

DRAFT

feet of the land-side toe of the levee, relocate fences outside USACE jurisdiction, and remove all encroachments on the newly acquired property. Salt Lake County is taking a phased approach to acquire the property needed to fully address the deficiencies. The project commenced the phased approach in 2017, with initial mapping, project development, and coordination with USACE and local agencies to bring the levee into compliance. The second phase (2018–2021) involved residential property acquisitions. Phase 3 (2021–2025) will conclude the project with commercial property acquisitions.[133] These flood mitigation measures may decrease future vulnerability to flood for the affected areas; however, population increases in the county have heightened vulnerability.

Figure 120: Surplus Levee Right of Way Map for Salt Lake County[134]

VULNERABILITY SCORE

To analyze the county's vulnerability to flooding, the NRI was used as a primary tool during the 2024 HIRA update. The NRI defines risk as the potential for negative impacts as a result of a natural hazard and determines a community's risk relative to other communities by examining the EAL and social vulnerability in a given community in relation to that community's resilience. Salt Lake County's NRI riverine flooding risk rating is shown in Figure 121. Salt Lake County has relatively moderate riverine flooding risk and a risk score of 93.

Heavy Rain

Hazard Description

Heavy amounts of precipitation from rain can cause flash flood events. The Wasatch Front has been susceptible to these types of storms because of proximity to the mountain ranges. Much of the valley's development has occurred on old alluvial fans from the canyon mouths. During heavy rain events, water and debris collect on these alluvial fans, damaging residential and commercial property and infrastructure. In 2017, near Salt Lake City International Airport, 1.97 inches of rainfall was recorded; this was the wettest day on record for the month of March and the sixth wettest day since records began in 1874.

Figure 122: Image of Heavy Rain[136]

According to NOAA, atmospheric rivers are narrow channels of wind pulling a large, condensed amount of moisture from the ocean before dumping it all once it reaches land. In the western United States, California gets the brunt of the moisture dump. As the storm makes its way over the Sierra Nevada Mountains and further east, Utah will typically see a good amount of precipitation from what is left.[137]

Hazard Profile

Potential Impact		Catastrophic	**Probability**		Highly Likely
	X	Critical		X	Likely
		Limited			Occasional
		Negligible			Unlikely

[136] https://pixabay.com/photos/windshield-rain-glass-surface-5366584/.
[137] Fox, Derick. "What is an Atmospheric River and What can Utahns Expect?" ABC4. February 1, 2024. https://www.abc4.com/utah-weather/utah-weather-stories/atmospheric-river-explained/.

Location	Can occur in areas throughout the county
Seasonal Pattern	Year-round
Conditions	Vary based on latitude, elevation, aspect, and landforms
Duration	Heavy rain generally lasts hours; some conditions can persist for days
Secondary Hazards	Flooding
Analysis Used	National Climatic Data Center, National Weather Service, Utah Avalanche Center, Utah Division of Emergency Management, local input, and review of historic events and scientific records

Magnitude/Extent

The rainfall rate is a measure of the amount of rain that falls during a period, such as millimeters or inches per hour. The Manual of Surface Weather Observation Standards includes the following general categories to classify rainfall intensity.[138]

Table 63: Rainfall Intensity Scale

Description	Rate
Light Rain	Less than 0.1”/hour
Moderate Rain	0.1 to 0.3”/hour
Heavy Rain	0.3 to 2”/hour
Violent Rain	>2”/hour

Location

The entire area of Salt Lake County can be affected by most heavy rain events; however, low-lying areas and valleys are most prone to the effects. Communities with poor, obstructed, or limited stormwater drainage systems are at greater risk during heavy rain events. Heavy rain events occur mostly in the fall or winter months and are produced by large synoptic weather systems originating out of the South, Southwest, or West that produce rainfall for an extended period. Snow may also melt due to rainfall, which primarily occurs in the southern half of the state.

Historical Events and Probability of Future Occurrences

Based on the FEMA Disaster Declarations Database, Salt Lake County has received no designation for heavy rain disaster declarations since the last plan update.

According to the NWS, historical rainfall data for Salt Lake City shows an average of 1.71 inches in October with 13 average rain days, 1.77 inches in November with 16 average rain days, and 2.07 inches in December with 19 average rain days.

[138] “Rain Rate Intensity Classification.” Barani. January 19, 2020. https://www.baranidesign.com/faq-articles/2020/1/19/rain-rate-intensity-classification.

Although rain obviously occurs frequently as part of natural weather processes, rains heavy enough to be classified specifically as “heavy rain” events in the NCEI records have occurred 9 times from 1996 to 2024, approximately 1 event every 3 years, a rate likely to continue. The probability of future occurrences is likely. Property damage from these 9 events was $1,567,000, with $12,000 in crop damage.

On August 13–14, 2024, two days of intense thunderstorms and heavy rainfall caused flooding across the Salt Lake City metro area. UDOT reported flooding across northern Utah. Streets in metro Salt Lake City turned into rivers as many storms brought heavy rain, and hail caused many road closures in Salt Lake and Wasatch counties.

On August 18, 2021, NWS issued a Flood Warning for urban and small stream flooding in the valley, and the downpour caused Utah Highway Patrol to close Interstate 215 East Belt at 3300 South due to “significant flooding” in the area. Crews waded into the nearly knee-high pool of rainwater and used industrial pumps to remove it from the road. Flooding also occurred at the intersection of 3300 South and 700 East.

On March 23, 2017, heavy rain fell across the Salt Lake Valley. At the Sunnyvale Apartments on 3940 South 764 West, two families had to evacuate their apartments due to flooding. Relatively close by at the Salt Lake City International Airport, 1.97 inches of rainfall was recorded; this was the wettest day on record for the month of March and the sixth wettest day since records began in 1874.

On August 8, 2006, about 1.3 inches of rain fell in one hour from Murray to East Millcreek. On several occasions, around 2 inches of rain has fallen at multiple locations in the county.

Climate Change Considerations

Climate change can have a significant impact on heavy rain. Higher temperatures can cause the atmosphere to hold more moisture, leading to more intense and frequent heavy rainstorms. Heavy precipitation can cause flash flooding in Salt Lake County, overwhelming stormwater systems and damaging infrastructure. Climate change can also alter precipitation patterns and increase the intensity of rainstorms, leading to heavy rainstorm events.

The 2024 Utah Enhanced State Hazard Mitigation Plan states climate models consistently indicate that increased convective storms are a likely outcome of climate change, with worsening severe storm activity increasing with worsening climate change.

Secondary Hazards

The most significant secondary hazard associated with heavy rain events is localized flooding. Heavy rain can also be accompanied by high wind, which can cause falling and downed trees, downed power lines, and associated power outages. Rapidly melting snow combined with heavy rain can overwhelm natural and human-made drainage systems, causing overflow and property destruction.

DRAFT

According to Commonwealth Edison (ComEd), “Weather-related events cause 70 percent of all power outages.” Power outages usually last anywhere from a few minutes to a few hours. In extreme cases, power outages have lasted a few days or even weeks. Severe weather-induced power failures may come from rain that damage insulators and other components vital for maintaining a functioning circuit.

Vulnerability Assessment

Weather events are inherently unpredictable, with the severity and precise locations of an event subject to change. Conditions can evolve quickly, making it challenging to pinpoint specific areas, facilities, structures, or systems that may be affected by heavy rain. Due to the broad reach of this hazard, heavy rains can impact all populations, structures, critical facilities, infrastructure, and the economy. All critical facilities are vulnerable, including fire stations, police stations, hospitals, schools, and all 218 county facilities. Utilities, such as power and communications networks and transportation systems and road networks, also are vulnerable. The extent of the impact and the severity of the damage will vary considerably from one event to another.

ESTIMATED IMPACT AND POTENTIAL LOSSES

Heavy rain can cause localized flooding and subsequent water damage to nearby structures. Prolonged heavy rain can overwhelm storm drainage systems, causing further damage. Low-lying areas, such as bridge underpasses, may be more likely to experience flooding. Vehicles may lose traction or be unable to travel roadways safely. Flooding or unsafe driving conditions may require road closures, potentially blocking major transportation routes. Transportation disruptions also may delay emergency response.

Power outages and other service disruptions may occur as a secondary effect of heavy rainstorms. These outages negatively impact county residents and business operations, resulting in economic losses. Critical facilities may require backup power systems to continue operations during power outages.

Attendees at outdoor events, such as sporting or recreation activities, farmers markets, and other community events, might have difficulty finding shelter during fast-moving storm events.

The NRI does not include data on the EALs for heavy rain. Based on the damage recorded in NCEI, $1,579,000 in losses have been incurred in the last 28 years in Salt Lake County. This averages approximately $56,393 per year.

VULNERABLE POPULATIONS

The following populations are most vulnerable to a heavy rain event, face isolation and exposure during these events, or could suffer more secondary effects of the hazard.

Severe weather, like heavy rain, typically affects people who are outdoors. Those without access to shelter, such as outdoor workers in construction or agriculture, are particularly affected. Individuals who are unhoused are especially vulnerable to the dangers posed by heavy rains.

DRAFT

Those dependent on powered medical devices also are particularly vulnerable to power outages caused by severe weather events. Elderly residents or those with disabilities or mobility difficulties might have difficulty seeking shelter or addressing damage caused by heavy rain. Individuals with low incomes may face more significant challenges recovering if their residences are damaged or if they lose wages from business or other economic impacts of storms.

COMMUNITY LIFELINES

Heavy rain can disrupt transportation and energy lifelines. The importance of these lifelines cannot be overstated. In a disaster, communities can be left without access to necessities, such as food, water, and shelter. The lifelines help ensure that these needs are met and that people have the resources they need to survive. By providing access to medical care, public health services, and transportation, the lifelines help ensure that people can receive the care they need and safely evacuate if necessary. In addition, the Hazardous Materials lifeline helps to ensure that dangerous materials are managed safely, reducing the risk of further harm. Community lifelines help create a sense of safety and security in a community. They provide a safety net for individuals who may be struggling and offer comfort and reassurance that help is available when needed. Without these lifelines, communities would be much more vulnerable to crises and emergencies.

CHANGES IN DEVELOPMENT

In Salt Lake County, development and population growth have significant implications for managing heavy rainstorm events. Impervious surfaces like parking lots, buildings, and roads will increase as population grows and this increases water runoff in the county. This can overwhelm stormwater systems and increase the likelihood of urban flooding. Development in flood-prone areas also can increase the risk of being impacted by a heavy rain event. Salt Lake City and communities south along Route 15 already have a high level of impervious surfaces, generally between 50% and 100%, according to the U.S. Environmental Protection Agency. In the past five years, suburban and exurban communities in the western part of the county—like Herriman, West Jordan, and South Jordan, which used to have very low levels of impervious surfaces—have started to add more with increased development. As development continues, so does the chance of increased runoff from heavy rain events.

Potential impact from heavy rains includes loss of life/property and flooding. Rain combined with snowmelt runoff can contribute to potential flooding. In addition, population growth, new construction of homes and businesses, and construction or changes in transportation routes provide new economic opportunities but may also indicate an increase in exposure to heavy rain. Changes in land use and development may be impacted as residential zoning may change for areas experiencing significant precipitation. Overall, vulnerability to heavy rain has increased since the last plan update.

VULNERABILITY SCORE

The NRI does not provide data to define risks associated with a heavy rain hazard.

DRAFT

High Wind

Hazard Description

High wind can occur with or without a storm and are unpredictable. According to NWS, "High wind has sustained winds speeds of 40 miles per hour (mph) lasting for 1 hour or longer, or wind of 58 mph or greater for any duration."[139] Salt Lake County has experienced high winds in the past and can expect future events.

Figure 123: Damage from a High Wind Event in 2020[140]

According to the NWS definition, straight-line winds are defined as "any wind that is not associated with rotation, used mainly to differentiate them from tornadic winds."[141] Straight-line winds are responsible for most thunderstorm wind damage, and their speeds can exceed 125 mph. Other damaging winds originating from thunderstorms include downbursts and microbursts. Utah has also experienced downslope wind events, which occur when wind generated as a deep layer of air is forced over a barrier. According to the NWS, a downslope flow is defined as "a thermally driven wind directed down a mountain slope and usually occurring at night, part of the along-slope wind system."[142] Winds accelerate down mountain slopes and generate high winds in a wave region formed at the base of the terrain. A downslope windstorm in December 2011 generated many reports of 60–80 mph winds, and maximum gusts of 80–100 mph in the Bountiful/Centerville area, resulting in loss of power and significant damage in the region. In October 2020, a severe windstorm with wind gusts reaching up to 89 mph caused extensive damage across Salt Lake County leading to power outages for many residents, with some lasting over a week. The State of Utah declared a state of emergency due to the situation. Tragically, one individual in

[142] Ibid.

South Salt Lake lost their life. Canyon winds can bring wind gusts greater than 100 mph through the canyon mouths into the populated areas of the Wasatch Front. Winds are usually strongest near the mouths of canyons and have resulted in the loss of power resulting in loss of electricity in homes and businesses. Winds have also damaged roofs, destroyed and knocked down large trees and fences, overturned tractor trailers and railroad cars, and downed small airplanes.

Figure 124: Wind Damage in Salt Lake County Following a Storm in 2020[143]

Hazard Profile

Potential Impact		Catastrophic	**Probability**	X	Highly Likely
	X	Critical			Likely
		Limited			Occasional
		Negligible			Unlikely
Location	High wind can occur in areas throughout the county.				
Seasonal Pattern	High wind can occur year-round.				
Conditions	High winds vary based on latitude, elevation, aspect and landforms.				
Duration	High Wind hazard generally lasts hours; some conditions can persist for days.				
Secondary Hazards	Potential secondary hazards include wildfire and flooding.				
Analysis Used	National Climate Data Center, National Weather Service, Utah Avalanche Center, Utah Division of Emergency Management, local input, and review of historic events and scientific records

Extent/Magnitude

The Beaufort Wind Scale was developed to estimate wind speeds based on their effects by visual observations. Initially used by sailors based on sea conditions, it is still in use today to estimate wind strengths.

Table 64: Beaufort Wind Scale[144]

Force	Speed (mph)	Speed (knots)	Description	Specifications
0	0–1	0–1	Calm	Calm; smoke rises vertically
1	1–3	1–3	Light Air	Direction of wind shown by smoke drift, but not by wind vanes
2	4–7	4–6	Light Breeze	Wind felt on face; leaves rustle; ordinary vanes moved by wind
3	8–12	7–10	Gentle Breeze	Leaves and small twigs in constant motion; wind extends light flag
4	13–18	11–16	Moderate Breeze	Raises dust and loose paper; small branches are moved
5	19–24	17–21	Fresh Breeze	Small trees in leaf begin to sway; crested wavelets form on inland waters
6	25–31	22–27	Strong Breeze	Large branches in motion; whistling heard in telegraph wires; umbrellas used with difficulty
7	32–38	28–33	Near Gale	Whole trees in motion; inconvenience felt when walking against the wind
8	39–46	34–40	Gale	Breaks twigs off trees; generally, impedes progress
9	47–54	41–47	Severe Gale	Slight structural damage occurs (chimneypots and slates removed)
10	55–63	48–55	Storm	Seldom experienced inland; trees uprooted; considerable structural damage occurs
11	64–72	56–63	Violent Storm	Very rarely experienced; accompanied by widespread damage
12	72–83	64–71	Hurricane	See Saffir-Simpson Hurricane Scale.

Location

The entire region of Salt Lake County can be affected by most high wind events and their effects. Wind events are most damaging to areas that are heavily wooded and areas with exposed property and aboveground utility lines.

[144] NOAA, NWS. “Beaufort Wind Scale.” https://www.weather.gov/mfl/beaufort.

Historical Events and Probability of Future Occurrences

Based on the FEMA Disaster Declarations Database, one high wind event has occurred during the period of January 1, 2019, through June 3, 2025.[145] The event was declared on January 21, 2021, from events that occurred on September 7 and 8, 2020, and categorized as straight-line winds. A severe windstorm with gusts up to 89 mph caused extensive damage and prolonged power outages in Salt Lake County, leading the State of Utah to declare a state of emergency. About 1,000 trees were knocked down in Salt Lake City alone. As many as 170,000 homes and businesses lost power. Areas with the most power outages included Millcreek, northeast Salt Lake City, South Salt Lake, Murray, Holladay, and northern Taylorsville.[146]

NOAA data records indicate that the highest wind event recorded in the county occurred on January 8, 2005, with gusts up to 99 knots (113.93 mph), This level of wind exceeds the limits of the Beaufort Wind Scale.

According to NCEI data, there have been 264 days with high wind events from 1956 to 2024 (68 years), totaling $10.6 million in property damage and $365,800 in crop damage. These also resulted in 2 deaths and 48 injuries. There were 8 strong wind events that resulted in $36,000 in damage. The NRI defines "strong wind" as consisting of "winds, often originating from thunderstorms that are classified as exceeding 58 mph."[147] 186 thunderstorm wind event days caused 15 injuries and resulted in over $5 million in property damage and $65,600 in crop damage. Damage of $16,127,400 averages to approximately $237,168 in losses per year. The median property damage amount for all high, strong, and thunderstorm wind events is $0, indicating that the data are skewed upwards by a smaller number of higher costing events. For example, three events that took place on August 1, 2006, May 2, 2001, and March 20, 2000, totaled approximately $4,500,000 by themselves, although most events caused little to no property damage.

Since 2019, the time of the last mitigation plan update, 103 wind events have been recorded, totaling $4,929,000 and resulting in 1 death and 12 injuries. Most of these were from a single event in September 2020, described below. Figure 126 shows the location and strength of past wind events in the county. The frequency of events is an indicator that probability of future occurrences is highly likely.

On September 8, 2020, a weather pattern abnormal for September developed, triggering a significant downslope flow wind event. Based on climatology and previous case study findings, this type of event most commonly occurs during the winter months. Downslope wind events are often confined to areas near canyon mouths and usually impact only isolated areas with extreme winds. This event was unusual in both the early fall timing and the extensive spatial coverage of the damage. High winds were reported as far south as the Tooele Valley, with high wind reports all along the Interstate 15 corridor stretching north into the Cache Valley. Because trees still had their full canopy, the tree damage all along the

[145] FEMA, Disaster Declarations for States and Counties." https://www.fema.gov/data-visualization/disaster-declarations-states-and-counties.
[146] Gonzalez, Norma, Taylor Stevens, and Sean P. Means. "Utah declares state of emergency after windstorm knocked down thousands of trees." The Salt Lake Tribune. September 9, 2020. https://www.sltrib.com/news/2020/09/09/utahs-winds-are-dying/.
[147] FEMA, National Risk Index, "Strong Wind." https://hazards.fema.gov/nri/strong-wind.

Wasatch Front was extreme, with an estimated 4,500 trees damaged in Salt Lake County alone. Current estimates put the cost at $8.9 million for the region. The storm led to 1 fatality, 20 direct injuries, and 4 indirect injuries. Over 180,000 power outages were reported along the Wasatch Front, with power restorations taking up to a week in some locations due to extensive damage. Schools and recreation facilities were closed.

Figure 125: Windstorm Damage in Salt Lake County, September 2020[148]

Very strong winds developed across much of Utah on April 16, 2018, ahead of a cold front, with wind damage reported in parts of the Wasatch Front. Maximum recorded wind gusts included 73 mph at SR-201 at I-80, 65 mph at Baccus, 63 mph at Flight Park South, and many other reported gusts in the 50 mph to 62 mph range. The gusts blew down multiple trees, and one fell on a house in Murray. Trampolines became airborne and landed in yards, over fences, and on the roof of a home in one case. Total damage was recorded as $50,000, and more than 7,500 power outages were reported.

On August 1, 2006, severe thunderstorm winds up to 75 mph impacted the southern part of Salt Lake County in conjunction with Utah County Storms. Trees up to 12 inches in diameter snapped in East Millcreek, and large trees were uprooted in the Sugarhouse area. Numerous power poles also were downed in the southern portion of county. According to a regional insurance claim estimate, the reported damage was approximately $2 million.

On May 2, 2001, strong canyon winds developed along the Wasatch Front, lasting until the early morning of May 4. The storm caused an estimated $3 million in property damage between Davis and Salt Lake counties and several hundred thousand dollars damage to trees. The worst damage was reported in Sandy City and Cottonwood Heights. A semi-truck was overturned on I-15 in Centerville on May 3, and a large tree smashed into a house in Farmington. No injuries were reported.

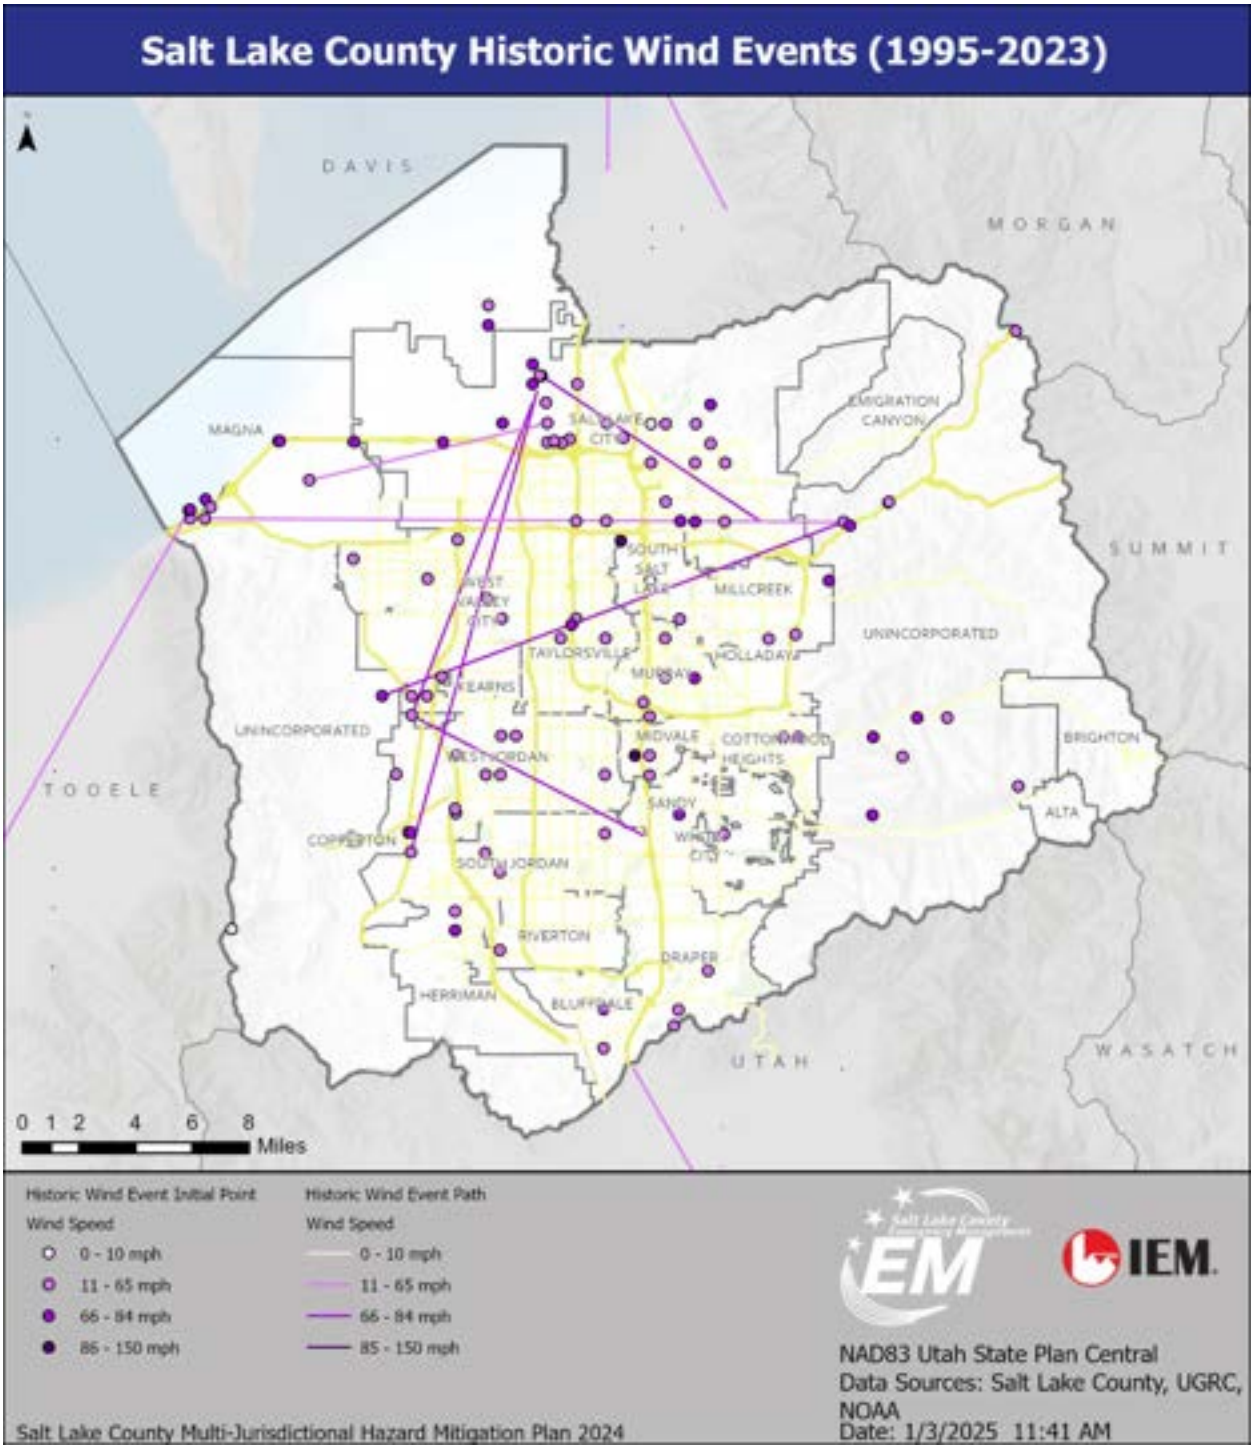

Figure 126: Historic Wind Events in Salt Lake County, 1995–2003

Climate Change Considerations

Climate change can have a significant impact on the natural hazard of high winds. Higher temperatures can cause more intense and frequent weather systems—including high wind events—while increased moisture in the atmosphere can lead to more frequent severe storms, such as thunderstorms, which often

bring high winds. The change in climate will exacerbate the frequency and intensity of high wind events in Salt Lake County.

The 2024 State Enhanced Hazard Mitigation Plan states that research on climate change and its effects on severe weather in Utah does not provide clear evidence of how increased convective activity will impact future wind events. However, climate models consistently indicate that increased convective storms are a likely outcome of climate change, with worsening tornado activity, and strong evidence exists that extreme heat will continue to increase with worsening climate change.

Secondary Hazards

The most significant secondary hazards associated with high winds are fallen trees, downed power lines, and the resulting power outages. According to ComEd, “Weather-related events cause 70 percent of all power outages.” Power outages usually last anywhere from a few minutes to a few hours. In some extreme cases, power outages have lasted a few days or even a few weeks. Severe weather-induced power failures can come from the following sources:

- High and moderate winds lead to power outages by blowing objects into power lines and other components, causing an interruption of services. Both high winds (more than 55 mph) and moderate winds (35–55 mph) may be sufficient to cause power outages.
- Momentary outages may occur if an object, such as a tree limb, is blown onto a power line, disrupting electrical services. If high wind coincides with warm temperatures and low humidity, it can pose an increased risk of fire danger. A Red Flag Warning may be issued to warn fire officials, firefighters, and the public of potentially dangerous fire weather conditions that may affect power lines.

Vulnerability Assessment

High winds can cause widespread damage that affects multiple jurisdictions at the same time. They can cause personal injury and structural damage to homes and business, and they can disrupt service from multiple community lifelines. Due to the widespread and unpredictable nature of severe weather, all populations, structures, and infrastructure are potentially at risk of the impacts of high wind. All critical facilities—such as fire and police stations, hospitals, and schools—are vulnerable. All 218 county facilities are also vulnerable to damage or disruptions. Utilities—such as power and communications networks, transportation systems, and road networks—also are vulnerable.

ESTIMATED IMPACT AND POTENTIAL LOSSES

Residents can face injury or death related to high wind events, most often caused by trees or limbs falling on homes or vehicles. People residing in mobile homes or RV parks are particularly vulnerable to injury or death from high wind events. People outdoors may be harmed by wind-driven debris. Others face isolation and exposure during severe storms, or they could suffer from secondary effects of the hazard.

DRAFT

Trees uprooted by wind or fallen limbs can cause significant damage to homes and other structures and vehicles. Mobile and manufactured homes are particularly vulnerable to damage. High wind can damage roof materials, gutters, or other exterior fixtures. Windows can be broken by windblown debris.

Critical facilities may experience damage by wind-driven debris or downed trees. They may also be affected by wind-driven damage to power lines, producing power outages that cause disruptions to operations. In addition, response times can be delayed by interruptions to transportation networks.

Power infrastructure, particularly aboveground power lines and substations, are particularly vulnerable to damage during high winds. Other utility facilities, such as water or communications systems, may be disrupted while power is out. Debris can block roadways, and power outages can disable traffic signals, which can create difficulty navigating transportation networks. Removing debris after the event can be time-consuming and costly.

Wind-related damage and secondary hazards, such as utility disruption, can also have negative impact on businesses. Significant economic impacts can result from physical damage to structures, building contents, and revenue and wage losses when businesses are inoperable due to power and/or communications outages. Debris removal can be costly to local governments and may strain local resources.

The NRI includes data on the EALs to individual natural hazards, historical loss, and overall risk at a county and census tract level. Salt Lake County's NRI EAL value for strong wind is $741,000 with a risk score of 76.6 and a rating of relatively moderate percentile compared with the rest of the United States (Figure 127).

DRAFT

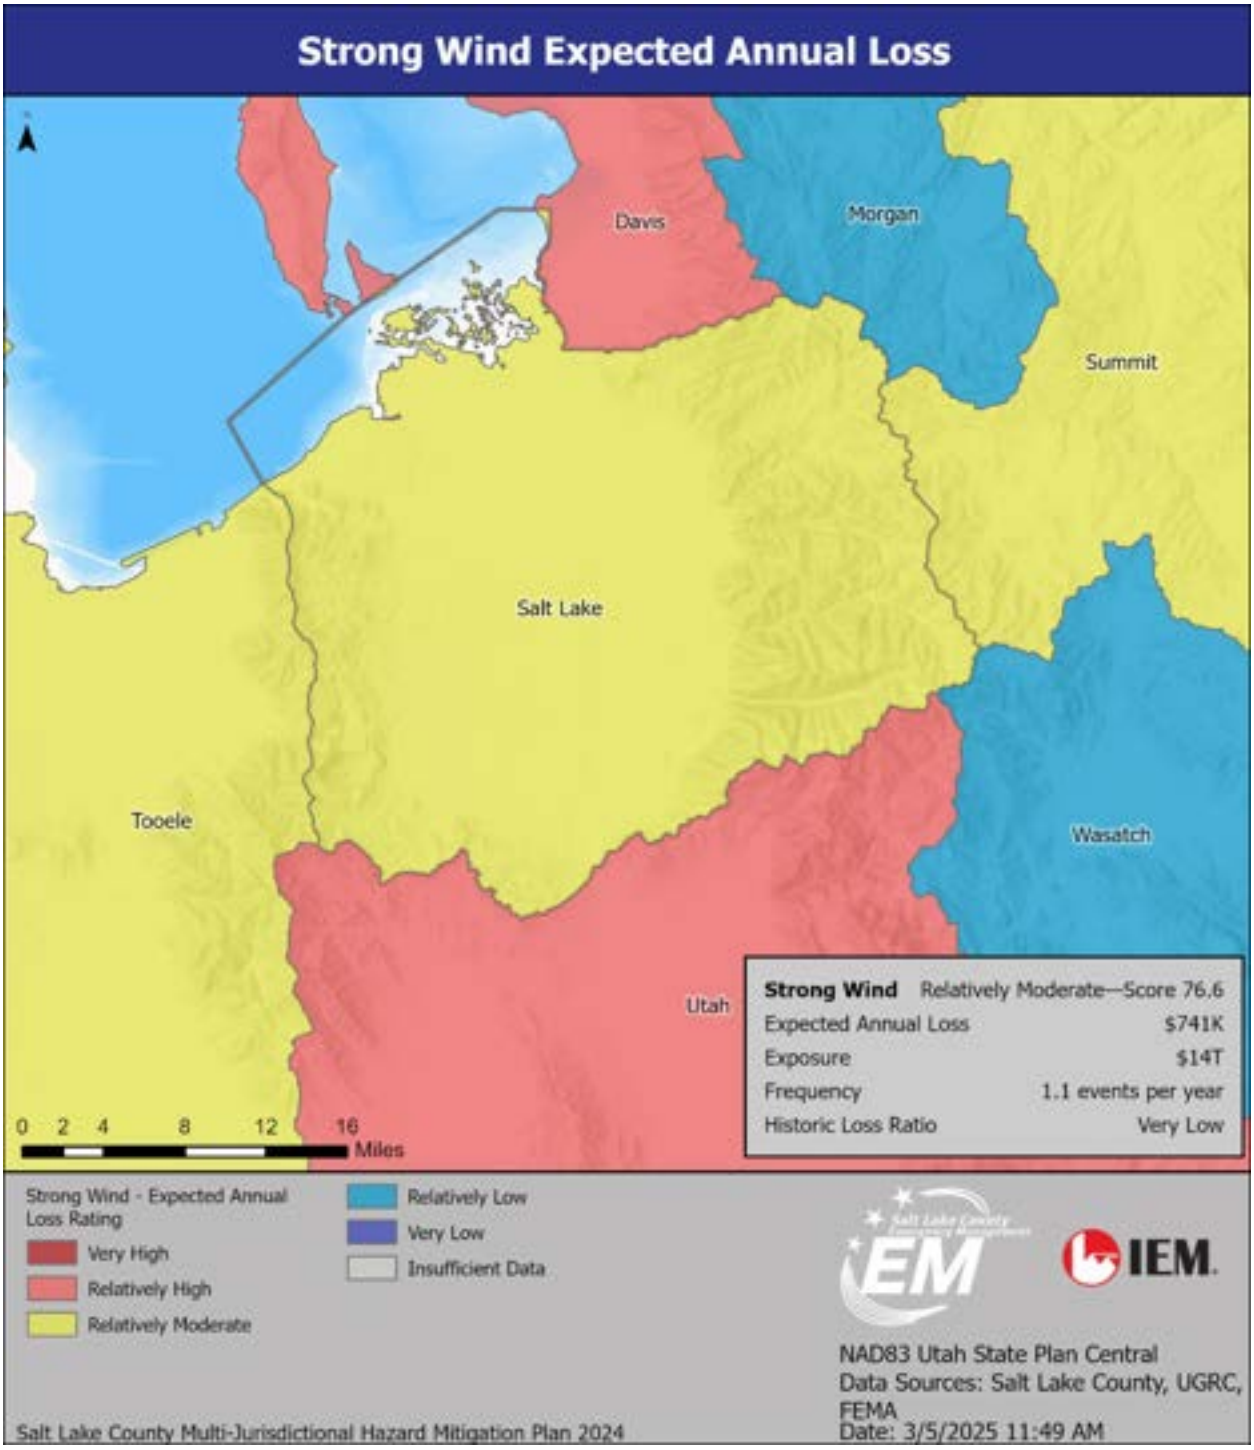

Figure 127: National Risk Index Expected Annual Loss from Strong Wind in Salt Lake County[149]

[149] FEMA, National Risk Index. "Salt Lake County Expected Annual Loss Strong Wind Risk Score, Map and Legend." https://hazards.fema.gov/nri/map.

VULNERABLE POPULATIONS

The 2024 State Enhanced Hazard Mitigation Plan states that people living in less-wind resistant housing, such as mobile homes, are more vulnerable to wind hazard. Outdoor workers, outdoor recreationists, or unhoused populations might have difficulty seeking adequate shelter during a wind event and are vulnerable to injury from wind effects. Elderly residents or people with disabilities may be negatively affected by power outages if they rely on power for medical devices or for ingress and egress to their homes. They may be isolated from critical support services if debris or other damage leads to roadway closures. They might have difficulty addressing debris cleanup.

COMMUNITY LIFELINES

High winds can disrupt safety and security, energy, transportation, and food, hydration and shelter lifelines. The importance of these lifelines cannot be overstated. In a disaster, communities can be left without access to necessities, such as food, water, and shelter. The lifelines help ensure that these needs are met, and that people have the resources they need to survive. By providing access to medical care, public health services, and transportation, the lifelines help ensure that people can receive the care they need and safely evacuate if necessary. In addition, the Hazardous Materials lifeline helps to ensure that dangerous materials are managed safely, reducing the risk of further harm. Community Lifelines help create a sense of safety and security in a community. They provide a safety net for individuals who may be struggling and offer comfort and reassurance that help is available when needed. Without these lifelines, communities would be much more vulnerable to crises and emergencies.

CHANGES IN DEVELOPMENT

In Salt Lake County, development and population growth have significant implications for high wind events. Population growth and development increases infrastructure, such as buildings, roads, and especially powerlines, which can increase the risk associated with high winds. In addition, urbanization can exacerbate these risks by creating wind tunnels which increases the potential for wind damage. The concentration of development in certain areas can also change localized wind patterns, which can lead to higher wind speeds and more frequent wind-related incidents.

Potential impacts from increase in high wind vulnerability include loss of life and property, power failure, and decreased air quality. Overall growth in population and new building construction in Salt Lake County results in a higher number of people potentially exposed to high wind. Changes in local economies may affect whether a community is financially able to recover from a high wind event. In 2020, the county had a high wind event that caused extensive damage in the county with debris in roads, trees down, and power failures (in some areas for over a week), forcing employees to miss work. Changes in land use and development may require stricter building codes for new builds to withstand extreme weather events. Overall vulnerability high wind has increased since the last plan update.

VULNERABILITY SCORE

To analyze the county's vulnerability to severe weather, the NRI was used as a primary tool during the 2024 HIRA update. The NRI defines risk as the potential for negative impacts as a result of a natural

DRAFT

hazard and determines a community's risk relative to other communities by examining the EAL and social vulnerability in a given community in relation to that community's resilience. Salt Lake County's NRI strong wind risk rating is shown in Figure 128. Salt Lake County has relatively moderate strong wind risk and a risk score of 72.6.

DRAFT

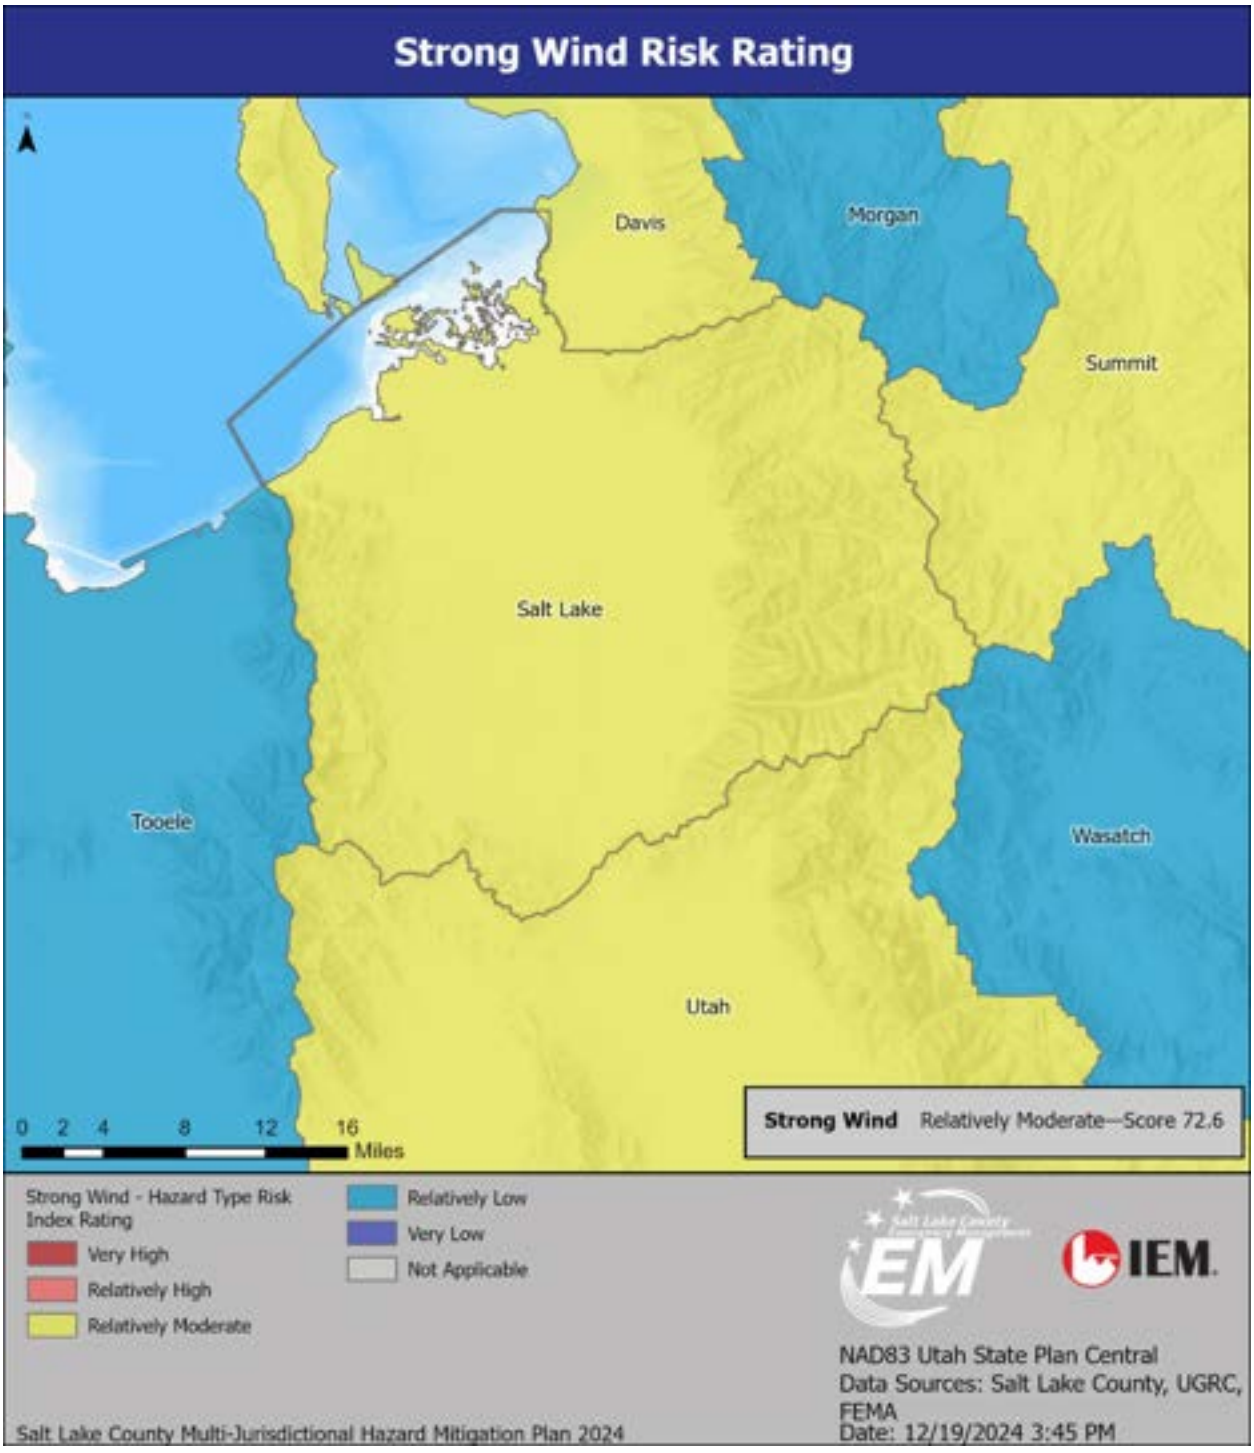

Figure 128: National Risk Index Strong Wind Risk Map, Legend, and Score for Salt Lake County[150]

[150] FEMA, National Risk Index. "Salt Lake County Strong Wind Score, Map and Legend." https://hazards.fema.gov/nri/map.

Landslide/Slope Failure

Hazard Description

Slope failure is any ground disturbance on a sloped surface. Slope failures, also known as landslides, are classified according to the type of movement and material involved. Movement types include falls, topples, slides, lateral spreads, and flows. Materials include rocks, debris (coarse-grained soil), and earth (fine-grained soil). The most common slope failures in Utah include rock falls, rock topples, debris slides, debris flows, earth slides, and earth flows.

Figure 129: Image of a Landslide[151]

A landslide is a mass of earth or rock that moves downslope by flowing, spreading, sliding, toppling, or falling. Landslides are one of Utah's most common natural hazards, primarily in areas with moderate to steep slopes or weak slope materials. Most landslides are associated with precipitation events with sustained above-average precipitation, individual intense rainstorms, or snowmelt events. Erosion, removal of vegetation by wildfires, and earthquake-induced ground shaking increase the likelihood of landslides. Human activities, such as grading slopes or increasing soil moisture through landscape irrigation, can also trigger landslides.

[151] https://unsplash.com/photos/brown-and-gray-rocky-mountain-fsj6Ly_lqOs.

Figure 130: Diagram of an Idealized Landslide with Commonly Used Terminology[152]

Rock falls and topples are downslope movements of loosened blocks or boulders from a bedrock area. These generally occur along steep canyons with cliffs, deeply incised stream channels in bedrock, or steep bedrock road cuts. The most significant damage from rock falls is to roads, railroads, and aboveground pipelines.

Debris slides and flows occur in steep mountainous areas and involve relatively rapid, viscous flows of coarse-grained soil, rock, vegetation, and other surface materials. Debris flows contain more water than slides and are potentially more dangerous because they can form quickly, move at high speeds, and travel long distances. Debris flows generally remain in stream channels but can flow outward from canyon mouths for a considerable distance, potentially damaging buildings, bridges, roads, railroads, and pipelines. Areas impacted by wildfires may be more likely to experience debris flows because vegetation no longer holds soils in place.

Earth slides and flows are composed of fine-grained material; earth slides contain less water than earth flows. Earth slides and flows vary in size, including some of the largest earth slides in Utah's history. Like other landslides, earth slides and flows can damage anything in their path.

Slumps are common along road embankments and river terraces. They slide along a curved plane away from the upper part of a slope, leaving a scarp. They generally do not travel far from the source area.

The distribution of landslides is dependent on geology, topography, and climate. They are most common in the Middle Rocky Mountain's physiographic province and the High Plateaus section of the Colorado Plateau province. As previously mentioned, weak rock types, steep slope gradients, and relatively abundant precipitation are the primary contributors to landslides. Vegetative cover, slope, aspect, and ground shaking from earthquakes can also influence slope stability. Nearly all landslides in Utah are

[152] Beukelman, Gregg. "Landslide Hazards in Utah." Utah Geological Survey. 2011. https://ugspub.nr.utah.gov/publications/public_information/pi-98.pdf.

reactivations of preexisting landslides. Risk can be reduced by avoiding development in areas of known landslide risk and/or stabilizing landslides.

Hazard Profile

Potential Impact		Catastrophic	**Probability**		Highly Likely
		Critical		X	Likely
	X	Limited			Occasional
		Negligible			Unlikely
Location	Typically in canyon mouths and foothills and areas of recent wildfire activity				
Seasonal Pattern	Spring and summer months				
Conditions	Typically caused by the stress release of over-weighted soils or loosening of rock and debris by wind, water, or ground shaking				
Duration	Landslides/rock falls: hours to months; debris flows: instantaneous				
Secondary Hazards	Flooding (natural dams), traffic accidents				
Analysis Used	Information and maps provided by Utah Geological Survey, Utah Division of Emergency Management, Utah Geospatial Resource Center				

Magnitude/Extent

Several factors can influence an area's susceptibility to landslide including the steepness of the slope, the type of soil and rock present, the amount of precipitation the area receives, and impacts from human development. Landslides in Salt Lake County can vary in size and by speed and force of the sliding mass. They can be affected by erosion and landscape changes, or secondary hazards, such as debris flows following a wildfire.

The extent and magnitude of a landslide in Salt Lake County would depend on the size and speed of the landslide and the specific location and elevation of the impacted area. Landslide hazard is primarily located in the mountainous areas of the county. A large portion of the county is in an area of moderate susceptibility to landslide. Landslides may occur in parts of the county where little to no development exists and damage would be negligible. However, some may occur in areas where it can disrupt transportation, damage property, and could lead to injury. The extent of landslide susceptibility is shown in Figure 132–Figure 137.

The Rio Tinto Landslide was the single largest natural disaster in Salt Lake County's history. The North Salt Lake City landslide was categorized as a "major" landslide. Due to the nature of Salt Lake County's topography and development encroaching into steeper areas, the magnitude of damage is likely to increase. Many landslide or slope failure events may be minor and cause little to no damage, but it is also possible that future landslides can cost hundreds of thousands of dollars to hundreds of millions of dollars in damage.

DRAFT

Location

Landslides and debris flows are most common in the foothills along the base of the Wasatch Mountain Range and are caused by wet climatic conditions. Some major landslide areas include the Grand View Peak rockslide in upper City Creek Canyon, the Little Valley Red Rock landslide in Draper, and the shallow disrupted landslides in and near Steep Mountain in Draper. As urbanization spreads into geologically unstable areas of the county, the risk to life and property increases. Figure 132–Figure 137 show the locations of critical facilities in relation to landslide susceptibility in the county.

Figure 131 provides information on the varying scales used in each of the following maps.

Landslide Susceptibility	Susceptibility Description	
High		Areas of existing shallow and deep landslides.* Slope angle and geologic map unit are not considered in this category.
Moderate		Areas that have slopes prone to landsliding based on observed landslide slope angles. The category includes slopes greater than 7° (12%) to greater than 18° (32%) depending on the geologic unit.**
Low		Areas that have slopes that may produce landslides. The category includes slopes from 5 - 7° (9 - 12%) for lower slope-angle threshold ranging up to 13 - 18° (23 - 32%) for the upper slope-angle threshold depending on the geologic unit.**
Very Low		Areas that are unlikely to produce landslides. The category includes slopes less than 5° (9%) to less than 7° (12%) depending on the geologic unit.**

Figure 131: Landslide Susceptibility Scale

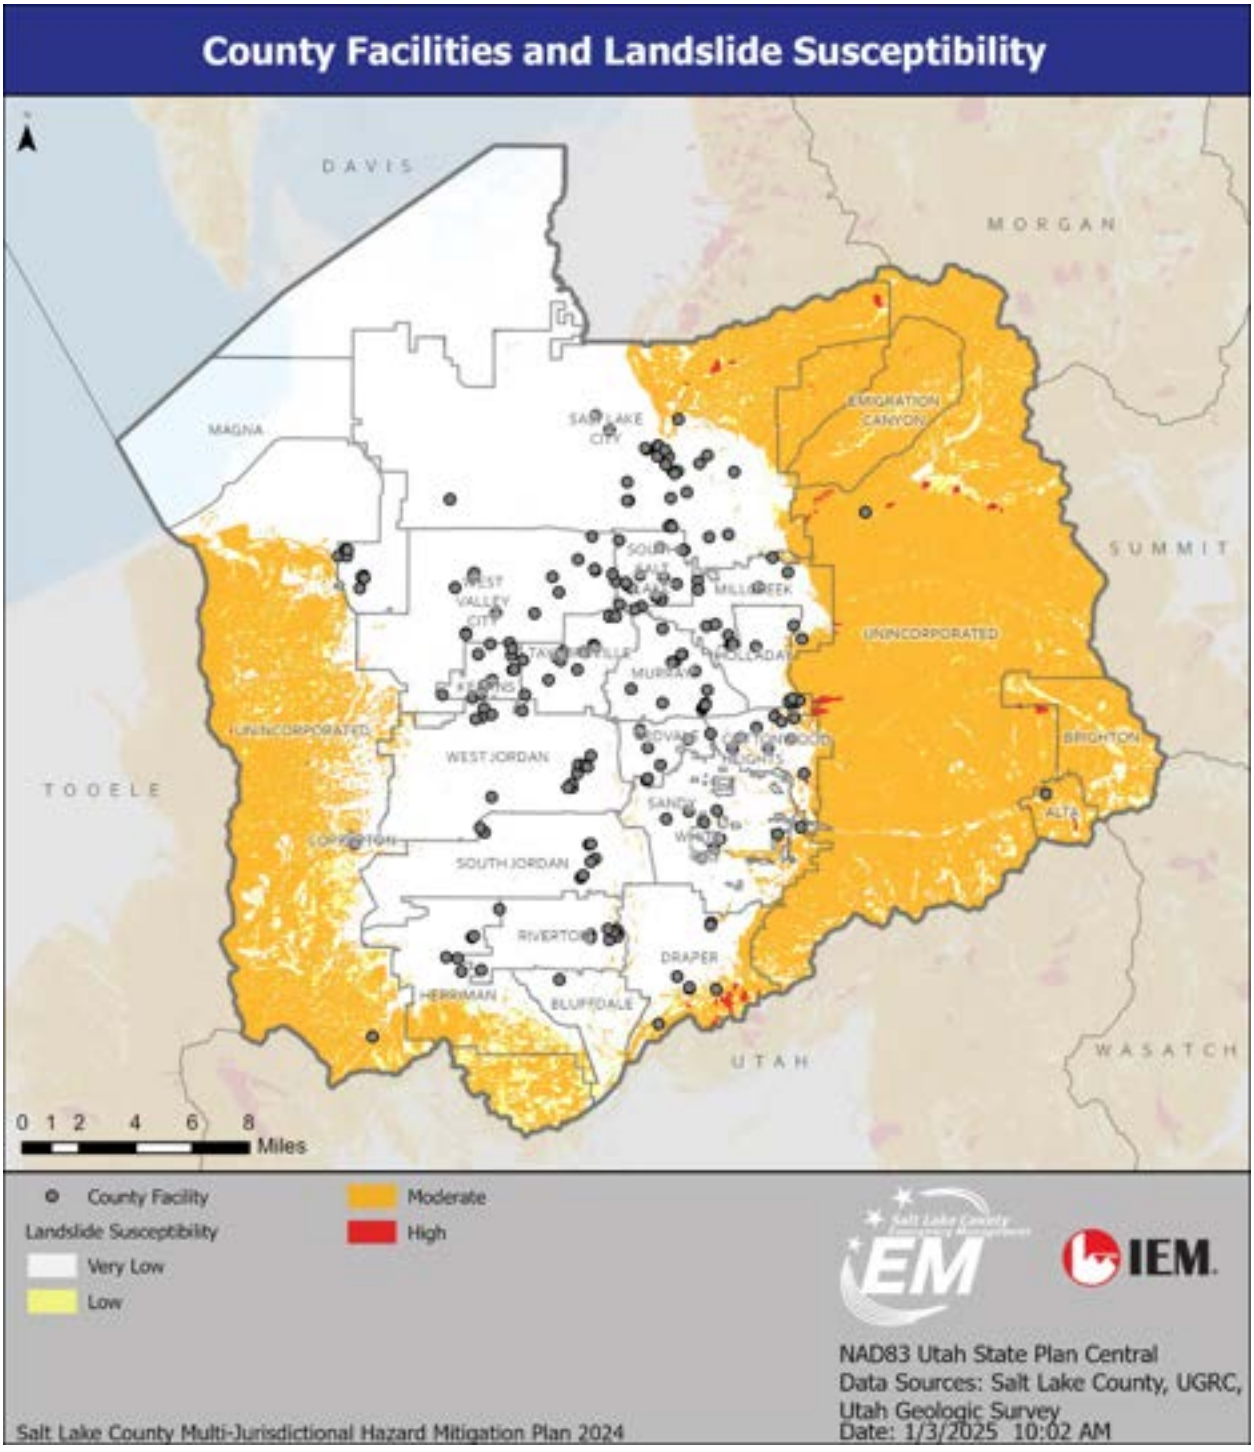

Figure 132: Salt Lake County Facilities in Areas Susceptible to Landslides

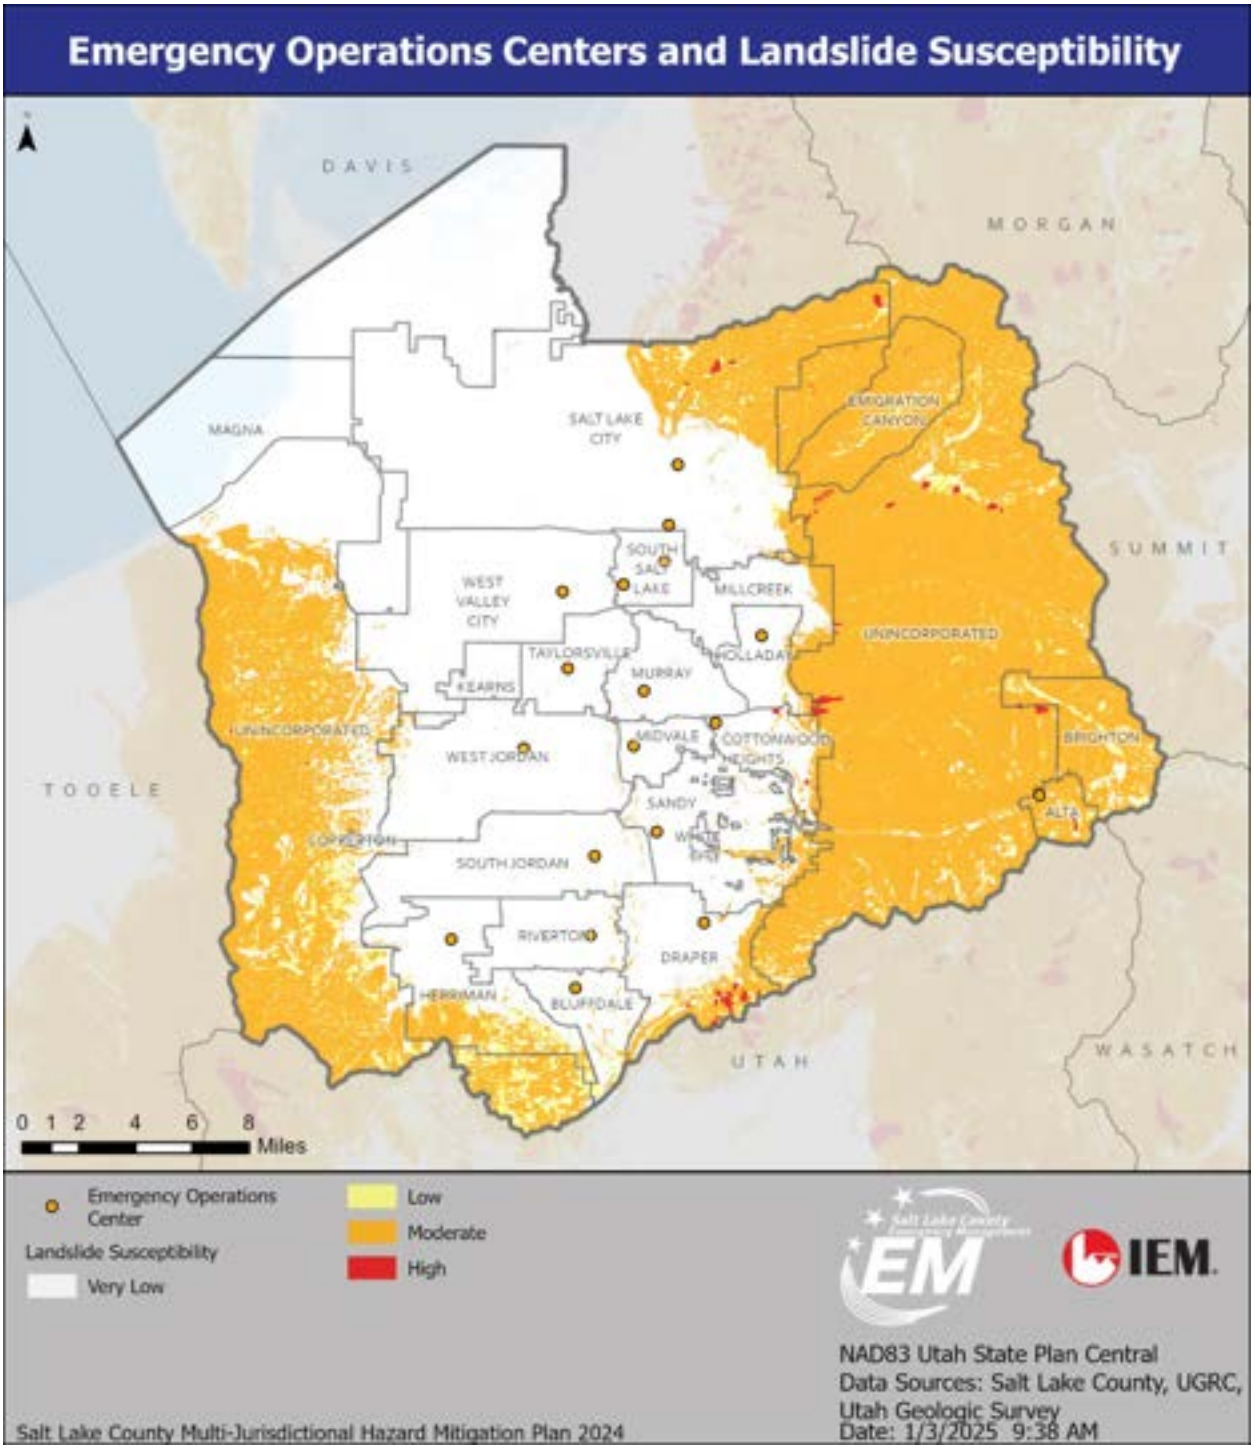

Figure 133: Emergency Operations Centers Areas Susceptible to Landslides in Salt Lake County

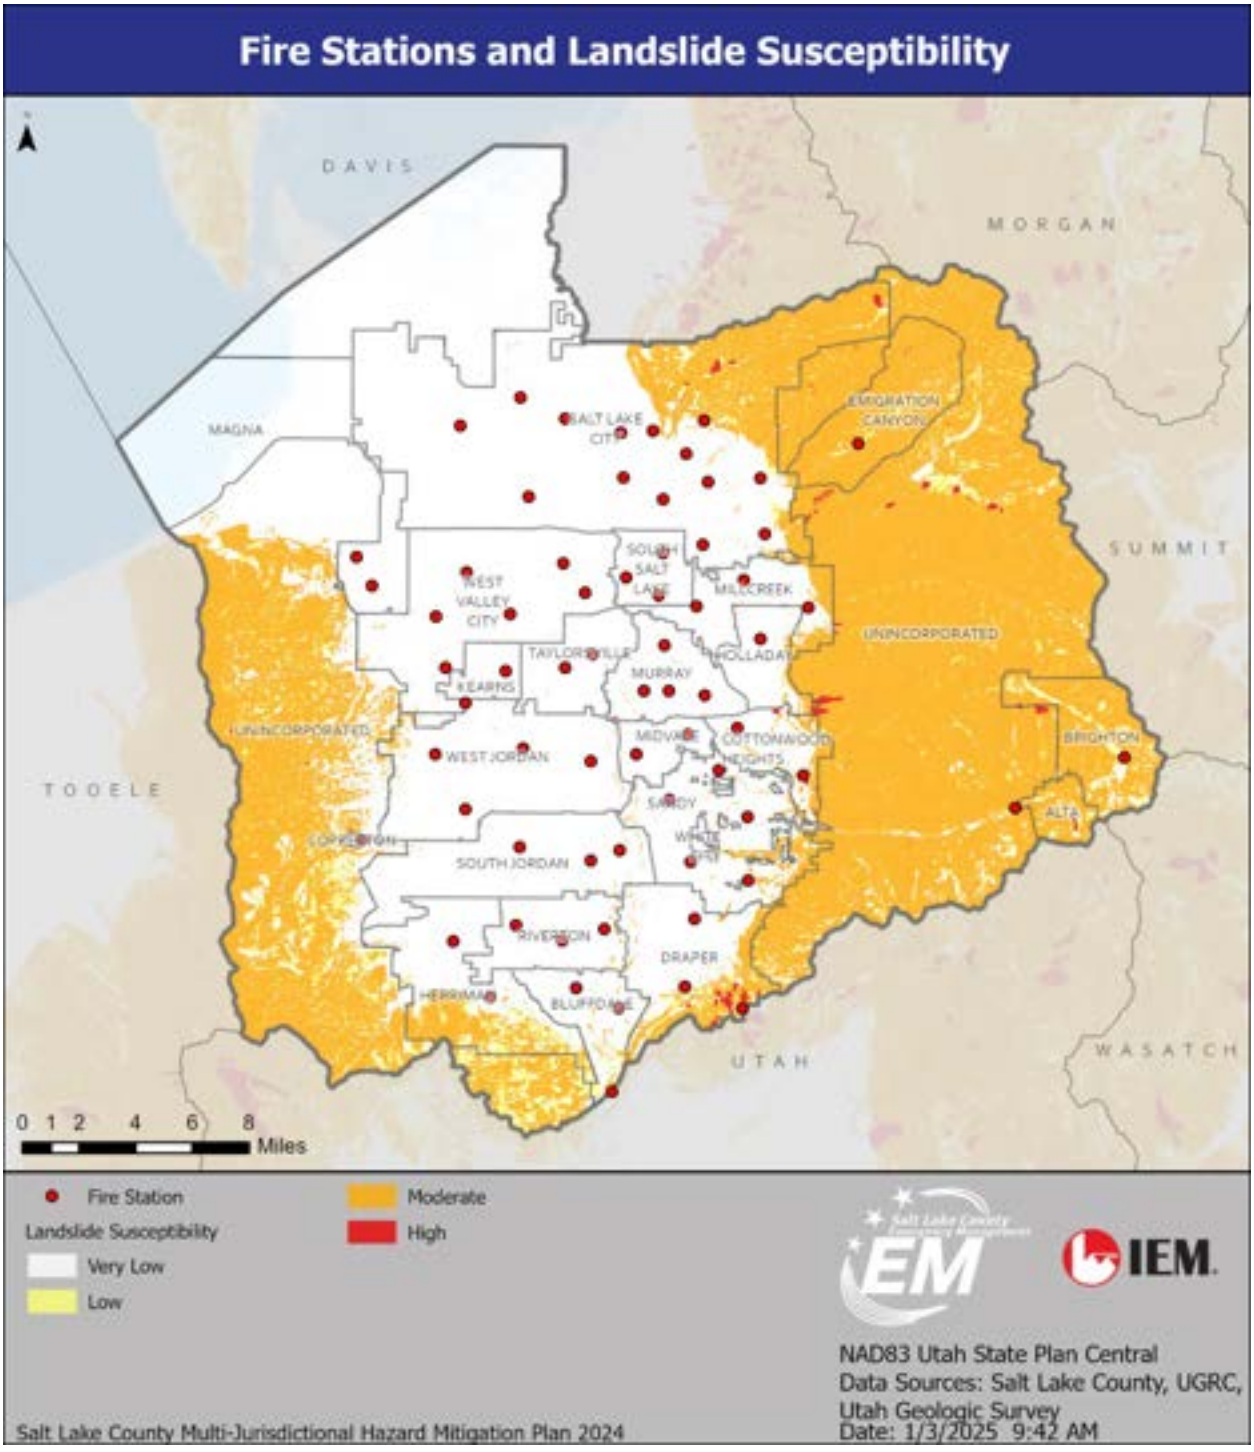

Figure 134: Fire Stations in Areas Susceptible to Landslides in Salt Lake County

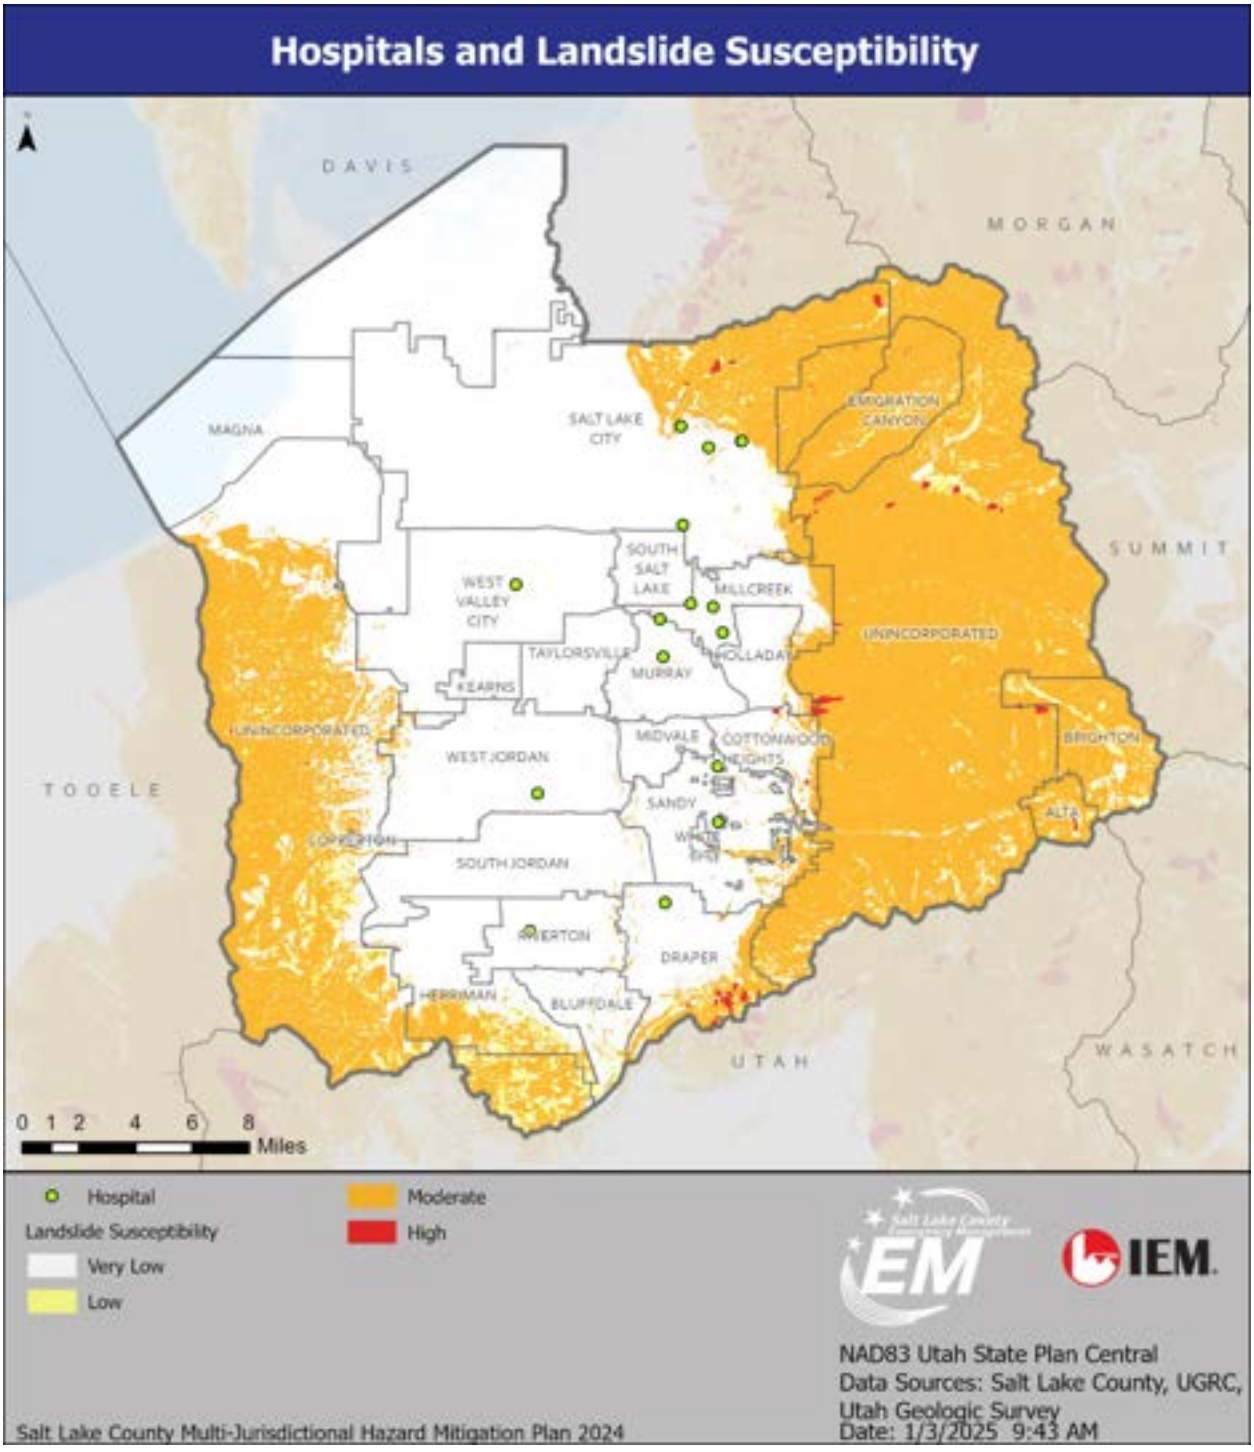

Figure 135: Hospitals in Areas Susceptible to Landslides in Salt Lake County

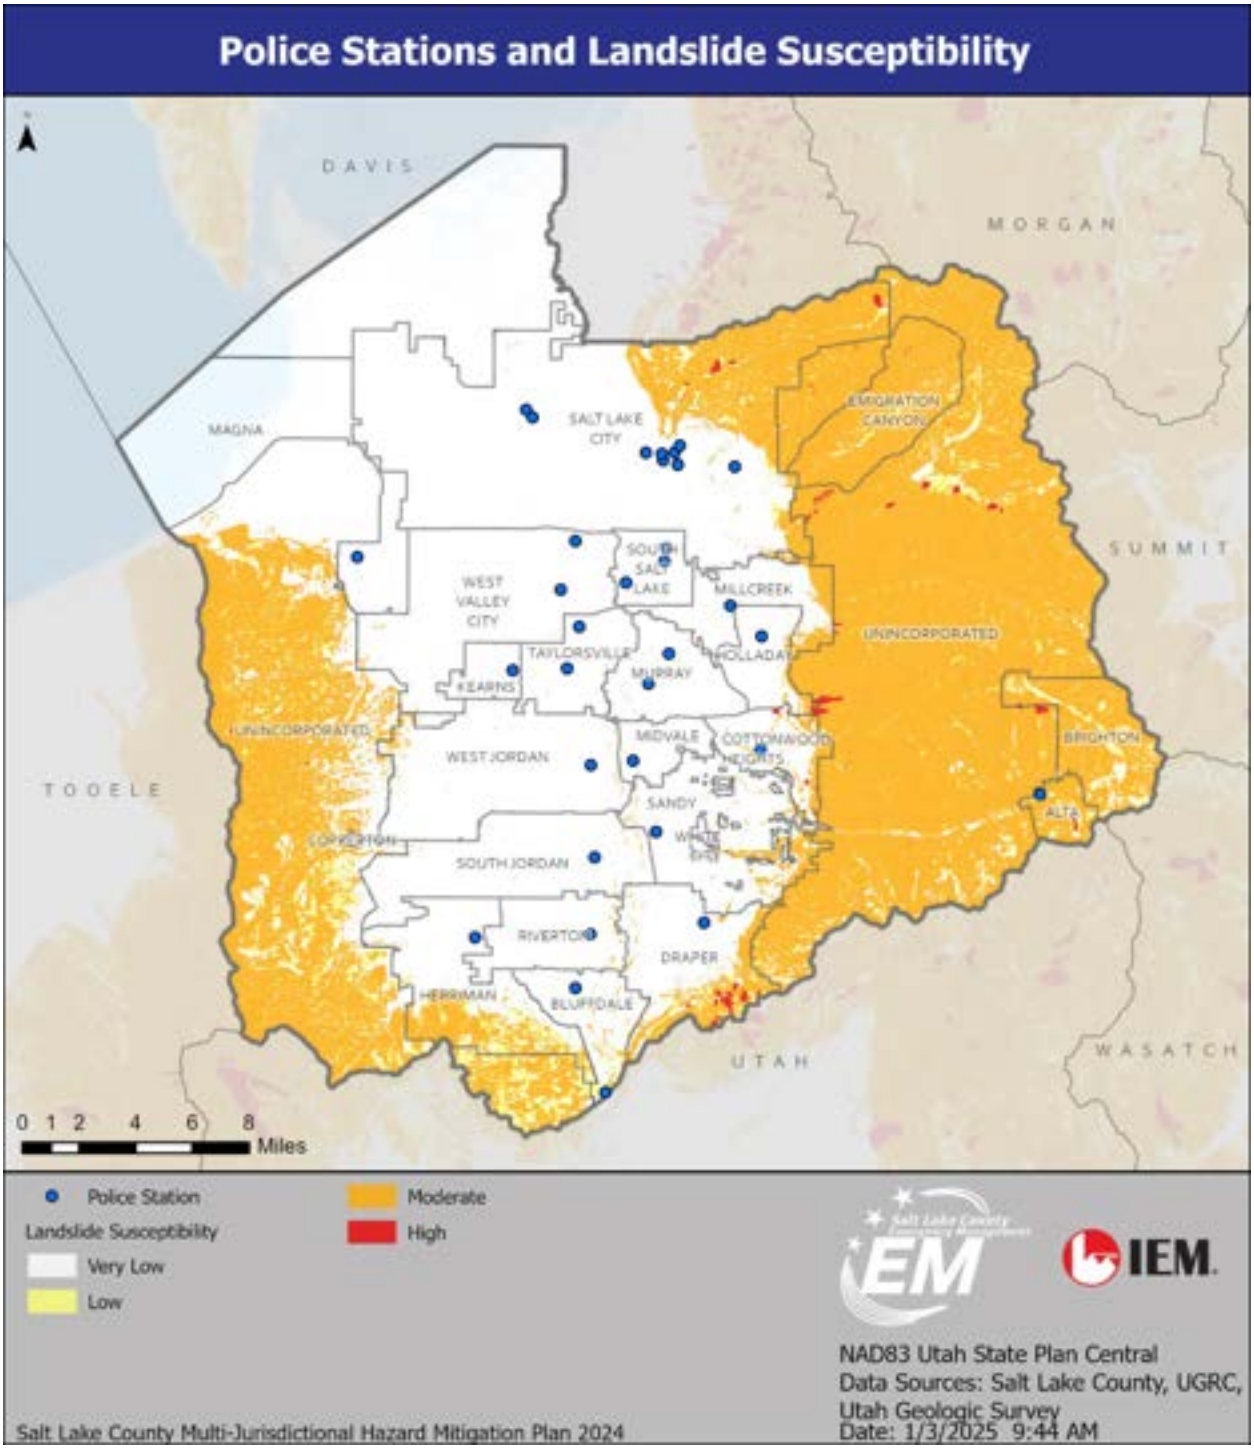

Figure 136: Police Stations in Areas Susceptible to Landslides in Salt Lake County

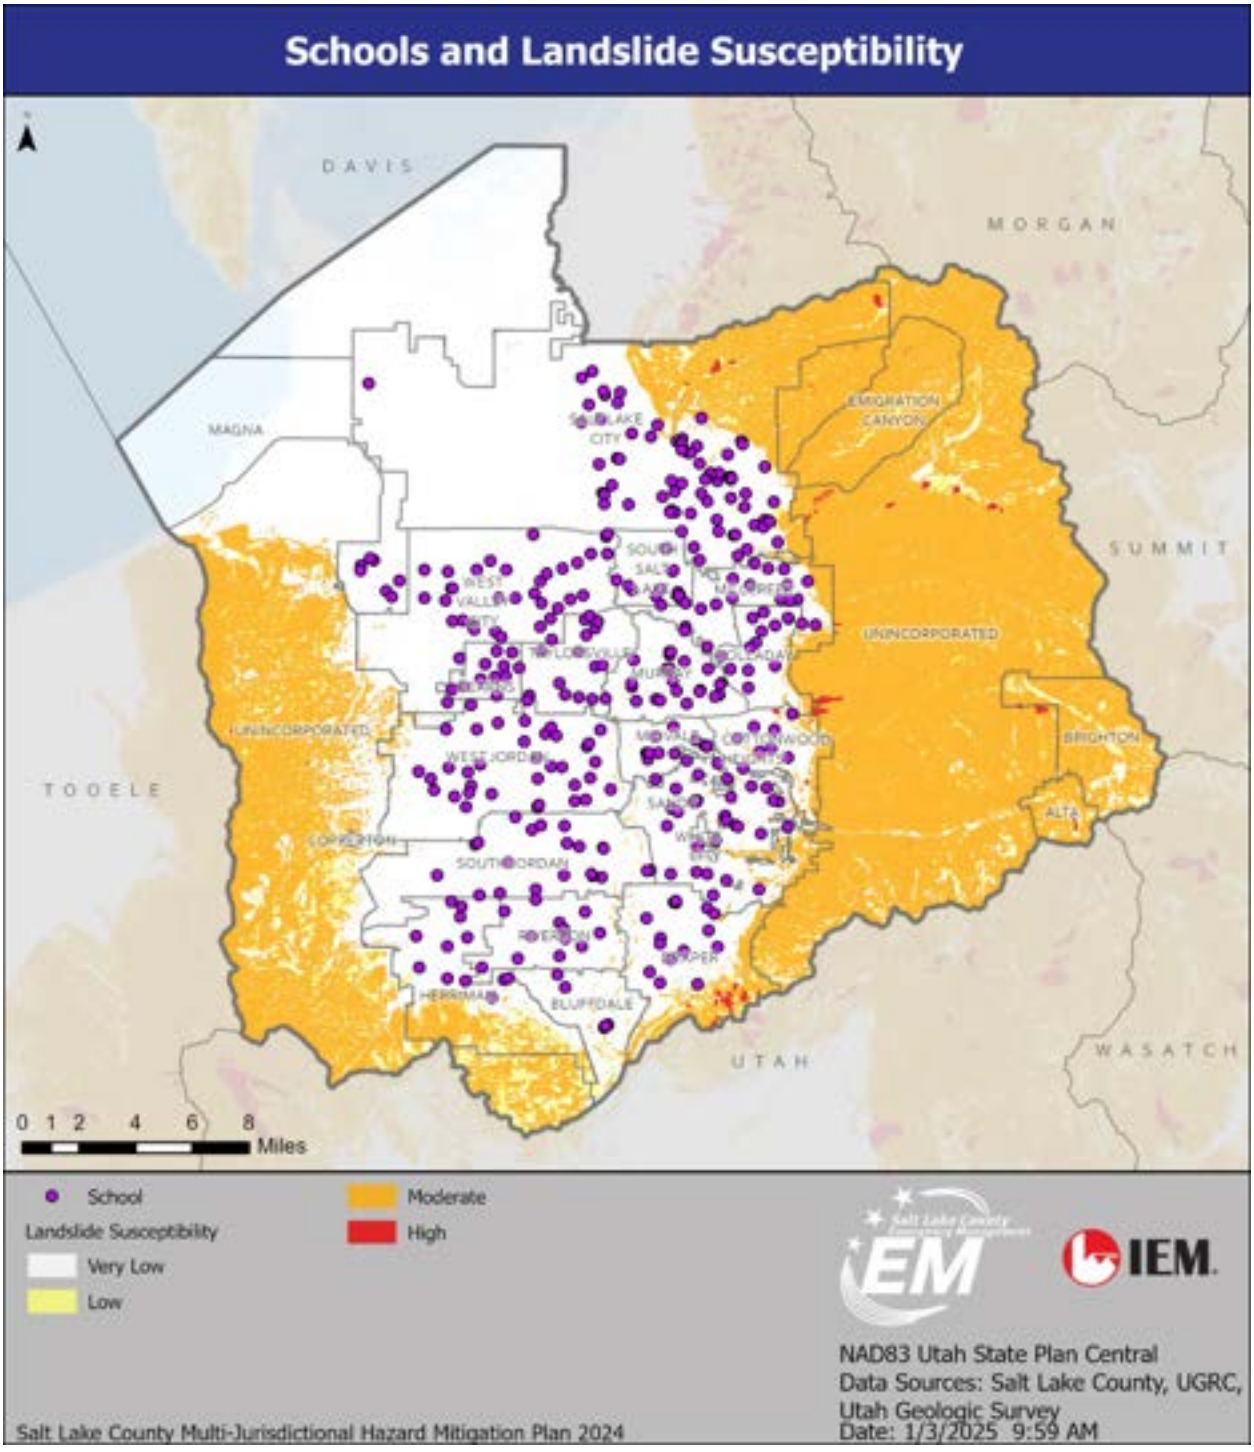

Figure 137: Schools in Areas Susceptible to Landslides in Salt Lake County

According to the 2019 Utah State Hazard Mitigation Plan, 56% of all slope failures in Salt Lake County occurred on hillsides with slopes of 31%–60%. In addition, 1.63 square miles of the county are categorized as “High Hazard” in terms of landslide susceptibility, 320 square miles are “Moderate,” 25 square miles are “Low,” and 373.9 square miles are “Very Low.”

Historical Events and Probability of Future Occurrences

Based on the FEMA Disaster Declarations Database, there have not been any slope failure disaster declarations in Salt Lake County for landslide and slope failure since the last plan update.

Landslides and slope failures are likely to continue to occur periodically in Salt Lake County. In addition, subsidence may occur in City Creek, Emigration, Parley's, and Big Cottonwood Canyons due to the prevalence of dissolvable limestone. Subsidence may also occur in the Avenues area of Salt Lake City and the Taylorsville–Kearns area due to collapsible soils that are compactable upon wetting (Mulvey 1992).

Little Cottonwood Canyon Landslide: A landslide occurred on Tuesday afternoon, May 2, 2023, in Little Cottonwood Canyon, covering the entire roadway on SR-210 near mile marker 7. A second landslide from the same source occurred on top of the first approximately one hour later. The road was closed all day on May 2nd for avalanche mitigation, meaning that no cars were on the road, and therefore no injuries were reported. The type of landslide was debris flow, approximately 100 feet wide and 4 feet deep, according to UDOT. Elevated groundwater levels from the melting of above-normal snowpack led to spring flow at the source. The impacts from the landslide included minor damage to the road and damaged or destroyed guard rails. No people were injured, and no buildings were damaged.

Figure 138: Landslide in Big Cottonwood Canyon, August 2021[153]

Draper Springtime Road Landslide: On Saturday morning, April 22, 2023, a landslide occurred on Springtime Road in Draper, Salt Lake County. Two homes collapsed when the hill they were on slid and fell into the small valley below; fortunately, these homes were evacuated in October 2022 due to unstable slope conditions. The landslide was reported to be the width of two tennis courts at the top, with a length of more than three football fields. The homes were not built on natural slopes, rather they had been

[153] Photograph provided by SLCo EM/Unified Fire Authority.

constructed on building pads engineered to fill the ravine. Besides the two that were damaged, two other homes were ordered to evacuate. The landslide and debris fell onto Ann's Trail, which remains closed.

Emigration Canyon Landslides: Record snowpack and subsequent warmer weather caused flooding and 10–15 landslides through April 2023 in Emigration Canyon, along with several small snow avalanches. A local emergency was declared in the city of Emigration Canyon on April 13th. The earthflow landslide damaged two homes, one of which had considerable damage. Emigration Canyon Road was closed periodically during the spring months of 2023 due to avalanches and landslides.

City Creek Canyon Landslides: A cluster of historical landslides remains visible from the hairpin turn in Bonneville Boulevard in lower City Creek Canyon in Salt Lake City. The Utah Geological Survey and the Salt Lake City Surveyor have monitored the movement of the largest and most destructive of these landslides since June 1998. Over that time, the toe of the landslide has moved intermittently approximately 24 feet, and the main scarp has offset the ground surface by nearly the same amount. Like most recurrently active landslides in northern Utah, movement typically occurs between March and June as groundwater levels rise following the melting of the snowpack. Four houses at the top of the slide are threatened, and efforts to protect one house have cost over $300,000 to date. In 2006, the landslide reactivated again, moving approximately 2 feet, despite drier-than-normal conditions in Salt Lake City.[154]

Bingham Canyon Landslides: Two landslides occurred in 2013 at Rio Tinto's Bingham Canyon Mine. The first occurred on April 10, 2013, at 9:30 p.m. and moved around 65–70 million cubic meters of dirt and rock down the side of the mining pit. Officials at the mine anticipated the slide and took precautions. This is the largest recorded landslide in the United States not connected to volcanism. On September 11, 2013, 100 workers were evacuated when a second, smaller landslide occurred. No injuries occurred during either landslide.[155]

Climate Change Considerations

Climate change can have a significant impact on the natural hazard of landslides. Higher temperatures can cause more intense and frequent weather events, including an increase in precipitation patterns and heat waves. This can lead to more intense and frequent rainfall, which can destabilize slopes and saturate unstable soils. In addition, increased melting of snowpack can raise groundwater levels, reducing slope stability in vulnerable areas.

The 2024 State Enhanced Hazard Mitigation Plan states climate change will continue to alter the landslide risk in Utah. The amount, timing, and type of precipitation in Utah are expected to change during the remainder of the twenty-first century. In general, projections of precipitation suggest that by 2100, northern Utah will receive increased precipitation. More important to landslide risk, the timing and type of precipitation is likely to change. A shift from snow-dominated precipitation to rain-dominated precipitation is well underway and expected to continue. Increased winter temperatures may increase the likelihood of landslides. Warmer winter temperatures reduce the extent of frozen soil, even if the snowpack exists. If

[154] 2019 Utah State Hazard Mitigation Plan.
[155] Ibid.

heavy rain falls on snow at low- to mid-elevations when the snowpack is present and the soil is not frozen, there is a greater landslide risk. In addition, the projected increase in extreme precipitation events, in both summer and winter, will increase the landslide risk.[156]

Secondary Hazards

Landslides can often enter water courses, increasing turbidity and polluting water supplies. Landslides can also block or alter river courses, disrupt large volumes of soil, contaminate the air, and cause long-term forest or other vegetation loss. These environmental changes can lead to an increased risk of vector-borne diseases or bacteria, potentially impacting human health long after the landslide disaster has occurred. Other potential impacts on infrastructure include broken and failed railways, roadways, bridges, and even utility lines, which could lead to loss of power or delay the delivery of vital services to certain parts of the county.

Vulnerability Assessment

Landslides may occur in the Wasatch Mountains in eastern Salt Lake County, the Oquirrh Mountains in the western part of the county, and the Traverse Mountains to the south. As shown in the landslide susceptibility maps, the cities along the east bench of the Wasatch Mountains, including Salt Lake City, Emigration Canyon, Millcreek, Holladay, Cottonwood Heights, Sandy, Draper, the canyon communities of Brighton and Alta, and the southern part of Herriman City, all have areas of moderate to high landslide susceptibility. The western part of the county has less area in incorporated cities at risk of landslides. Smaller areas of susceptibility are found along the Jordan River and creeks in Cottonwood Heights and Sandy City. Structures in these areas are primarily residential; homes and other structures near these areas may be at risk of damage from landslides. Swift-moving slope failures can cause injury or death for those in the affected area.

Landslides can damage homes or other structures, block major transportation routes, and disrupt power and water infrastructure and services. Some landslides affect only small areas that include a few structures. Landslides affecting primary transportation routes can have impacts beyond the immediate area by blocking emergency services and the delivery of goods and services.

Landslide susceptibility is highest in the mountainous areas of the county, which tend to have lower density development and assets. Limited data are available to understand where landslides are most likely to occur, but all structures, populations, and assets in the susceptibility areas should be considered at possible risk to impacts from landslides.

ESTIMATED IMPACT AND POTENTIAL LOSSES

Landslides can damage or block major roadways, including I-80, Emigration Canyon Rd., Highway 190 in Big Cottonwood Canyon, and Highway 210 in Little Cottonwood Canyon. City Creek Canyon Rd, Mill Creek Canyon Rd., or Wasatch Boulevard could also be affected. Several of these routes have only one outlet, so residents or recreationists above the slide could become isolated until roadways are cleared.

[156] 2024 Utah State Hazard Mitigation Plan.

DRAFT

Many residential streets in the foothills are small, dead-end spur roads that may be difficult to access following a landslide; this could cause the emergency response to be delayed due to transportation limitations.

Landslides can also damage aboveground utility infrastructure including power lines or substations, water treatment facilities, or water lines. Disruption of these services can affect residents and businesses beyond the area directly impacted by the landslide. Much of the eastern mountains of Salt Lake County are part of the Salt Lake City watershed; landslides in this area could impact the water supply for residents.

Prolonged closure of roads can have significant economic impacts due to reduced access to recreation areas. Recreation areas, parking lots, trails, and other improvements can also be damaged by landslides. This may reduce tourism to the area and strain budgets to repair amenities.

The 2024 State Enhanced Hazard Mitigation Plan affirms the assessment of the vulnerability of assets to geologic hazards is limited by data availability. Ideally, the vulnerability of assets to geologic hazards would be based on the type, location, construction, height, and age of assets.

The following tables provide the potential estimated impacts on Salt Lake County from landslide and slope failure. These data are taken from the previous plan due to time constraints and the assumption that the change in hazard risk is minimal. Four fire stations and two county facilities are in moderate susceptibility zones. The daytime population in the county in high or moderate landslide-susceptibility areas is approximately 23,573 people; the nighttime population in high or moderate landslide-susceptibility areas is approximately 24,443 people.

Table 65 and Table 66 provide estimated values for infrastructure, populations, and residences vulnerable to landslides, respectively, in incorporated and unincorporated Salt Lake County. The tables include the number of units or total length of the vulnerable infrastructure and the estimated replacement costs as provided by Hazus lost estimation software. The tables also provide estimates for the total area, population, and buildings vulnerable to landslides for individual cities, although not all identifiable areas are specifically listed. Note that replacement costs have likely increased from the time this analysis was completed.

Table 65: Infrastructure Vulnerable to Landslides, Salt Lake County

Item	Length (Miles) or Number of Units	Replacement Cost
Highways/Interstates	46.86 miles	$259,322,175
Highway Bridges	38 bridges	$33,527,413
Railway Segments	4.98 miles	$5,716,617
Railway Bridges	1 bridge	$23,520
Water Distribution Lines	609.38 miles	$19,621,849
Gas Lines	243.64 miles	$7,848,732
Sewer Lines	365.61 miles	$11,773,110

Item	Length (Miles) or Number of Units	Replacement Cost
Total Estimated Infrastructure Replacement Cost		**$337,833,416**

Table 66: Vulnerability Assessment for Landslides, Incorporated Salt Lake County

Incorporated Areas	Acres Affected	Population Affected	Structures in Areas of Moderate or Greater Hazard	
			Residential Structures (Replacement Value)	Commercial Structures (Annual Sales)
Alta	2,477	986	322 ($65,881,200)	0

The NRI includes data on the EALs to individual natural hazards, historical loss, and overall risk at the county and Census tract level. Salt Lake County's NRI EAL value for Landslide is $440K with a risk score of 97.3 and a "Relatively High" rating compared with the rest of the United States (Figure 139).

DRAFT

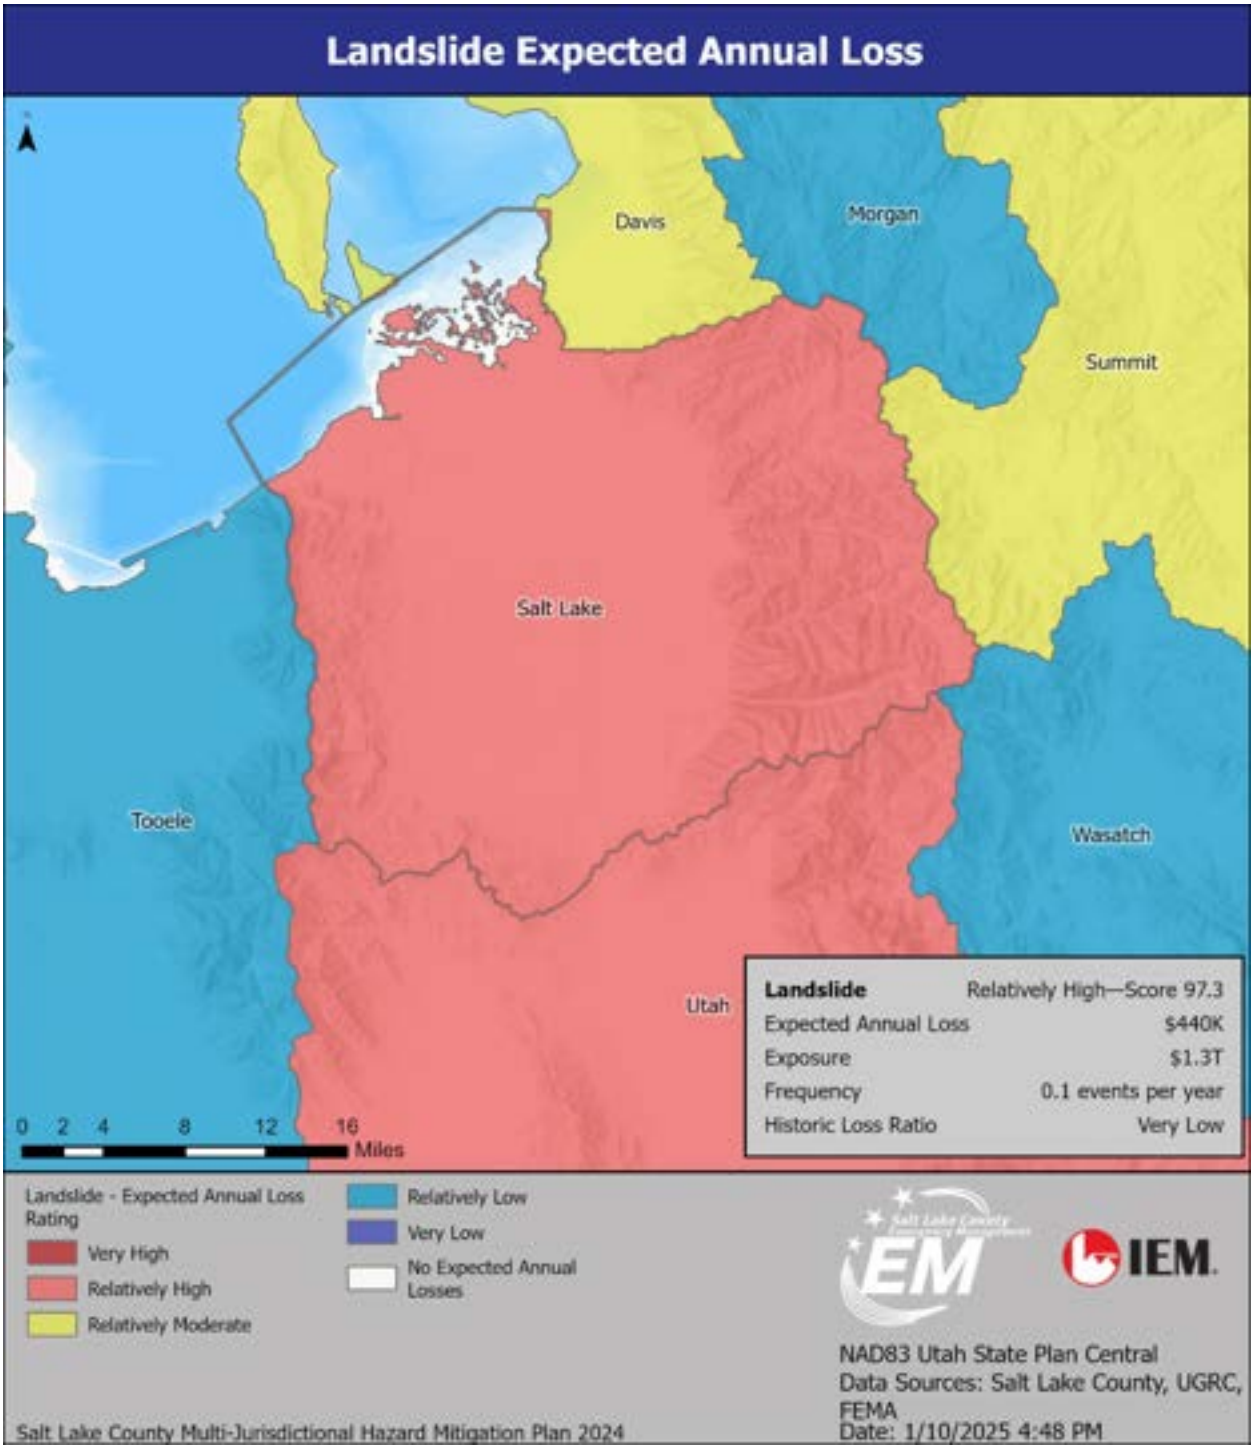

Figure 139: FEMA National Risk Index Salt Lake County Expected Annual Loss from Landslides[157]

[157] FEMA, National Risk Index. https://hazards.fema.gov/nri/map.

VULNERABLE POPULATIONS

All populations in the planning area located near identified hazard areas are at risk. Elderly residents or those with mobility limitations or other disabilities will likely have more difficulty evacuating from an imminent landslide.

COMMUNITY LIFELINES

Landslides can disrupt food, hydration, and shelter if a slide damages residences. Transportation, energy, water, and communications lifelines can also be impacted. These lifelines are of critical importance. In a disaster, communities may lose access to necessities, such as food, water, and shelter. Lifelines help ensure that these needs are met, and that people have the essential resources they need to survive. By providing access to medical care, public health services, and transportation, the lifelines help ensure that people receive the care they need and safely evacuate if necessary. In addition, the Hazardous Materials Lifeline helps to ensure that dangerous materials are managed safely, reducing future risk.

CHANGES IN DEVELOPMENT

Salt Lake County's development and population growth can have significant impacts on the hazard of landslides. Population growth may increase the amount of infrastructure that must be constructed on or near slopes prone to landslides, and this can destabilize the soil and increase the likelihood of landslides. Urbanization can also lead to changes in natural water drainage patterns, causing increased runoff and erosion—further destabilizing slopes and contributing to landslide occurrences. These increases in vulnerability are most prominent in the foothills of the Oquirrh Mountains to the west of Salt Lake County. Developments in western Herriman and South Jordan in these foothills add structures and infrastructure that could be damaged in landslides.

The population of Salt Lake County is predicted to grow over the next 30 years, reaching almost 5 million by 2050. This growth necessitates the development of key infrastructure elements guided by long-range planning. To address the challenges of population growth on housing availability, many communities have updated their plans and implemented the Wasatch Choice Vision (previously known as Wasatch Choices 2040 and Wasatch Choice 2050) in unique and meaningful ways, including coordinating the planning and location of land use, housing, transportation, economic development, and open space to increase the quality of life. These efforts may reduce the risk of landslide and slope failure and the county's future vulnerability in areas of new development.[158] However, risk remains where development has already occurred, and it is not always known where landslides may occur before development. Due to population growth and new construction, the overall vulnerability to landslide and slope failure has increased since the last plan update.

VULNERABILITY SCORE

To analyze the county's vulnerability to landslides, the NRI was used as a primary tool during the 2024 HIRA update. The NRI defines risk as the potential for negative impacts as a result of a natural hazard and determines a community's risk relative to other communities by examining the EAL and social

[158] Wasatch Choice Vision, 2024. https://wasatchchoice.org/.

vulnerability in a given community in relation to that community's resilience. Salt Lake County's NRI landslide risk rating is shown in Figure 140. Salt Lake County has a relatively high landslide risk and a risk score of 95.9.

DRAFT

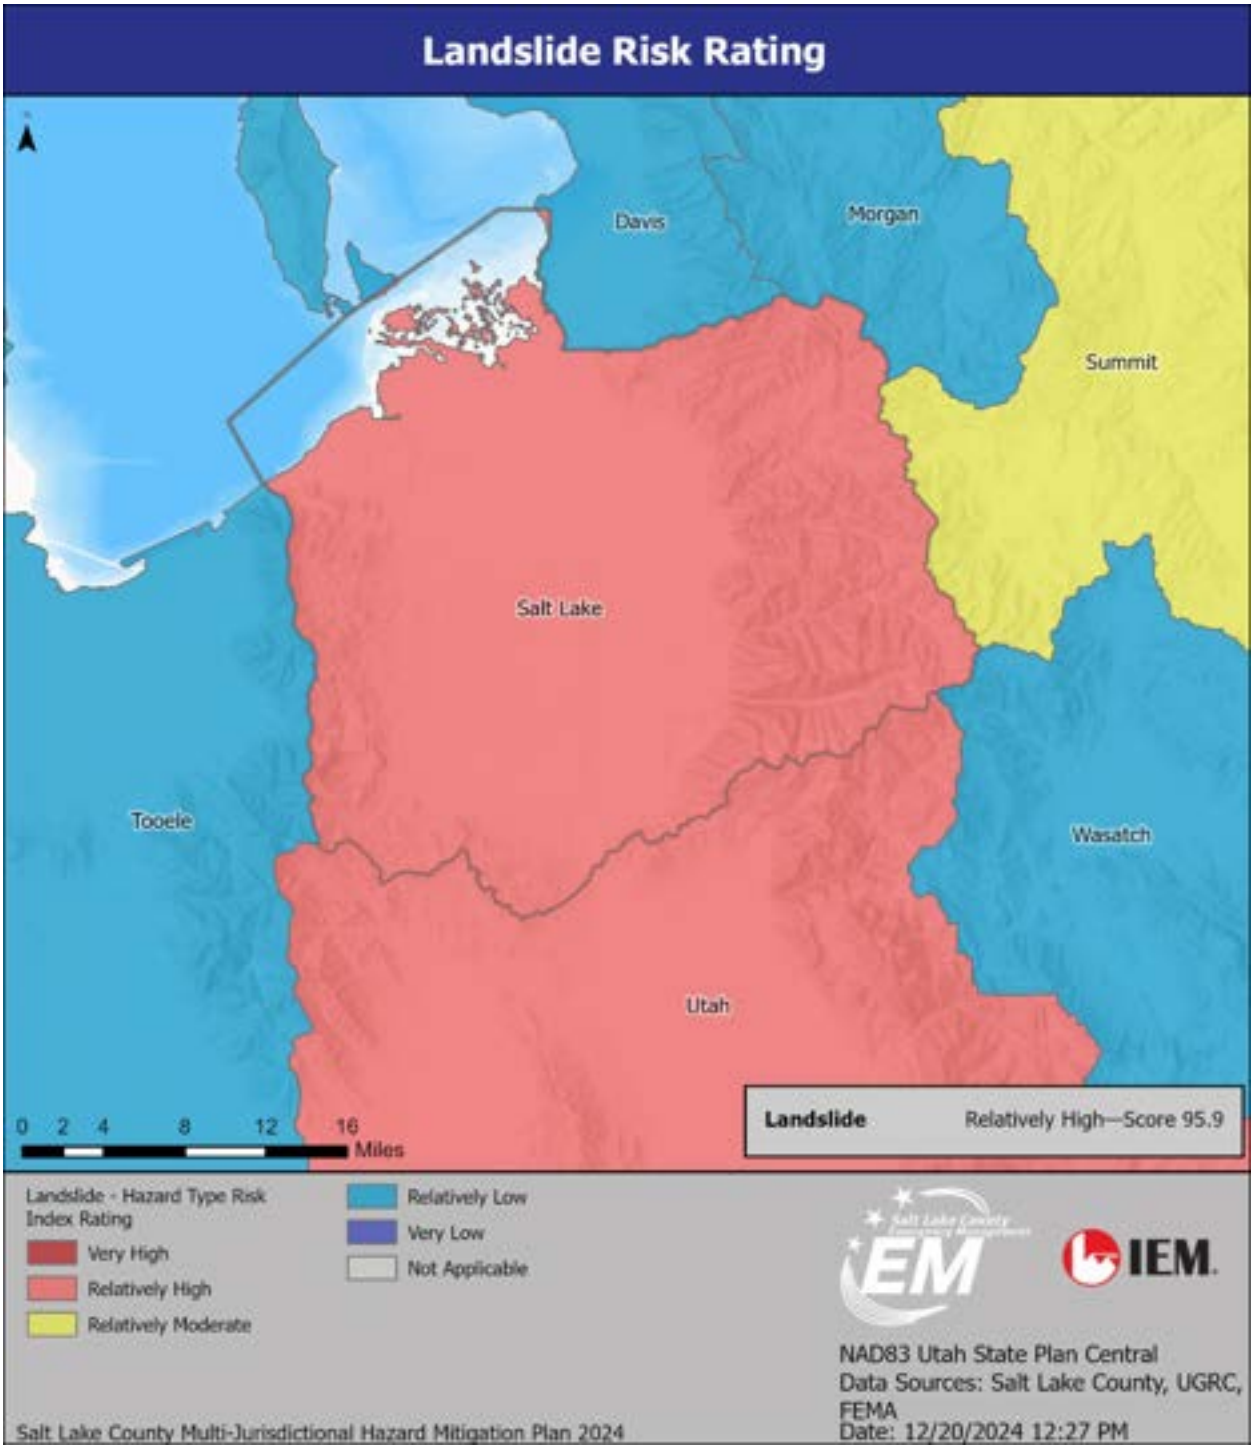

Figure 140: National Risk Index Landslide Risk Map and Score for Salt Lake County[159]

[159] FEMA, National Risk Index. "National Risk Index Salt Lake County Landslide Score, Map and Legend." https://hazards.fema.gov/nri/map.

Lightning

Hazard Description

Lightning is the discharge of atmospheric electricity from a thunderstorm. It can travel at speeds up to 140,000 mph and reach temperatures approaching 54,000 degrees Fahrenheit.[160] Lightning is often perceived as a minor hazard. According to NWS, lightning is a major cause of storm-related deaths in the United States. NWS Storm Data recorded an average of 43 reported lightning fatalities per year in the United States between 1989–2018.[161] In addition, lightning can produce damage to infrastructure and buildings.

Figure 141: Image of lightning[162]

Hazard Profile

Potential Impact		Catastrophic	**Probability**	X	Highly Likely
	X	Critical			Likely
		Limited			Occasional
		Negligible			Unlikely
Location	Can occur in areas throughout the county				
Seasonal Pattern	Year-round				
Conditions	Vary based on latitude, elevation, aspect and landforms				
Duration	Severe weather hazards generally last hours; some conditions can persist for days

[161] National Weather Service (NWS). “How Dangerous Is Lightning?” https://www.weather.gov/safety/lightning-odds.
[162] https://pixabay.com/photos/summer-thunder-storm-lightning-storm-3465247/.

Potential Impact		Catastrophic	**Probability**	X	Highly Likely
	X	Critical			Likely
		Limited			Occasional
		Negligible			Unlikely
Secondary Hazards	Wildfire, power outage				
Analysis Used	National Climate Data Center, National Weather Service, Utah Avalanche Center, Utah Division of Emergency Management, local input, and review of historic events and scientific records				

Magnitude/Extent

Lightning can occur anywhere in the county. Although more common in the summer, lightning can strike at any time of year. Lightning strikes can cause severe injury or death in this area. Lightning routinely occurs without causing significant damage. However, in 1997, lightning resulted in $300,000 in property damage in Salt Lake County. Damage of this magnitude is considered rare and has not occurred since. Table 67 provides information on lightning activity levels (LALs).

Table 67: Lightning Activity Scale[163]

Level	Description
LAL 1	No thunderstorms.
LAL 2	Isolated thunderstorms. Light rain will occasionally reach the ground. Lightning is very infrequent, with 1 to 5 cloud-to-ground strikes in a 5-minute period.
LAL 3	Widely scattered thunderstorms. Light to moderate rain will reach the ground. Lightning is infrequent, with 6 to 10 cloud-to-ground strikes in a 5-minute period.
LAL 4	Scattered thunderstorms. Moderate rain is commonly produced. Lightning is frequent, with 11 to 15 cloud-to-ground strikes in a 5-minute period.
LAL 5	Numerous thunderstorms. Rainfall is moderate to heavy. Lightning is frequent and intense, with greater than 15 cloud-to-ground strikes in a 5-minute period.
LAL 6	Dry lightning (same as LAL 3 but without the rain). This type of lightning has the potential for extreme fire activity and is normally highlighted in fire weather forecasts with a Red Flag Warning.

Location

The entire region of Salt Lake County can be affected by lightning events. Utah ranks 31st in total lightning count and 39th in lightning density in the Vaisala 2024 Annual Lightning Report. Although the number of strikes is relatively low, lightning does occur regularly in the planning area.

[163] National Weather Service, "LALs (L)ightning (A)ctivity (L)evels Numbered 1 through 6." https://www.weather.gov/media/rnk/fire/LAL.pdf

Historical Events and Probability of Future Occurrences

Based on the FEMA Disaster Declarations Database, Salt Lake County has received no designation for lightning disaster declarations since the last plan update.

Lightning routinely strikes without causing significant damage, but 11 events recorded from 1996 to 2018 have caused significant damage, injury, or death. During this time span, NCEI[164] recorded 4 deaths, 10 injuries, and $351,200 in property damage. NCEI did not indicate any new events since the last plan update in 2019. It is certain that lightning events will continue to strike routinely in the county. Based on a recurrence interval of one significant event every two years, future probability is highly likely.

"On May 24, 2000, an 11-year-old girl was killed, and six other children were injured when lightning struck them as they were leaving Midvalley Elementary School in Midvale. The children were walking across the playground, heading for their bus, when the lightning struck. The victim was still alive as she was transferred to the hospital but died later from her injuries. One other child was hospitalized but recovered." The other children suffered minor injuries. Shortly afterward, also in Midvale, a 36-year-old man was injured by lightning as he left the shelter of his home for his car.[165]

On August 13, 1997, lightning struck a chimney and sparked a fire in the Aix La Chapelle Condominiums in Holladay. Several units received heavy fire damage, $300,000 in total.[166]

Climate Change Considerations

Climate change may influence the occurrence of lightning by altering atmospheric conditions. This may create favorable conditions for thunderstorms, which are accompanied by lightning. The increased frequency and intensity of thunderstorms due to higher temperatures could lead to more lightning events.

The 2024 State Enhanced Hazard Mitigation Plan[167] states that research related to climate change and impacts on severe weather in Utah present no clear indications about the impact of increased convective storm activity on the frequency of lightning.

Secondary Hazards

Lightning often occurs along with wind and heavy rain associated with thunderstorms. The most significant secondary hazards associated with these severe storms are falling and downed trees, downed power lines, and power outages.

According to the Edison Electric Institute, "70% of power outages in the U.S. are weather related."[168] Power outages usually last anywhere from a few minutes to a few hours. In some extreme cases, power

[164] NOAA, NCEI. Storm Events Database. "Salt Lake City." https://www.ncdc.noaa.gov/stormevents/eventdetails.jsp?id=5178474.
[165] Ibid.
[166] Ibid.
[167] Utah Enhanced State Mitigation Plan. 2024. https://hazards.utah.gov/state-of-utah-hazard-mitigation-plan/.
[168] Generator Source. "The Many Causes of Power Failure." https://www.generatorsource.com/Causes_of_Power_Failures.aspx.

outages have lasted a few days or even a few weeks. Thunderstorms increase the chance of lightning striking a vital part of a power grid. Rain may damage components vital for maintaining a functioning circuit.

Lightning can also ignite wildfires, particularly if vegetation is dried out due to drought or extreme heat. Utah experiences a monsoon season from July into September, during which seasonal wind and pressure changes cause warm, moist air to flow into Utah. Hot, unstable air rises and can cause thunderstorms along with lightning. Monsoon season coincides with wildfire season. Hot summer temperatures begin to dry out fuels which can easily be ignited by a lightning strike.

Vulnerability Assessment

Lightning strikes only impact a small area, but it is impossible to know where ahead of time. A large area is at risk of a lightning strike during every thunderstorm. If thunder can be heard, lightning is close enough to strike and shelter should be sought. Because it is impossible to know where lightning will strike, all people, structures, and infrastructure are considered vulnerable to lightning. All residents are at risk, but those who are recreating or working outdoors and those who are unhoused, face a higher likelihood of harm from lightning. All critical facilities, including all 218 county facilities, are also vulnerable to damage or disruption from lightning. Utilities, such as power and communications networks and transportation systems and road networks, also are vulnerable.

The 2024 State Enhanced Hazard Mitigation Plan states that lightning is one of the deadliest severe weather events in Utah, cumulatively killing more people than any other hazard and injuring roughly twice as many people as any other severe weather hazard.

ESTIMATED IMPACTS AND POTENTIAL LOSSES

The primary concern for lightning is risk of injury or death. Most injuries and deaths associated with lightning strikes occur when people are outdoors. This can affect outdoor workers, outdoor recreationists, or those without stable housing. However, almost one-third of lightning-related injuries occur indoors. Males are four times more likely than females to be struck by lightning, and the average age of a person struck by lightning is 37 years.[169]

Lightning can contribute to damage to power lines and other power infrastructure. Power outages can affect operations for emergency responders, medical facilities, and homes and businesses. Critical facilities may experience damage to electrical systems from power surges due to lightning. Lightning can also damage communications towers and antennas, which can disrupt signals and hinder the operations of government services, emergency responders, and businesses. Lightning can damage trees, and resulting debris may obstruct roadways.

[169] Center for Disease Control (CDC). “Lightning Strike Victim Data.” April 2024. https://www.cdc.gov/lightning/data-research/index.html.

The NRI includes data on the EALs to individual natural hazards, historical loss, and overall risk at a county and census tract level. Salt Lake County's NRI EAL value for lightning is $676K with a risk score of 92.0 and a rating of "relatively high" compared with the rest of the United States (Figure 142).

DRAFT

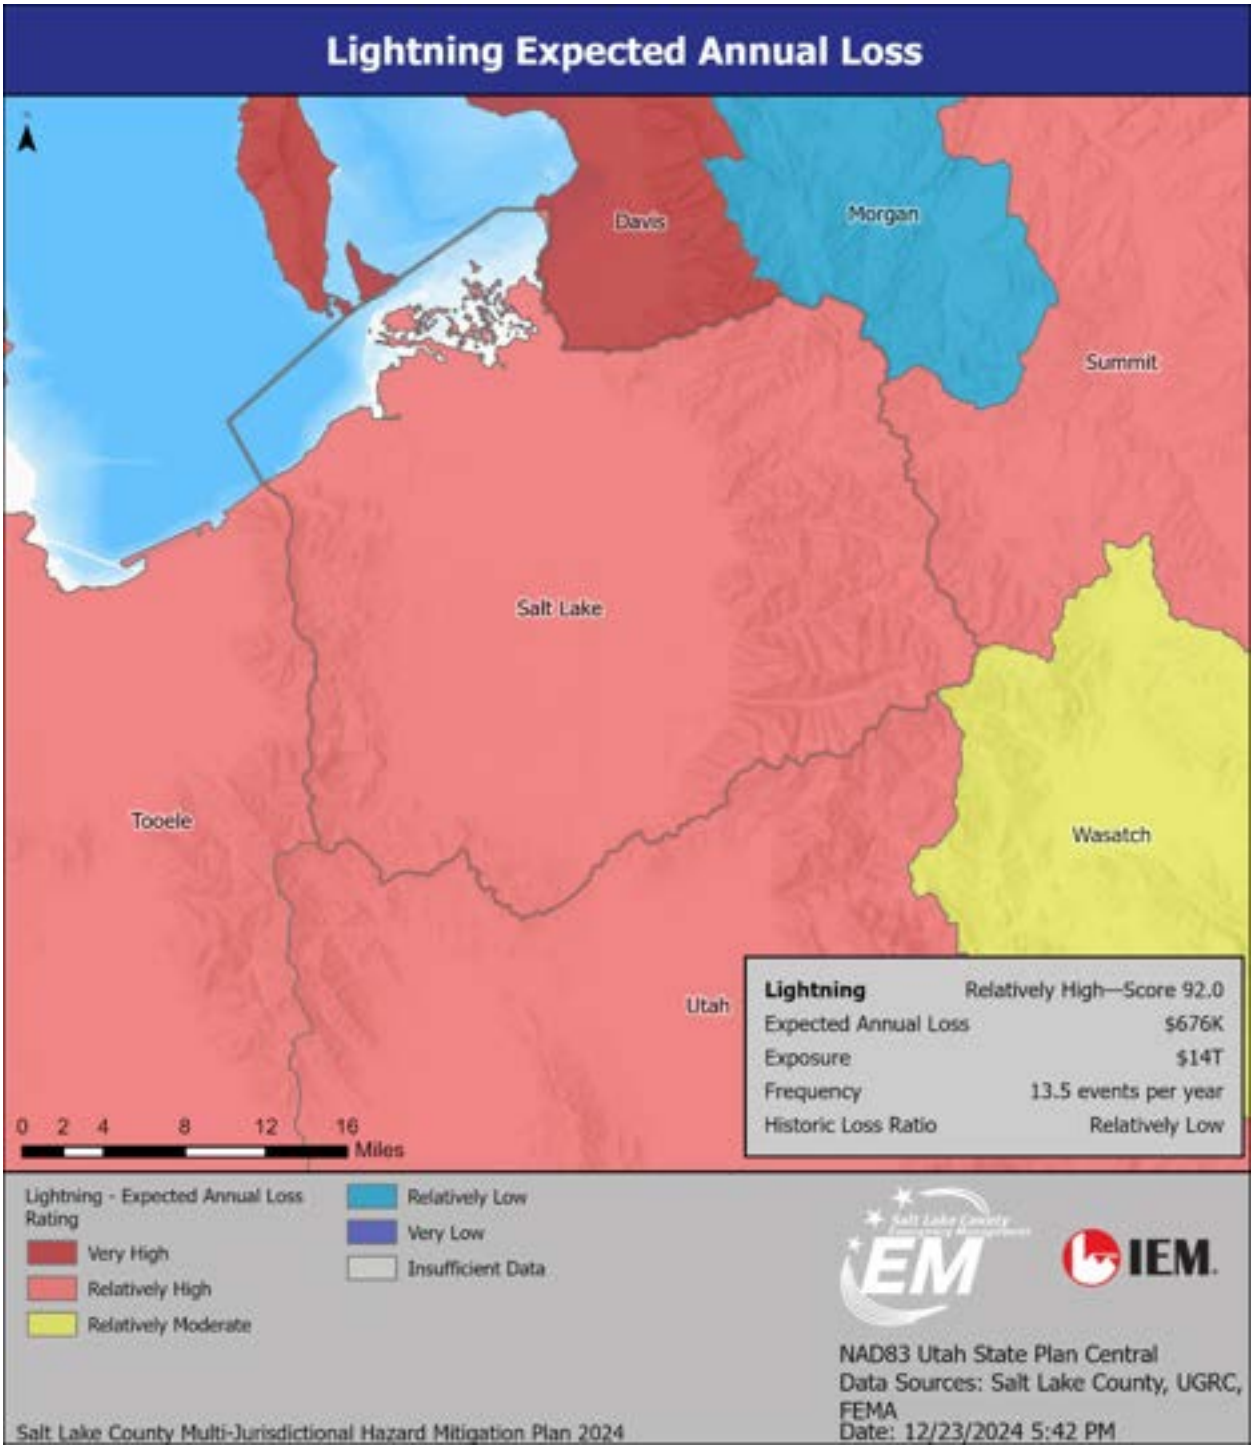

Figure 142: FEMA National Risk Index Salt Lake County Expected Annual Loss from Lightning[170]

[170] FEMA. National Risk Index. "Salt Lake County Expected Annual Loss Lightning Risk Score, Map and Legend." https://hazards.fema.gov/nri/map.

VULNERABLE POPULATIONS

Besides outdoor workers and other people without shelter during a storm, individuals with disabilities may face challenges seeking shelter during storms, and the elderly may require additional support and assistance during and after the storm.

COMMUNITY LIFELINES

Lightning can impact several FEMA Community Lifelines. Safety and Security may be compromised due to potential injury from lightning and disruption to emergency response in the case of power outages. Health and Medical services also may be affected by power outages, which can disrupt medical facilities and individuals reliant on electricity-powered medical equipment. Lightning also can disrupt the Energy lifeline by contributing to power outages, which impacts services for residents and businesses. The Communications lifeline can be affected by lightning producing damage to infrastructure, including 911, dispatch, and responder communications abilities.[171]

CHANGES IN DEVELOPMENT

Salt Lake County's development and population growth can have significant impacts on the hazard of lightning. Urbanization can lead to the construction of taller structures, increase population density, and concentrate infrastructure, attracting lightning and increasing the potential for damage and injury from lightning strikes. Larger cities that are continuing to develop, like West Valley City and West Jordan, are starting to build taller structures that are at higher risk from lightning strikes. Increased outdoor activities and recreational areas due to population growth can also lead to higher exposure to the hazard of lightning.

Potential impacts from an increase in vulnerability to lightning could cause loss of life/property and power failure from increase in severe storms related to climate change. Increased population patterns may lead to more people recreating outdoors, thus increasing vulnerability to lightning strikes. Overall vulnerability to lightning has remained the same since the last plan update.

VULNERABILITY SCORE

To analyze the county's vulnerability to severe weather, the NRI was used as a primary tool during the 2024 HIRA update. The NRI defines risk as the potential for negative impacts because of a natural hazard and determines a community's risk relative to other communities by examining the EAL and social vulnerability in a given community in relation to that community's resilience. Salt Lake County's NRI lightning wave risk rating is shown in Figure 143. Salt Lake County has relatively high lightning risk, and a risk score of 90.3.

Public Health/Epidemic/Pandemic

Hazard Description

An epidemic is a sudden increase in disease cases above what is typically expected in a specific geographic area. It often occurs in a community or region and can spread quickly among the population.

Figure 144: Testing During the COVID-19 Pandemic[173]

A pandemic is an epidemic that has spread over multiple countries or continents, affecting many people. It typically involves a new infectious agent against which the population has little or no immunity, leading to widespread transmission.

Based on their characteristics and ability to spread, the following human diseases could also contribute to a severe epidemic or pandemic and should be noted:

- Methicillin-resistant staphylococcus
- West Nile virus
- H1N1 influenza
- Severe acute respiratory syndrome
- Measles
- Hepatitis
- Tuberculosis
- E. coli
- Lyme disease

[173] https://unsplash.com/photos/people-standing-near-white-table-during-daytime-zRGqHTHP-HQ.

- Hantavirus
- Leptospirosis
- COVID-19

Hazard Profile

Potential Impact	X	Catastrophic	**Probability**		Highly Likely
		Critical		X	Likely
		Limited			Occasional
		Negligible			Unlikely
Location	The entire county could be affected. Higher-density areas may be more vulnerable.				
Seasonal Pattern	Some are seasonal, such as West Nile Virus in warmer months, while others may occur year-round.				
Conditions	Disease may spread faster in areas where people congregate. Some populations may be more susceptible or experience more severe consequences.				
Duration	Outbreak can last weeks, months, or years.				
Secondary Hazards	Supply chain interruption and/or shortages and economic losses; healthcare systems and supplies may be overwhelmed.				
Analysis Used	Review of historic events, hazard analysis plans, local input, and other information provided by the Utah Division of Emergency Management				

Magnitude/Extent

The potential magnitude of pandemics or epidemics in Salt Lake County can vary widely depending on the disease's transmissibility, population density, and public health measures in place. In mild cases, effective interventions and vaccination could limit the impact on a few hundred manageable cases. However, a moderate outbreak might lead to thousands of infections, strain healthcare services, and increase morbidity. In severe scenarios, a highly transmissible and lethal pathogen could overwhelm the healthcare system, resulting in tens of thousands of cases and significant fatalities, prompting quarantines and long-term economic disruptions. Beyond immediate health impacts, such events can have lasting effects on mental health, job stability, and access to healthcare, highlighting the importance of preparedness and community cooperation in addressing public health crises.

The Pandemic Severity Index (PSI) measures the severity of pandemics and their potential global health impact, focusing primarily on influenza. It assesses diseases based on factors like the severity of illness caused, the transmissibility of the virus, and the impact on healthcare systems.

DRAFT

	Pandemic Severity Index		
Interventions by Setting	**1**	**2 and 3**	**4 and 5**
Home			
Voluntary isolation of ill at home (adults and children); combine with use of antiviral treatment as available and indicated	Recommend	Recommend	Recommend
Voluntary quarantine of household members in homes with ill persons (adults and children); consider combining with antiviral prophylaxis if effective, feasible, and quantities sufficient	Generally not recommended	Consider	Recommend
School			
Child social distancing –dismissal of students from schools and school-based activities, and closure of child care programs	Generally not recommended	Consider: ≤ 4 weeks	Recommend: ≤ 12 weeks
–reduce out-of-school contacts and community mixing	Generally not recommended	Consider: ≤ 4 weeks	Recommend: ≤ 12 weeks
Workplace/Community **Adult social distancing**			
–decrease number of social contacts (e.g., encourage teleconferences, alternatives to face-to-face meetings)	Generally not recommended	Consider	Recommend
–increase distance between persons (e.g., reduce density in public transit, workplace)	Generally not recommended	Consider	Recommend
–modify, postpone, or cancel selected public gatherings to promote social distance (e.g., stadium events, theater performances)	Generally not recommended	Consider	Recommend
–modify workplace schedules and practices (e.g., telework, staggered shifts)	Generally not recommended	Consider	Recommend

Figure 145: Pandemic Severity Index

Location

Epidemics and pandemics can emerge in various locations, often influenced by several factors that affect susceptibility. In Utah, specific locations may be more susceptible to epidemics and pandemics due to population density, travel patterns, and healthcare access. Urban centers, such as Salt Lake City, Provo, and Ogden have higher population densities, making them more vulnerable to the rapid spread of infectious diseases, especially during crowded events. College campuses, such as the University of Utah and Salt Lake Community College, can also be hotspots for outbreaks due to the concentration of students in communal living spaces. In addition, popular tourist areas, such as Park City and Zion National Park, face increased risks from visitors who may introduce various pathogens. Regions with fewer healthcare facilities may struggle to manage outbreaks effectively, while rural areas, despite lower population densities, could face challenges due to limited access to medical resources. Lastly, transportation hubs near significant highways or airports can facilitate individual interactions, increasing the risk of disease transmission.

Historical Events and Probability of Future Occurrences

Table 68 provides information on historical health outbreaks in Utah.[174]

Table 68: Historical Health Incidents, Utah

Disease	Date	Deaths/Cases	Etiology
Diphtheria	1880	749 deaths	*Corynebacterium diphtheriae*; poor hygiene practices
Spanish Flu[175]	1918	2915 deaths	H1N1 virus with genes of avian origin
Rheumatic Fever	1985–1986	136 cases	Streptococcus bacteria; untreated strep throat
Hantavirus	1993–2017	38 cases	Infected rodents
West Nile Virus[176]	1999–2023	497 cases	Mosquitos
Measles	2011	13 cases	Morbillivirus
Hepatitis C	2013	4800 potentially exposed, seven infected	Exposure to blood from unsafe injection practices; unsafe healthcare; unscreened blood transfusions; injection drug use; sexual practices that lead to exposure to blood
Hepatitis A	2018	295 cases, two deaths	Ingestion of food or water contaminated by an infected person's feces

Disease	Date	Deaths/Cases	Etiology
COVID-19[177]	2020–2022	1,090,346 cases, 5,293 deaths	Exposure to coronavirus2, also called SARS-CoV-2

Salt Lake County Specific: Like many other US cities during the late 19th and early 20th centuries, Salt Lake City was a hotbed for **typhoid**. People hunted, camped, picnicked, and polluted near the seven mountain streams that provided the city with most of its water. Sheep and cattle grazed near the watershed, barnyards were built near water sources, and flies had easy access to the open privies and manure piles.

Typhoid was also quickly passed by finger contamination when an ill person or even a recovered victim handled food and did not wash his or her hands carefully after using the restroom. In 1923, a Salt Lake City woman working in a delicatessen was ill with what was later diagnosed as “walking typhoid.” She had diarrhea and was getting weaker, but she did not want to leave her boss shorthanded; she also needed the money. She stayed on the job, serving food between her frequent trips to the lavatory and her less frequent or thorough handwashing. One day, four adults and two young people came into town from their westside farm to see a double feature at a movie theater. Afterward, they visited the delicatessen and bought some food to take home for their evening meal. The young people left on dates while the adults shared the deli food. The four adults came down with typhoid, and two died.

Some 188 cases of typhoid (13 deaths) were traced to the woman carrier, but no one knows for sure how many people contracted the disease, took it home, possibly to another state, and spread it even further. The problem was compounded by the fact that a drugstore near Salt Lake City’s tourist district bought food from the delicatessen and served it to countless people. Eventually, the deli was tracked down as the outbreak’s source and quarantined. Reports of typhoid soon subsided.

Before 1900, doctors had seen more typhoid fever than any other disease and treated it in various ways. Some felt it was best to starve the patient; others felt hot water was the cure. Salt Lake City Cemetery records from 1850 to 1894 record 924 deaths due to typhoid, but the actual number was probably higher. Many deaths among typhoid-prone adolescents and young adults who died in the summer and fall when typhoid is most common were attributed to “diarrhea” or “fever.” Many people recognized the connection between typhoid and contaminated food and drink, but little action was taken until health boards were established. Even then, educating the public to take simple precautions was difficult.

When the housefly was implicated as a typhoid carrier in the late 19th century, Dr. Theodore B. Beatty, state health commissioner, began a crusade against the pest. He distributed literature, gave talks and demonstrations at schools, and helped make “Swat the Fly” a standard greeting. A contest offered prizes to whoever killed the most flies. The winner brought in 707 quarts of dead flies, an estimated 9.5 million, and received the $1,000 prize donated by a Salt Lake City businessman; in one year, Utahns captured

[177] Johns Hopkins University and Medicine. “Coronavirus Resource Center.” https://coronavirus.jhu.edu/region/us/utah.

3,715 quarts of flies. The fly menace was lessened, but real progress was made when attention gradually turned to eradicating their breeding grounds.

Following the example of some eastern cities, Salt Lake City instituted a water chlorination program in 1915. It gradually expanded until 1927, when daily testing of chlorinated water was done at all city water intake points. Reactions to chlorination varied. Mothers worried when they could not taste the chlorine, fearing that the water they gave their children was unsafe. Others said chlorine made the water unpalatable and killed their goldfish. During the prohibition era, some complained that it ruined the taste of their home brew and bathtub gin.

Gradually, with increasing use of sanitary methods—improved sewer systems, purer water, and laws regulating the handling and dispensing of foods—plus the use of a vaccine discovered by Almoth Wright of London in 1906–1907, typhoid was controlled.[178]

The **1918 influenza outbreak**, known as the Spanish Flu, significantly impacted communities worldwide, including Salt Lake City. The pandemic, which emerged in the final stages of World War I, reached Salt Lake City in the autumn of 1918 when the region was still recovering from the war.

The first cases were reported in late September, and by October, the virus had spread rapidly, particularly affecting healthy young adults. Influenza often led to pneumonia, resulting in high mortality rates due to the limited medical resources of the time.

Local health officials launched a public health campaign promoting mask-wearing, social distancing, and gathering restrictions. Schools and theaters closed, and strict quarantine measures were implemented. Despite these efforts, the city faced thousands of cases and over 500 deaths, overwhelming the healthcare system.

The pandemic also caused economic disruption as businesses and schools closed and communities united to support one another. As the outbreak waned in early 1919, Salt Lake City reflected on the importance of public health preparedness and effective communication.

The legacy of the 1918 influenza outbreak remains a poignant reminder of community resilience in the face of public health challenges.[179]

In 1985, Salt Lake County faced an outbreak of acute rheumatic fever (ARF), a serious condition stemming from untreated streptococcal throat infections that notably affected children and adolescents. The 99 verified cases were in 20 of Utah's 29 counties; the most significant outbreaks occurred in Salt Lake County and Utah County. ARF can lead to severe complications, including rheumatic heart disease, emphasizing the need for early diagnosis and treatment of strep throat.

[178] Murphy, Miriam B. "Salt Lake City Had Its Typhoid Mary." History to Go, History Blazer. April 1996. https://historytogo.utah.gov/typhoid-mary/.
[179] University of Michigan Center for the History of Medicine and Michigan Publishing, University of Michigan Library. "Influenza Encyclopedia: Salt Lake City, UT." https://www.influenzaarchive.org/cities/city-saltlakecity.html.

Local health officials, schools, and healthcare providers collaborated to identify cases and educate the community about the symptoms of strep throat and the importance of antibiotic treatment to prevent ARF. This outbreak highlighted the necessity of monitoring communicable diseases and ensuring proper healthcare access to prevent serious complications associated with bacterial infections. As a result, measures were reinforced to guarantee that children received appropriate medical attention for throat infections.[180]

Beginning in late 2016, communities across the United States reported a significant increase in **hepatitis A** infections, with over 22,000 cases documented nationwide by July 2019. Although some areas continue to face this outbreak, Utah officially declared its outbreak over in February 2019 after nearly 300 cases had been recorded. This success was primarily attributed to innovative strategies implemented by the Salt Lake County Health Department (SLCo HD). Of the cases in Utah, about 200 were reported in Salt Lake County, primarily among individuals experiencing homelessness or using illicit drugs, which complicated efforts to provide treatment.[181]

The first case of COVID-19 in Utah was documented in early March 2020. By November 2023, Salt Lake County had experienced 419,514 confirmed cases, 18,930 hospitalizations, and 1,909 deaths during the pandemic.[182] COVID-19 demonstrated how disease outbreaks can evolve rapidly and have wide-ranging public health impacts, disrupt supply chains, and contribute to economic losses.

Several interrelated factors shape the probability of future occurrences of epidemics and pandemics. Globalization and increased travel enable the rapid spread of disease across borders, while urbanization creates densely populated environments where infections can thrive. Climate change also plays a role, as shifting climates may expand the habitats of vectors like mosquitoes, potentially increasing diseases, such as malaria and dengue fever. In addition, zoonotic diseases—those that jump from animals to humans—become more likely as humans encroach on wildlife habitats. Antimicrobial resistance further complicates matters, making infections more challenging to treat and control. The strength of public health infrastructure is crucial, as more robust systems can effectively contain outbreaks. With these various elements at play, the risk of future epidemics and pandemics remains significant, highlighting the need for proactive global health measures and improved surveillance to mitigate potential threats.

Figure 146 displays a list of priority pathogens that could cause the next pandemic. The list was compiled by more than 200 scientists from 50 countries. Although these pathogens may not currently be active in the United States, they could emerge or reemerge due to various modes of travel and transportation.

[181] Shapiro, Michelle. “Field Notes: Salt Lake County Stops Hepatitis A Outbreak.” National Association of County & City Health Officials. September 30, 2019. https://www.naccho.org/blog/articles/field-notes-salt-lake-county-stops-hepatitis-a-outbreak.
[182] Utah Coronavirus Dashboard. https://coronavirus-dashboard.utah.gov/overview.html.

Figure 146: Emerging or Reemerging Priority Pathogens[183]

Climate Change Considerations

Climate change significantly influences the incidence of pandemics and epidemics through various interconnected ways. As climate shifts alter habitats, humans come into closer contact with wildlife, increasing the risk of zoonotic diseases. Higher temperatures and changing precipitation patterns expand the ranges of disease-carrying vectors like mosquitoes and ticks, introducing new diseases to vulnerable populations. Furthermore, climate-induced migration from rural to urban areas often results in crowded living conditions where infections can spread quickly. Extreme weather events disrupt public health infrastructure, exacerbating disease transmission, while food insecurity linked to climate change can heighten susceptibility to infections. These factors create an environment where infectious diseases can emerge and spread more readily, highlighting the urgent need for integrated public health strategies considering climate impacts.

Secondary Hazards

Epidemics and pandemics often generate a range of secondary hazards that can exacerbate the initial health crisis. One significant issue is the impact on mental health, as individuals may experience increased anxiety, depression, and stress due to isolation and fear of the disease. Economic disruption is another primary concern; job losses and business closures can lead to heightened poverty and financial instability. Healthcare systems can become overwhelmed, resulting in diminished care quality for infected individuals and those with other medical needs. Supply chain disruptions may cause shortages of essential items, while social unrest can arise from economic hardship and misinformation. Vulnerable populations often face more significant risks during these times, experiencing heightened challenges in access to healthcare and essential resources. In addition, environmental concerns may arise from inadequate waste management practices, and educational disruptions can hinder children's development, particularly in low-income families. All these secondary hazards were evident during the recent COVID-19 pandemic. The combination of these secondary hazards underscores the interconnectedness of public health crises and highlights the need for comprehensive strategies to mitigate their far-reaching impacts.

Vulnerability Assessment

In Salt Lake County, certain areas and populations are particularly vulnerable to public health outbreaks and epidemics. Low-income communities often face limited access to healthcare, preventive services, and health education, making them more susceptible. Housing conditions, especially in crowded areas, can facilitate the spread of infectious diseases due to increased close contact among residents. High population density, particularly in urban centers like downtown Salt Lake City, further contributes to this risk. In addition, the elderly, who might have compromised immune systems, and children in schools—frequent sites for outbreaks—are at increased risk. Uninsured or underinsured individuals may delay seeking medical help due to financial constraints, exacerbating their vulnerability. Furthermore, specific

[183] Sarukhan, Adelaida. "A New List of Priority Pathogens that Could Cause the Next Pandemic." IS Global Barcelona Institute for Global Health. August 29, 2024. https://www.isglobal.org/en/healthisglobal/-/custom-blog-portlet/a-new-list-of-priority-pathogens-that-could-cause-the-next-pandemic.

ethnic and racial groups may experience disparities in health access, while individuals with preexisting health conditions face higher susceptibility to severe outcomes during health crises.

ESTIMATED IMPACTS AND POTENTIAL LOSSES

In the event of an epidemic or pandemic, Salt Lake County could face significant challenges impacting public health, the economy, and social structures. Healthcare facilities might become overwhelmed, leading to shortages of critical resources, such as beds and medical equipment, which could increase morbidity and mortality rates. Economically, local businesses—especially in hospitality, retail, and services—could suffer considerable losses due to forced closures and reduced customer traffic, resulting in higher unemployment rates. The education sector might also be affected, with school closures disrupting learning and exacerbating disparities between high- and low-income families. Mental health issues could arise as individuals deal with the stress and anxiety associated with illness and financial strain. In addition, demand for social services might increase, stretching resources and support systems thin. Public transportation could see reduced ridership, complicating access to essential services, while public safety resources might be tasked with enforcing public health measures. Overall, the multifaceted impacts of an epidemic or pandemic could create lasting challenges for the community.

VULNERABLE POPULATIONS

In Salt Lake County, certain populations are particularly vulnerable during public health outbreaks. Children are at higher risk due to their developing immune systems and close interactions in schools and childcare settings. The elderly also face significant threats, as age often correlates with increased severity of illness. Individuals with chronic health conditions, such as diabetes, heart disease, or respiratory ailments, are more susceptible to complications from infections. Low-income communities may struggle with limited access to healthcare, nutritious food, and stable housing, further increasing their risk. In addition, people with compromised immune systems, including those undergoing medical treatments, are at increased danger. Those experiencing homelessness often lack proper hygiene and healthcare access, increasing their vulnerability. Minority communities may also face unique cultural and socioeconomic challenges that impact their health during outbreaks. Lastly, while essential for response efforts, healthcare workers face a heightened risk of exposure due to their front-line roles.

COMMUNITY LIFELINES

In Salt Lake County, various FEMA community lifelines could be significantly impacted by an epidemic or pandemic. The Safety and Security lifeline may face strain as public health concerns limit the capacity of law enforcement and emergency services, impacting their response to other emergencies. The Health and Medical lifeline is directly affected as healthcare systems become overwhelmed with increased patient loads, shortages of medical supplies, and healthcare worker fatigue. The Food, Hydration, and Shelter lifeline may experience disruptions in supply chains, leading to food shortages and challenges in providing clean water. The Energy lifeline could also suffer from workforce shortages in the energy sector, affecting power supplies. Communication become crucial as the need for accurate public health information increases, putting pressure on communication systems to counter misinformation. The Transportation lifeline may be disrupted by travel restrictions, complicating logistics for healthcare and

DRAFT

essential services. Lastly, due to the need for proper disposal of medical waste and personal protective equipment (PPE), the functioning of the Hazardous Waste Community Lifeline becomes a concern.

CHANGES IN DEVELOPMENT

Epidemics and pandemics can significantly shape Salt Lake County development trends through various channels. For instance, public health crises often prompt increased funding for healthcare infrastructure, leading to facility enhancements and better emergency preparedness. This, in turn, influences urban planning and resource allocation. Economically, such events can disrupt local businesses, particularly in sectors like tourism, resulting in shifts in real estate development and job markets. Changes in population dynamics may occur as people relocate for better opportunities or living conditions, further impacting housing and urban growth. In addition, the rise of remote learning during health crises can drive investments in technology infrastructure in educational institutions. As communities reassess transport needs, there might be a shift toward sustainable mobility solutions. Greater emphasis may be placed on mental health and community support services, affecting funding for related facilities and public spaces.

Epidemics and pandemics can significantly reshape land use development by prioritizing public health and community resilience. For instance, an increased demand for open spaces may prompt cities to improve parks and recreational areas, promoting social distancing and overall well-being. In addition, the rise in remote work could lead to a decline in traditional office spaces, encouraging developers to repurpose commercial properties for residential or collaborative work environments. There may also be a surge in the construction of healthcare facilities, with zoning regulations adjusted to support this need. Communities might focus on mixed-use developments to create vibrant neighborhoods that minimize commuting and encourage local living. Furthermore, urban planning could incorporate sustainable practices and infrastructure to withstand future health crises better. These changes aim to foster healthier, more adaptable communities that can effectively respond to emerging public health challenges.

In addition, a pandemic or epidemic can significantly reshape future land development by introducing various challenges and shifts in priorities. Economic slowdowns often accompany such crises, leading to reduced investment in real estate and delayed projects due to financial uncertainty. Public health concerns can also prompt governments to implement new regulations that alter zoning laws. Developers might favor locations that minimize reliance on crowded infrastructure as commuting patterns evolve. Moreover, the construction industry could face supply chain disruptions, increasing project costs and timelines.

Salt Lake County’s development and population growth can have significant impacts on public health especially pandemics and epidemics as increased population density can facilitate the spread of infectious disease as people are more likely to come into contact with each other. Urbanization is especially problematic where healthcare resources may be stretched to its limits especially in the context of pandemics. Population growth might also have an impact on public health as the influx of population may strain public health services.

Salt Lake County plans several future land development initiatives to accommodate its growing population and enhance community well-being. Key projects include transit-oriented developments

DRAFT

encouraging public transportation by creating mixed-use spaces near transit hubs. In addition, there is a strong focus on affordable housing initiatives to tackle the housing crisis through partnerships with developers. The county is also investing in expanding parks and recreational facilities to improve the quality of life for residents. Urban renewal projects are in place to revitalize targeted neighborhoods, while sustainable development practices are being integrated into new projects. Furthermore, transportation improvements and designated economic development zones aim to enhance infrastructure and attract businesses, fostering job creation in the region. For the latest updates, consulting the Salt Lake County planning department or local government resources is advisable.

VULNERABILITY SCORE

Given Salt Lake County's moderate social vulnerability, high EAL, and high community resilience to overall hazards, its vulnerability to an epidemic or pandemic may still be significant.[184] Although the high community resilience can help in the aftermath of a public health crisis, the high EAL indicates that the potential impact of an infectious disease outbreak is substantial. In addition, the moderate social vulnerability suggests that there are underlying factors that could exacerbate the impact of a public health crisis.

Radon

Hazard Description

Radon is a radioactive gas released from the nuclear decay process of uranium and radium, which are trace elements of many soils. Small particles of uranium in rocks and soil decay into radium, which, breaks down further into radon. Alpha, beta, and gamma radiation are emitted. Radon is odorless, colorless, and tasteless. As it moves up through the ground, radon can enter a home through cracks and gaps in walls and floors, cavities inside walls, and gaps around service pipes and water supply connections. Though relatively harmless at low levels, radon is classified by the EPA as a known human carcinogen and is considered the leading cause of non-smoking lung cancer in the United States. Small radioactive particles are inhaled and become lodged in the lungs, damaging DNA. Because radon is tasteless, odorless, and invisible, it presents unique challenges in minimizing daily exposure to this naturally occurring radiation.

Figure 147: Image of How Radon Enters Homes[185]

Nearly 18,000 deaths in the United States each year are caused by radon gas, according to the Huntsman Cancer Institute and other cancer centers. Since 2005, the Office of the Surgeon General has warned the public of the dangers of radon, especially its cancer-causing abilities. Radon can be detected through an inexpensive test and can be mitigated through proper ventilation of excessive radon and installation of systems to prevent radon from entering the home. Thirty-three percent of Utah homes have

[185] https://www.epa.gov/system/files/styles/huge/private/images/2021-10/how-radon-enters-home.jpg?itok=yhnoFgEF. Radon Media Resources for Partners and Stakeholders | US EPA indicates these infographics are available to use for public education.

dangerously high levels of radon. Radon is the leading cause of lung cancer in nonsmokers. Smokers living in high radon homes have nine times the risk of lung cancer.[186]

Utah also has high levels of uranium, the source of radon, in the ground, leading to high levels of gas in the state. Found in most Utah homes, radon can enter a home through cracks and gaps in walls and floors if not properly vented. In fact, 21,000 Americans and an estimated 200–300 Utahns die annually from radon-induced lung cancer.[187]

The danger of high exposure to radon in mines was known back in the 1500s, yet the presence of radon in indoor air was not documented until 1950. In 1970, research was initiated to address sources of indoor radon, determinants of concentration, health effects, and approaches to mitigation. A widely publicized incident in Salt Lake County escalated the problem of indoor radon in 1984, and investigation intensified, with the EPA taking a strong lead to educate states through its State Indoor Radon Grant.

EPA's grant has been partially funding the Indoor Radon Program at the Utah Division of Radiation Control (DRC), which enables the DRC to respond to a continuous stream of public telephone and email inquiries, provide education to homeowners and professionals, conduct "target area" indoor radon assistance and surveys, and offer individualized assistance to homeowners and public agencies concerning all aspects of the indoor radon hazard problem. The DRC's primary goal is to ensure that radiation exposure to individuals is kept to the lowest practical level. A vital mechanism in reducing radiation exposure and potentially saving lives is the Indoor Radon Program. Radiation risk to the American public from radon gas is undisputed. Radon is the leading environmental cause of cancer mortality in the United States and the seventh leading cause of cancer mortality overall. The Harvard School of Public Health in the Center for Risk Analysis has ranked radon as the highest of ten risks of death in homes in the United States, ahead of falls and home fires. Radon awareness in Utah has grown steadily in the past decade.

Hazard Profile

Potential Impact		Catastrophic	**Probability**	X	Highly Likely

[187] Ibid.

Magnitude/Extent

Radiation is measured in curies. A curie is a rate of disintegration of 1 gram of radium. Radon is measured in picocuries per liter, shown as pCi/L. The 2019 Utah State Hazard Mitigation Plan maps the counties in the state according to radon, pCi/L, which shows the range of magnitude that can be found in the county (Figure 148).

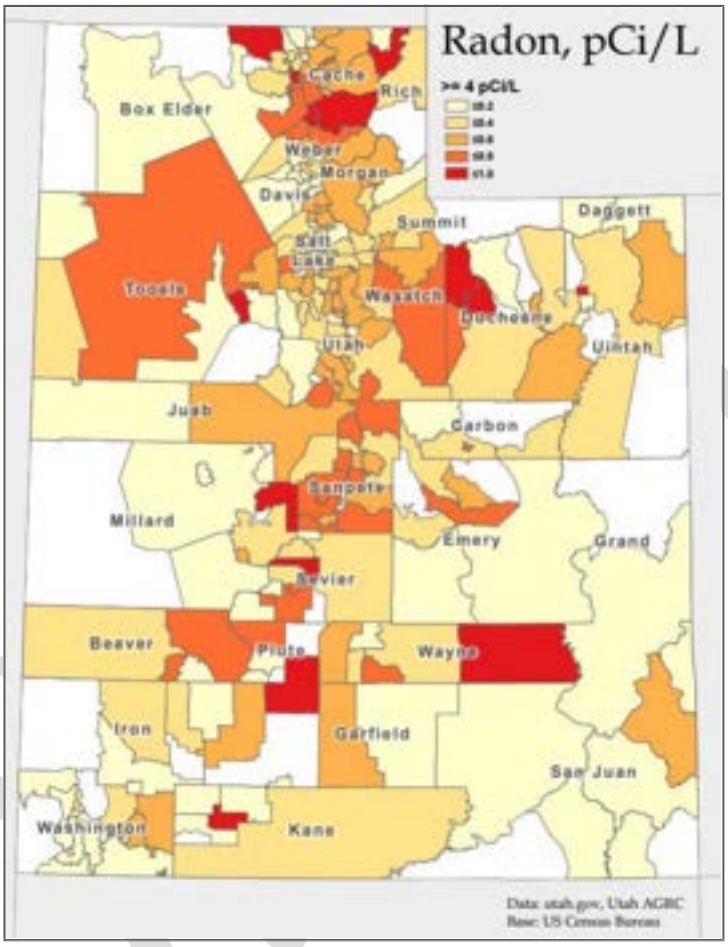

Figure 148: Radon, pCi/L Range of Magnitude by County in Utah

The 2024 Utah State Enhanced Hazard Mitigation Plan maps the counties in the state according to radon geological hazard significance ranking in LHMPs. Salt Lake County hazard ranking for radon is moderate (Figure 149).

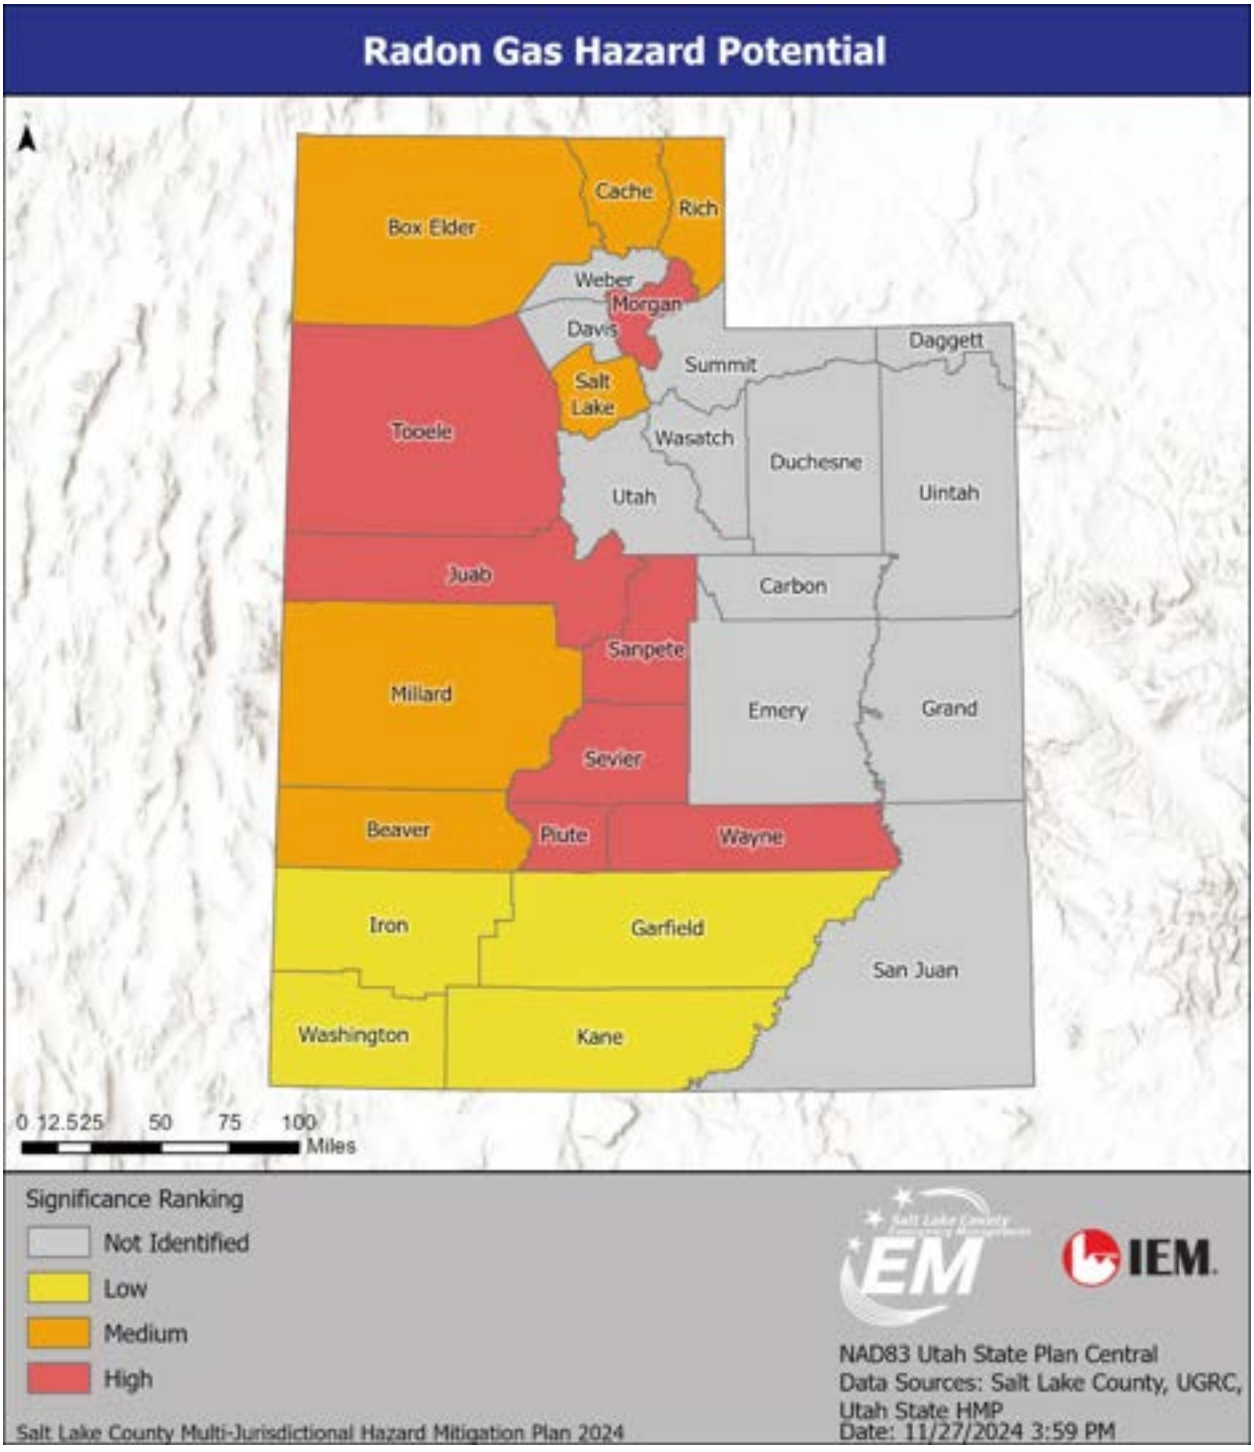

Figure 149: Radon Hazard Ranking in Local Mitigation Plans by County in Utah

Location

Due to the types of geologic formations found in Salt Lake County, radon gas is likely present in higher concentrations in homes in the Wasatch and Oquirrh Mountains and their foothills. Sites further from the mountains and foothills generally have lower concentrations of radon. Radon does not pose a threat to

infrastructure. Through collections of tests performed by various households in the county, households containing higher levels of radon were indeed found to roughly follow the patterns predicted by geologic formation. One exception is the area just south of Interstate 80 in western Salt Lake City. Utah Department of Environmental Quality provides data on radon test results summarized by zip code. Figure 150 shows the average radon score by zip code in Salt Lake County. Homes confirmed to have 4 pCi/L or higher are considered to have elevated radon levels and are recommended to take action. Figure 151 shows the percentage of homes with elevated radon levels.

DRAFT

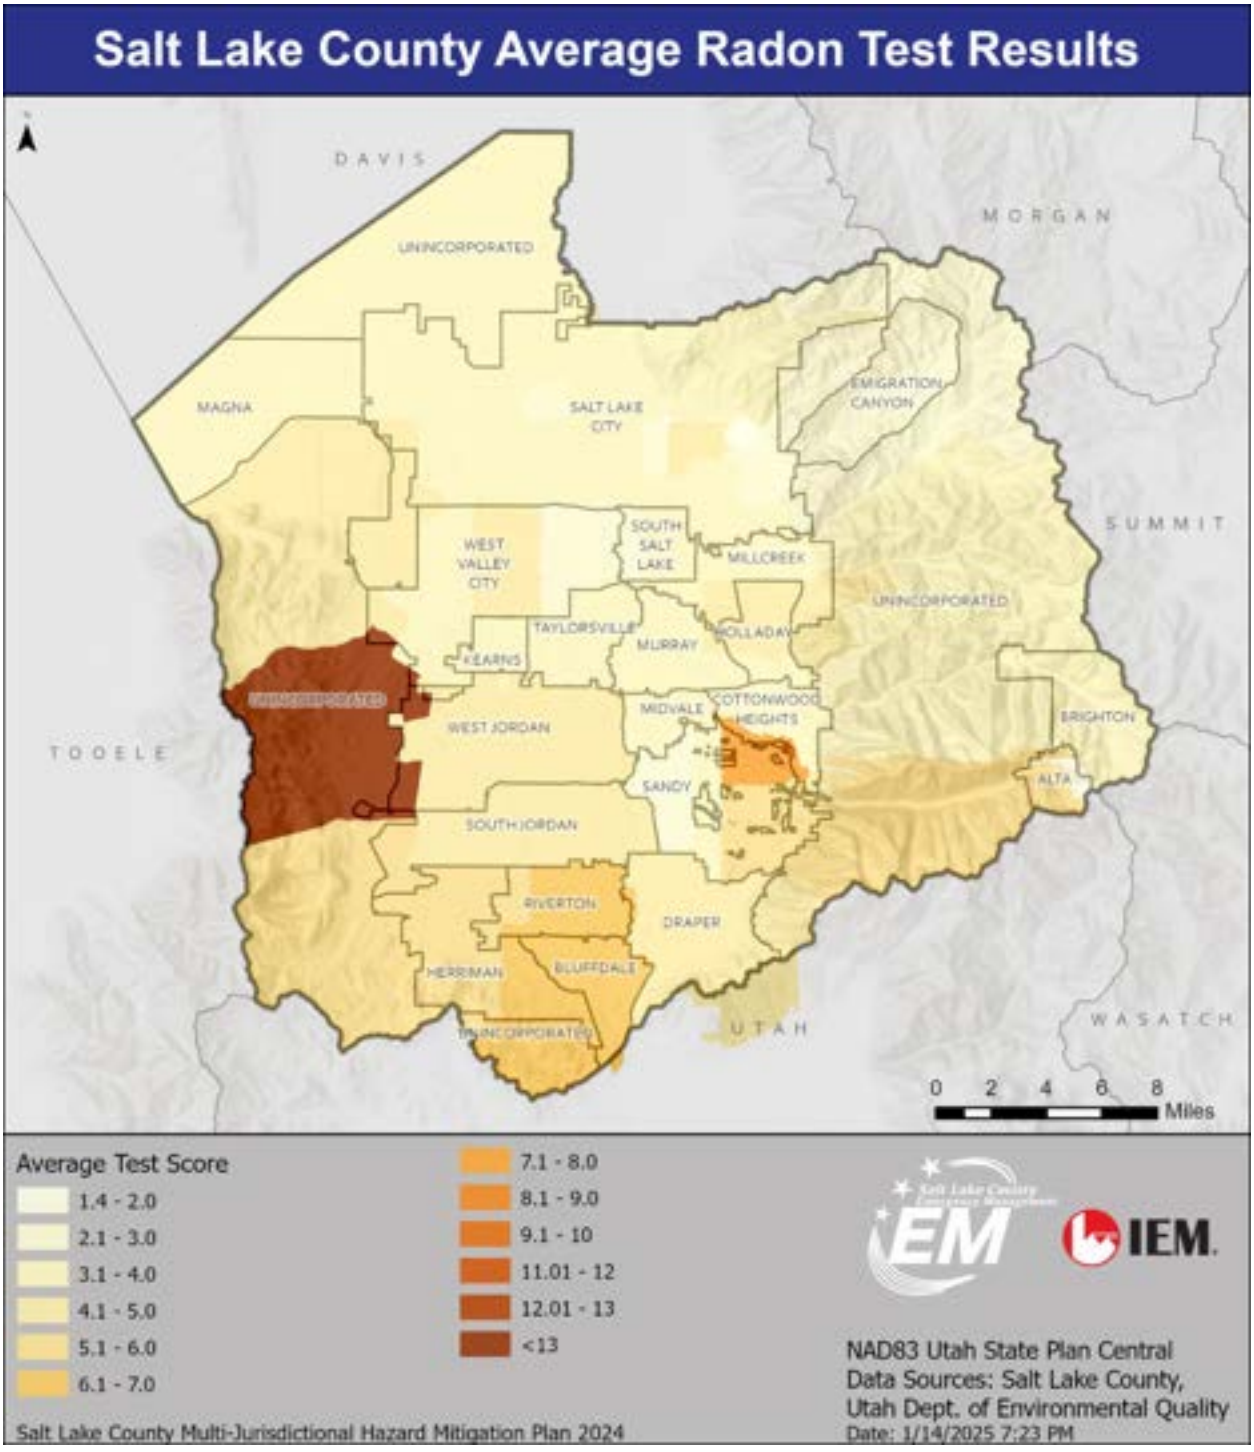

Figure 150: Average Radon Test Results for Salt Lake County

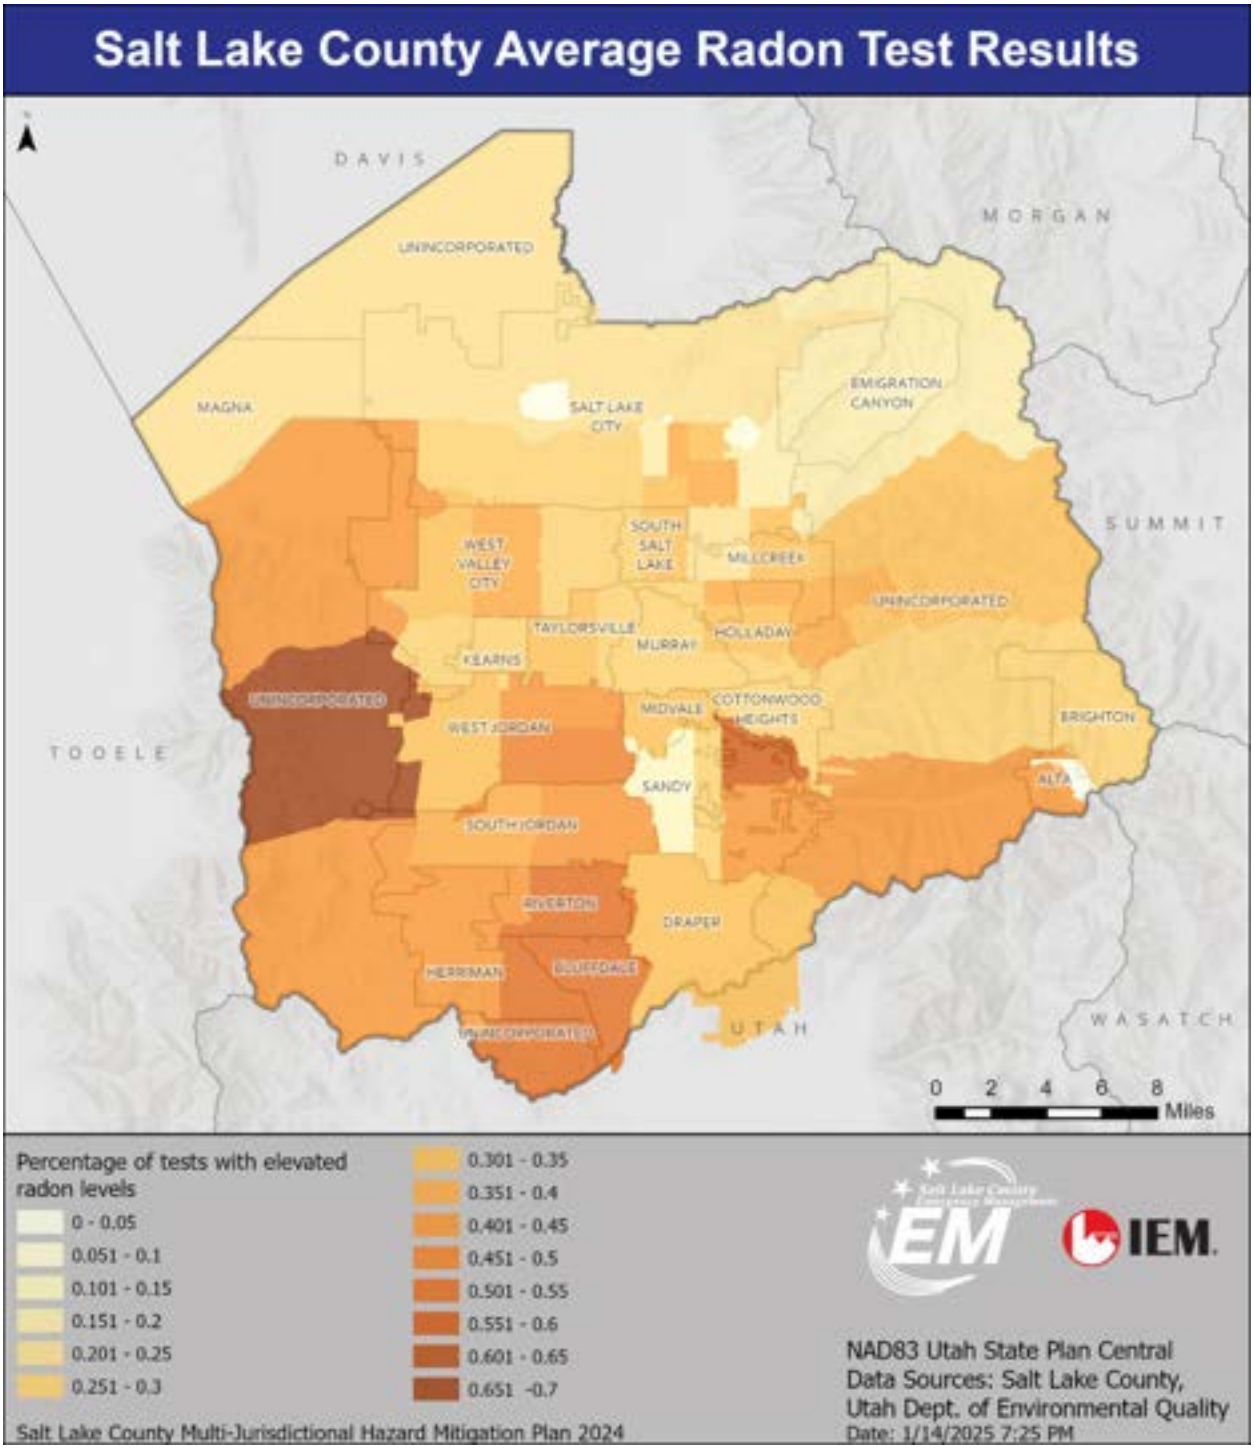

Figure 151: Percentage of Tests in Salt Lake County with Elevated Radon Levels

Historical Events and Probability of Future Occurrences

According to FEMA's Disaster Declarations for States and Counties, there were no federally declared radon disasters from January 1, 2019, through June 4, 2025.[188] In addition, no state declarations have been made for the state of Utah due to radon.[189]

According to the EPA, nearly 1 in 3 homes checked in seven states and on three tribal lands had screening levels over 4 pCi/L, the EPA's recommended action level for radon exposure.

A family whose home has radon levels of 4 pCi/L is exposed to approximately 35 times as much radiation as the Nuclear Regulatory Commission would allow if that family was standing next to the fence of a radioactive waste site (25 millirem limit, 800 millirem exposure).

An elementary school student that spends 8 hours per day and 180 days per year in a classroom with 4 pCi/L of radon will receive nearly 10 times as much radiation as the Nuclear Regulatory Commission allows at the edge of a nuclear power plant (25 mrem limit, 200 mrem exposure).

The Utah Department of Public Health tracks the results for indoor radon levels in each county every year. Figure 152 shows the percentage of radon tests performed per year from 2006 to 2021, and the test result by category. The chart categories are blue, indicating results less than 2 pCi/L; yellow, indicating 2 to 3.9 pCi/L, and red, indicating greater or equal to 4 pCi/L. The 2021 radon test results showed 34.7 percent of results were greater or equal to 4 pCi/L, 30.4 percent of results were between 2 to 3.9 pCi/L, and 34.9 percent of results were less than 2 pCi/L.

[189] Utah Department of Public Safety, "Utah Disaster History." https://dem.utah.gov/utah-disaster-history/.

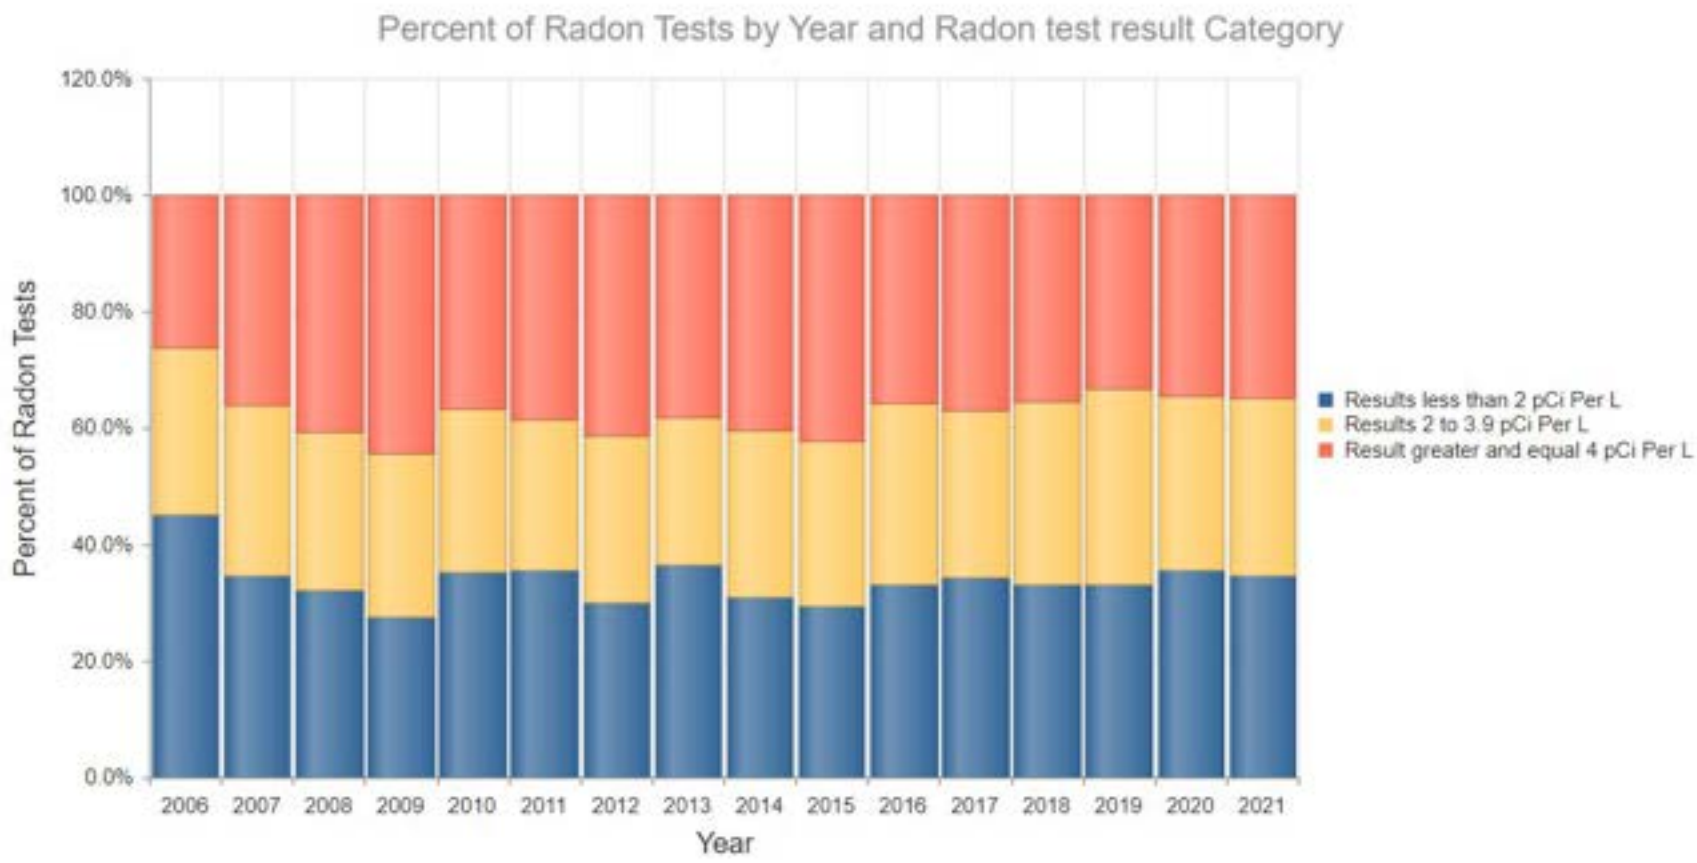

Figure 152: Salt Lake County Radon Test Results, 2006–2021[190]

[190] Utah Environmental Public Health Tracking. "Salt Lake County Results (2006–2021)." 2024. https://ibis.utah.gov/epht-view/query/result/radon/RadonNumberTest/Percent.html.

The Salt Lake County Board of Realtors is currently maintaining a database of radon readings in homes. County ordinances require homes with unacceptable radon levels to undergo mitigation procedures before sale. This should eventually make all homes safe; however, the county will continue to experience radon exposure for the foreseeable future. Because radon is always present in the soil, the probability of future occurrences is highly likely.

Climate Change Considerations

There has been study in arctic climates that thawing of the permafrost layer that normally acts as a barrier to radon can lead to increased vulnerability. However, the effects of climate change on radon exposure in Utah are not well understood.

Climate change can have an impact on radon levels in Salt Lake County by altering soil and atmospheric conditions as higher temperatures and changes in precipitation patterns can affect the movement of radon gas in the soil. Increased rainfall can lead to higher groundwater levels, which can increase radon movement especially into buildings.

Secondary Hazards

No secondary hazards from radon are known at this time.

Vulnerability Assessment

Radon does not impact infrastructure, but all humans and households exposed in the county are at risk. These figures can be seen in the Salt Lake County Demographics portion of this plan. As previously stated, radon decays into radioactive particles that can be trapped in the lungs when inhaled. These particles release small bursts of energy that damage lung tissue and may lead to lung cancer. Most EPA lifetime safety standards for carcinogens are established based on a 1 in 100,000 risk of death. Most scientists agree that the risk of death for radon at 4 pCi/L is approximately 1 in 100. At the 4 pCi/L EPA action guideline level, radon carries approximately 1,000 times the risk of death as any other EPA carcinogen. It is important to note that the action level is not a safe level because there are no “safe” levels of radon gas. Radon is the second leading cause of lung cancer in the United States. Only smoking causes more deaths from lung cancer, and smoking combined with radon is a particularly serious health risk. Chances of getting lung cancer are higher from the combination of smoking and radon than from either source alone. Although not every individual exposed to radon will develop lung cancer, the likelihood of developing it increases with higher radon concentrations and prolonged exposure. The amount of time between exposure and onset of the disease is usually many years.

ESTIMATED IMPACT AND POTENTIAL LOSSES

The most pronounced impact of radon is the health impacts on the population. Radon exposure contributes to chronic disease and death. According to the Utah State Hazard Mitigation Plan, radon gas is estimated to have caused 5,630 deaths between 1973 and 2015 and is considered Utah’s most deadly geologic hazard.

DRAFT

Although radon does not cause direct structural losses to buildings or infrastructure, it does have a societal cost. Treatment of lung cancer or other healthcare costs for affected individuals are significant. The Utah Geological Survey reported that the estimated 5,630 fatalities in Utah lung cancer cases caused by radon would have an estimated cost of between $2.7 to 3.6 million.[191]

Residences, government offices and other public buildings, schools, businesses, and other structures across the county are vulnerable to radon. The concentration may vary by location, soil characteristics, and construction characteristics. Installation of radon mitigation systems in existing buildings or including them in new construction will incur costs to building owners, but these costs may offset potential later health costs.

VULNERABLE POPULATIONS

All populations in Salt Lake County can be exposed to radon gas and are considered vulnerable. However, some may be exposed to higher concentrations, exposed for longer durations, or have other characteristics that put them at greater risk to radon-related illness. People who live in rented housing may be less aware of their exposure and might have restrictions on installing mitigation systems. Lower-income families may not have access to financial resources to address radon concentrations in their homes. Language barriers may limit some individuals' awareness of the effects of radon. Other social vulnerability characteristics may affect individuals' decisions about seeking medical care for radon-related illness, such as limited income or lack of access to health insurance.

Children may be more vulnerable, because their lungs are smaller, still developing, and they tend to breathe more rapidly. Elderly individuals might have underlying health conditions or weakened immune systems that may contribute to vulnerability to radon. They also might have physical limitations, particularly if they have a disability or limited mobility, and might have more prolonged exposure to radon. They might have challenges adequately ventilating their homes, which may contribute to radon buildup.

Individuals who have a history of smoking face compounded risks from radon exposure and are more likely to develop cancer than either smoking or radon alone.

COMMUNITY LIFELINES

Radon is not likely to disrupt the day-to-day operations of Community Lifelines.

CHANGES IN DEVELOPMENT

Salt Lake County's development and population growth can have impacts on radon exposure, as construction can disturb the ground and release radon gases trapped in the soil. Increased urbanization can also lead to changes in soil ventilation and water drainage patterns, affecting the movement of radon gases. This urbanization is happening most acutely in northwest, south, and southwest Salt Lake County.

[191] Utah Geological Survey, Geologic Hazards. "Costs of Geologic Hazards." https://geology.utah.gov/hazards/info/costs/#tab-id-4.

Potential impacts from increased vulnerability to radon exposure is loss of life and decreased air quality and soil erosion. Changes in population patterns may lead to populations seeing an increase in health issues for radon exposure. People may move to an area with lower or no levels of radon. Changes in land use and development can lead to changing building inspection requirements to prevent radon exposure. Overall vulnerability to radon exposure has stayed the same since the last plan update.

VULNERABILITY SCORE

The NRI does not include any data on the relative risk of radon. The EPA created a map (Figure 153) to identify radon potential across the country.[192] Salt Lake County is in Zone 2, which has moderate potential for elevated radon levels, with averages between 2 and 4 pCi/L.

DRAFT

[192] U.S. Environmental Protection Agency. “Radon Zones Map.” May 2024. https://www.epa.gov/system/files/documents/2024-05/radon-zones-map_text_link.pdf.

	Zone 1 (red zones)	Highest potential; average indoor radon levels may be greater than 4 pCi/L (picocuries per liter)
	Zone 2 (orange zones)	Moderate potential; average indoor radon levels may be between 2 and 4 pCi/L
	Zone 3 (yellow zones)	Low potential; average indoor radon levels may be less than 2 pCi/L

Figure 153: EPA Map of Radon Zones in the United States

Severe Winter Weather

Figure 154: Snowplow Clearing Road After a Heavy Snow[193]

Hazard Description

Severe winter weather in Salt Lake County includes heavy snow, lake effect snow, snow squalls, and blizzards. Significant snowstorms are characterized by the rapid accumulation of snow, often accompanied by high winds, cold temperatures, and low visibility.

Heavy snow generally means snowfall accumulating 4" or more in depth in 12 hours or less, or snowfall accumulating 6" in depth in 24 hours or less.[194] Salt Lake County also experiences lake effect snow. As cold air moves over the warmer water of the Great Salt Lake, warmth and moisture are transferred into the lowest portion of the atmosphere. The air rises and clouds form and grow into narrow bands that produce heavy snow downwind of the lake.

A snow squall is often associated with a strong cold front. Snow squalls move in and out quickly and typically last less than an hour. Although they typically do not lead to large accumulations of snow, the combination of gusty winds, white-out conditions, and cold temperatures can create icy roads in just a few minutes. Reduced visibility and slick roads create extremely dangerous conditions for motorists.

A blizzard is categorized as a snowstorm with winds of 35 mph or greater and/or visibility of less than one-quarter mile for 3 or more hours. The strong winds during a blizzard blow about falling and already existing snow, creating poor visibility and impassable roadways. Blizzards can cause property damage. Blizzard conditions not only cause power outages and loss of communication but also make

[193] https://pixabay.com/photos/road-cleaning-blizzard-snow-drifts-2582429/.
[194] National Weather Service Forecast Glossary. https://forecast.weather.gov/glossary.php?word=HEAVY%20SNOW.

transportation difficult. Blowing snow can reduce visibility to less than one-quarter mile, and the resulting disorientation makes even travel by foot dangerous if not deadly.

Figure 155: Snow in the Wasatch Mountains[195]

Hazard Profile

Potential Impact		Catastrophic	**Probability**	X	Highly Likely
	X	Critical			Likely
		Limited			Occasional
		Negligible			Unlikely
Location	Can occur in areas throughout the county				
Seasonal Pattern	Winter months				
Conditions	Vary based on latitude, elevation, aspect, and landforms				
Duration	Severe weather hazards generally last hours; some conditions can persist for days				
Secondary Hazards	Secondary hazards can include the potential for avalanches, flooding, transportation failure, and infrastructure damage and failure, including power outages				
Analysis Used	National Centers for Environmental Information, National Weather Service, Utah Avalanche Center, Utah Division of Emergency Management, local input, and review of historical events and scientific records				

Magnitude/Extent

Although many of these events occur and cause little to no significant impact, there have been several occasions in the state's history that demonstrate the potential magnitude of these hazard events. There have been many other occasions where significant ice buildup has occurred, or 2 to 3 feet of snow has fallen along with gusts over 70 mph. In the Blizzard of 1997, up to 4 feet of snow fell in some places,

[195] Pixabay. https://pixabay.com/photos/snow-mountain-winter-nature-3304547/.

many avalanches were triggered, and gusts of up to 77 mph were experienced, resulting in 50 injuries, several deaths, and approximately $40 million in damage in the state.

The NWS Winter Storm Severity Index is a tool to assist forecasters in describing the possible significance of weather-related impacts of winter storms. It aims to convey the complexities and hazards associated with winter storms and the potential societal effects on the public. The classification tool and description of potential impacts are shown in Figure 156.

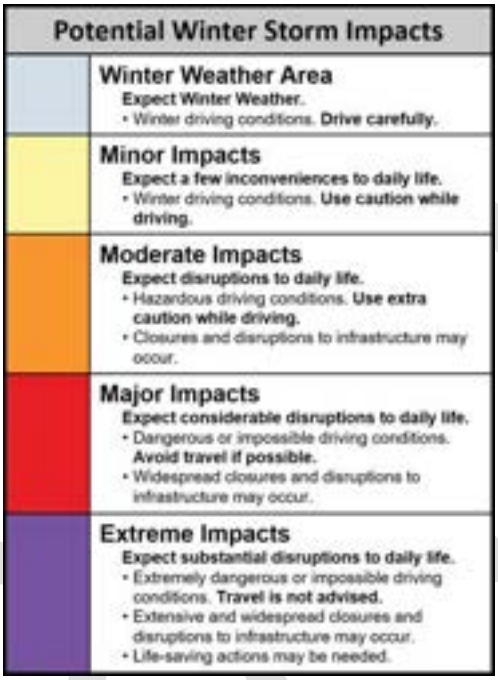

Figure 156: Winter Storm Severity Index

Location

Salt Lake County can be affected by severe winter weather events. A storm could affect the entire county or only a portion of it. Snow accumulation totals and other conditions vary with elevation, aspect, landforms, and other local variations.

Historical Events and Probability of Future Occurrences

Based on the FEMA Disaster Declarations Database, Salt Lake County has received no severe winter weather disaster declarations since the last plan update.

According to NOAA data from 1996 to 2024, there have been 477 days with a blizzard, ice storm, winter weather, or winter storm event, totaling 13 deaths, 267 injuries, and $47,096,000 in damage. However, 3 of the deaths, 50 of the injuries, and $40,000,000 of the damage occurred in one event on January 11, 1997. If this outlier is removed from the data, there is an average of approximately 0.43 deaths, 9.43 injuries, and $308,522 in property damage per year, although these averages are likely still skewed

upwards by a small number of high-impact events. Based on the frequency of past events, future occurrences are highly likely.

On January 9, 2024, snow squalls developed and moved southward through Northern Utah during the evening hours on January 9 and January 10, impacting the evening commutes. Utah Highway Patrol reportedly responded to 101 vehicle accidents on January 9, and 143 vehicle accidents on January 10. A portion of these were included in estimates of $75,000 in property damage. Surprisingly, no injuries were reported with these accidents.

On March 7, 2002, a ferocious cold front moved across Northern Utah with lightning, small hail, and heavy snow. Very heavy snow along with strong winds made driving treacherous several hours after the frontal passage. Around 200 accidents occurred in the Salt Lake Valley on the 8th, with 2 weather-related traffic fatalities and about 50 injuries. Approximately $140,000 in damage were recorded. Some of the snow totals in the mountains included 31" at Alta, 26" at Snowbird, 25" at Solitude, 15" at Trial Lake, and 12" at Sundance. Snowfall in the valleys and benches included 8" in Holladay and Olympus Cove, 7" in Sandy City and Laketown, 6" in Centerville and Brigham City, and 5" at the Salt Lake City International Airport.

In the Blizzard of 1997, up to 4 feet of snow fell in some places, many avalanches were triggered, and gusts of up to 77 mph were experienced, resulting in 50 injuries, several deaths, and approximately $40 million in damage in the state. There have been many other occasions where significant ice buildup has occurred, or 2 to 3 feet of snow has fallen along with gusts over 70 mph.

HEAVY SNOW/LAKE EFFECT SNOW

According to NOAA data from 1996 to 2024, there have been 243 days with a reported heavy or lake effect snow event. There were 6 deaths, 161 injuries, and $3,272,950 in property damage from these hazards during this period. This averages to approximately one death every four years and seven injuries and $142,302 in property damage per year. However, most events cause no death, injury, or significant property damage and these averages are influenced by a small number of high-impact events.

On March 24, 2023, the snowpack in Salt Lake City was measured at 26", tying a decades-long record and making the winter of 2022–2023 one of the wettest in Utah's history, according to Natural Resources Conservation Service data. NWS reported the snowstorm delivered 4" in the valleys, with nearly 2 feet at the top of Little Cottonwood Canyon, and lake effect snow bands along the northern Wasatch Front and in parts of Salt Lake County.[196]

On February 18, 2018, the Salt Lake and Tooele Valleys saw widespread heavy snowfall. Snowfall totals included 25" in Sandy City, 23" in Cottonwood Heights, 17.5" in Tooele, 15" in Olympus Cove, and 14" in Taylorsville. On February 19, Tooele recorded 13" of snow, which broke the calendar day record of 8" set in 1945.

[196] Dunphey, Kyle. "The snowiest winter in decades continues, with more storms on the way." Deseret News. March 24, 2023. https://www.deseret.com/utah/2023/3/24/23655000/utah-friday-storm-snowpack-record/.

On December 5, 1996, a storm system combined with a moist westerly flow to spread heavy snow to much of the state. The valleys received from 6 to 11", while the mountains received from 1 to 2 feet of snow. The highest total for the mountains was at the Park City ski resort in neighboring Summit County, where 23" accumulated. The wet snow helped trigger 6 avalanches during and shortly after the storm. A 37-year-old man snowmobiling near Bountiful Peak in neighboring Davis County was killed when he was overcome by one of these slides. There were also about 100 traffic accidents with 20 known injuries during this storm.

Climate Change Considerations

Utah State University Researcher and Assistant State Climatologist Jon Meyer stated that the jet stream—the fast and narrow current of air flowing from west to east that directs storms across the Western United States—has returned. After several years of the jet stream pushing many storms to the north or east of Utah, the jet stream has shifted and has had a major impact on winter weather conditions. The stronger winter storms are consistent with research undertaken by the Utah Climate Center that identified atmospheric dynamics that exist in the Western Pacific and define 6-year dry and wet phases for Northern Utah's weather. The winter storms begin as a Pacific low-pressure system, with moisture concentrated into narrow bands, which scientists refer to as atmospheric rivers—narrow corridors of much higher atmospheric humidity than in typical storms.[197]

Climate change can have a significant impact on severe winter weather in Salt Lake County by shortening the winter season due to higher temperatures. As temperatures rise, winters become milder, leading to fewer days with extreme cold temperatures and more precipitation falling as rain rather than snow. This shift will have an effect on water resources, as decreased snowpack will lead to a decline in the water supply. Milder winters will also have an impact on local ecosystems and winter recreational activities.

Secondary Hazards

The most significant secondary hazards associated with severe winter weather include structural damage from snow loads, wind damage, impacts on life safety, disruption of traffic, economic impact, loss of ability to evacuate, taxing first-responder capabilities, and disruption of services, such as power, water, and communications. Snow accumulation is often accompanied by a heightened risk of avalanche in the days following the storm.

Vulnerability Assessment

All residents, structures, and infrastructure systems in the planning area are vulnerable to severe winter weather. Winter storms occur frequently in Salt Lake County but with varying levels of severity and impacts.

[197] Jensen, Marcus. "State Climate Officer Explains the Winter Snow Surge and What It Means for Utah's Water Future." Utah State University, Utah State Today. January 17, 2023. https://www.usu.edu/today/story/?story=state-climate-officer-explains-the-winter-snow-surge-and-what-it-means-for-utahs-water-future.

The 2023 State Enhanced Hazard Mitigation Plan states that winter storms are considered deceptive killers because most deaths are indirectly related to the storm. Fatalities occur to individuals involved in traffic accidents caused by slick roads and are also the result of heart attacks brought on by the exertion of shoveling snow and hypothermia due to prolonged exposure to the cold. The NOAA reports that of all fatalities related to ice and snow, about 70% occur in automobiles and 25% are a result of people caught out in the elements. Most winter storm fatalities occur in males over age 40. Fifty percent of all exposure-related deaths are people over age 60 and more than 75% of victims are male. Some winter fatalities occur inside the home, primarily when people leave space heaters on, which then catch fire. Others die of carbon monoxide poisoning from furnaces or other heating devices that are not properly ventilated.[198]

All critical facilities are vulnerable to damage or reduced functionality due to severe winter weather, including all 218 county facilities, fire stations, police stations, schools, hospitals, and EOCs. Utilities, such as power and communications networks and transportation systems and road networks also are vulnerable.

ESTIMATED IMPACT AND POTENTIAL LOSSES

Disruptions to transportation networks from snowy, slick conditions or poor visibility are common during winter months. These can cause traffic delays throughout the valley. Vehicle collisions and slide offs are possible and may lead to injury. Emergency response can be delayed by traffic and poor driving conditions. Canyons and foothill areas tend to have higher snow accumulations due to higher elevation and roads may become impassable.

Severe storms may also contribute to power outages if distribution systems are damaged by wind or heavy snow and ice accumulation. Outages can be life-threatening to individuals who depend on electricity for life support. They can also disrupt operations for other utility services and communications networks and affect emergency response and other critical facilities. In addition, power outages can cause life-threatening situations if residents use alternative means to heat their homes without the use of proper ventilation.

Transportation delays from severe winter storms can have economic impacts by slowing the delivery of goods and services, delaying employees to report to work, and other reductions in business operations. Furthermore, power outages may contribute to losses if businesses cannot open until power is restored.

The NRI includes data on the EALs to individual natural hazards, historical loss, and overall risk at a county and census tract level. Salt Lake County's NRI EAL value for winter weather is $1.1 million with a risk score classified as very high (97.9), compared with the rest of the United States (Figure 157). This value is primarily due to population loss (injuries or fatalities), monetized into a population equivalence value.

[198] Utah State Enhanced Hazard Mitigation Plan. 2024.

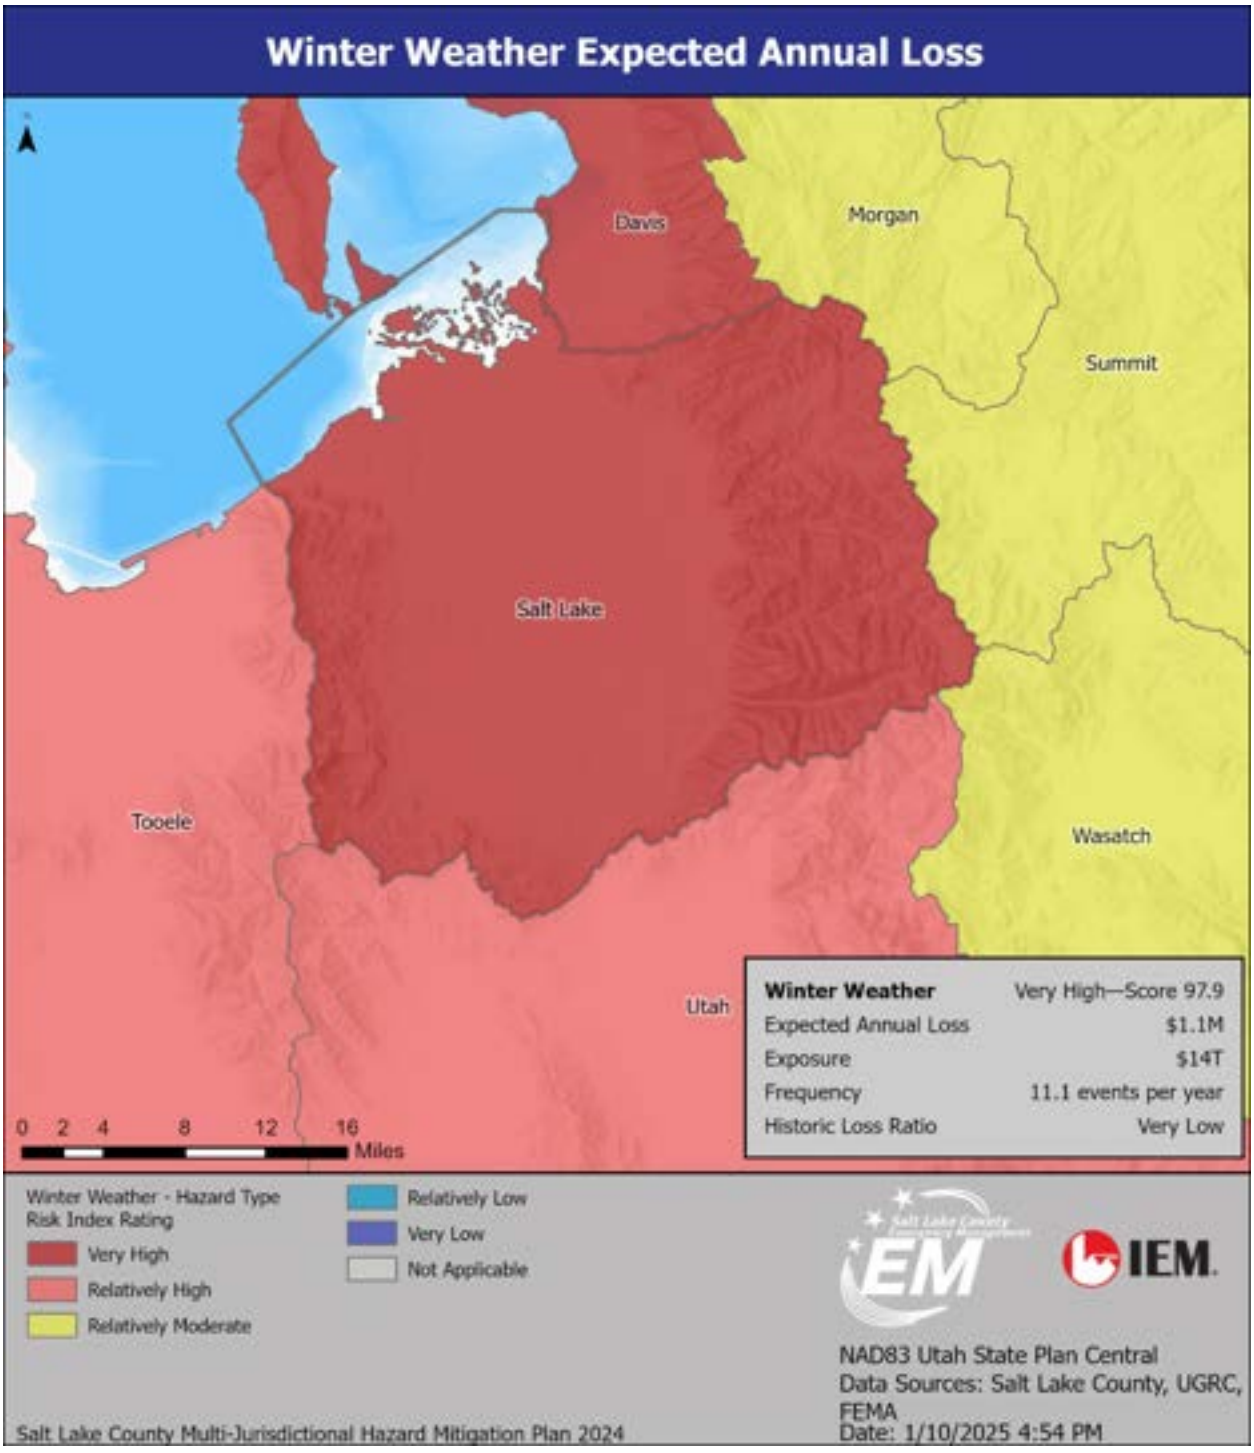

Figure 157: National Risk Index Expected Annual Loss from Winter Weather in Salt Lake County[199]

[199] FEMA, National Risk Index. "Salt Lake County Expected Annual Loss Winter Weather Risk Score, Map and legend." https://hazards.fema.gov/nri/map.

VULNERABLE POPULATIONS

Unhoused individuals and others without adequate shelter may be especially vulnerable to hypothermia or frostbite if exposed to the cold and wet conditions of winter storms. Motorists may become stranded in poor driving conditions and can also experience hypothermia if isolated for long periods, particularly if they leave their vehicles.

Some residents in canyon communities or on the benches may become isolated due to limited transportation routes, which may become impassable during or immediately following a storm. The elderly and persons with disabilities or life-threatening illnesses are particularly vulnerable if they depend on caregivers who cannot travel through winter storms. Power outages can be life-threatening to those dependent on electricity for life support.

Low-income households, linguistically isolated populations, and other disadvantaged groups tend to suffer greater losses during hazard events. They may be more severely impacted by interruption of services, economic losses, or lack of access to needed resources. Table 69 provides a breakdown of vulnerable populations for which data were available.

Table 69: Salt Lake County Vulnerable Populations[200]

Population Under 5	Population Over 65	Foreign Born	Language Other than English	Population with Disability	No Health Insurance	Population in Poverty
79,892	133,703	12.9%	21.6%	11.4%	9%	9.4%

COMMUNITY LIFELINES

Severe winter weather particularly disrupts transportation lifelines, and can also disrupt energy, communications, food, hydration and shelter, and safety and security lifelines. The importance of these lifelines cannot be overstated. In a disaster, communities can be left without access to necessities, such as food, water, and shelter. The lifelines help ensure that these needs are met and that people have the resources they need to survive. By providing access to medical care, public health services, and transportation, the lifelines help ensure that people can receive the care they need and safely evacuate if necessary. In addition, the Hazardous Materials lifeline helps to ensure that dangerous materials are managed safely, reducing the risk of further harm. Any or all of these lifelines could be disrupted following a severe winter storm. The severity of the storm may determine how long it will take to restore the various services. Community lifelines help create a sense of safety and security in a community. They provide a safety net for individuals who may be struggling and offer comfort and reassurance that help is available when needed. Without these lifelines, communities would be much more vulnerable to crises and emergencies.

[200] United States Census Bureau. “American Community Survey Data, Health.” 2023. https://data.census.gov/profile/Salt_Lake_County,_Utah?g=050XX00US49035#health.

CHANGES IN DEVELOPMENT

Salt Lake County's development and population growth can increase the potential for damage and disruptions from severe winter weather. As the population grows, so does the demand for heating during the winter months, which can place a strain on the energy grid. An overall population increase in the county represents an increase in potential exposure to this hazard.

VULNERABILITY SCORE

The NRI was used as a primary tool during the 2024 HIRA update to analyze the county's vulnerability to severe winter weather. The NRI defines risk as the potential for negative impacts as a result of a natural hazard and determines a community's risk relative to other communities by examining the EAL and social vulnerability in a given community in relation to that community's resilience. Salt Lake County's NRI winter weather risk rating is shown in Figure 158. Salt Lake County is rated as having a very high winter weather risk, with a score of 97.4.

DRAFT

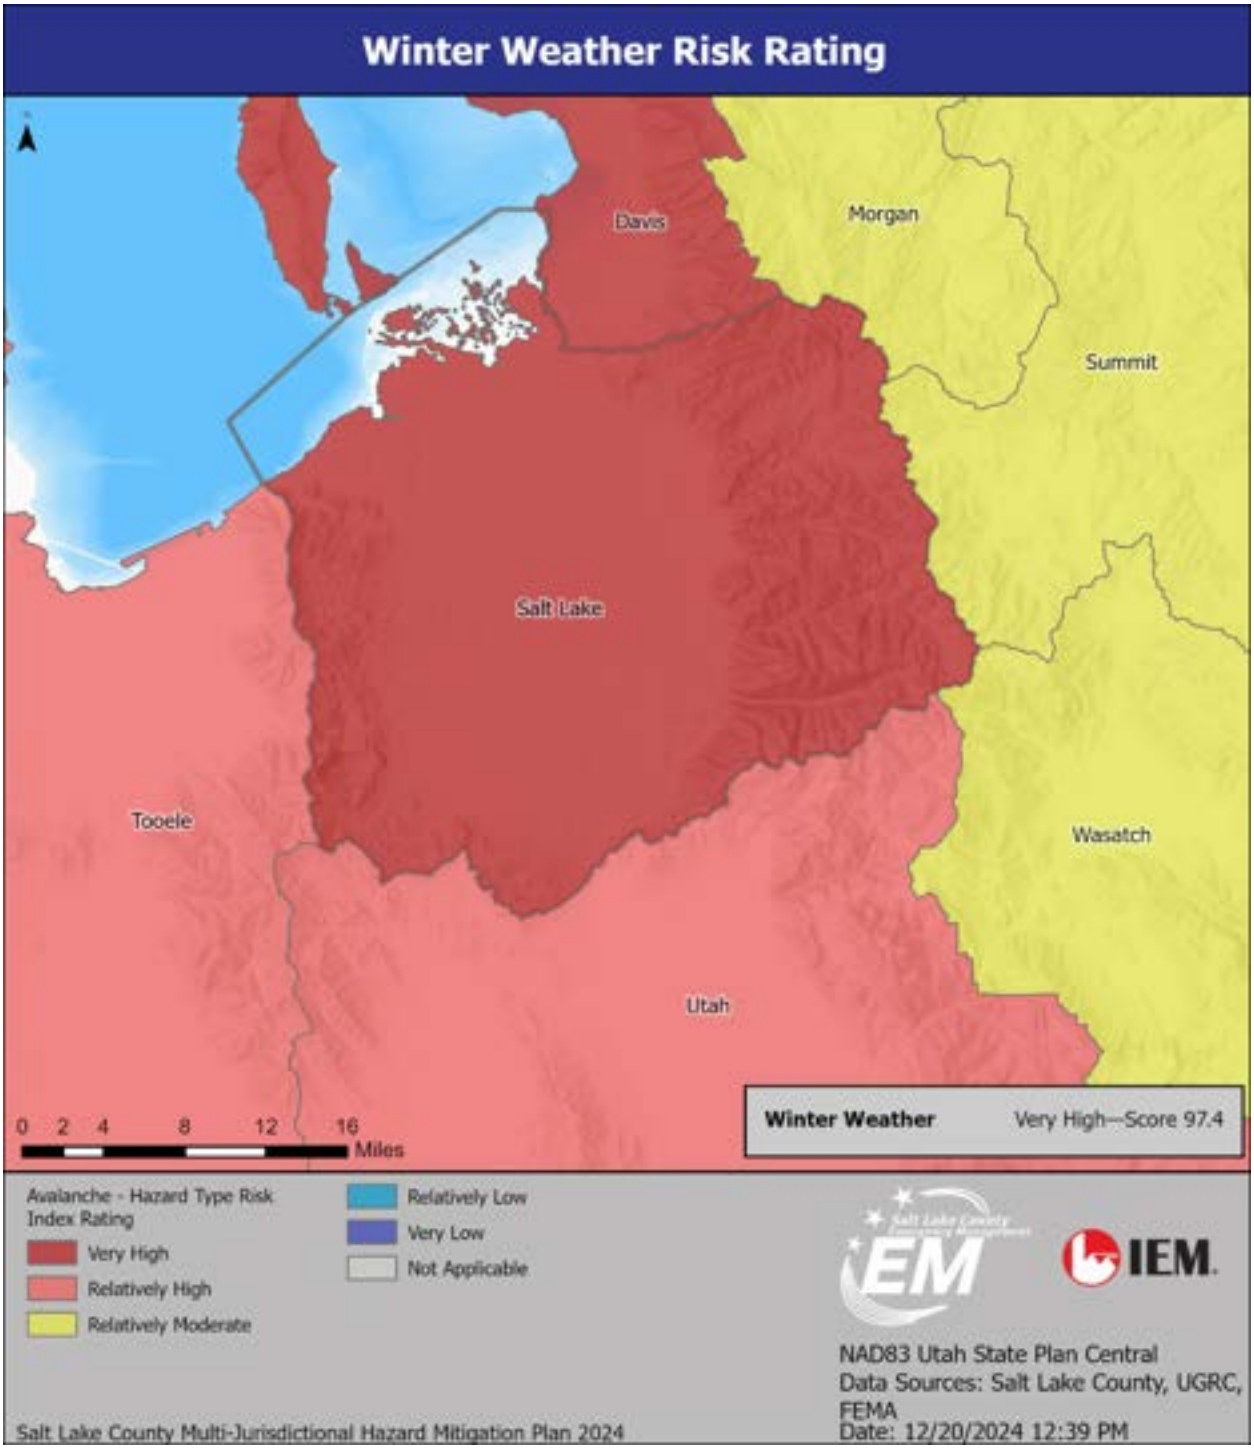

Figure 158: National Risk Index Winter Weather Risk Map, Rating, and Score for Salt Lake County[201]

[201] FEMA, National Risk Index. "Salt Lake County Winter Weather Score, Map, and Legend." https://hazards.fema.gov/nri/map.

Tornado

Figure 159: Image of a Tornado[202]

Hazard Description

A tornado is a narrow, violently rotating column of air that extends from the base of a cumulonimbus cloud to the ground. The visible sign of a tornado is the dust and debris that is caught in the rotating column made up of water droplets. Tornadoes are the most violent of all atmospheric storms. The following are common elements in tornado formation:

- Very strong winds in the mid- and upper levels of the atmosphere
- Clockwise turning of the wind with height (i.e., from southeast at the surface to west aloft)
- Increasing wind speed in the lowest 10,000 feet of the atmosphere (e.g., 20 mph at the surface and 50 mph at 7,000 feet)
- Very warm, moist air near the ground with unusually cooler air aloft
- A forcing mechanism, such as a cold front or leftover weather boundary from previous shower or thunderstorm activity

Tornadoes can form from individual cells in severe thunderstorm squall lines or from an isolated super-cell thunderstorm. Weak tornadoes can sometimes form from air that is converging and spinning upward, with little more than a rain shower occurring in the vicinity. The most extreme tornadoes can attain wind

[202] https://en.wikipedia.org/wiki/File:Stovepipe_Tornado_near_Yuma,_Colorado.jpg.

speeds of more than 300 mph, stretch more than 2 miles across, and stay on the ground for dozens of miles.

Types of tornadoes include landspouts, multiple vortex tornadoes, and waterspouts. Other tornado-like phenomena that exist in nature include dust devils, fire whirls, and steam devils. Downbursts are frequently confused with tornadoes, though their actions are dissimilar.

Hazard Profile

Potential Impact		Catastrophic	**Probability**		Highly Likely
		Critical		X	Likely
	X	Limited			Occasional
		Negligible			Unlikely
Location	A tornado event is possible anywhere in the county.				
Seasonal Pattern	Most of tornado and funnel cloud activity in the county has occurred during the late spring to early fall period of the year.				
Conditions	Tornadoes can often form from individual cells in severe thunderstorm squall lines.				
Duration	Tornadoes can last from a few seconds to an hour, although most last less than 10 minutes.				
Secondary Hazards	Potential secondary hazards include hazardous material releases, structural fires, and infrastructure failure if key facilities are damaged.				
Analysis Used	National Centers for Environmental Information, local input, and review of historic events and scientific records.				

Magnitude/Extent

Tornadoes were originally categorized using the Fujita Scale (F-Scale) or Pearson Fujita Scale, introduced in 1971, based on a relationship between the Beaufort Wind Scales (B-Scales) (measure of wind intensity) and the Mach scale (measure of relative speed). The Fujita Scale is used to rate the intensity of a tornado by examining the damage caused by the tornado after it has passed over a human-made structure. The F-Scale categorizes each tornado by intensity and area. The scale is divided into six categories, F0 (Gale) to F5 (Incredible). Table 70 outlines each of the F-Scale categories.

Table 70: Fujita Tornado Damage Scale[203]

Scale	Wind Speed (mph)	Typical Damage
F0	<73	Light damage: Some damage to chimneys; branches broken off trees; shallow-rooted trees pushed over; sign boards damaged
F1	73–112	Moderate damage: Peels surface off roofs; mobile homes pushed off foundations or overturned; moving autos blown off roads

[203] National Oceanic and Atmospheric Administration (NOAA) Storm Prediction Center. “Fujita Tornado Damage Scale.” https://www.spc.noaa.gov/faq/tornado/f-scale.html.

Scale	Wind Speed (mph)	Typical Damage
F2	11–57	Considerable damage: Roofs torn off frame houses; mobile homes demolished; boxcars overturned; large trees snapped or uprooted; light-object missiles generated; cars lifted off ground
F3	15–06	Severe damage: Roofs and some walls torn off well-constructed houses; trains overturned; most trees in forest uprooted; heavy cars lifted off the ground and thrown
F4	20–60	Devastating damage: Well-constructed houses leveled; structures with weak foundations blown away some distance; cars thrown and large missiles generated
F5	26–18	Incredible damage: Strong frame houses leveled off foundations and swept away; automobile-sized missiles fly through the air in excess of 100 meters (109 yards); trees debarked; incredible phenomena

The primary limitations of the F-Scale rating system are a lack of damage indicators, no account of construction quality and variability, and no definitive correlation between damage and wind speed. These limitations have led to the inconsistent rating of tornadoes and, in some cases, an overestimate of tornado wind speeds. These limitations led to the development of the Enhanced Fujita Scale (EF-Scale) by the Texas Tech University Wind Science and Engineering Center and a national forum of meteorologists and wind engineers. The EF-Scale takes into account more variables than the original F-Scale did when assigning a wind speed rating to a tornado. The EF-Scale became operational on February 1, 2007.

Because the EF-Scale was revised from the original F-Scale to better reflect examinations of tornado damage, it considers how most structures are designed. Tornado ratings are assigned based on estimated wind speeds and related damage. When tornado-related damage is surveyed, it is compared with a list of Damage Indicators and Degree of Damage, which help better estimate the range of wind speeds produced by the tornado. From that, a rating is assigned, with six categories from EF0 to EF5, representing increasing degrees of damage. Table 71 lists the six categories of the EF-Scale.

The EF-Scale offers a set of wind estimates (not measurements) based on damage. Its uses three-second gusts estimated at the point of damage based on a judgment of eight levels of damage to the 28 indicators listed in Table 71. These estimates vary with height and exposure. Standard measurements are taken by weather stations in open exposures. Table 71 also describes the EF-scale ratings.

Table 71: Enhanced Fujita Scale for Tornado Damage[204]

EF-Scale Number	Intensity Phrase	Wind Speed (mph)	Type of Damage Done
EF0	Light tornado	65–85	Light damage: Peels surface off some roofs; some damage to gutters or siding; branches broken off trees; shallow-rooted trees pushed over

[204] NOAA. Enhanced Fujita Scale for Tornado Damage. https://www.spc.noaa.gov/efscale/ef-scale.html.

EF-Scale Number	Intensity Phrase	Wind Speed (mph)	Type of Damage Done
EF1	Moderate tornado	85–110	Moderate damage: Roofs severely stripped; mobile homes overturned or badly damaged; loss of exterior doors; windows and other glass broken
EF2	Significant tornado	111–135	Considerable damage: Roofs torn off well-constructed houses; foundations of frame homes shifted; mobile homes completely destroyed; large trees snapped or uprooted; light-object missiles generated; cars lifted off ground
EF3	Severe tornado	136–165	Severe damage: Entire stories of well-constructed houses destroyed; severe damage to large buildings, such as shopping malls; trains overturned; trees debarked; heavy cars lifted off the ground and thrown; structures with weak foundations blown away some distance
EF4	Devastating tornado	166–200	Devastating damage: Well-constructed houses and whole frame houses completely leveled; cars thrown and small missiles generated
EF5	Incredible tornado	>200	Incredible damage: Strong frame houses leveled off foundations and swept away; automobile-sized missiles fly through the air in excess of 100 meters (109 yards); high-rise buildings have significant structural deformation; incredible phenomena

Location

Some tornadoes can have wind speeds greater than 250 mph with a damage zone 50 miles long and greater than a mile wide. Currently, the most intense tornado in Utah's history has been an F3 on August 11, 1993, in the Uinta Mountains. No recorded tornado has been greater than an F2 in Salt Lake County specifically. However,. Although they are less common in the Intermountain Region, an average of three tornadoes per year occur in Utah. Examples are the Salt Lake City tornado August 11, 1999, and the Manti tornado in 2002. Most tornadoes in Utah typically have winds of less than 110 mph (F2 or smaller), are no wider than 60 feet, and are on the ground for no longer than a few minutes.

Tornado distribution for the region suggests many tornadoes are funnel clouds aloft encountering the increasing elevation of the region's foothills and mountains, as can be seen in Figure 160. Several of the tornadoes impacting Salt Lake County have specifically struck Magna City. A tornado event is possible anywhere in or immediately around the planning region, however.

Historical Events and Probability of Future Occurrences

Based on the FEMA Disaster Declarations Database, Salt Lake County has received no designation for tornado disaster declarations since the last plan update.

According to National Oceanic Atmospheric Administration (NOAA) data from 1965 to 2024 (60 years), there have been 1 death, 80 injuries, and $170,165,000 in property damage in Salt Lake County from 18 tornado or funnel cloud events—an average of one event every 3 years. However, the most recent

DRAFT

recorded event occurred in 2001. This would indicate that, although a tornado remains possible in a given year, the expected frequency of this hazard for the near future is likely to be less than one event every 3 years. Based on this recurrence interval, the probability of a future tornado is likely.

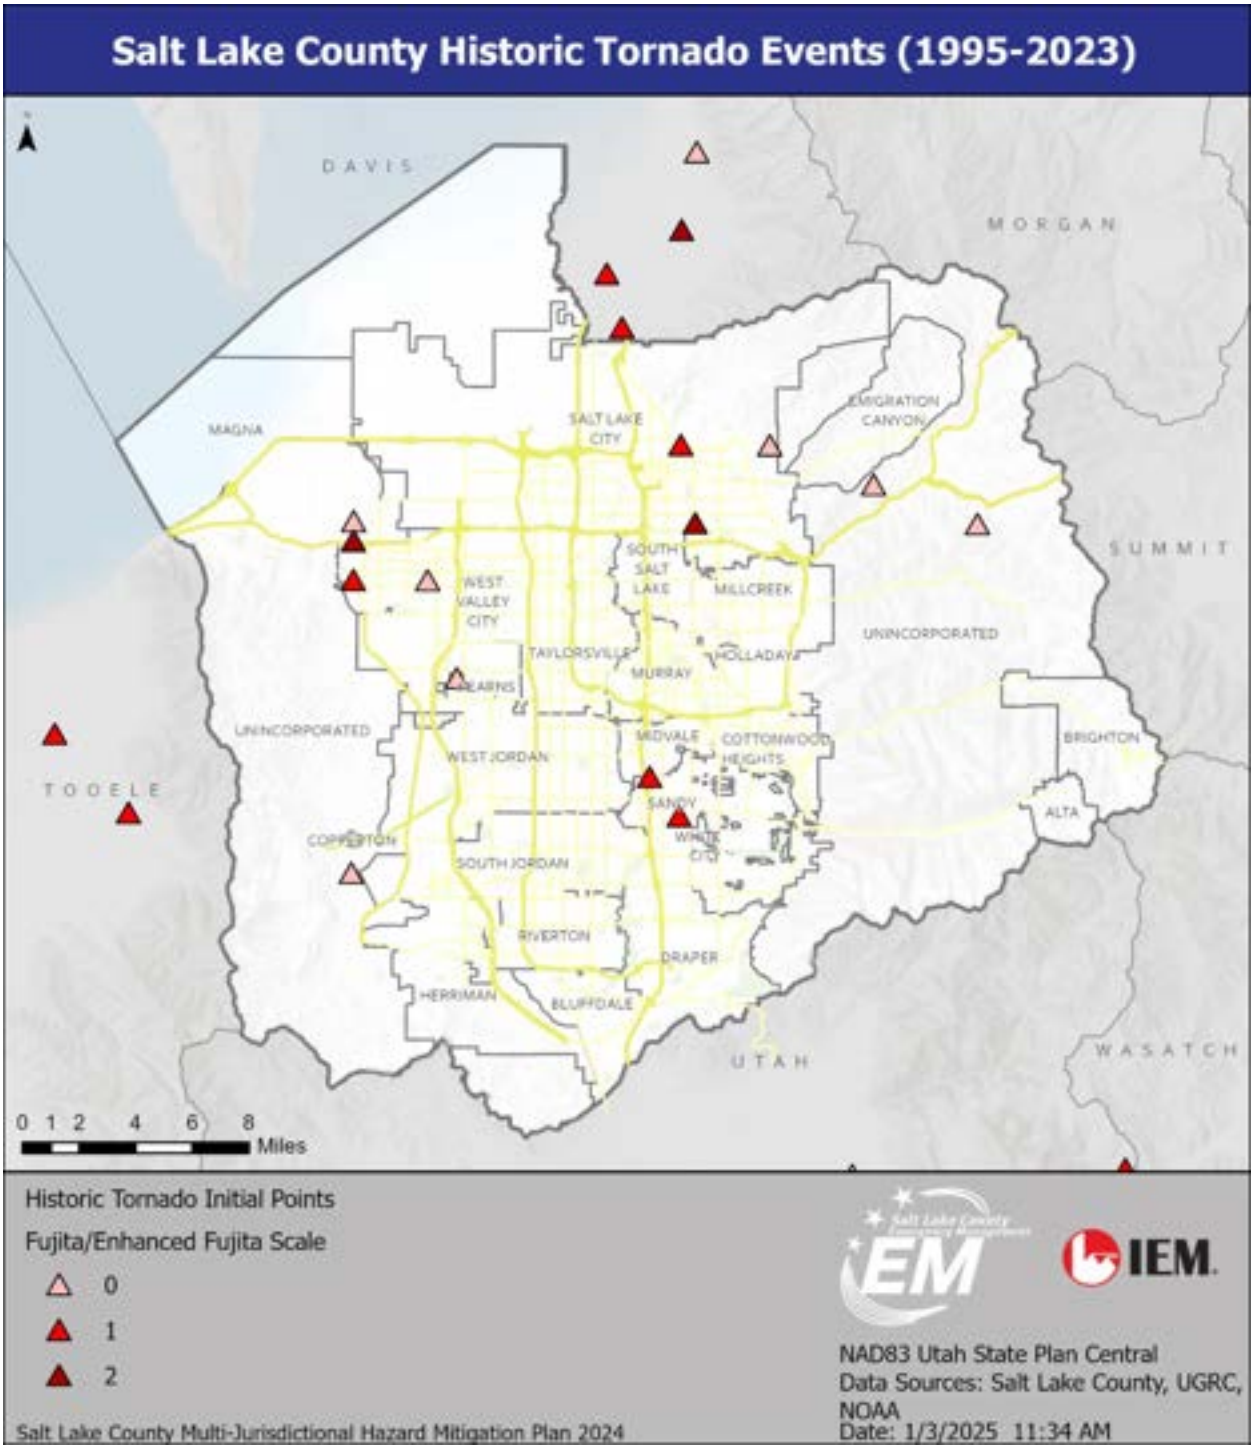

Figure 160: Tornadoes in Salt Lake County, 1995–2023

Historically, atmospheric conditions have not been favorable for tornado development in Utah due to a dry climate and mountainous terrain. Despite this fact, interactions of the relatively cool air of the Great Salt Lake and relatively warm air of urban areas could create situations more favorable for tornado development. This phenomenon possibly contributed to the formation of the August 11, 1999, Salt Lake City tornado.[205] Around lunch time, a tornado touched down in the southwest portions of Salt Lake City. The tornado intensified to an F2 on the Fujita scale and moved northeast through the metropolitan area of Salt Lake City. It caused widespread damage at the Delta Center, then ripped across an outdoor retailer's convention tent, where the lone fatality occurred along with many of the injuries. After blowing out many windows in the Wyndham Hotel, the tornado continued its northeast track, knocking down scaffolding and shearing off a crane where the Assembly Hall of the Church of Jesus Christ of Latter-Day Saints (LDS) was being constructed. Next, it skirted the Capitol, ripping out several large trees there and in historic Memory Grove. It then moved into the residential area known as The Avenues, damaging hundreds of trees and ripping the roofs off of several homes, before finally lifting back into the clouds. All told, there was 1 fatality, 80 injured, and 300 buildings and homes sustained damage, with 34 homes deemed uninhabitable. At least 500 trees were totally destroyed, with 300 more damaged. Many vehicles were damaged or totaled as well. The $170 million in damage caused by this tornado makes it the costliest disaster in Salt Lake County history. This event caused the only human losses to tornado events ever recorded in Salt Lake County.

Figure 161: Explosion of a Power Substation During a Tornado in Salt Lake City, August 11, 1999

[205] American Meteorological Society (AMS). "Tornadogenesis and Operational Considerations of the 11 August 1999 Salt Lake City Tornado as Seen from Two Different Doppler Radars." August 1, 2001. https://journals.ametsoc.org/view/journals/wefo/16/4/1520-0434_2001_016_0377_taocot_2_0_co_2.xml.

Figure 162: Path of a Tornado Across Salt Lake City, August 11, 1999[206]

Climate Change Considerations

The 2024 State Enhanced Hazard Mitigation Plan concludes that an ongoing trend in worsening tornado activity especially in this century is clearer, but little information exists to describe likely consequences for Utah.

Climate change can impact the frequency and intensity of tornadoes in Salt Lake County by altering atmospheric conditions. As temperatures increase, so do evaporation and moisture in the atmosphere. This creates favorable conditions for the formation of thunderstorms and tornadoes. The potential for tornado activity may increase due to climate change.

Secondary Hazards

Tornadoes can lead to widespread utility failure, thus exposing vulnerable populations to extreme temperatures. Tornado events may also be accompanied by strong thunderstorms, straight-line winds, and heavy rain, which can also cause significant property damage.

Vulnerability Assessment

Tornadoes are not confined to specific areas in the county, but they are generally more likely in the valley than in the mountains. Areas not directly impacted by a tornado can experience the disruption of water,

[206] https://en.wikipedia.org/wiki/1999_Salt_Lake_City_tornado#/media/File:1999_Salt_Lake_City_Tornado_path.jpg.

transportation, and communications systems and economic losses. All populations, structures, critical facilities, and infrastructure are vulnerable to the dangers posed by tornadoes. Tornadoes pose a significant threat to the safety of county residents. Individuals exposed to the storm can be struck by flying debris, falling limbs, or downed trees, causing serious injury or death. Tornadoes can cause significant structural damage and can destroy critical facilities and infrastructure.

ESTIMATED IMPACT AND POTENTIAL LOSSES

Tornadoes can cause substantial structural damage. Even lower intensity or magnitude tornadoes can damage roofs, siding, gutters, windows. Stronger tornadoes can completely destroy residences and other structures. Manufactured homes are more vulnerable than site-built structures and are likely to suffer extensive damage. Structures can also be damaged or crushed by falling trees, resulting in physical harm to the occupants. Tornadoes can destroy or make residential structures uninhabitable, and displaced residents may require public shelter or relocation. Large or intense tornadoes may result in a dramatic population fluctuation because people cannot return to their homes or jobs and must seek shelter and/or work outside the affected area.

Significant debris and downed trees can block roads and make it impossible for emergency response vehicles to access areas of the community. Downed power lines may make roadways unsafe, preventing first responders from answering calls for assistance or rescue.

Tornadoes often cause widespread power outages, increasing the risk to more vulnerable portions of the population who rely on power for health and/or life safety. Extended power outages can increase structure fires and/or carbon monoxide poisoning as individuals attempt to cook or heat their home with alternate, unsafe cooking or heating devices, such as grills.

First responders must enter the damaged area shortly after the tornado passes to begin rescue operations and to organize cleanup and assessment efforts; therefore, they are exposed to downed power lines, unstable debris, hazardous materials, and generally unsafe conditions, elevating the risk of injury to first responders and potentially diminishing emergency response capabilities. Damaged facilities, loss of communications, and damaged emergency vehicles and equipment may significantly impact emergency operations and services. When the community is affected by significant property damage, funding will be required for infrastructure repair and restoration, temporary services and facilities, overtime pay for responders, and day-to-day operating expenses. City or county departments may be damaged or destroyed, delaying response and recovery efforts for the entire community.

Tornadoes can lead to significant economic losses related to structural damage and disruption to services. Businesses that are uninsured or underinsured might have difficulty reopening, resulting in a net loss of jobs for the community and a potential increase in the unemployment rate. Extended restoration of roads and utilities may further slow economic recovery. Displaced residents may not be able to return to work immediately, further slowing economic recovery. Lost wages contribute to hardship for the population and affect lower-income households more severely.

DRAFT

Private sector entities that the city and its residents rely on, such as utility providers, financial institutions, and medical care providers, may not be fully operational and require assistance from neighboring communities until full services can be restored. Economic disruption negatively impacts the programs and services the community provides due to short- and long-term losses in revenue. Damage to infrastructure may slow economic recovery since repairs may be extensive and lengthy. Residential structures destroyed by a tornado may not be rebuilt for years, reducing the community's tax base.

Recreation activities may be unavailable, and tourism can be unappealing for years following a large tornado that has devastated directly related local businesses.

The economic and financial impacts of a tornado event on the community will depend on the scale of the event, what is damaged, costs of repair or replacement, lost business days in impacted areas, and how quickly repairs to critical components of the economy can be implemented. The level of preparedness and pre-event planning done by government, businesses, and citizens will contribute to the overall economic and financial conditions in the aftermath of a tornado event.

Critical facilities are the buildings, land, equipment, and activities provided on the public's behalf by government and/or private organizations. These facilities are important components to a municipality's quality of life. Critical Facilities are necessities for the health, safety, well-being, and stability of communities. Critical infrastructure systems are essential for life safety and economic viability, including transportation, power, communications, and water and wastewater systems (Figure 163). Any of these facilities and their associated functions can be damaged or disrupted by a tornado.

DRAFT

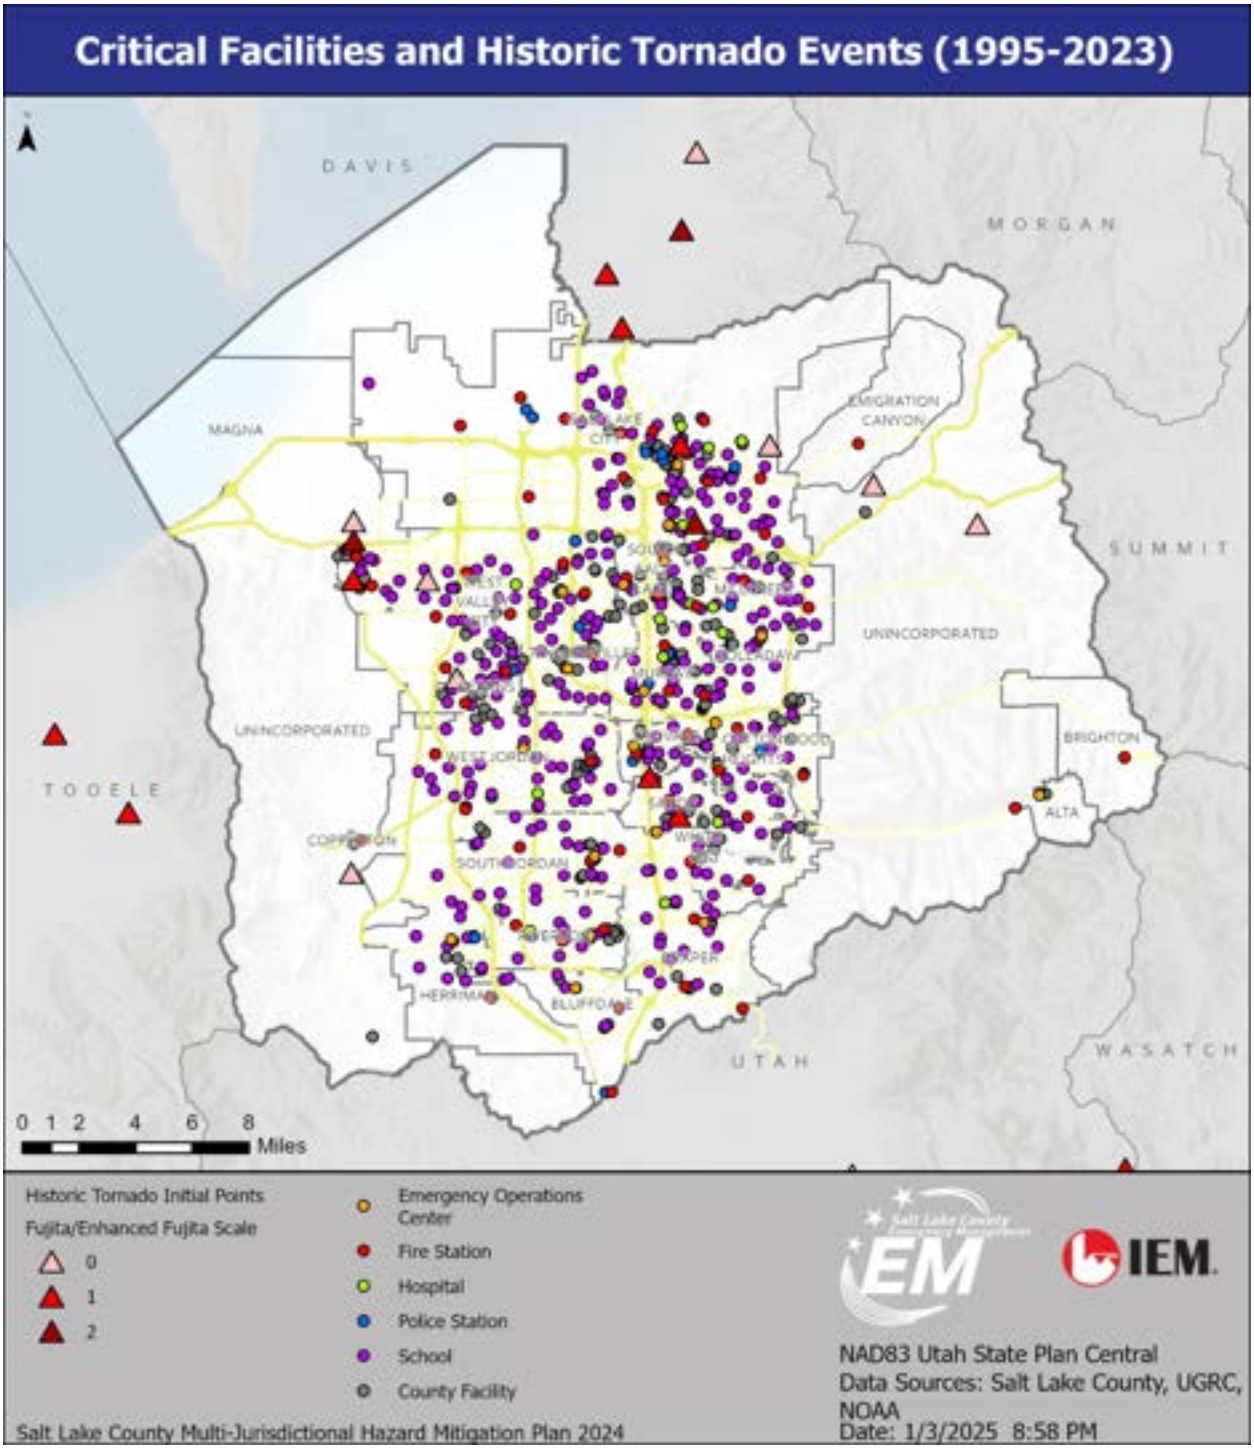

Figure 163: Critical Facilities in Relation to Tornadoes in Salt Lake County, 1995–2023

The NRI includes data on the EALs to individual natural hazards, historical loss, and overall risk at a county and census tract level. Salt Lake County's NRI EAL value for Tornado is $3.4 million with a risk score of 81.4 and a rating of "relatively moderate" compared with the rest of the United States (Figure 164).

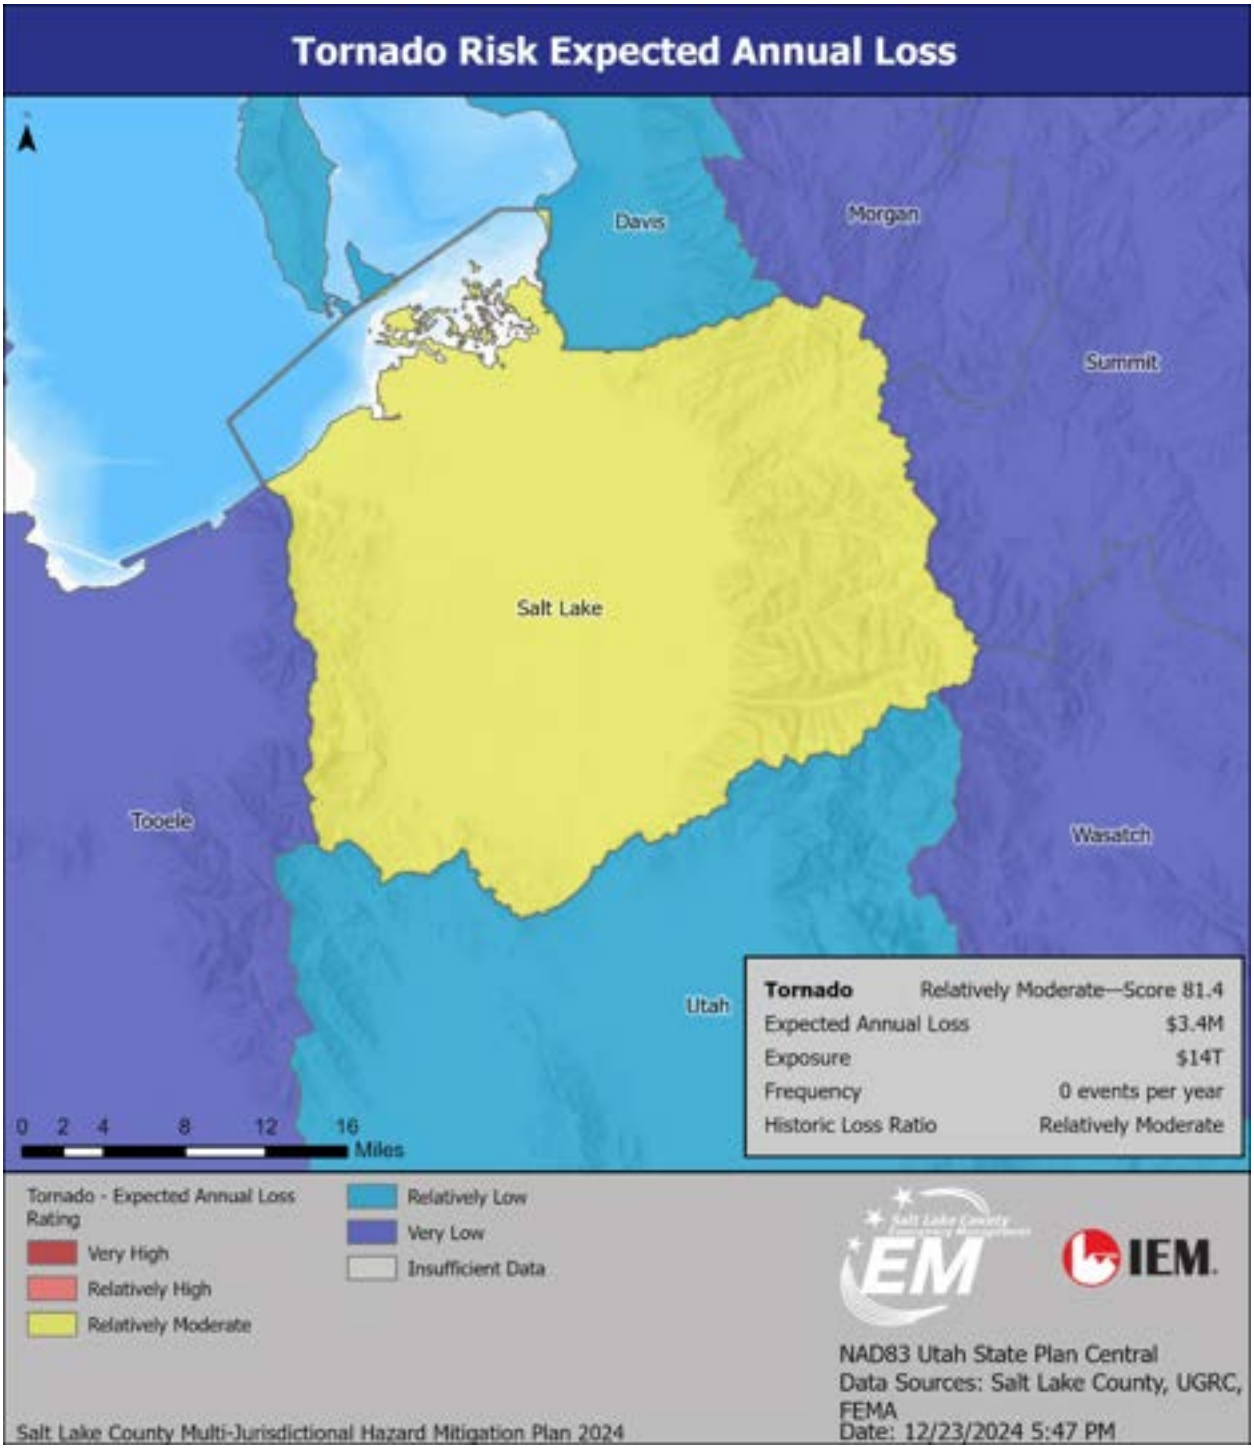

Figure 164: National Risk Index Expected Annual Loss from Tornadoes in Salt Lake County[207]

[207] FEMA, National Risk Index. "Salt Lake County Expected Annual Loss Tornado Risk Score, Map and Legend." https://hazards.fema.gov/nri/map.

VULNERABLE POPULATIONS

FEMA defines vulnerability as susceptibility to physical injury, harm, damage, or economic loss. Tornadoes can pose a significant risk to the population and can create dangerous situations. Providing and preserving public health and safety is often difficult. Impacts to vulnerable populations can include greater susceptibility to tornado impact, injuries and even death due to limited mobility and decreased ability to respond rapidly to tornado warnings or evacuate. Other barriers include the lack of a safe place to go during tornadoes.

The following populations are most vulnerable to a severe weather event, face isolation and exposure during severe storms, or could suffer more secondary effects of the hazard. The elderly and functional needs populations are considered most vulnerable because they require extra time or outside assistance to seek shelter and are more likely to seek or need medical attention, which may not be available due to isolation during or after an event. Those with a language barrier who might not be able to follow warning messages would be vulnerable as well. Those living in mobile homes would be especially vulnerable to injury from heavy winds and tornado activity. Table 72 provides a breakdown of vulnerable populations.

Table 72: Salt Lake County Vulnerable Populations[208]

Population Under 5	Population Over 65	Foreign Born	Language Other Than English	Population with Disability	No Health Insurance	Population in Poverty	Population in Mobile Homes
79,892	133,703	12.9%	21.6%	11.4%	9%	9.4%	7,199

The population in a car at the time of a tornado would also be vulnerable. According to the 2023 American Community Survey, 23.1 percent of the population in Salt Lake County transported to work by car, truck, or van.

COMMUNITY LIFELINES

Any or all of the lifelines could be disrupted following a tornado. The severity of the tornado may determine how long it takes to restore the various services. The importance of these lifelines cannot be overstated. In a disaster, communities can be left without access to necessities, such as food, water, and shelter. The lifelines help ensure that these needs are met, and that people have the resources they need to survive. By providing access to medical care, public health services, and transportation, the lifelines help ensure that people can receive the care they need and safely evacuate if necessary. In addition, the Hazardous Materials lifeline helps to ensure that dangerous materials are managed safely, reducing the risk of further harm. Any or all these lifelines could be disrupted following a tornado. Community lifelines help create a sense of safety and security in a community. They provide a safety net for individuals who may be struggling and offer comfort and reassurance that help is available when needed. Without these lifelines, communities would be much more vulnerable to crises and emergencies.

[208] U.S. Census Bureau. “American Community Survey Data.” 2023. https://data.census.gov/profile/Salt_Lake_County,_Utah?g=050XX00US49035#health.

CHANGES IN DEVELOPMENT

The changes in development that would increase vulnerability of Salt Lake County to tornadoes would be increase in population since the last plan update. As more people and infrastructure are concentrated in the area, the potential for damage and disruption of services from tornadoes can increase. Urbanization can also create wind tunnels and increase the potential for wind damage in high-density areas.

The 2024 State Enhanced Hazard Mitigation Plan states Salt Lake County is one of the fastest growing counties in the state in terms of percent increase, and because of this, more and more people and assets are being exposed to severe weather hazards, thus potentially increasing vulnerability to certain hazards.[209] Although the likelihood of a tornado is unchanged, an increase in population represents an increase in vulnerability to tornadoes since the last plan update.

VULNERABILITY SCORE

To analyze the county's vulnerability to tornadoes, the NRI was used as a primary tool during the 2024 Hazard Identification & Risk Assessment (HIRA) update. The NRI defines risk as the potential for negative impacts because of a natural hazard and determines a community's risk relative to other communities by examining the EAL and social vulnerability in each community in relation to that community's resilience. Salt Lake County's NRI Tornado risk rating is shown in Figure 165. Salt Lake County has relatively moderate Tornado risk and a risk score of 78.5.

DRAFT

[209] Utah 2024 State Enhanced Hazard Mitigation Plan.

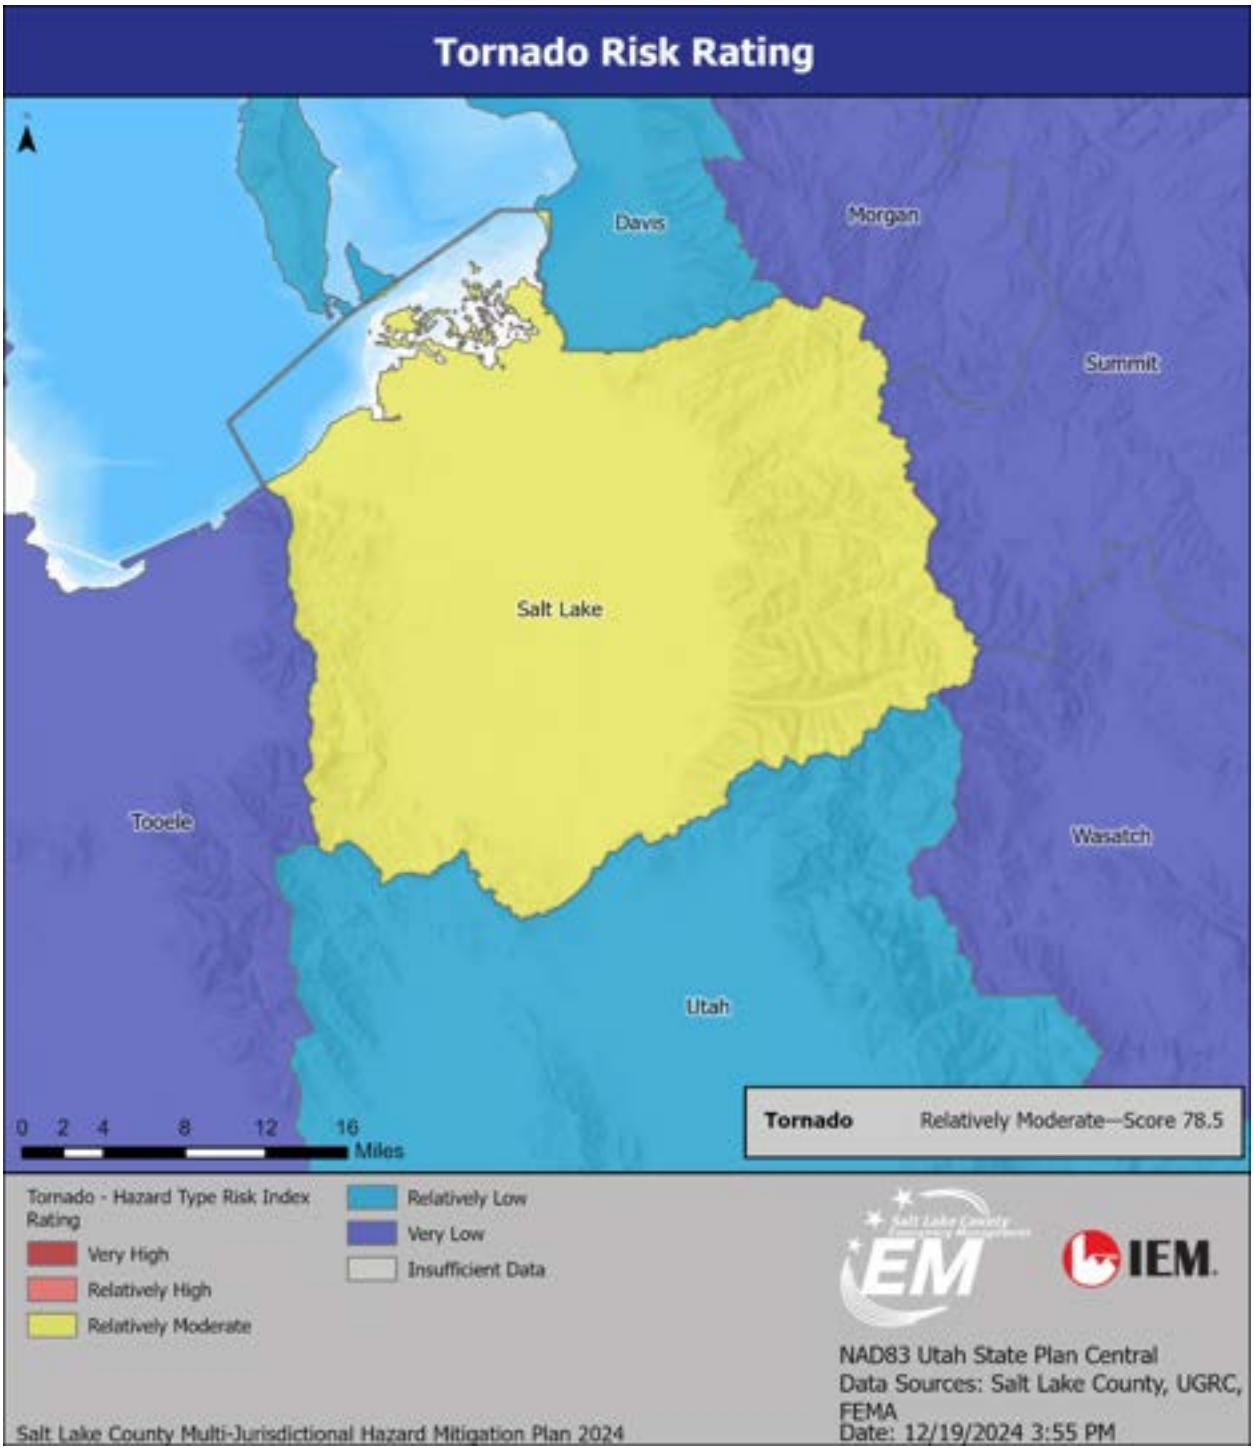

Figure 165: National Risk Index Tornado Risk Map, Legend, and Score for Salt Lake County[210]

Wildfire

Hazard Description

Figure 166: Wildland Firefighters at Work

Fire is a natural process in wildland areas. However, wildfires are particularly concerning in the wildland–urban interface (WUI). The WUI is the line, location, or zone where structures or other human development meet or intermingle with undeveloped wildland or vegetative fuel. Examples include homes, storage sheds, recreational facilities, transmission lines, and other buildings. Significant human development has occurred in the WUI in Salt Lake County, leading to many residents occupying fire-prone areas. Approximately 65 percent of Utah's wildfires are started by lightning, although 35 percent are initiated by human activity.

Wildfire removes vegetation that protects soil from excessive rainfall and the resulting runoff. It also damages soil by making it hydrophobic or water-repellent. These conditions contribute to the depletion of wildlife resources, soil erosion, water runoff, and, in some cases, severe slope failures and debris flows. Past wildfires in Salt Lake County have also significantly impacted watersheds. State and local agencies have worked together to enhance ordinances and other measures to protect watersheds in the county.

Providing adequate fire protection in the WUI can be difficult. Local suppression methods and resources may not be suited to wildfire suppression, and personnel can become easily overwhelmed when multiple structures are threatened simultaneously. The energy output from a wildfire can make protecting homes nearly impossible and pose tremendous danger to firefighters and homeowners.

The three conditions that affect fire behavior are topography, vegetation, and weather.

- **Topography:** Topography includes factors, such as slope, aspect, and elevation. Fires spread faster upslope due to the proximity of fuel to flames. Aspect also influences fuel moisture content. Fuels tend to be drier on south- and west-facing slopes. Higher elevations are associated with cooler temperatures, higher relative humidity, and changes in vegetative fuel types.
- **Vegetation:** The type of surrounding vegetation significantly influences how quickly a fire will spread. For example, light grasses burn rapidly, whereas heavy, dense fuels like Douglas Fir burn slowly but more intensely. Different fuels vary in their rates of spread, intensity, and resistance to control.

Size, continuity, and compactness also affect the fuel's rate of spread. Large fuels do not burn as readily as small fuels and take more heat to ignite. Small fuels ignite more easily, allowing fire to spread rapidly. Continuity describes how a fuel is arranged horizontally. Fuel broken up in patches burns unevenly and more slowly than uniform fuels. Compactness refers to how fuel is placed vertically. Compact fuels burn more slowly than tall, deep fuels, which have greater access to oxygen.

- **Weather:** Weather (temperature, humidity, precipitation, and wind) affects how easily a fuel ignites, how intensely it burns, and how easy it is to control. High temperatures heat fuels and reduces water content, which increases flammability. A decrease in relative humidity causes a proportionate reduction in fuel moisture, promoting easier ignition and more intense burning. The wind carries the heat from a fire into unburned fuels, drying them out and causing them to ignite more easily. The wind can also blow embers into unburned areas ahead of the primary fire, potentially starting spot fires.

Figure 167 illustrates the key factors contributing to an area's wildfire vulnerability: vegetation and fuel sources, topography, and weather conditions.[211] Possible ignition sources should also be considered. Many wildfires in Utah are caused by lightning, but more are due to human influences. Most human-caused wildfires are accidental ignition from faulty electrical systems or damaged power lines, sparks from vehicles or machinery, improperly extinguished campfires, or weed burning. Wildfire can also be caused by intentional acts of arson.

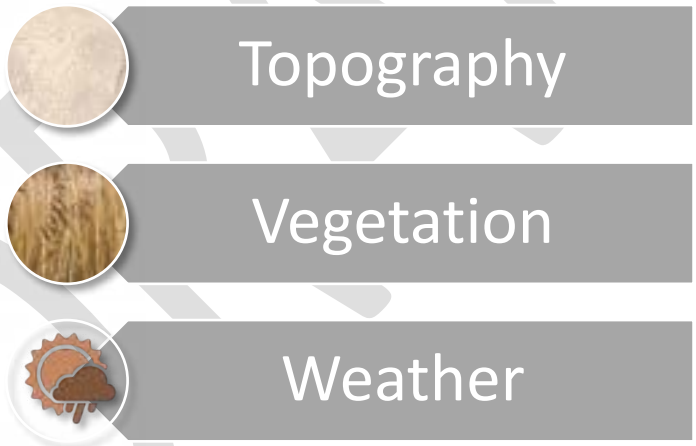

Figure 167: Key Factors of an Area's Vulnerability to Wildfire

Hazard Profile

Potential Impact		Catastrophic	**Probability**	X	Highly Likely
	X	Critical			Likely
		Limited			Occasional
		Negligible			Unlikely
Location	Wildland–urban interface (WUI) zones near the foothills and in forested areas; WUI in canyons in the Wasatch, Oquirrh, and Traverse Mountains;				

[211] First Street. "Does Salt Lake County have Wildfire Risk?" https://firststreet.org/county/salt-lake-county-ut/49035_fsid/fire.

	undeveloped areas along the Jordan River; and undeveloped islands in urban areas (Dimple Dell)
Seasonal Pattern	June–October
Conditions	Areas affected by drought, heavily overgrown and dry brush and debris, lightning, and human triggers
Duration	Days to months, depending on the climate, fuel load, and available resources (financial, manpower) to extinguish the fire
Secondary Hazards	Debris flows, erosion, traffic accidents, air pollution, destruction of natural resources
Analysis Used	Review of plans and data provided by the US Forest Service, Utah Division of Forestry, Fire, and State Lands, FEMA, Utah Geospatial Resource Center, Utah Wildfire Risk Assessment Portal, and Utah Division of Emergency Management

Magnitude/Extent

Utah uses the following fire danger rating scale:[212]

- **Low:** Grasses and brush are not easily ignited by small firebrands. Dead and down timber fires spread slowly along the ground with little danger of spotting.
- **Moderate:** Fire in open grasslands can burn briskly and spread rapidly on windy days. Timber fires spread at a slow to moderate pace.
- **High:** Fires can ignite easily from various causes. Unattended brush and campfires are prone to escape, and fire spreads rapidly, with short distance spotting common.
- **Very High:** Fires ignite easily from any cause, spreading rapidly immediately after ignition and intensifying quickly. Spot fires that start new fires are a constant danger.
- **Extreme:** All fires are potentially serious because they ignite, spread, and burn intensely. It is often too dangerous for firefighters to use direct attack suppression tactics.

Location

The areas of Salt Lake County most likely to experience significant destruction from a wildland fire include the foothills and bench areas on or near the Wasatch Range, Traverse Mountain, and the Oquirrh's. These WUI areas are most susceptible due to the amount of forested lands and the increasing population growth spreading into the foothills. Another area concern is vegetation type, such as sagebrush, mountain scrub oak, cheatgrass, pinyon and juniper trees, and riparian vegetation. Sagebrush and mountain shrubs in the county burn hot and fast and spread quickly. During prime burning conditions (hot, dry, and windy), the pinyon-juniper class is also prone to burning.

As population growth continues, the pressure to develop in WUI areas will likely increase the threats associated with wildfire. To reduce these threats, mitigation measures must be identified and enforced. The Risk to Potential Structures map (Figure 168) represents the likelihood of a wildfire and fire intensity,

[212] Utah Fire Info. "Fire Danger." https://utah-fire-info-utahdnr.hub.arcgis.com/pages/fire-danger.

with generalized consequences for a home on each pixel. For every location on the landscape, it poses the hypothetical question, “What would be the relative risk to a house if one existed here?” This allows for comparing wildfire risk between areas with existing homes and areas where new construction may be proposed.[213]

Table 73: Wildfire Hazard Potential Area by Category

	Wildfire Hazard Potential Category	Acres	Percent
	Minimal Direct Wildfire Impacts	223,886	43.3 %
	Very Low	0	0.0 %
	Low	6,231	1.2 %
	Moderate	51,345	9.9 %
	High	122,449	23.7 %
	Very High	112,591	21.8 %
	Total	**516,502**	**100.0 %**

Historical Events and Probability of Future Occurrences

According to FEMA's Disaster Declarations database, Salt Lake County experienced one federally declared wildfire disaster on August 14, 2021.[215] According to NOAA, there have been 18 wildfire events in Salt Lake County from 2010 to 2024 (Salt Lake and Tooele Valleys, Great Salt Lake Desert and Mountains, Wasatch Mountains I-80 North, Wasatch Mountains South of I-80, Great Salt Lake Desert and Mountains, Salt Lake Valley, Wasatch Mountains I-80 North, Wasatch Mountains South of I-80). Figure 170 shows additional data from Utah Forestry Fire and State Lands, including fire perimeters and fire origin points from 1999 to 2020.

DRAFT

[215] FEMA, Disaster Declarations for States and Counties." https://www.fema.gov/data-visualization/disaster-declarations-states-and-counties.

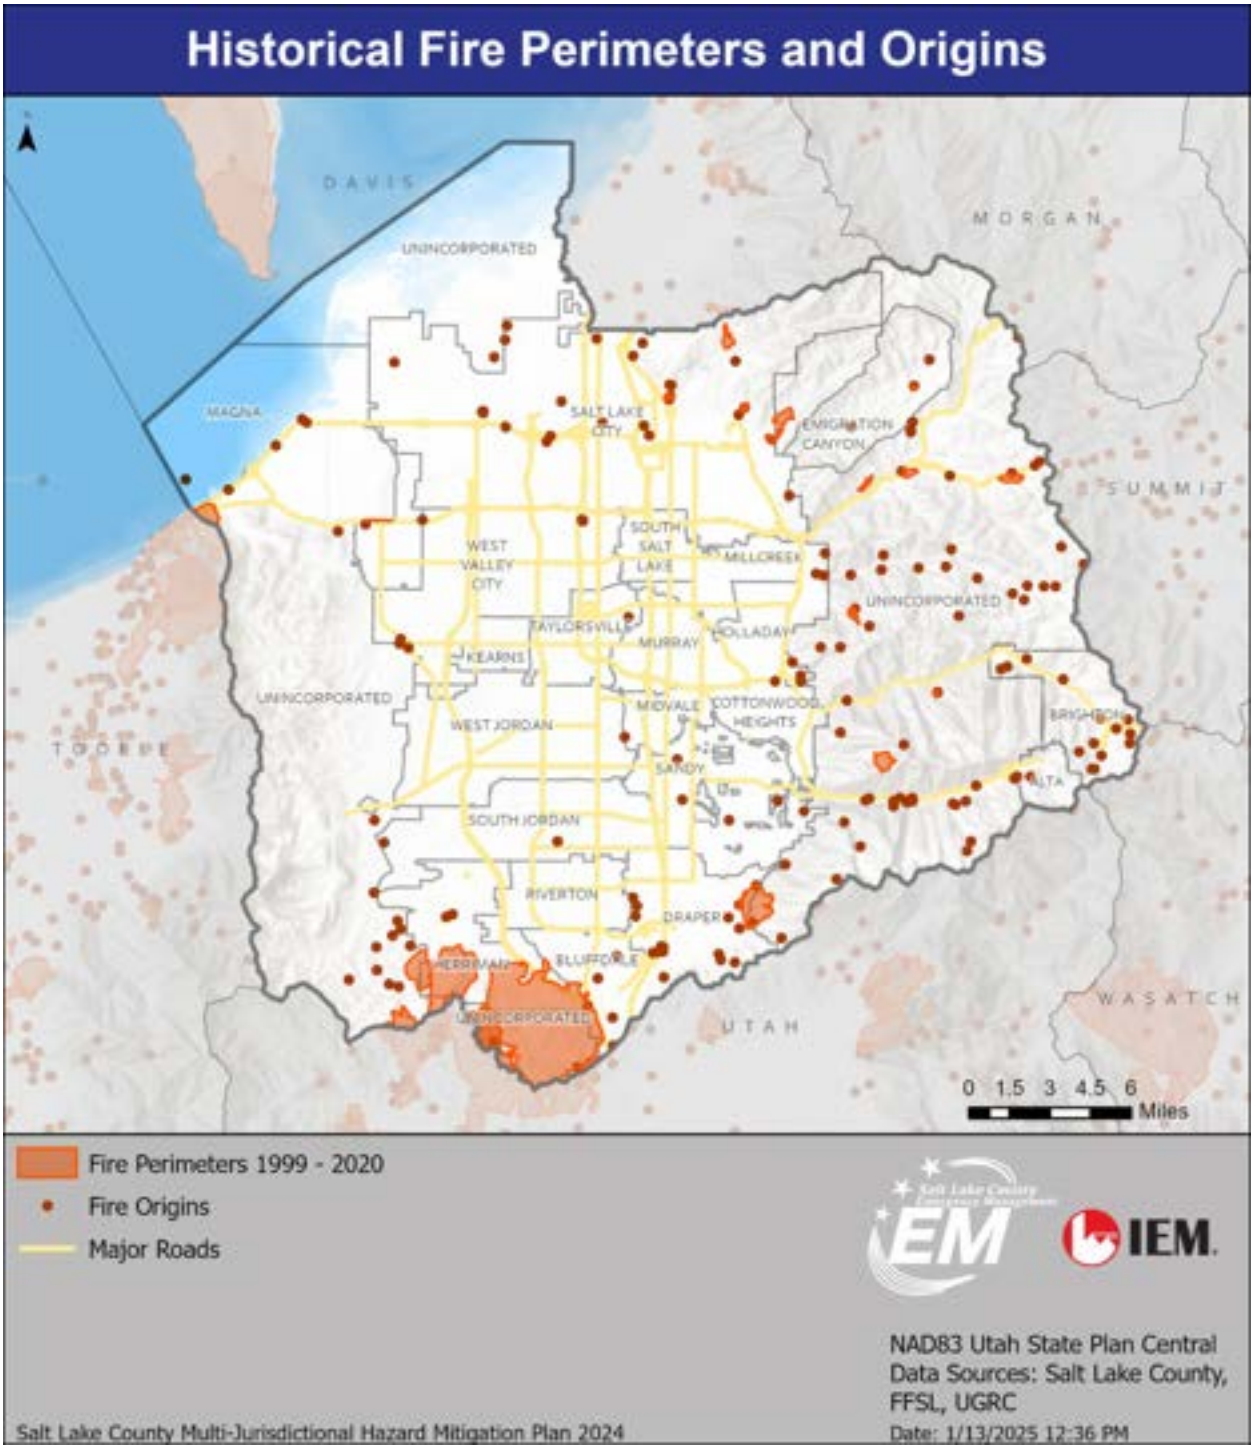

Figure 170: Historical Fire Perimeters and Origin Points

Figure 171 presents data on human-caused wildfires and the number of fires from October to May by year. Figure 172 shows the frequency of fires by month and whether a local, state, or federal agency reported them.

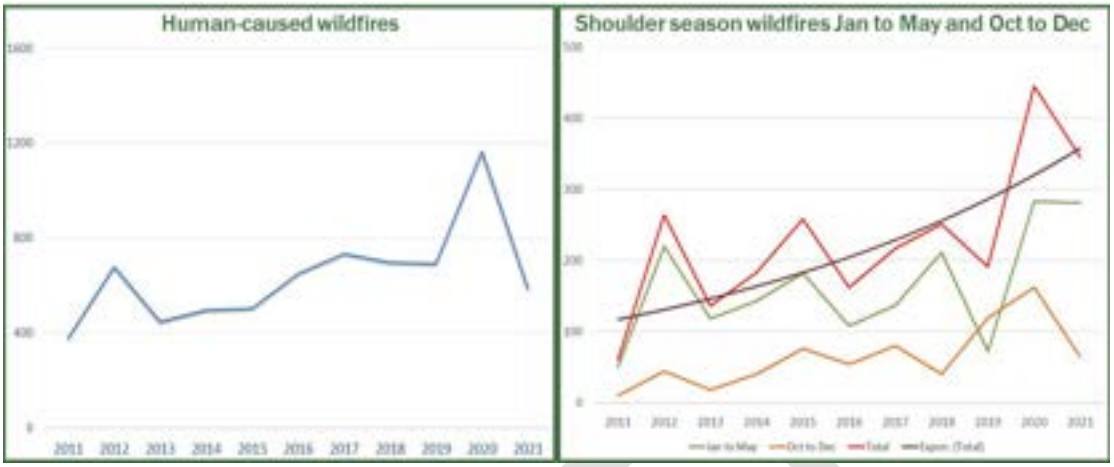

Figure 171: Wildfire Data for Utah, 2011–2021[216]

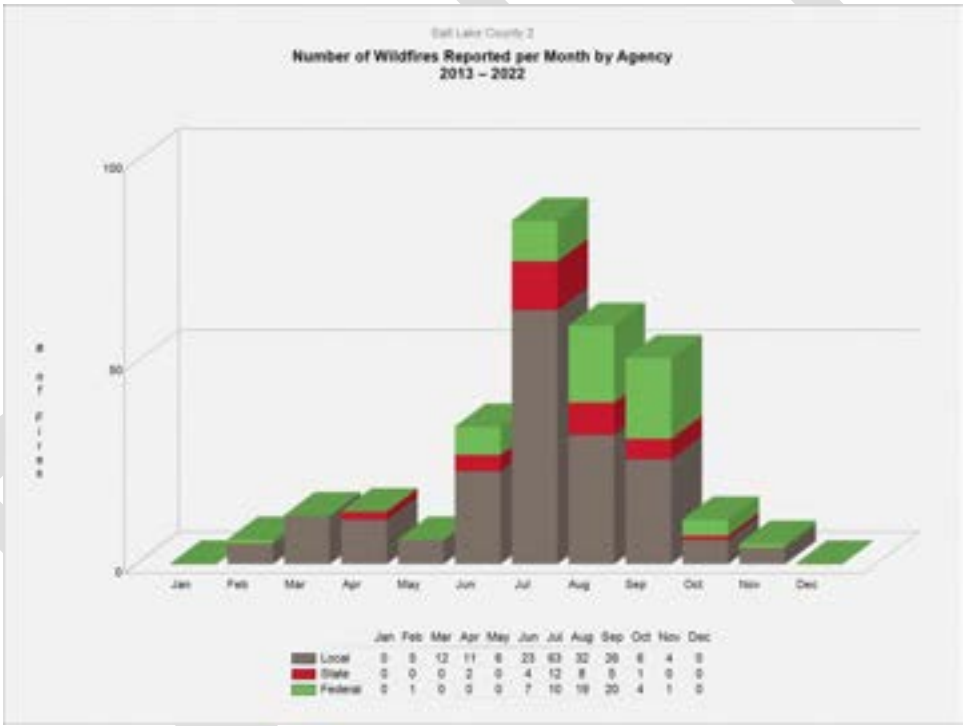

Figure 172: Number of Wildfires Reported per Month by Agency[217]

Several notable wildfires have occurred in Salt Lake County recently. On July 20, 2024, the Sandhurst Fire began near Ensign Peak above the Utah Capitol building in northern Salt Lake City. Several roads were closed to allow emergency response crews access. Twenty-two homes were evacuated, and several radio towers and the City Creek watershed protection were a concern. The fire burned 203 acres before it was contained.

[216] Utah Division of Forestry, Fire, and State Lands. "Fire Program Overview and Strategic Plan." 2022. https://ffsl.utah.gov/fire/catastrophic-wildfire-risk-reduction/.
[217] Utah Wildfire Risk Explorer. "Area of interest summary report for Salt Lake County." https://wrap.wildfirerisk.utah.gov/.

On August 14, 2021, sparks from a vehicle started a fire in Parley's Canyon. Thousands of homes were evacuated near Lambs Canyon, Mill Creek Canyon, and Summit Park in neighboring Summit County. Interstate I-80 was temporarily closed to traffic. The fire was initially estimated at over 2,000 acres, but more accurate mapping indicated that the fire burned 538 acres. No structures were destroyed.

The Neff's Canyon fire in the Mount Olympus Wilderness area burned from September through October 2020, scorching over 60 acres. The timber and oak brush fire started about 1 mile up the Neff's Canyon trail when a lightning strike ignited underground embers, which smoldered for days before spreading to nearby foliage. More than 150 firefighters were involved in the initial efforts to combat the fire, creating firebreaks and clearing debris.

Containment of the fire was slow in the early weeks, primarily due to the difficult terrain of the canyon, which made it challenging for fire managers to access steep and rocky areas with equipment and personnel. Ultimately, the fire was extinguished in October, aided by a rainstorm.[218] In April 2015, a brush fire occurred in the Avenues area of Salt Lake City. Another fire occurred in Herriman City in 2016, destroying two homes and causing evacuations. In neighboring Tooele County, the Dollar Ridge Fire destroyed 90 homes. These fires prompted significant fire responses, required many citizens to evacuate, and created the threat of debris flows in the following years. The Dollar Ridge Fire received a Fire Management Assistance Declaration.

According to historical averages, there is a nearly 100 percent chance of a wildfire occurrence in the next year. As previously stated, NOAA data indicate that there have been 14 recorded days with a wildfire event in Salt Lake County from 2010 to 2024. This averages out to approximately one wildfire event every year. The USDA Forest Service ranks the wildfire potential for most of Salt Lake County as "Very High" or "High" (see Figure 173).

[218] The City Journals, "Neff's Canyon Fire Awakens Residents to Dangers of the Wildland Urban Interface." https://www.holladayjournal.com/2020/10/26/332713/neff-s-canyon-fire-awakens-residents-to-dangers-of-the-wildland-urban-interface.

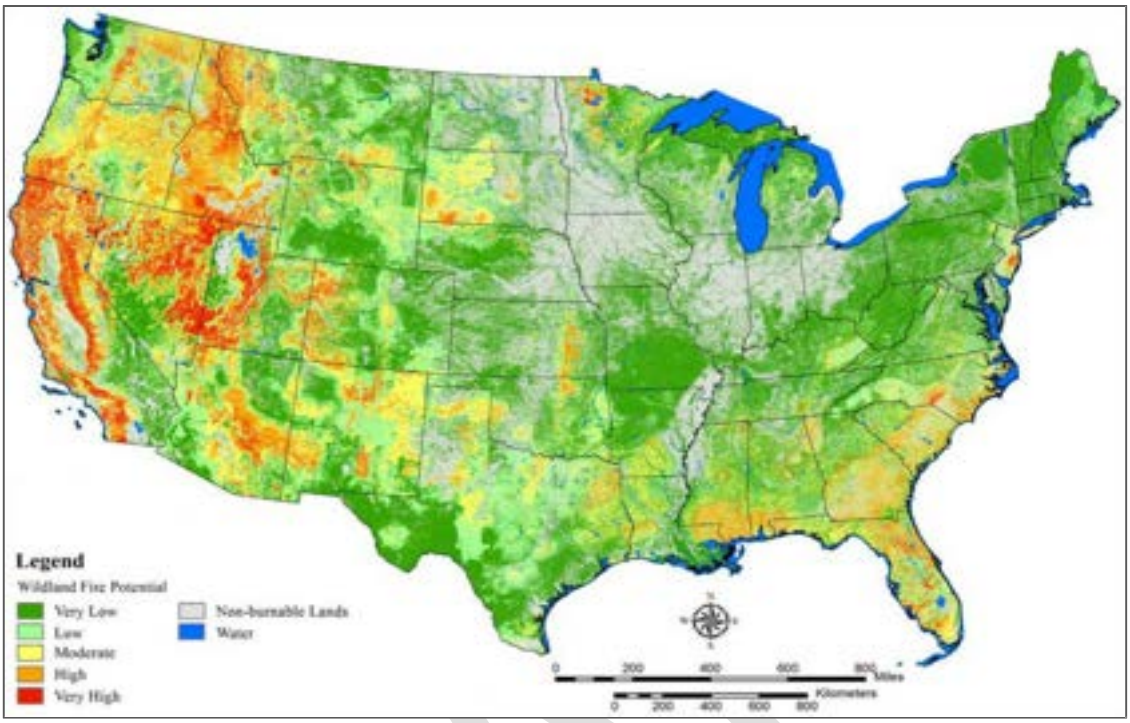

Figure 173: Wildland Fire Potential in the United States[219]

Figure 174 shows another measure of fire probability based on the Utah Wildfire Risk Assessment. Burn probability is the annual probability of a wildfire burning in a specific location. It is based on fire behavior models that simulate thousands of possible fire seasons. These simulations are based on past observations and include factors, such as the probability of a fire occurring, weather, topography, and ignition. It does not predict or forecast fire danger conditions nor represent information about the potential intensity of a fire if one occurs.[220]

[219] From Dillon, Greg, et al. "Fire Potential: A Tool for Assessing Wildfire Risk and Fuel Management Needs." Proceedings of the Large Wildland Fires Conference. US Forest Service. 2015. https://www.fs.usda.gov/rm/pubs/rmrs_p073/rmrs_p073_060_076.pdf.

	1-in-215 to 1-in-100	128,477	24.9 %
	1-in-100 to 1-in-10	47,728	9.2 %
	> 1-in-10	215	0.0 %
	Total	**516,501**	**100.0 %**

The probability of extreme fire behavior (Figure 175) represents the likelihood of flame lengths exceeding 11 feet, considered the threshold for extreme fire behavior during fire operations.[222]

[221] Ibid.
[222] Utah Wildfire Risk Explorer. https://wrap.wildfirerisk.utah.gov/Map/.

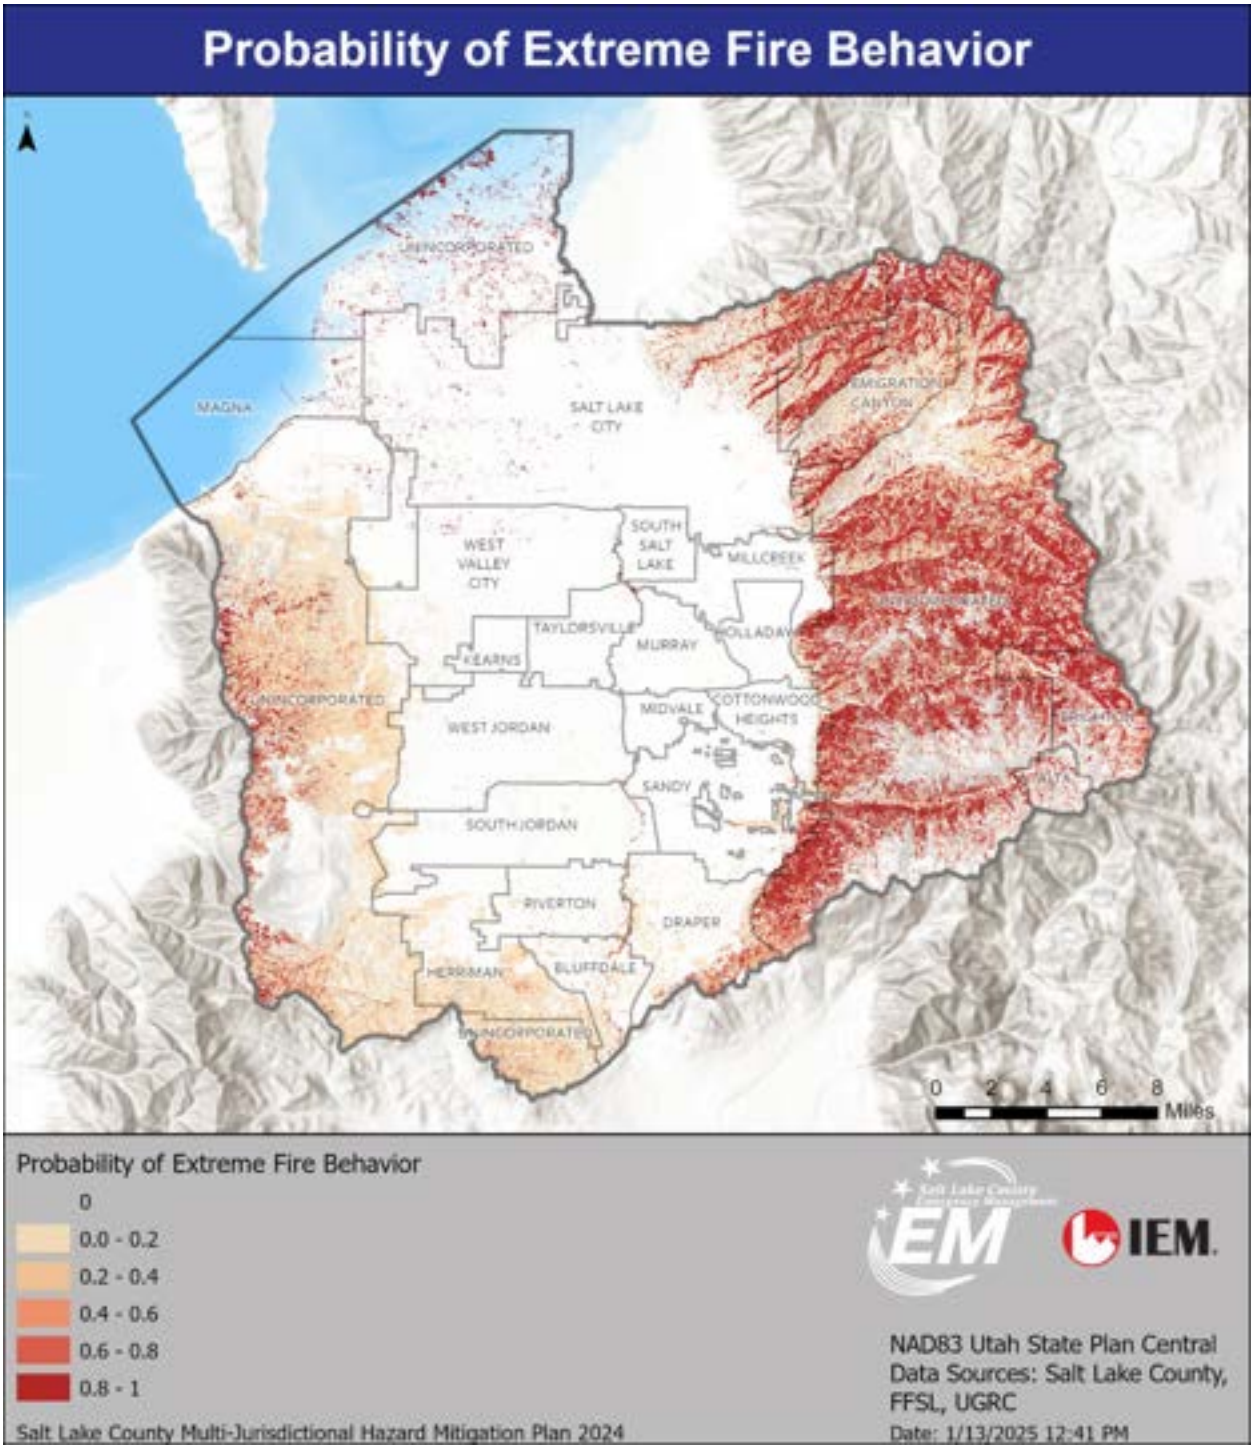

Figure 175: Potential for Extreme Fire Behavior in Salt Lake County

Climate Change Considerations

Climate change can have a significant impact on wildfires in Salt Lake County by creating conditions that are more conducive to wildfires. As temperatures rise, the potential for prolonged droughts also

increases, making vegetation more flammable and conducive to the start of wildfires. Changes in precipitation patterns can also lead to longer fire seasons and more intense fire behavior.

As climate conditions have warmed, wildfires have become more intense and destructive, especially in the western United States. Fire can play an important role in ecosystems, and forest management policies have shifted to allow more natural fire cycles. However, rising temperatures and periods of drought, which contribute to changes in fuels and create dangerous fire conditions, have complicated this natural cycle. Higher temperatures also allow invasive species like the bark beetle to thrive. These beetles have killed thousands of square miles of trees, making them more susceptible to wildfire and increasing the likelihood of faster-spreading fires.[223]

Since the early 20th century, Utah's temperature has increased by more than 2.5°F. The 2024 Utah Enhanced State Hazard Mitigation Plan projects that warming temperatures and increasing drought incidents in the western United States will increase the number of acres burned by wildfires. In addition, early spring onsets, snowmelts, and reduced seasonal snowpacks are projected to heighten fire risk.[224]

Secondary Hazards

The most direct impacts of a wildfire are damage or complete loss of property, injury, or even death. Secondary impacts can include poor air quality due to smoke in nearby areas. This can be particularly harmful for elderly individuals or others with chronic heart or lung conditions. Damage to the environment, wildlife, and natural resources also are significant. Much of the mountainous area in western Salt Lake County is a watershed, and fire can impact the quality of the water supply. As the area is a major outdoor recreation and tourism hub, a major fire can also have significant economic impacts. The risk of debris flows after a fire in mountainous areas is high for several years after a fire until vegetation is reestablished.

Vulnerability Assessment

The risk of wildfire to the people and property of Salt Lake County is a significant concern. The county has large areas of forested land, with high fuel loads near developed areas. Of the 516,502 acres in Salt Lake County, 235,040 (46%) are in High or Very High Wildfire Hazard Potential areas. These factors—combined with compounding weather conditions, such as high heat, drought, and high wind—create the potential for natural and human-caused fires that can lead to property damage and loss of life.

In the risk assessment framework (Figure 176), wildfire hazard is measured by two primary factors: 1) burn probability (or likelihood of burning), and 2) fire intensity (measured as flame length, fire line intensity, or similar measures). Figure 168–Figure 175 and Table 74 provide various examples of probability and intensity. This section aims to identify assets potentially exposed to wildfire hazards to assess vulnerability.

[223] USGS. "Wildfire and Climate Change." https://www.usgs.gov/science-explorer/climate/wildfire.
[224] Utah Hazard Mitigation. "Climate Change Considerations." 2024 Utah State Hazard Mitigation Plan. https://hazards.utah.gov/state-of-utah-hazard-mitigation-plan/.

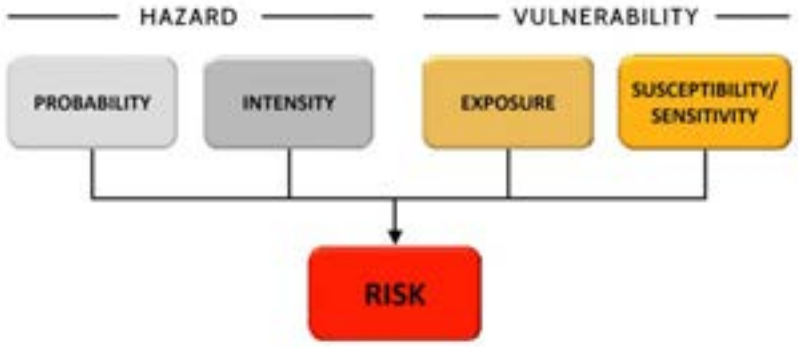

Figure 176: Fire Risk Assessment Framework[225]

An analysis based on the Utah Wildfire Risk Assessment Portal was conducted to identify each county's wildfire threat risk. The results show the threat based on the percentage of land falling under various threat categories, ranging from VVL (Very, Very Low) to VVH (Very, Very High). Seven Utah counties have 25 percent or more of their land classified as a high wildfire threat, with Salt Lake County having the highest percentage, at 59.8 percent.

Table 75: Salt Lake County Wildfire Threat, 2024[226]

VVL%	VL%	L%	LM%	M%	HM%	H%	VH%	VVH%	High Totals
1.2%	8.9%	6.2%	9.5%	14.3%	18.0%	15.3%	11.2%	15.4%	59.8%

Growing counties are recommended to follow FEMA's Firewise construction recommendations for all new development areas to minimize wildfire risk. The Firewise program encourages and supports neighborhoods in mitigating wildfire hazards. There are currently 28 Firewise communities in Utah.

Table 76: Firewise Communities in Salt Lake County[227]

Title	Number of Residents	First Year
Emigration Canyon	850	2002
Hi-Country Estates Phase 1	88	2016
Mt. Aire	100	2017
Town of Brighton	299	2021

In 2005, Utah identified almost 600 communities and their surrounding natural resources as "at risk" from wildland fire. The annually updated list comprises communities in Utah that wildland fire officials have determined to be at risk from wildland fire. The "Overall Score" represents the sum of multiple risk factors analyzed for each community. Risk factors include fire history, local vegetation, and firefighting

[225] Utah Department of Natural Resources, Forestry, Fire, and State Lands. "Utah Wildfire Risk Assessment." https://ffsl.utah.gov/fire/utah-wildfire-risk-assessment/.
[226] 2024 Utah State Hazard Mitigation Plan.

Access to some areas in the WUI can be challenging for emergency response. Some communities have private roads with limited access. Some roads are unimproved and may be impassable during winter months. Others are single lane, so access for large heavy vehicles like fire engines is difficult. Some are dead-end spur roads with limited ability to turn around.

The 2019 Salt Lake County Wildfire Preparedness Plan estimate the following properties at risk and their estimated value.

- Residential Land: $41,698,494,520
- Residential buildings: $72,369,023,500
- Commercial Land: $19,878,556,430

[228] Utah Department of Natural Resources, Forestry, Fire, and State Lands. "2019 Communities at Risk." https://ffsl.utah.gov/fire/wildfire-community-preparedness/communities-at-risk/https://ffsl.utah.gov/fire/wildfire-community-preparedness/communities-at-risk/, https://drive.google.com/file/d/1VQeWa63cO1eydm9uvuPDqdGnyzLIQLue/view.

DRAFT

- Commercial Buildings: $52,976,176,180

ESTIMATED IMPACT AND POTENTIAL LOSSES

Fire can damage or destroy structures, including homes, businesses, critical facilities, and other community assets. In strong winds, embers can travel several miles from the main fire and may ignite secondary fires when they encounter flammable dry vegetation, rooftops, or debris.

Residents closest to the fire may be evacuated; longer-term displacements are likely if residences are damaged. Some households may need to seek public shelter. Homes in the foothills may be on dead-end spur roads that may be more difficult to navigate in an evacuation due to narrow lanes and higher traffic volumes. These areas may also be more problematic for fire trucks to reach. Individuals closest to the wildfire are at risk of burns, other injuries, or death. Poor air quality and smoke inhalation can affect individuals across a large area and are particularly harmful to those with underlying health conditions.

Fires can damage utility systems, such as power lines and substations, communications towers, water treatment facilities, and other infrastructure systems. Roads and other transportation networks may require closure, which can cause widespread disruption as people seek alternative routes. Some canyon communities only have one major access road, which may leave residents isolated from services and, during an evacuation, may cause traffic delays. Emergency response may be delayed by power or communications disruptions if roadways are inaccessible or responding agencies are overwhelmed.

Wildfires can also have significant economic consequences. Businesses can experience direct damage to facilities, inventory, or equipment. Fire can also disrupt power, communications, other utility services, and transportation networks, which can further interrupt business operations. Businesses closed by evacuations or other interruptions will experience a loss in revenue. Businesses that remain open may be short-staffed due to employees' inability to report to work. The canyons and forests are vital to Salt Lake County's recreation and tourism industries. Fires restrict access to these areas during the event and may lead to long-term reductions in visits to the affected areas. The cost of fire suppression, repairs to damaged facilities, and economic losses can all make recovery difficult for a community. A large-scale fire can strain the community's financial resources and further slow economic recovery.

As one might expect, the effect of wildfires on the environment is typically devastating. Significant vegetation and wildlife habitats can be destroyed, requiring a long time to regenerate. Ash and debris can diminish water quality and affect the water supply. Furthermore, when land is stripped of vegetation, soil stability is reduced and erosion increases, which could further threaten structures or impact water supplies and quality. This also contributes to secondary hazards, such as slope failure or debris flows.

The NRI includes data on the EALs from individual natural hazards, historical loss, and overall risk at a county and census tract level. Salt Lake County's NRI EAL value for wildfire is $24 million, with a risk score of 99.4 and a rating of Relatively High percentile compared with the rest of the United States (Figure 177).

DRAFT

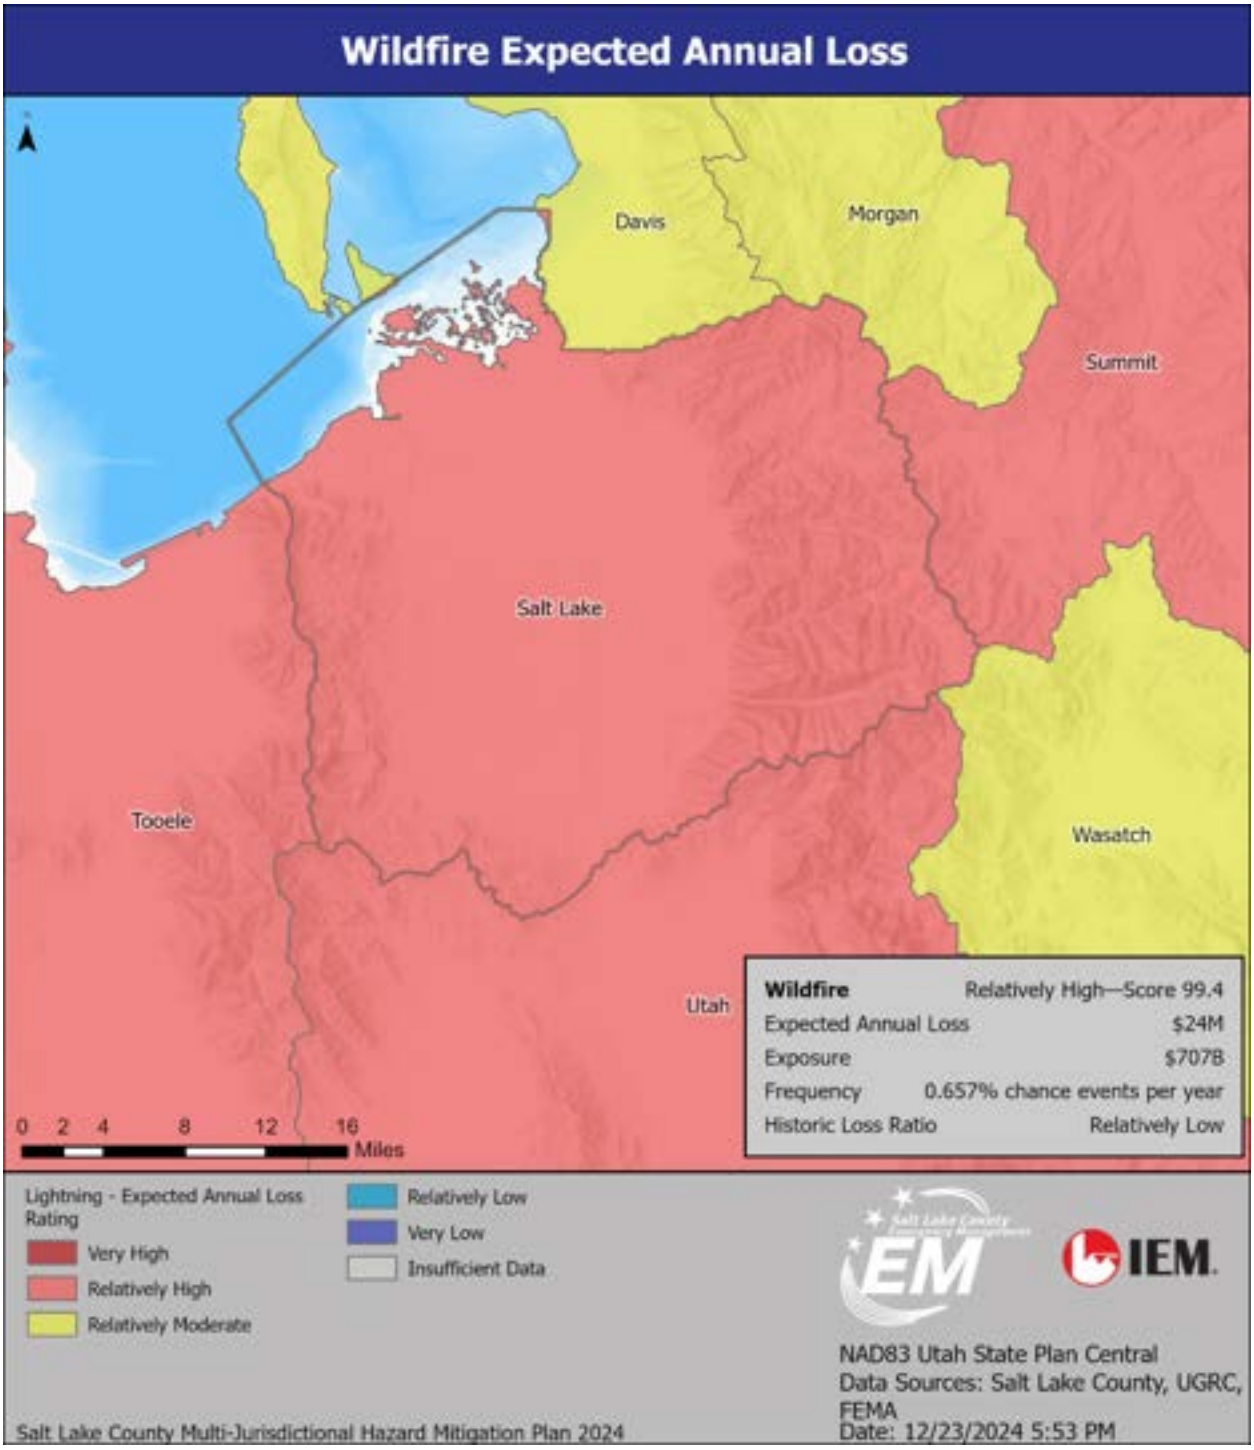

Figure 177: National Risk Index Expected Annual Loss from Wildfires in Salt Lake County[229]

[229] FEMA, National Risk Index. "Salt Lake County Expected Annual Loss Wildfire Risk Score, Map and Legend." https://hazards.fema.gov/nri/map.

VULNERABLE POPULATIONS

Social vulnerability is an indicator of an individual's ability to cope with and recover from trauma. For a given exposure, populations with high social vulnerability tend to experience impacts more severely. Social and economic factors can make it more difficult for some people to prepare for, respond to, and recover from wildfires. Vulnerable populations may lack access to resources, experience cultural and institutional barriers, have limited mobility, or have medical conditions exacerbated by stress or smoke conditions.

People over the age of 65 and individuals with disabilities are more susceptible to air pollution and particulates associated with wildfire smoke. These individuals also may experience challenges if evacuations are required. Language barriers can make it difficult to follow directions during an evacuation or to access support after a disaster. Race and ethnicity are strongly correlated with disparities in health and access to aid and resources. Wildfires disproportionately impact people with low incomes due to factors, such as inadequate housing and a diminished ability to evacuate or afford relocation expenses.

Diminished air quality is an environmental impact that can result from a wildfire and pose potential health risks. Smoke plumes from wildfires can contain potentially inhalable carcinogenic matter. Particles of soot and ash that are too small for the respiratory system to filter can cause immediate and possibly long-term health effects. Older adults or those with compromised respiratory systems may be more vulnerable to diminished air quality after a wildfire event.

In addition, fire protection in WUI areas is difficult because the tactics used for wildfire suppression cannot be used for structure protection and suppression. The energy emitted from a wildfire is hazardous to firefighters and homeowners, making protecting homes almost impossible. One-third of all firefighter deaths occur while fighting wildfires. Many believe that WUI areas significantly increase firefighter risks. Legally, federal wildland protection agencies are seldom responsible for protecting structures. State forestry agencies' legal responsibility for protecting structures in non-federal wildlands varies widely.

Table 78 provides statistics on vulnerable populations living in Salt Lake County. Figure 178 illustrates the areas in Salt Lake County with vulnerable populations, based on the indicators under 5 years old, limited English proficiency, and over 65 years old.

DRAFT

Table 78: Salt Lake County Vulnerable Populations at Risk of Wildfire[230]

Indicator	Number	Percent
Families in poverty	14,238 ±1,027	5.1% ±0.4%

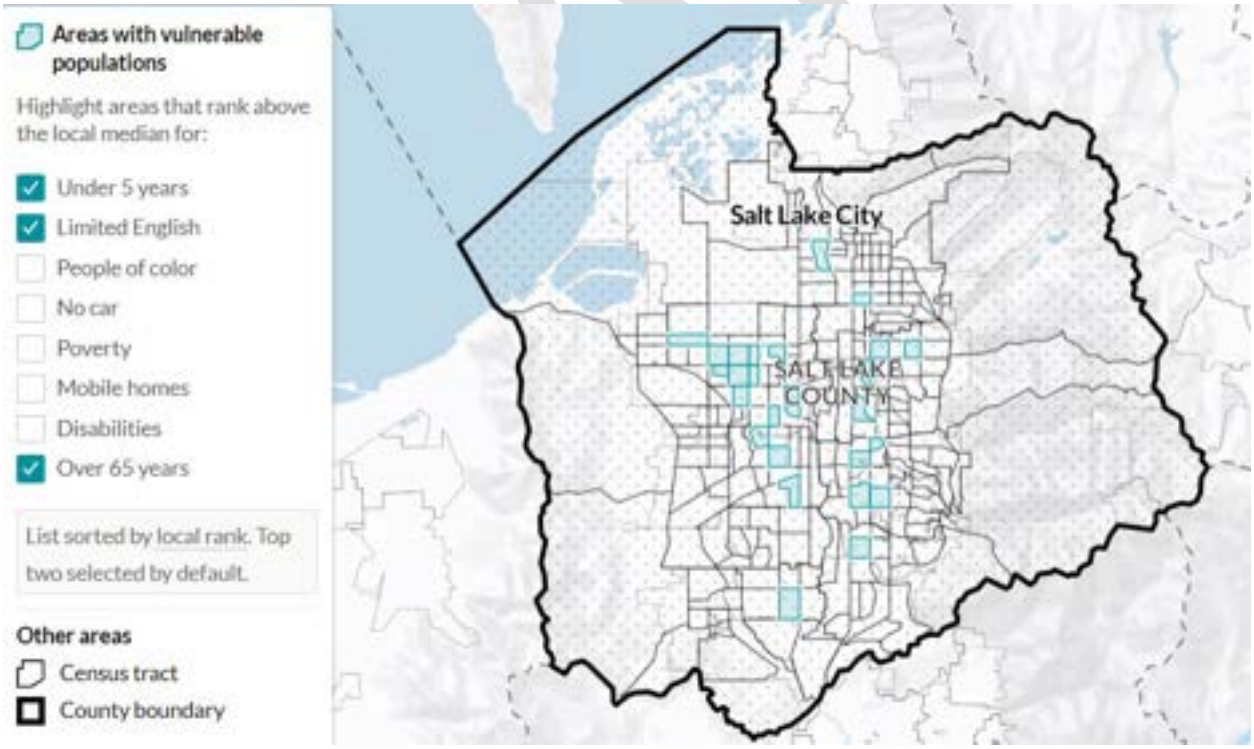

Figure 178: Three Populations Vulnerable to Wildfire in Salt Lake County[231]

COMMUNITY LIFELINES

Wildfires can strain food, hydration, and shelter lifelines for those evacuated. Safety and security lifelines also may be strained when responding to the fire and enacting evacuation procedures. Damage caused by the fire may also disrupt energy, transportation, communications, and water systems.

CHANGES IN DEVELOPMENT

Salt Lake County's development and population growth can have significant impacts on wildfires. Population increases will lead to more demands for housing and infrastructure. This need can lead to more development in wildfire-prone areas, increasing the risk of wildfires on infrastructure and the populace.

Salt Lake County continues to experience growth and development in the WUI. According to the U.S. Census, it was the most populous county in the state, with a population of 1,185,813 in 2023, reflecting steady growth over the past 13 years. However, the estimated 2024 population is slightly lower at 1,185,057, with a growth rate of -0.06 percent in the past year, according to the latest census data. Since 2010, when the population was 1,032,997, Salt Lake County has grown 14.72 percent.[232]

Growth increases vulnerability to wildfire, as the county's high projected population growth coincides with significant wildfire threats. These wildfire threats are most acute near the Wasatch and Oquirrh Mountains, where fires can quickly start and grow. Development is happening particularly quickly along the southwest border of Salt Lake County, where it meets the Oquirrh Mountains and where a significant wildfire risk exists. This growth is also increasing residents' exposure to wildfires and may leave many newcomers to Salt Lake County unaware of the risk. Besides direct risk, this growth could lead to more disruptions associated with evacuations, air quality, and public health concerns. Overall, vulnerability to wildfire has increased since the last plan update.

VULNERABILITY SCORE

The NRI was used as a primary tool during the 2024 update to analyze the county's vulnerability to wildfire. The NRI defines risk as the potential for negative impacts from a natural hazard. It determines a community's risk relative to other communities by examining the EAL and social vulnerability in a given community in relation to its resilience. Salt Lake County's NRI wildfire risk rating is shown in Figure 179. Salt Lake County has a relatively high wildfire risk, with a risk score of 99.2.

[230] Wildfire Risk. "Salt Lake County Vulnerable Populations at risk from Wildland Fire." 2024. https://wildfirerisk.org/explore/vulnerable-populations/49/49057/.

Civil Disturbance

Figure 180: Civil Unrest, Salt Lake City, 2020[234]

Hazard Description

Civil disturbance or disorder is a wide-ranging phenomenon encompassing any incident involving large groups of individuals participating in activities that disrupt public order and put the safety of the public, businesses, or critical infrastructure at risk. This can include rioting, looting, and violent demonstrations or protests.

Civil disorder can be the spontaneous impact of a triggering event, such as the looting seen following disasters (e.g., 2005 Hurricane Katrina in New Orleans), or it can be a specific hazard unrelated to any other hazard (e.g., 1999 World Trade Organization riots in Seattle). It can arise from peaceful events, gatherings, or demonstrations or be preplanned and intentional. Civil disturbances are rooted in highly complex social, economic, and political interactions.

The right of public assembly is protected by the First Amendment of the United States Constitution; accordingly, emergency managers must be careful to protect the rights of their citizenry. Individuals participating in civil disorder will exploit actual or perceived infringements on this right to gain public sympathy for their cause. Therefore, the most effective way to reduce politically motivated civil disorder is to stop it before it occurs. This involves significant planning by emergency managers and robust intelligence from law enforcement entities.

[234] Photo courtesy of SLCo EM.

Once civil disorder erupts, responders have access to a range of nonlethal tools designed to manage riots effectively. These include equipment, such as helmets, body armor, and gas masks, which are essential for protecting against physical harm and tear gas. Crowd control tools, such as batons, shields, and pepper spray, can be used to manage and disperse crowds if necessary. Communications devices like two-way radios and earpieces are crucial for maintaining contact and coordination among first responders. Nonlethal weapons, such as rubber bullets, bean bag rounds, and stun grenades can be used for crowd control and dispersal, while armored vehicles can be used to transport and protect first responders in volatile situations. Finally, to ensure the safety of the public, first responders, and other protesters, lethal force may be considered as a last resort.

CIVIL DISTURBANCE DURING DISASTERS

Civil disorder, primarily in the form of looting, often occurs during or immediately after a disaster. Other types of civil disorder, such as rioting, are exceedingly rare after a disaster.

Civil disorder during disasters arises from a range of motivating factors. One factor contributing to civil disorder during disasters is the disruption of environmental and social norms, which creates an atmosphere of chaos. This can lead to the rationalization of acts that would normally be considered unacceptable. This behavior change, combined with a displaced or overburdened police force, can escalate civil disorder after disasters. Another factor contributing to disaster-related civil disorder is resource scarcity when individuals either lack basic supplies or fear losing access to them. Disasters often disrupt a community's ability to provide citizens with food, clothing, and potable water. Fearing for their survival, people may loot to obtain these necessities. Lastly, it has been argued that civil disorder during disasters stems from social inequalities. There is a strong correlation between lower socioeconomic status and crime, with evidence suggesting that these conditions are worsened during and immediately following disasters, leading to an increase in crime rates and incidents of looting.

Differing opinions exist regarding the frequency of looting during disasters. Some argue that the scale of looting is often exaggerated, with perceptions of widespread looting influenced by misinterpreted behavior, misunderstandings over property ownership, exaggerated claims, and sensational media coverage. In addition, it is widely observed that in the aftermath of disasters, prosocial behaviors, such as citizens volunteering to help and feed one another, far outweigh antisocial behavior like looting. Nonetheless, looting does exist in many disasters to some degree. Looting can be traced back to various social issues but is likely influenced by a combination of factors. Although looting is often seen as opportunistic theft during chaotic events, its historical and cultural contexts play a significant role in understanding its roots.

Due to the stress caused by the impacts of a disaster, the affected populace is already under considerable duress. Therefore, responders and emergency managers must exercise caution when responding to these events. Shifting search and rescue operations to trained strike teams could help free up police resources, allowing law enforcement to focus on preventing looting. Establishing disaster recovery operations quickly and efficiently is crucial for meeting the basic needs of residents. In addition, public information campaigns are vital for informing citizens and alleviating fears.

DRAFT

POLITICALLY MOTIVATED CIVIL DISORDER

Politically motivated civil disorder occurs when a large group of individuals disturb public order to bring about political or social change. This can be preplanned in response to a significant social event or happen spontaneously at large gatherings. This type of civil disorder can lead to rioting, looting, or unauthorized gatherings that disrupt public order.

Politically motivated civil disorder can arise for various reasons, such as attempts to address socioeconomic inequalities, advocate for changes in laws, exploit chaotic situations, or pursue anarchist objectives. It can occur in the following scenarios, among others: peaceful marches and parades, planned summits and major political events, and large gatherings at concerts and sports arenas.

In politically motivated civil disorder, the initial targets often serve as symbolic acts of defiance against institutions seen as upholding the societal norms participants wish to change. This includes destructive behavior toward police forces and their equipment, firefighters and their equipment, and other symbols of law and order. This destructive behavior often morphs into crimes of opportunity, such as looting and theft, and finally, aggression toward the public and peacekeepers.

In recent years, politically motivated civil disorder and those who participate in it have become increasingly organized. These individuals often attach their cause to otherwise innocuous or peaceful demonstrations, seeking to exploit a police force already stretched thin with other responsibilities. Anarchist groups like the Black Bloc incorporate guerilla tactics into their operations, such as concealing their identities and using misdirection to evade police, to maximize the opportunity to cause damage. Another tactic used by these groups is inciting violence in the larger crowd. Exploiting existing tensions surrounding various issues—such as hunger, unemployment, lack of community services, poor housing, and labor issues—can elevate tensions in a large group. When tensions are high, a seemingly minor incident, rumor, or act of injustice can quickly incite a crowd to violence**.**

Magnitude/Extent

The magnitude or extent of civil disturbances in Utah can vary depending on the situation. Like any other area, Salt Lake County can experience a range of civil disturbances, from peaceful protests and demonstrations to more severe incidents, such as riots or civil unrest. Factors, such as population size, current social and political issues, and law enforcement response, can play a role in the extent of civil disturbances in Salt Lake County.

Location

Though civil unrest can occur anywhere, it is more likely in locations with high levels of inequality, lack of access to education and economic opportunities, political instability, ethnic or religious tensions, and a history of unresolved conflicts. In addition, issues, such as police brutality, government corruption, and lack of trust in institutions, can also make a community more vulnerable to civil disturbances.

DRAFT

Historical Events and Probability of Future Occurrences

Although civil disturbances and riots of significant magnitude are not highly likely in a given year, they remain a possibility in Salt Lake County. For instance, in February 2016, a civil disturbance arose following an altercation between police and a teenage male, which resulted in the teen being shot. A crowd soon gathered and began to throw rocks and yell obscenities at the police. This led to the arrest of four people who failed to obey commands to evacuate. In another example, at a rowdy celebration during the 2002 Winter Olympics in Salt Lake City, a crowd attempted to force its way into a beer tent and evade security. The situation escalated, requiring 75 to 100 police in full riot gear to regain control of the area. At least 30 people were arrested.

On June 1, 2020, Salt Lake City experienced significant protests in response to police brutality and the death of George Floyd. The protests began peacefully during the day but escalated as night fell. Demonstrators marched through the streets, chanting slogans and holding signs calling for justice and an end to racial inequality. However, as the evening progressed, tensions rose, and clashes between the police and protesters resulted in vandalism and destruction of property. A 7-11 store, the State Capitol building, City Creek Mall, a police station, and other locations were vandalized. The National Guard was deployed to help restore order.[235]

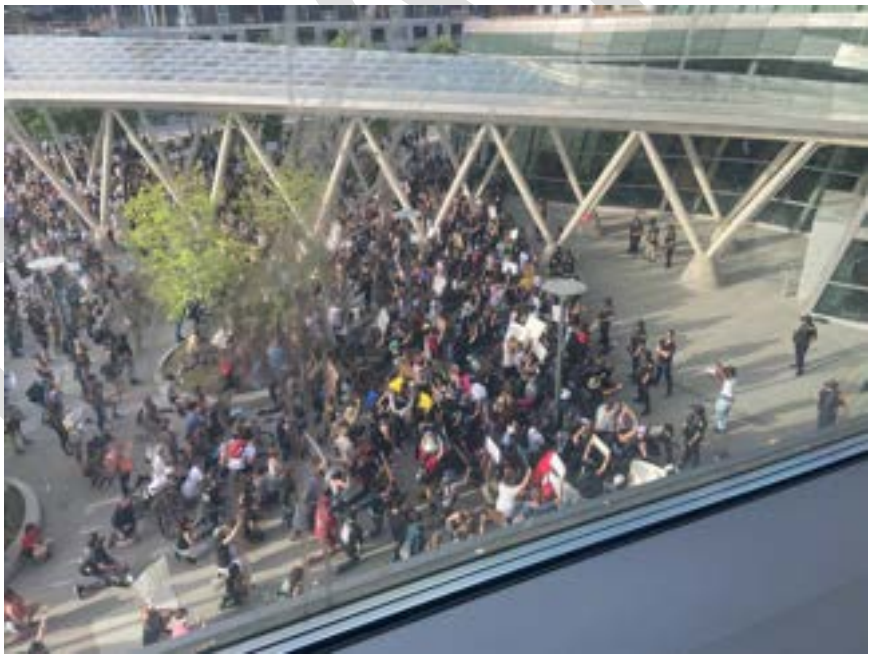

Figure 181: Protest Outside Salt Lake City Public Safety Building, June 2020[236]

On April 29, 2024, an Israel–Hamas protest took place at the University of Utah. Over 200 protestors gathered and set up tents. Officers from the University of Utah, Salt Lake City, West Valley City, Utah Highway Patrol, and the UPD dispersed the crowd and cleaned up the tents, pallets of water, toilet paper,

[235] McGurk, Nick. "Salt Lake DA: 40–50 Arrested, Police and Protester Actions Being Examined." ABC 4. June 1, 2020. https://www.abc4.com/news/salt-lake-city-protests/salt-lake-district-attorney-40-50-arrested-police-and-protestor-actions-being-examined/.
[236] Photo courtesy of SLCo EM.

buckets of human waste, and other debris left by the protestors. More than 21 people were arrested for trespassing, disorderly conduct, failure to disperse, and resisting arrest. The protestors violated the Utah State Law Administrative Code and the University of Utah Speech Policy by setting up structures overnight on campus.[237]

According to the Southern Poverty Law Center, as of 2023, 20 hate and antigovernment groups were being tracked in Utah, including five with a significant presence in Salt Lake City: The Active Club, Eagle Forum, Mom Army Salt Lake City, Utah Constitutional Militia, and Utah Patriots.[238] In addition, seven groups are statewide. Although civil disturbances could arise from any contentious situation or gathering of predisposed people, Salt Lake County needs to remain aware of groups with the potential to spark these events.

Climate Change Considerations

Civil disturbances and violent protests or riots can have localized short-term environmental impacts, such as damage to buildings and infrastructure, leading to increased waste and emissions from fires. However, in the larger context of climate change, the direct impact of civil disturbances and violent riots is relatively minor. Although civil disturbances and violent riots can have immediate environmental consequences, their effects on climate change are minimal compared with other human activities.

Secondary Hazards

Civil disturbances can have far-reaching impacts on the climate through secondary or cascading events. These disturbances can disrupt crucial infrastructure, such as power plants, transportation networks, and industrial facilities, leading to increased emissions of greenhouse gases and other pollutants. In addition, civil disturbances can contribute to deforestation through land clearing and illegal logging, reducing the capacity of forests to absorb carbon dioxide and thereby increasing levels of greenhouse gases in the atmosphere. The displacement of populations due to civil disturbances can also lead to increased demand for resources and energy in host communities, putting pressure on natural resources and contributing to environmental degradation and climate change. Furthermore, the economic impacts of civil disturbances, such as damage to businesses and infrastructure, loss of livelihoods, and increased poverty, can further exacerbate pressure on natural resources and contribute to environmental degradation and climate change. These examples highlight the interconnectedness of civil disturbances and their potential impact on the climate.

Vulnerability Assessment

Although civil disorder is inherently a threat to the public, its many hazardous impacts also threaten public safety. Salt Lake County, like any other area, has the potential for civil disturbances. Social tensions, public demonstrations, and other forms of civil unrest can contribute to the county's vulnerability by

[237] University of Utah Communications. "University of Utah Campus Protest Recap." The University of Utah. May 1, 2024. https://attheu.utah.edu/facultystaff/university-of-utah-campus-protest-recap/.
[238] Southern Poverty Law Center. "In 2023, 20 Hate and Antigovernment Groups were Tracked in Utah." https://www.splcenter.org/states/utah.

creating social tensions, disrupting public order, and potentially leading to unrest and conflict. Public demonstrations and other forms of civil unrest can strain resources and infrastructure, impacting the community's safety and security. In addition, civil disturbances can affect the functioning of essential services and disrupt daily life, making it necessary for residents to stay informed and prepared to follow guidance from local authorities.

ESTIMATED IMPACTS AND POTENTIAL LOSSES

IMPACT ON SALT LAKE COUNTY RESIDENTS

During a civil disturbance, residents can be impacted in several ways. They may experience disruptions to essential services, such as transportation, healthcare, and utilities. There is also potential for property damage, personal injury, and emotional distress. Civil disturbances can also lead to economic repercussions, including loss of income and damage to businesses. Injuries and fatalities also are possible.

IMPACT ON ESSENTIAL FACILITIES AND OTHER PROPERTY

Essential facilities may be impacted if they are near or the target of civil disorder or riots. Businesses are often the focus of civil disruption, as individuals will target these establishments for looting and vandalism. In addition, in scenarios where supplies are limited, these businesses are often looted for their goods. Any building/edifice where the riot or disorder occurs may be vulnerable to damage.

IMPACT ON CRITICAL INFRASTRUCTURE

Civil disturbances can lead to various impacts and losses to a community's critical infrastructure. This can include damage to transportation systems, such as roadways, bridges, and public transit facilities, and disruption to communications networks, including phone lines and internet services. In addition, civil disturbances can damage power plants, electrical grids, and water supply systems, leading to power outages and water supply disruptions. These disruptions can significantly impact the daily lives of community members and hinder the delivery of essential services.

IMPACT ON OPERATIONS

First responders are particularly at risk during civil disruptions. They are often the first individuals on the scene, which puts them in direct danger of injury. In addition, responders are seen as part of the authority being protested, making them potential targets. Civil disturbances can also overwhelm local emergency response services, impacting their ability to manage the situation effectively. This can lead to increased call volumes, communications challenges, physical damage to facilities, and the need for heightened security measures. Emergency operation centers may need to coordinate with law enforcement and other agencies to effectively manage civil disturbances.

IMPACT ON ENVIRONMENT

Civil disturbances can have several impacts on the environment. These include increased pollution from burning vehicles, buildings, and other materials and the use of chemical agents to disperse crowds.

DRAFT

Habitat destruction is also a concern, as unrest can destroy natural habitats, such as forests and wetlands. In addition, large gatherings during civil disturbances can increase the generation of waste, including litter and potentially hazardous materials. Furthermore, civil disturbances can disrupt ecosystems and wildlife, leading to the displacement of animals and the destruction of natural resources.

VULNERABLE POPULATIONS

The populations most vulnerable to social disturbances generally include marginalized communities, such as low-income individuals, ethnic minorities, refugees, and people with disabilities. These groups often face systemic barriers and discrimination, making them more susceptible to the negative impacts of social disturbances. In addition, individuals who lack access to education, healthcare, and social support systems are also at heightened risk during times of social unrest. However, all individuals and infrastructures near a civil disorder are vulnerable to injury or damage.

COMMUNITY LIFELINES

Civil disturbances can impact several community lifelines, including safety and security, food, hydration, shelter, health and medical services, energy, communications, and transportation. These disturbances can disrupt law enforcement and emergency services, compromising public safety. In addition, they can cause shortages of essential resources, such as food, water, and shelter due to damaged infrastructure or restricted access. Health and medical services may be overwhelmed, while energy distribution and communications networks can be disrupted, leading to power outages and compromised access to information. Furthermore, transportation systems may be delayed, hindering the movement of goods, services, and people and emergency response and evacuation efforts.

CHANGES IN DEVELOPMENT

Civil disturbances can significantly impact future land use and development in a community. These disturbances can lead to damage to infrastructure, businesses, and residential properties, which may cause a decline in property values. As development and population increase in Salt Lake County more structures, property, and lives are at risk of damage and loss from civil disturbances. As a result, developers and investors may be hesitant to invest in the affected areas, leading to a slowdown in development and revitalization efforts. Civil disturbances can also create a sense of insecurity and instability, which may discourage businesses and residents from moving into the area. This can alter land use patterns, with certain regions being abandoned or repurposed for other uses. Overall, civil disturbances can hinder the long-term growth and development of a community, requiring significant time and effort to rebuild and restore trust with investors and developers.

VULNERABILITY SCORE

The county’s diverse population, including various political and social viewpoints, can lead to tensions and potential conflicts. In addition, large public gatherings and events may present opportunities for civil disturbances. Recent social and political movements have created conditions that can lead to civil unrest.

DRAFT

Based on Salt Lake County's moderate social vulnerability, high EAL, and high community resilience to overall hazards, the community's vulnerability to civil disturbance is moderate to high. Although its moderate social vulnerability may help mitigate some impacts, the high EAL and high community resilience to overall hazards suggest that the community may still be significantly vulnerable to civil disturbances.

DRAFT

Hazardous Materials

Figure 182: Image of Hazardous Materials in Storage[239]

Hazard Description

Hazardous materials, also known as HAZMAT, threaten human health, safety, and the environment and are classified as physical or health hazards. Physical hazardous materials can explode, catch fire easily, or react dangerously with water or other substances. They include explosives, flammable gases and liquids, organic peroxides, oxidizers, pyrophoric materials, and unstable/reactive materials. Health hazard materials are those that can cause harm to human health if ingested, inhaled, or absorbed through the skin. They include toxic, highly toxic, and corrosive substances. These materials come in various forms, including gases, liquids, and solids. HAZMAT can be found in many settings, such as workplaces, homes, and transportation systems. Hazardous materials are classified based on the National Fire Protection Association (NFPA) codes and standards.

- HAZMAT Incident—**Fixed Site** is defined as an uncontrolled release of hazardous material originating from a building, structure, or fixed equipment that can pose a risk to life, health, safety, property, or the environment.
- HAZMAT Incident—**Transportation** is defined as the uncontrolled release of a hazardous material during transport that can pose a risk to life, health, safety, property, or the environment.

Magnitude/Extent

Hazardous materials can have a devastating and enduring impact on communities. Exposure to these substances may lead to various health issues, ranging from minor irritations to serious illnesses or even fatalities. In addition, HAZMAT spills can severely damage the environment by contaminating the air, soil,

[239] https://unsplash.com/photos/a-large-group-of-red-barrels-sitting-next-to-each-other-ETgEwZXbooU.

and water. Cleanup can take weeks, months, or even years to complete, depending on the extent of the spill.

Beyond their physical impact, HAZMAT incidents can lead to considerable psychological and economic harm in a community. Evacuations, property loss, and interruptions to everyday life can significantly affect individuals and families. In addition, these incidents can have a ripple effect on the local economy, reducing productivity and revenue for businesses and industries. Information on various HAZMAT incident levels can be found in Table 79.

Table 79: HAZMAT Incident Levels[240]

Incident Level	Type	Description
Incident Level 1	Minor Hazard	The hazardous material poses a low risk and can usually be handled by the local fire department or HAZMAT team without extra assistance.
Incident Level 2	Moderate Hazard	The hazardous material poses a moderate threat to human health and the environment. Additional resources and specialized equipment may be required to manage the situation.
Incident Level 3	Serious Hazard	A hazardous material significantly threatens human health and the environment. These situations often require a large-scale response with multiple agencies and specialized equipment.
Incident Level 4	Severe Hazard	A significant threat to humans and the environment requires a massive response from multiple agencies, specialized equipment, and significant resources.
Incident Level 5	Catastrophic Hazard	The hazardous material poses an extreme threat to human health and the environment.

The seriousness of a hazardous material incident is assessed based on several factors, including the type and number of hazardous materials involved, the location and scale of the release or spill, and the potential effects on human health, the environment, and property. Other influencing factors include weather conditions, population density, and how quickly emergency services can respond. Generally, these incidents can vary in severity from minor spills that can be rapidly contained and cleaned to significant events that might have enduring and devastating impacts on the surrounding area.

Location

Hazardous materials incidents occur more frequently than commonly thought and can occur anywhere worldwide. Certain regions are particularly susceptible due to factors, such as industrial facilities dealing with hazardous substances, natural disasters, and individuals' mistakes. Such incidents can lead to serious damage to property and infrastructure, disturb everyday life, and, tragically, even loss of life.

For example, regions with a high density of industrial facilities that manage hazardous materials are more vulnerable to incidents, including spills, leaks, or explosions. Such events can cause environmental harm,

[240] Lone Star HAZMAT. "What is Meant by the Different HAZMAT Incident Levels?" https://lonestarhazmat.com/what-is-meant-by-the-different-hazmat-incident-levels/.

injuries, fatalities, and disruptions to the local economy and community. Salt Lake County contains several chemical plants, as detailed in Table 80, which put the area at risk of incidents involving hazardous materials and potential contamination. In addition, the county has many pipelines transporting natural gas, natural gas liquids, condensate, crude oil, petroleum, and petrochemical products.

Figure 183: Pipelines That Carry Gas and Hazardous Liquids in Salt Lake County[242]

Historical Events and Probability of Future Occurrences

From January 1, 2018, to October 28, 2024, at the time of writing, Salt Lake County experienced 2,368 HAZMAT incidents. Fortunately, there were no injuries, fatalities, or evacuations. However, eleven incidents were considered serious, as detailed in Table 81.[243]

SUPERFUND SITES

A Superfund site is a location identified by the EPA as contaminated by hazardous waste. These areas seriously threaten human health and the environment, often containing toxic chemicals, heavy metals, and other harmful substances.

The presence of a Superfund site in a community can have serious repercussions. Residents may be exposed to harmful contaminants, which can lead to various health issues, such as cancer, birth defects, respiratory problems, and neurological conditions. Moreover, the pollution can negatively affect local ecosystems, endangering wildlife and disrupting the natural environment.

DRAFT

Superfund site cleanup tends to be complicated, lengthy, and costly. It may include activities, such as digging up contaminated soil, purifying polluted water, and disposing of hazardous waste. Generally, taxpayers pay the expenses; the entire process can span years or even decades.

Table 82: Superfund Sites, Salt Lake County

Site	City	NPL[245] Status	Description
700 South 1600 East PCE Plume	Salt Lake City	Final	The 700 South 1600 East PCE Plume site is near the George E. Wahlen U.S. Department of Veterans Affairs (VA) Medical Center in Salt Lake City, Utah. In the late 1970s and early 1980s, the VA operated a dry-cleaning service that used tetrachloroethylene (PCE), leading to soil and groundwater contamination through improper disposal. PCE was first detected in the groundwater at 32 µg/L in the 1990s, exceeding the drinking water standard of 5.0 µg/L. This prompted EPA investigations in 1999, finding concentrations between 11 and 320 µg/L. By 2010, dissolved PCE was found in residential springs. On September 18, 2012, officials supported listing the site on the National Priorities List (NPL) due to exposure concerns. It was officially added to the Superfund NPL in May 2013, with the VA responsible for cleanup.[246]
Davenport and Flagstaff Smelters	Sandy City	Deleted	The Davenport and Flagstaff smelters site is about 15 miles southeast of Salt Lake City, Utah, at the mouth of Little Cottonwood Canyon. Established around 1870, the smelters processed lead and silver ore from nearby Alta, Utah, leading to soil contamination. Both smelters were decommissioned by 1879, and the area transitioned from agricultural use to residential and commercial development in the 1970s and 1980s. Cleanup efforts are ongoing at the site.[247]
Kennecott North Zone/Tailings	Magna	Proposed	The Kennecott North Zone is an industrial area at the northern edge of the Oquirrh Mountains, near Magna and the Great Salt Lake. Major transport routes, including I-80, pass through the site. Since 1906, the area has processed ores, such as copper, lead, and gold, producing hazardous waste that has contaminated soils, water, and wetlands. Key contaminants include arsenic, cadmium, lead, and selenium. On January 18, 1994, the EPA proposed adding the North Zone to the NPL. A 1995 agreement between Rio Tinto Kennecott Copper (RTKC), the EPA, and Utah Department of Environmental Quality (UDEQ) allowed RTKC to undertake cleanup projects while deferring the NPL listing. The 2002 Record of Decision (ROD) outlined a cleanup strategy targeting surface materials threatening workers and wildlife. It included long-term efforts to treat groundwater and

Site	City	NPL[245] Status	Description
			remediate inaccessible waste. The ROD included detailed summaries of the necessary actions.[248]
Kennecott South Zone/Bingham	Copper-ton	Non-NPL, Superfund Alternative Approach	The Kennecott South Zone, located 25 miles southwest of Salt Lake City in the Oquirrh Mountains, includes the Bingham Mining District, the Bingham Canyon open pit mine, waste rock dumps, and the Copperton Mill. Mining began in the 1860s and continues today, resulting in hazardous waste that contaminates soils, sludge, surface water, and groundwater, impacting nearby wetlands and the Great Salt Lake. Cleanup efforts are ongoing. Although not on the NPL, the site is considered NPL-caliber and is being managed through the Superfund Alternative Approach.[249]
Midvale Slag	Midvale	Deleted NPL	The 446-acre Midvale Slag site in Midvale and Murray City, Utah, hosted five lead and copper smelters from 1871 to 1971. After the facilities were demolished in the 1970s, the area was contaminated with heavy metals, and ongoing cleanup and maintenance efforts continue.[250]
Murray Smelter	Murray City	Proposed NPL	The 142-acre Murray Smelter site in Murray City, Utah, was once the largest lead smelter in the U.S. Owned by ASARCO, it operated two smelters: the Germania Smelter (1872–1902) and the Murray Smelter (1902–1949). Smelting byproducts include slag, arsenic, and cadmium, leading to contamination of soil, sediment, and groundwater with heavy metals. The cleanup is complete, and ongoing maintenance activities are in place.[251]
Petrochem/ Ekotek	Salt Lake City	Deleted NPL	The 7-acre Petrochem Recycling Corp./Ekotek site in northern Salt Lake City, Utah, has a history of oil refining, hazardous waste management, and used oil recycling. Improper practices contaminated the groundwater and soil with hazardous substances. After cleanup, the EPA removed the site from NPL in 2003, but groundwater monitoring is ongoing.[252]
Portland Cement	Salt Lake City	Final NPL	The 71-acre Portland Cement site in Salt Lake City, Utah, was used from 1963 to 1983 to deposit approximately 500,000 cubic yards of cement kiln dust, which contains heavy metals, such as arsenic, lead, and chromium. The site also saw the disposal of chromium-bearing bricks, leading to soil, air, and groundwater contamination. Cleanup has occurred, and ongoing maintenance activities are in place.[253]

Site	City	NPL[245] Status	Description
Rose Park Sludge Pit	Salt Lake City	Deleted NPL	The Rose Park Sludge Pit is in Rosewood Park, Salt Lake City, Utah. From the 1930s to 1957, the Utah Oil and Refining Company disposed of acidic waste in an unlined pit, covering around 5 acres and reaching depths of 20 feet. This waste contaminated the soil and groundwater. After cleanup, the EPA removed the site from the NPL in 2003, and maintenance continues.[254]
Sharon Steel	Midvale	Deleted NPL	The 470-acre Sharon Steel Corp. (Midvale Tailings) site in Midvale, Utah, operated as a smelting and ore milling facility from 1906 to 1971, producing lead, copper, and zinc. In 1982, UDEQ intervened after discovering residents were using contaminated tailings in gardens and sandboxes. Testing revealed high levels of lead and arsenic in the groundwater. Contamination impacted air, soil, and water. After cleanup efforts, the EPA removed the site from the NPL in 2004.[255]
Utah Power & Light	Salt Lake City	Final NPL	The 2.2-acre Utah Power & Light/American Barrel Co. site in Salt Lake City operated from 1870 to 1987 for barrel storage, wood treatment, and coal gasification. These activities produced hazardous byproducts, contaminating soil and groundwater. Cleanup has been completed, and maintenance activities continue.[256]
Wasatch Chemical	Salt Lake City	Final NPL	The 18-acre Wasatch Chemical Co. site in Salt Lake City, Utah, was used from 1957 to 1971 for warehousing and producing industrial chemicals. From the 1970s to 1992, it blended and packaged pesticides, herbicides, and fertilizers, discharging wastewater on-site and contaminating the soil and groundwater. The cleanup is complete, but operation and maintenance activities are ongoing.[257]

Climate Change Considerations

Climate change may increase the likelihood and intensity of hazardous waste incidents. Extreme weather events, such as tornadoes, floods, and wildfires, can damage infrastructure, disrupt waste management systems, and lead to hazardous materials leaking into the environment. In addition, rising temperatures can intensify chemical reactions that produce hazardous waste and raise the volatility of certain substances. Furthermore, climate change can modify ecosystems, create new pathways for hazardous waste to enter the food chain, and impact human and animal health. Therefore, it is essential to

[254] U.S. Environmental Protection Agency. "Rose Park Sludge Pit Salt Lake City, UT." https://cumulis.epa.gov/supercpad/SiteProfiles/index.cfm?fuseaction=second.Cleanup&id=0800663#bkground.
[255] U.S. Environmental Protection Agency. "Sharon Steel Corp. (Midvale Tailings) Midvale, UT." https://cumulis.epa.gov/supercpad/SiteProfiles/index.cfm?fuseaction=second.Cleanup&id=0800694#bkground.
[256] U.S. Environmental Protection Agency. "Utah Power & Light/American Barrel Co. Salt Lake City, UT." https://cumulis.epa.gov/supercpad/cursites/csitinfo.cfm?id=0800680.
[257] U.S. Environmental Protection Agency. "Wasatch Chemical Co. (Lot 6) Salt Lake City, UT." https://cumulis.epa.gov/supercpad/SiteProfiles/index.cfm?fuseaction=second.Cleanup&id=0800596#bkground.

incorporate climate change considerations into a comprehensive strategy to prevent and address hazardous waste incidents, safeguarding public health and the environment.

Secondary Hazards

Secondary hazards from hazardous materials incidents can significantly amplify the risks associated with the initial event. One major concern is the potential for fires and explosions, especially if flammable materials are involved, which can extend the danger beyond the original site. In addition, chemical reactions can produce toxic gases, contaminate the air, and pose serious health risks to first responders and nearby residents. Environmental contamination is another critical issue, as hazardous substances can seep into soil and waterways, leading to long-term ecological damage and affecting drinking water supplies. The health of emergency personnel can also be compromised during their response efforts. Evacuations may be necessary, causing panic and posing logistical challenges. Increased traffic from fleeing citizens and arriving emergency responders can create further hazards and accidents. In addition, structural damage from the incident can cause dangerous collapses. Public panic fueled by misinformation can also complicate response efforts.

Vulnerability Assessment

Salt Lake County is significantly vulnerable to hazardous materials in various locations, including industrial sites, transportation routes, and waste management facilities. The proximity of residential areas to these sites increases the risk of exposure to toxic substances in the event of accidental releases or spills. The effects of hazardous materials incidents include physical harm from inhalation or coming into contact with released substances. If substances ignite or explode, injury or property damage may result. The county's geographical features along the Wasatch Range, coupled with emissions from the US Magnesium refinery, cause air quality concerns, including ground-level ozone particle pollution.[258] According to a 2023 report by the American Lung Association, the Salt Lake City region experienced more unhealthy air pollution in three categories: ozone, short-term particle pollution, and annual particle pollution. This report listed Salt Lake City among the nation's most air-polluted cities, ranking it 10th for ozone and 19th for short-term particle pollution.[259] Salt Lake County's geography, coupled with emissions from refineries, results in an increased potential impact of hazardous materials on public health and the environment.

ESTIMATED IMPACTS AND POTENTIAL LOSSES

In a significant hazardous materials incident in Salt Lake County, the estimated losses could be substantial, affecting the local economy and community health. The immediate financial impact may include emergency response costs, damage to infrastructure, and the potential for long-term environmental rehabilitation. In addition, businesses nearby might face temporary closures, leading to job losses and decreased revenue. The public health ramifications could be severe, with possible evacuation

[258] NOAA Research. "One Facility Makes a Big Contribution to Salt Lake's Winter Brown Cloud." January 25, 2023. https://research.noaa.gov/one-facility-makes-a-big-contribution-to-salt-lakes-winter-brown-cloud/.
[259] NOAA Chemical Sciences Laboratory. "Finding Helps Explain Salt Lake City's Persistent Air Quality Problems." January 25, 2023. https://csl.noaa.gov/news/2023/368_0125.html.

orders, health-related emergencies, and long-term effects on air and water quality. This incident could also strain local resources and emergency services, highlighting the need for robust preparedness and response protocols to mitigate such risks.

VULNERABLE POPULATIONS

Populations vulnerable to hazardous materials incidents often include those living near industrial facilities, transportation routes for hazardous goods, and areas prone to natural disasters. Communities with lower socioeconomic status may face heightened risks due to inadequate emergency preparedness and response resources. In addition, children, senior citizens, and individuals with preexisting health conditions are particularly susceptible to the adverse effects of hazardous materials exposure, as their physical resilience may be compromised. Furthermore, marginalized groups might experience barriers in accessing timely information and medical care during incidents, amplifying their vulnerability and potential health impacts.

COMMUNITY LIFELINES

Several of community lifelines can be significantly impacted in a hazardous materials incident, affecting the overall response and recovery efforts. The Safety and Security lifeline may be strained as authorities work to protect the public from exposure and containment of hazardous materials. Meanwhile, the Health and Medical lifeline could become overwhelmed as hospitals and medical facilities are forced to handle potential casualties requiring immediate care due to exposure or contamination. The Food, Hydration, and Energy lifelines also may be disrupted if the incident involves contamination of local water supplies or facilities producing critical resources. Lastly, the Transportation lifeline may face challenges as roadways are restricted or closed for cleanup and safety measures, hampering emergency responders and the flow of supplies needed for recovery efforts. The interconnected nature of these lifelines highlights the need for a coordinated response to minimize the impact of such incidents on the community.

CHANGES IN DEVELOPMENT

Salt Lake County's development and population growth have significant impacts on the release of hazardous materials, since the increase in infrastructure can raise the potential for accidents to occur. Urbanization can also lead to increased population near areas where hazardous materials are present, increasing the likelihood of accidental exposure. In northwest Salt Lake County, there is a combination of hazardous waste sites and population growth that could expose more individuals to hazardous material spills or contamination.

Future development in Salt Lake County may face significant challenges due to the risks associated with hazardous materials incidents. The presence of industrial facilities and transportation routes for hazardous substances poses a potential threat to public safety and the environment. Such incidents can lead to long-term consequences, including contamination of land and water resources, which may deter new investments and slow down redevelopment efforts. Zoning regulations may become more stringent because of past incidents, leading to restrictions on where certain businesses can operate. In addition, community concerns about safety could push policymakers to prioritize environmental assessments and disaster preparedness, ultimately reshaping development plans.

DRAFT

Future land development in Salt Lake County could be significantly impacted by incidents involving hazardous materials. Such events can contaminate soil and water resources, limiting land usability for residential, commercial, or recreational purposes. Areas that have experienced spills or accidents may be designated as hazardous zones, leading to increased regulatory scrutiny and potentially costly remediation processes. Developers may face restrictions on building permits, and the perception of risk can deter investment and development in affected regions. In addition, prioritizing environmental safety measures may lead to more stringent planning and development guidelines, potentially reshaping community layouts and infrastructure design. As awareness of environmental issues grows, future projects may increasingly require comprehensive risk assessments and sustainable practices to mitigate the effects of any hazardous incidents.

VULNERABILITY SCORE

The vulnerability score is likely moderate to high for a community experiencing frequent minor HAZMAT incidents alongside several petrochemical plants and hazardous pipelines. This assessment considers several key factors. First, the high EALs suggest significant financial impacts that can strain community resources and hinder long-term resilience strategies. Although the community exhibits moderate social vulnerability, indicating some degree of cohesion and support, existing disparities can foster tensions. However, the community's high resilience to overall hazards provides a crucial buffer, suggesting that it has robust infrastructure and preparedness measures.[260] Ultimately, while risks remain elevated due to industrial presence and historical incidents, high resilience may mitigate these vulnerabilities, leading to a complex but manageable risk profile.

DRAFT

[260] FEMA. "National Risk Index." https://hazards.fema.gov/nri/map.

Terrorism

Hazard Description

FEMA defines terrorism as "the use of force or violence against persons or property in violation of the criminal laws of the United States for purposes of intimidation, coercion, or ransom."[261] This definition encompasses various violent acts, including those committed by individuals, groups, or governments, intended to instill fear and achieve political or ideological goals. Terrorists use threats to create fear, spread propaganda, and gain attention. Terrorism includes international terrorism, domestic terrorism, transnational terrorism, and cyberterrorism. For this plan, this hazard definition includes active shooter situations, which may be either randomly or intentionally directed and could impact significant numbers of people. Figure 185 shows a stack of newspapers after a terrorist event.[262]

Figure 184: Newspapers After a Car Bombing

- **International Terrorism:** Violent, criminal acts committed by individuals and/or groups who are inspired by or associated with designated foreign terrorist organizations or nations (state-sponsored). Activities transcend national boundaries or are sponsored by international groups.
- **Domestic Terrorism:** Committed by homegrown groups who have no ties or connections outside the United States. These groups are generally motivated by political, racial, ethnic, economic, health, and other grievances.
- **Transnational Terrorism:** Actions in which victims, perpetrators, and sites of violence represent different states and nationalities, such as the current war between Israel and Palestine.[263]
- **Cyberterrorism:** Any premeditated, politically motivated attack against information systems, programs, and data that threatens violence or results in violence.[264]

[261] FEMA. "Terrorism," in Are You Ready? – A Guide to Citizen Preparedness. Homeland Security Advisory System. Last updated April 25, 2023. https://www.fema.gov/pdf/areyouready/terrorism.pdf.

[263] Crenshaw, Martha. "Rethinking Transnational Terrorism." United States Institute of Peace. February 2020. https://www.usip.org/sites/default/files/2020-02/pw_158-rethinking_transnational_terrorism_an_integrated_approach.pdf.
[264] Awati, Robert, et al. "Cyberterrorism." TechTarget Network. Last updated February 2024. https://www.techtarget.com/searchsecurity/definition/cyberterrorism#:~:text=Cyberterrorism%20is%20usually%20defined%20as,violence%20or%20results%20in%20violence.

- **Active Shooter:** An emergency scenario in which an individual or individuals are actively engaged in killing or attempting to kill people in a populated area.[265] This type of situation is extremely dangerous and requires immediate action to ensure the safety and security of everyone involved.

Magnitude/Extent

Terrorist events typically, but not always, aim to impact large numbers of people. The extent of damage or casualties can vary widely, depending on terrorist intent, the setting, victim response, and law enforcement response time. Even those who are not directly impacted by the event may still be psychologically affected through fear, concern for safety, and reduced activity. Therefore, a terrorist or active shooter event in Salt Lake County may directly or indirectly have an impact on the community's citizens.

Location

Terrorists employ various methods to enter a country, including air travel, border crossings, waterways, and illicit means like human trafficking or smuggling. Terrorism can occur anywhere, but certain types of terrorism are more prevalent in specific locations.

International terrorism typically occurs in locations with high-value targets, such as military or civilian government facilities, international airports, major cities, and prominent landmarks. In addition, terrorists may target large public gatherings, water and food supplies, utilities, and corporate centers. International terrorists can also spread fear by sending explosives or chemical or biological agents through the mail.

Historically, domestic terrorism usually occurs in cities with high levels of poverty and racial tension, which are more prone to civil unrest.

Transnational terrorism is a global threat that can occur in various parts of the world, such as the Middle East, South Asia, Africa, Europe, and North America. Terrorist groups often cross borders and employ various tactics like bombings, kidnappings, assassinations, and cyberattacks to achieve their goals. Their operations pose a significant threat to multiple countries and their citizens, necessitating international cooperation and intelligence sharing to counter these threats effectively.

It is crucial to recognize that any entity or individual using technology is vulnerable to cybersecurity threats. However, certain areas are more susceptible than others. For instance, cybercriminals often target organizations that handle sensitive data, such as financial records, medical information, or personally identifiable information (PII). The finance, healthcare, and government sectors are frequent targets due to the sensitive nature of the data they manage. Cyberattacks can also impact small businesses and individuals, emphasizing the importance of safeguarding devices and information.

[265] Emergency Services and Continuity Planning. "Active Shooter Response." Sonoma State University. https://emergency.sonoma.edu/emergency-procedures/active-shooter-response.

Active shooter situations can occur in various locations, such as schools, workplaces, shopping malls, concert venues, and places of worship. These locations are often targeted because they are usually crowded and might have limited security measures in place.

Historical Events and Probability of Future Occurrences

The most recognized forms of terrorism include:

1. Religious terrorism
2. Political terrorism
3. Ideological terrorism
4. State-sponsored terrorism
5. Criminal terrorism

Acts of terrorism include threats of terrorism, assassinations, kidnappings, hijackings, bomb scares and bombings, cyberattacks, and the use of chemical, biological, nuclear, and radiological weapons.[266]

The following tables provide information on terrorism and active shooter incidents in Salt Lake County.[267]

Table 83: Salt Lake County Terrorism Incidents

Date	Location	Perpetrator Group	Deaths	Injuries	Target Type
11/03/2016	Draper	White supremacists/ nationalists	0	1	Private citizens and property
07/01/2010	Sandy City	Animal Liberation Front (ALF)	0	0	Business

Table 84: Active Shooter Incidents in Salt Lake County[268]

Date	Location	Event Description
02/12/2007[269]	Salt Lake City	One notable incident occurred at the Trolley Square Mall in Salt Lake City in 2007, where a gunman opened fire, resulting in five casualties and four injured. No motive was determined.
04/15/1999[270]	Salt Lake City	The LDS Family History Library shooting took place on April 15, 1999, in Salt Lake City. A man entered the library and randomly shot and killed two people and wounded at least five before being apprehended by police. The incident was a tragic and shocking event for the community and highlighted the importance of security and safety measures in public spaces.
01/14/1999[271]	Salt Lake City	The Triad Center shooting took place in Salt Lake City on January 14, 1999. A gunman opened fire at the Triad Center office complex, resulting in multiple casualties. The incident shocked the local community and prompted discussions about improving security measures to prevent such tragic events.

Probability: The increase in political disturbances, both foreign and domestic, is a cause for concern in the United States as it could increase the chances of terrorism and active shooter incidents in the future. Political tensions can often lead to violent acts and extremist ideology, which could lead to terrorism.[272] Moreover, the global rise of populist movements has fueled anti-immigrant and anti-minority sentiment, which can increase the risk of domestic terrorism.

Foreign interference in domestic politics can also pose a serious threat. It is not uncommon for foreign powers to fund extremist groups or carry out attacks in other countries to destabilize their governments. Such actions can cause significant harm and increase the likelihood of retaliatory attacks.

Salt Lake County has several community assets that could be at risk of terrorism. These include major events and venues, such as the Salt Palace Convention Center and the University of Utah; expo centers; amphitheaters and other concert venues; chemical plants and refineries, Salt Lake International Airport, extensive waterways, and power plants. Currently, the chance of a terrorist attack is low. However, due to population density, economic activity, and political climate, areas with larger populations or higher levels of economic activity may be considered more attractive targets for terrorist groups and active shooters.

Climate Change Considerations

Although terrorism itself does not cause climate change, with the possible exception of nuclear explosions, its indirect effects can contribute to it. Active shooter events have no impact on climate change. However, there is the potential for climate change to be a driver of future terrorism. Climate change can affect access to basic resources, such as water, food, and shelter and lead to economic hardships.[273] Policies, regulations, or other limitations causing reduced access to these resources may contribute to political contention.[274] Control of or access to these resources could lead to violent conflict or acts of terrorism. The indirect effects of terrorism are outlined in the Secondary Hazards section.

Secondary Hazards

Nuclear events, such as nuclear explosions or nuclear accidents, can significantly impact the climate. The most immediate and direct effect is the release of large amounts of energy, which can cause localized heating and cooling effects. However, the more significant long-term effects are due to the release of radioactive particles into the atmosphere. These particles can travel long distances and significantly impact the Earth's climate, particularly in the area downwind of the event. Radioactive particles can absorb and scatter sunlight, which can lead to a cooling effect on the Earth's surface. The particles can also absorb and emit heat, warming the atmosphere. The exact climate effects of a nuclear event depend on various factors, including the size and location of the event, the type of nuclear material involved, and the weather conditions at the time of the event.

Biological toxins, or biotoxins, are toxic substances produced by living organisms, such as bacteria, fungi, and plants. Although these toxins do not directly contribute to climate change, their release into the environment can indirectly impact the climate and the environment. For example, releasing biotoxins into water sources can lead to the growth of harmful algal blooms, which can deplete the oxygen in the water and harm aquatic life. Similarly, the release of biotoxins into soil can have negative impacts on soil quality and crop production. The use of biotoxins as weapons can also have indirect effects on the climate by contributing to political instability and conflict, which can lead to displacement, migration, and changes in land use. These changes can, in turn, impact the Earth's climate and the environment. In addition, the spread of infectious diseases caused by biotoxins can lead to changes in human behavior and land use, which can indirectly impact the climate. Although biotoxins do not directly affect the Earth's climate, their release and use can indirectly impact the environment and climate.

Chemical releases of sarin and ricin are highly toxic chemical compounds that can devastate human health but do not directly affect the Earth's climate. These chemicals are not greenhouse gases and do not deplete the ozone layer. However, their release into the environment can indirectly impact the climate and the environment. For example, if released into water sources, they can contaminate the water and harm aquatic life. Similarly, if released into the soil, they can contaminate crops and other plants. Using

[273] Spadaro, Paola Andrea. 2020. "Climate Change, Environmental Terrorism, Eco-Terrorism and Emerging Threats." *Journal of Strategic Security*. 13(4). https://www.jstor.org/stable/26965518?seq=3.
[274] Silke, Andrew and John Morrison. 2022. "Gathering Storm: An Introduction to the Special Issue on Climate Change and Terrorism." *Terrorism and Political Violence*. 34(5), 883–893. https://www.tandfonline.com/doi/full/10.1080/09546553.2022.2069444.

these chemicals can also indirectly impact the climate by contributing to political instability and conflict, leading to displacement, migration, and changes in land use. These changes can, in turn, impact the Earth's climate and the environment. However, it is important to note that the primary impact of sarin and ricin is on human health and safety rather than the climate or the environment.

Radiological dispersion, which refers to the release of radioactive material into the environment, can indirectly impact the Earth's climate, causing shifts in atmospheric conditions that lead to changes in weather patterns and temperatures. In addition, these particles can absorb and scatter sunlight, which can lead to a cooling effect on the Earth's surface. However, it is important to note that radiological dispersion primarily affects human health and safety rather than the climate or environment. The release of radioactive material can have significant short-term and long-term impacts on human health, the environment, and ecosystems.

In the immediate aftermath of 9/11, there were some short-term effects on the climate. The attacks resulted in the collapse of the World Trade Center towers, which released large amounts of dust and debris into the air. This dust and debris contained various pollutants, including asbestos, lead, and other toxic materials, which can negatively impact air quality and public health. In addition, the burning of jet fuel and other materials at the attack site released large amounts of carbon dioxide and other greenhouse gases into the atmosphere, which can contribute to long-term climate change. However, these climate effects were relatively minor compared with the overall impacts of the attacks on human life, infrastructure, and the economy.

Vulnerability Assessment

It is crucial to understand that a community's vulnerability to terrorist attacks depends on several factors, including social and economic inequality, political instability, and religious or ideological tensions. The availability of weapons and resources also affects terrorists' ability to carry out attacks.

DRAFT

Table 85: Terrorism Vulnerability[275]

Hazard	Application Mode	Hazard Duration	Extent of Effects: Static/Dynamic	Mitigating and Exacerbating Conditions
Conventional Bomb	Detonation of explosive device on or near the target; delivery is by person, vehicle, or projectile	Instantaneous; additional secondary devices may be employed, extending the duration of the hazard until the attack site is deemed clear	The extent of damage is determined by the type and quantity of explosive material. The effects are typically static, except for cascading consequences, incremental structural failures, etc.	Energy declines logarithmically as a function of distance from the seat of the blast. Terrain, forestation, structures, etc., can provide protection by absorbing and/or deflecting energy and debris. Exacerbating conditions include ease of access to the target, lack of barriers/shielding, poor construction, and ease of concealment of the device.
Chemical Agent	Liquid/aerosol contaminants can be dispersed using sprayers or other aerosol generators. Liquids can also vaporize from puddles/containers or munitions.	Chemical agents may pose viable threats for hours or weeks, depending on the agent and conditions.	Contamination can spread from the initial target area through people, vehicles, water, and wind. If not remediated, chemicals may be corrosive or cause long-term damage.	Air temperatures can affect the evaporation of aerosols. Ground temperatures affect the evaporation of liquids. Humidity can enlarge aerosol particles, reducing inhalation hazards. Precipitation can dilute and disperse agents, but dispersed vapors can also enlarge the target area. The micro-meteorological effects of buildings and terrain can alter the travel and duration of agents. Shielding in the form of sheltering in place can protect people and property from harmful effects.
Biological Agent	Liquid or solid contaminants can be dispersed using sprayers/aerosol generators or by point-of-line sources, such as munitions, covert deposits, and moving sprayers.	Biological agents may pose viable threats for hours to years depending on the agent and conditions.	Depending on the agent used and the effectiveness of deployment, contamination can be spread by wind and water. Infection can also be transmitted by human or animal vectors.	The altitude at which the release agent is used, along with the effectiveness of deployment, can affect aboveground contamination and dispersion. Sunlight destroys many bacteria and viruses, while light to moderate winds can break up aerosol clouds. The micro-meteorological effects of buildings and terrain can influence aerosolization and how agents travel. Enclosed structures extend the lifespan of biological agents due to the lack of ultraviolet radiation.
Radiological Agent	Radioactive contaminants can	Contaminants may remain	Initial effects will be localized to the site of the	Radiation exposure depends on the duration of exposure, distance from the source, the radiation level,

[275] Salt Lake County Hazard Mitigation Plan. 2021.

	be dispersed using sprayers/aerosol generators or by point-of-line sources, such as munitions, covert deposits, and moving sprayers.	hazardous for seconds to years depending on the isotope used.	attack. Depending on meteorological conditions, subsequent behavior or radioactive contaminants may be dynamic.	and the degree of shielding between the source and the target.
Nuclear Bomb	Detonation of nuclear device underground, on the surface, in the air, or at high altitude	Light/heat flash and blast/shock wave lasts for seconds; nuclear radiation and fallout hazards can persist for years. The electromagnetic pulse from a high-altitude detonation lasts for seconds and affects only unprotected electronic systems.	Initial light, heat, and blast effects of a subsurface, ground, or air burst are static and are determined by the device's characteristics and employment; the fallout of radioactive contaminants may be dynamic depending on meteorological conditions.	The harmful effects of radiation can be reduced by minimizing the duration of exposure. Light, heat, and blast energy decrease logarithmically as a function of distance from the seat of the blast. Terrain, forestation, structures, etc. can provide shielding by absorbing and/or deflecting radiation and radioactive contaminants.

DRAFT

ESTIMATED IMPACTS AND POTENTIAL LOSSES

During a terrorist attack, a community's infrastructure and residents could face various impacts. Infrastructure, such as transportation systems, communications networks, and utilities may be damaged, leading to disruptions in daily life. Access to essential and critical emergency services may be impeded. People may experience physical harm, emotional trauma, and loss of life or property. It could also incite widespread fear, anxiety, and a sense of insecurity among community members. The attack could also lead to economic repercussions, affecting businesses and disrupting the overall productivity of the community. Overall, a terrorist attack event can have far-reaching and long-lasting impacts on a community, affecting the physical and emotional well-being of residents and the functionality of the infrastructure.

The impacts of an active shooter event on a community can be profound and long-lasting. The immediate effects may include loss of life, physical injuries, and emotional trauma for those directly involved. In addition, the community may experience fear, anxiety, and a sense of vulnerability. Individuals and the community can experience long-term psychological effects and economic impacts due to decreased property values and potential loss of business activity. Rebuilding a sense of safety and security can take time and require significant resources, including mental health support, community outreach, and efforts to prevent future incidents.

VULNERABLE POPULATIONS

Specific populations in Salt Lake County are more vulnerable to terrorist attacks, including active shooter situations. These populations include children and students in schools and educational institutions; employees and customers in public places, such as shopping malls, restaurants, and entertainment venues; residents in densely populated urban areas; individuals in healthcare facilities, such as hospitals and clinics; participants in large public events and gatherings; individuals in religious institutions, such as churches, mosques, and synagogues; the homeless population; and individuals in temporary shelters. However, anyone can become a victim of terrorism or an active shooter, regardless of race, religion, ethnicity, or nationality.

COMMUNITY LIFELINES

During a terrorist event, all lifelines—safety and security, food, hydration and shelter, health and medical, energy (power and fuel), communications, transportation, water systems, and hazardous materials—are all at risk. Explosives, radiological devices, and nuclear bombs can cause substantial damage to structures and infrastructures, blocking evacuation routes and complicating access to essential and critical emergency services, law enforcement, medical aid, and essential items like food and water. Biological and chemical assaults can also destroy crops, poison livestock, and contaminate water supplies and soil, making food production challenging for years. Explosives can cause power outages, disrupting transportation, communications, and fuel supplies. Therefore, protecting citizens and critical assets from these worst-case scenarios in the United States is crucial.

DRAFT

CHANGES IN DEVELOPMENT

Terrorism and active shooters can profoundly impact community development. These acts of violence can create fear, distrust, and instability, hindering economic growth, discouraging investment, and disrupting social cohesion. Unfortunately, as areas in Salt Lake County grow, they could be increasingly attractive targets for those looking to harm people and property. Growing communities in the county, particularly those growing quickly, like Magna and Herriman, should be aware of this risk. The aftermath of such events often leads to increased security measures, which can limit public access to essential services and public spaces. In addition, the psychological trauma experienced by individuals and communities can impede progress and development.

Table 86 provides information on population, household, and employment projections from 2025 to 2065 in Salt Lake County, all of which could be affected by terrorism or active shooter incidents.

Table 86: Future Development Projections for Salt Lake County [276]

2025	2035	2045	2055	2065	Absolute Change 2025–2065	Percent Increase Change 2025–2065
Population Projections						
1,249,961	1,361,099	1,470,574	1,594,804	1,693,513	443,552	35%
Household Projections						
454,929	521,352	579,472	635,143	689,490	234,561	52%
Employment Projections						
1,053,362	1,182,092	1,293,225	1,385,240	1,454,567	401,205	38%

Terrorism and active shooter events can significantly impact population growth, household growth, and employment growth in a community. These events can create an atmosphere of fear and uncertainty, potentially hindering population growth as individuals may be reluctant to move to or remain in the affected area. Household growth also may be impacted as families choose to relocate to safer areas, leading to a decrease in new households in the community.

Regarding employment growth, terrorism and active shooter incidents can lead to declining business investment and economic activity in the affected area. This can lead to job losses and fewer employment opportunities, impacting overall employment growth in the community. In addition, businesses may be hesitant to establish or expand operations in an area that has experienced such events, further impacting employment growth.

Terrorism can significantly impact future land use and development trends in a community. In the aftermath of a terrorist attack, there may be increased emphasis on security measures and considerations in future land use planning and development. This could lead to stricter building codes, stronger security infrastructure requirements, and limitations on certain types of development in high-risk

[276] Salt Lake County Hazard Mitigation Plan. 2021.

areas. In addition, zoning regulations may be changed to enhance security and protect critical infrastructure. As a result, future growth may be influenced by the need to mitigate security risks, which could impact the layout and design of communities.

VULNERABILITY SCORE

Given Salt Lake County's moderate social vulnerability, high EAL, and high community resilience to overall hazards,[277] its vulnerability to a terrorist attack or active shooter event remains significant. Although its high community resilience can be beneficial in the aftermath of an attack, its high EAL indicates that the impact of an attack could be substantial. In addition, its moderate social vulnerability suggests the existence of underlying factors that could exacerbate the impact of a terrorist attack. Therefore, despite the resilience of the county, addressing its underlying vulnerabilities and their potential impact is vital to enhancing overall preparedness and response capabilities.

DRAFT

Capability Assessment

The capability assessment allows each jurisdiction to evaluate its current programs, funding, staffing, and other resources that can support the accomplishment of the mitigation strategy. A thorough understanding of existing capabilities helps decision makers identify feasible mitigation actions. This assessment also provides an opportunity to identify gaps in capabilities and consider ways to expand and improve policies and programs.

The assessment evaluates four types of capabilities:

1. **Planning and Regulatory:** The codes, ordinances, policies, laws, plans, and programs that guide growth and development.
2. **Administrative and Technical:** The staff, skills, and tools that implement resources and mitigate actions. This may include the private sector, community-based organizations, and other partner agencies.
3. **Financial:** The funding resources available for mitigation.
4. **Education and Outreach:** Programs and processes used to communicate risks and encourage risk reduction.

All participating jurisdictions conducted an assessment of their capabilities. Some of the findings are presented in through , with additional details available in the jurisdictional annexes.

Planning and Regulatory

Jurisdictions have the authority to create policies, programs, and regulations that protect and serve their residents. Local policies are typically outlined in community plans, enacted through local ordinances, and enforced by governmental bodies. Many communities have developed plans specifically aimed at enhancing disaster resistance. A major goal of these plans is to coordinate existing activities so that individual objectives are integrated into a comprehensive course of action.

Table 87: Assessment of the Planning and Regulatory Capabilities of Salt Lake County

Plan	Does it address hazards? (Y/N)	How can it be used to implement mitigation actions?	When was it last updated? When will it next be updated?
General Plan	Y	Incorporate goals identified in this plan into the county's Hazard Mitigation Plan (HMP) update.	May 10, 2022, reviewed annually.
Capital Improvement Plan (CIP)	Y	Incorporate goals identified in this plan into the county's HMP update.	Salt Lake County (SLCo) Flood Control CIP is updated annually.

DRAFT

Plan	Does it address hazards? (Y/N)	How can it be used to implement mitigation actions?	When was it last updated? When will it next be updated?
Climate Change Adaptation Plan	N/A	N/A	N/A
Community Wildfire Protection Plan	Y	Incorporate goals identified in this plan into the county's HMP update, specifically with the wildland–urban interface (WUI). It can also shed light on WUI building codes and/or development, since there are significantly more people living and/or building in these areas than in 2019.	December 1, 2019. Update planned for 2025.
Economic Development Plan	N/A	N/A	N/A
Land Use Plan	Y	Incorporate land use planning ideas into potential mitigation actions.	June 2020 and July 2017 (Wasatch Canyons Plan and Resource Management Plan). Reviewed annually.
Local Emergency Operations Plan	Y	Incorporate actions from the county level into mitigation actions in the county's HMP update.	2022. Reviewed annually.
Stormwater Management Plan	Y	Primarily incorporates information on hazardous waste, which can be used to develop mitigation actions for the plan update. Municipal Services District (MSD) is responsible for Unincorporated Salt Lake County stormwater.	May 2020. Reviewed annually.
Transportation Plan	Y	Can incorporate historical context to aid in new mitigation actions. MSD is responsible for Unincorporated Salt Lake County transportation.	May 2020 and May 2022. Reviewed annually.
Substantial Damage Plan	Y	It can include EM/activation information to improve coordination between agencies and jurisdictions.	2022. Reviewed annually.
Other? (Describe)	Y, Regional Hydrology and Hydraulics Study	Unknown	March 2020 for the Southwest and Northwest quadrants of SLCo. In progress for Eastside SLCo in 2024.

Jurisdictions manage land use by adopting and enforcing zoning laws, subdivision regulations, land development ordinances, building codes, building permit requirements, and stormwater management ordinances. When well-prepared and effectively administered, these regulations can help mitigate hazards.

DRAFT

Table 88: Assessment of the Regulations and Ordinances of Salt Lake County

Regulations and Ordinances	Does it effectively reduce hazard impacts?	Is it adequately administered and enforced?	When was it last updated? When will it next be updated?
Building Code	Y. Salt Lake County has adopted the International Building Code (IBC 2021) and the International Residential Code (IRC 2021), along with any amendments, as adopted by the state.	Y	2025
Flood Insurance Rate Maps	Y	No	November 19, 2021
Floodplain Ordinance	Y	No	August 3, 2021
Subdivision Ordinance	N/A	N/A	N/A
Zoning Ordinance	N/A	N/A	N/A
Natural Hazard-Specific Ordinance (Stormwater, Steep Slope, Wildfire)	Y	Unknown	August 3, 2021
Acquisition of Land for Open Space and Public Recreation Use	N/A	N/A	N/A
Prohibition of Building in At-Risk Areas	Y	Y	
Other? (Describe)	None		

Administrative and Technical Capabilities

Although legal, regulatory, and fiscal capabilities provide the foundation for effectively developing a mitigation strategy, successful implementation depends on the presence of appropriate personnel. Administrative and technical capabilities emphasize the availability of human resources responsible for executing all aspects of hazard mitigation. These resources include technical experts, such as engineers and scientists and personnel with specialized skills in areas like grant writing and project management.

Table 89: Assessment of the Administrative Capabilities of Salt Lake County

Administrative Capability	In Place? (Y/N)	Is staffing adequate?	Is staff trained on hazards and mitigation?	Is coordination between agencies and staff effective?
Chief Building Official	Y	No, there is a shortage of building inspectors statewide. MSD manages this.	Yes, but additional training is needed.	Yes
Civil Engineer	Y	Yes, SLCo Flood Control operates countywide.	Yes	Yes

DRAFT

Administrative Capability	In Place? (Y/N)	Is staffing adequate?	Is staff trained on hazards and mitigation?	Is coordination between agencies and staff effective?
Community Planner	Y	See MSD staffing levels.	Yes, but more training is needed.	Yes
Emergency Manager	Y	No. The statewide mandate for local jurisdictions to have emergency managers has resulted in many local jurisdictions having an emergency manager who wears multiple hats or only works part-time.	Yes, but more training is needed.	Yes, but improvements could always be made.
Floodplain Administrator	Y	SLCo Flood Control operates countywide.	Yes	Yes
Geographic Information System (GIS) Coordinator	Y	Yes, though additional staff with expertise in emergency management would be beneficial.	Yes, but there are gaps at the county level. Currently, we have one GIS Specialist for county EM. Other county GIS staff are not as familiar with EM and corresponding workflows.	Yes, but there is room for improvement.
Planning Commission	Y	No, there are vacancies on the planning commission boards.	They may be familiar with local risks, but because these are volunteer boards, more formal training would help.	No, it could be improved for better situational awareness.
Fire Safe Council	Y	Yes	Valley fire chiefs are aware of risks but may focus more on fire-related hazards. More extensive training would be beneficial.	Yes, though better communication across agencies and jurisdictions is needed.
CERT (Community Emergency Response Team)	Y	Varies by jurisdiction in terms of engagement. A revamp is underway to improve coordination and set more precise expectations.	Yes, though more training would be helpful.	Yes, but participation varies by jurisdiction.
Active VOAD (Voluntary Agencies Active in Disasters)	Y	Staffing shelters can sometimes be challenging due to the voluntary nature.	Yes, though additional training would be helpful.	Yes, but it is always possible to improve relationships.
Other? (Please describe)	None			

DRAFT

Table 90: Assessment of the Technical Capabilities of Salt Lake County

Technical Capability	In Place? (Y/N)	How has it been used to assess/mitigate risk in the past? (Answer or N/A)	How can it be used to assess/mitigate risk in the future?
Mitigation Grant Writing	Y	We have applied for mitigation funds with assistance from the Salt Lake County Division of Emergency Management and the county's grant writer.	We can use the county grant writer and geographic information system (GIS) staff to help with future grant applications. GIS staff can provide the demographic and mapping data to support the geographic needs, while the county grant writer can craft the narrative for the grant application.
Hazard Data and Information	Y	In the past, we have used Hazus and various GIS tools to identify local hazards in the county.	This data can be used to track mitigation progress over time, ensuring that it is an ongoing process rather than just a review every 5 years.
GIS	Y	We use GIS in various ways to identify, monitor, and prepare for hazards. Local dashboards, WebEOC, and Crisis Track, are integrated to track and share information.	More data integration is needed to track mitigation activities over time. Improved situational awareness for all local jurisdictions, agencies, and partners is crucial so everyone is aligned on expectations.
Mutual Aid Agreements	Y	Mutual aid agreements help in scenarios where local jurisdictions are overwhelmed or need additional resources.	These agreements should be reviewed more frequently to ensure that no overlap exists with other jurisdictions.
Other? (Please describe)	None		

Financial Capabilities

Identifying current and potential funding sources is critical to the mitigation planning process. Planning partners can select and implement financially viable actions to reduce future disaster risks by exploring, identifying, and assessing various funding options.

FEMA's Hazard Mitigation Assistance (HMA) grants are available to fund eligible mitigation measures to reduce future disaster losses. Eligible applicants include state agencies, local governments, special districts, federally recognized tribes, and private nonprofit organizations.

This plan adheres to federal guidelines to ensure that participants remain eligible for specific mitigation funds. As outlined in the Code of Federal Regulations (CFR) Title 44, Part 201.6 (§201.6), local governments must have a Federal Emergency Management Agency (FEMA)-approved plan to apply for and receive hazard mitigation project grant funds. These funds support various hazard mitigation programs, including the following:

- Hazard Mitigation Grant Program (HMGP)
- HMGP Post Fire Program (HMGP-PF)
- Building Resilient Infrastructure and Communities (BRIC)
- Flood Mitigation Assistance (FMA)
- Safeguarding Tomorrow Revolving Loan Fund Program

It is essential to consider multiple funding sources, as mitigation actions can and should be financed through various avenues. Potential funding opportunities include federal agencies; state, local, and tribal programs; and private funding sources. lists federal, state, and local funding opportunities.

Table 91: Assessment of the Financial Capabilities of Salt Lake County[278]

Funding Resource	In Place? (Y/N)	Has it been used in the past and for what types of activities?	Could it be used to fund future mitigation actions?	Can this be used as the local cost match for a federal grant?
Capital Improvement Project Funding	Y	Yes, Flood Control Improvement Projects	Y	Y
General Funds	Y	Countywide UPDES/ MS4 Program	Y	Y
Hazard Mitigation Grant Program (HMGP/404)	Y	Yes, Flood Control Improvement Projects	Y	Y
Building Resilient Infrastructure & Communities (BRIC)	Y	Levee Stability Study	Y	
Flood Mitigation Assistance (FMA)	Y	Yes, Flood Control Improvement Projects	Y	Y
Public Assistance Mitigation (PA Mitigation/406)	N/A	N/A	Y	N
Community Development Block Grant (CDBG)	Y	Yes, Stormwater Improvement Projects	Y	Y
Natural Resources Conservation Services (NRCS) Programs	Y	Yes, Flood Control Improvement Projects	Y	Y
U.S. Army Corps (USACE) Programs	Y	Federal Recognized Levee System	Unknown	Unknown
Property, Sales, Income, or Special Purpose Taxes	Y	Flood Control Levee	Unknown	Unknown

[278] MSD = Municipal Services District, SLCo = Salt Lake County, UPDES = Utah Pollution Discharge Elimination System.

Funding Resource	In Place? (Y/N)	Has it been used in the past and for what types of activities?	Could it be used to fund future mitigation actions?	Can this be used as the local cost match for a federal grant?
Stormwater (SW) Utility Fee	N	No, it would be implemented by the MSD. SW Utility Fee Study conducted in 2018.	N/A	N/A
Fees for Water, Sewer, Gas, or Electric Services	N/A	N/A	Unknown	Unknown
Impact Fees from New Development and Redevelopment	N	No, it would be implemented by the MSD. SW Utility Fee Study conducted in 2018.	N/A	N/A
General Obligation or Special Purpose Bonds	Y	Implemented by SLCo Flood Control and MSD	Y	Y
Federal-funded Programs (Please describe)	Unknown	N/A	Y	N
Private Sector or Nonprofit Programs	N/A	N/A	Unknown	Unknown
Other?	None			

Education and Outreach Program Capabilities

Regular engagement with the public on hazard mitigation issues offers a valuable opportunity to directly connect with community members. Assessing this outreach and educational capability highlights the important relationship between the government and the community, promoting a two-way dialogue. Such interactions help build a more resilient community, grounded in education and active public involvement.

Table 92: Assessment of the Education and Outreach Capabilities of Salt Lake County[279]

Education and Outreach Capability	In Place? (Y/N)	Does it currently incorporate hazard mitigation?	Could it be used to support mitigation in the future?
Community Newsletter(s)	Y	Yes, newsletters were used during the 2023 spring runoff emergency response.	Yes

[279] CERT = Community Emergency Response Team, EM = Emergency Management, MSD = Municipal Services District, SLCo = Salt Lake County.

Hazard Awareness Campaigns (such as Firewise, StormReady, Severe Weather Awareness Week, and School Programs)	Y	Yes. StormReady outreach was used during the 2023 spring runoff emergency response.	Yes
Public Meetings/Events (Please describe.)	Y	Yes. Public meetings/events used during the 2023 spring runoff emergency response.	Yes
Emergency Management Listserv	Y	Yes	Yes
Local News	Y	Yes. Used during the 2023 spring runoff emergency response.	Yes
Distributing Hard Copies of Notices (e.g., public libraries, door-to-door outreach)	Y	Yes. Door-to-door outreach was used during the 2023 spring runoff emergency response. SLCo EM has various mitigation materials that are handed out during outreach events, like preparedness events and CERT activities.	Yes
Insurance Disclosures/ Outreach	N/A	N/A	Yes
Organizations that Represent, Advocate for, or Interact with Underserved and Vulnerable Communities (Please describe.)	Y	SLCo EM has various mitigation materials that are handed out during outreach events, like preparedness events and CERT activities.	Yes
Social Media (Please describe.)	Y	Yes, social media was used during the 2023 spring runoff emergency response. We distribute hazard mitigation information through SLCo EM's social media pages, including Facebook, X, and Instagram.	We could leverage social media by posting more frequently, creating videos, etc.
Other? (Please describe.)	None		

Opportunities to Expand and/or Improve Capabilities

Actions that can expand and improve existing authorities, plans, policies, and resources for mitigation include budgeting for mitigation actions, passing policies and procedures for mitigation actions, adopting and implementing stricter mitigation regulations, approving mitigation updates, and making additions to existing plans as new needs are recognized. Table 93 lists the opportunities for the Salt Lake County.

DRAFT

Table 93: Opportunities to Expand and/or Improve the Capabilities of Salt Lake County

Capability Type	Opportunity to Expand and/or Improve
Planning and Regulations	The community wildfire protection plan will be updated in 2025. Areas in Draper have repeatedly flooded every year.
Administrative and Technical	The building official needs more staff to address inspections with the statewide shortage. County employees have to be better integrated into EM so requiring certain FEMA courses during the onboarding process would help, especially in the event of an activation.
Financial	The county grant writer could get more training/knowledge on EM-specific grants so they know what is needed as far as the narrative, data, and additional information for a successful grant application.
Education and Outreach	The public does not seem to be fully aware of what county EM does vs. a local EM so spreading that awareness/knowledge, whether that is at local preparedness fairs, special events, or social media would help with clarifying that. In addition, we would like mitigation to be a discussion more frequently instead of just when the plan update occurs. We would like to have information posted on our website to track mitigation efforts, get public feedback, and engage the community in mitigation efforts for situational awareness.

Jurisdictional Capabilities

Each participating jurisdiction also completed a detailed assessment of its planning and regulatory, administrative and technical, financial and educational and outreach capabilities. The jurisdictional annexes in Volume 2 provide the details regarding these capabilities.

National Flood Insurance Program (NFIP) Capabilities

Flooding is the costliest natural hazard in the United States, and recent federal regulations have led to rising flood insurance premiums for homeowners nationwide. Community participation in the National Flood Insurance Program (NFIP) allows access to additional grant funding to address flood-related issues. By assessing a jurisdiction's current NFIP status and compliance, planners can better understand local flood management efforts, identify areas for improvement, and explore available grant funding opportunities.

Salt Lake County currently participates in the NFIP. The designated Floodplain Administrator is the Director of Planning and Development. The Great Salt Lake Municipal Services District (MSD) Grading, Floodplain & Stormwater Manager implements the provisions of the NFIP on behalf of the unincorporated county, in addition to the communities of Brighton, Copperton, Emigration Canyon, Kearns, Magna, and White City. MSD staff are knowledgeable in current trends and stay apprised of the latest bulletins, including taking training like the National Disaster & Emergency Management University (formerly the Emergency Management Institute)'s course 273: Managing Floodplain Development Through the NFIP. Other MSD staff, including engineering/permitting staff, could use the 273 course. In addition, the Grading, Floodplain & Stormwater Manager is in the process of becoming a Certified Floodplain Manager

(CFM). CFMs play a crucial role in managing and mitigating flood risks by promoting floodplain management regulations in adherence to local, state, and federal best practices and requirements.

The most recent Flood Damage Prevention Ordinance was adopted on November 22, 2022. It includes the higher standard that structures must be built 1 foot above the Base Flood Elevation (BFE). The MSD is responsible for implementing this ordinance. In addition, the latest update included a clear reference to the migratory bird production area (MBPA) in the county. The latest Community Assistance Visit, during which FEMA audited the county's program, was in June 2022. During that visit, FEMA identified that the ordinance could be enforced more effectively in MBPAs. According to Utah law, duck clubs must approve ordinances that make changes in MBPAs. The MSD is working with the duck clubs to get their approval for an ordinance change that would allow for wetproofing so that they do not have to apply for a variance to perform wetproofing when they want to improve their structures. In addition, the ordinance could be updated to include more specific language regarding enforcement and inspections.

MSD is also responsible for issuing development permits in the special flood hazard area. This includes reviewing proposals for subdivisions to ensure that they minimize flood damage and reduce exposure to flood damage. The Engineering Division conducts the technical review using an electronic permitting portal. The portal automatically indicates whether a parcel is approximately in the regulatory floodway or the Special Flood Hazard Area (SFHA). In addition, staff are trained in how to flag parcels as some parcels particularly in the canyon area may not be mapped accurately. If anywhere on the parcel touches the floodplain, developers are required to obtain a floodplain permit. Prior to issuing a permit, the Grading, Floodplain & Stormwater Manager reviews all permits and ensures compliance with floodplain management regulations. GIS supports the identification of parcels and can track the number of buildings in the SFHA.

The Grading, Floodplain & Stormwater Manager is responsible for making substantial damage/substantial improvement determinations. This process occurs as part of the permitting process. MSD reviews the scope of a project during the permit process. When proposed costs are within 40–60% of the cost of the structure itself, the MSD uses the assessed value of the structure from the Salt Lake County assessor and requests a cost estimate for all labor and materials to make a substantial damage/substantial improvement determination. These estimates are compared with the cost of the structure, and a determination is made based on the value of the structure, not the land, before any damage. If structures are declared substantially damaged/substantial improvements, they must be brought into compliance or a variance may be issued. Variances are typically only issued in the duck club areas. Staff are always actively pursuing additional opportunities, both in-house and through in-person training, on how to make substantial damage/substantial improvement determinations.

The latest Flood Insurance Rate Map (FIRM) became effective on November 19, 2021. MSD also supports floodplain mapping, including Risk MAP and Letters of Map Amendment or Revisions as needed. FEMA is currently in the process of revising the BFE around Salt Lake to include V Zones. The Grading, Floodplain & Stormwater Manager and the SLCo Flood Control Engineering support flood insurance outreach and public awareness about the availability of flood insurance. The MSD advocates for obtaining flood insurance through conversations during permit applications, including conversations on the statistics of flooding during a 30-year mortgage and the likelihood of flood events. Additional outreach

DRAFT

could be conducted to promote flood insurance across the unincorporated county. Obtaining flood insurance is one way to reduce the exposed risk to flooding.

The NFIP's Community Rating System (CRS) is a voluntary program that recognizes and incentivizes community floodplain management activities that exceed the minimum NFIP requirements. Communities participating in the CRS receive discounted flood insurance premiums, reflecting the reduced flood risk from their proactive flood management efforts. The CRS has three main goals: to reduce flood damage to insurable properties, reinforce and enhance the insurance aspects of the NFIP, and encourage a comprehensive approach to floodplain management. Currently, according to the FEMA Community Status Book Report, no Salt Lake County planning jurisdictions currently participate in the National Flood Program, and they do not qualify for discount premiums based on the CRS class.

DRAFT

Mitigation Strategy

The heart of the mitigation plan is the mitigation strategy, which serves as the long-term blueprint for reducing the potential losses identified in the risk assessment. The mitigation strategy describes how the community will accomplish the overall purpose, or mission, of the planning process. In this section, mitigation goals were reevaluated and updated, and mitigation actions/projects were updated/amended, identified, evaluated, and prioritized.

Plan participants assessed and included a comprehensive range of hazard mitigation strategies/actions, including strategies from FEMA documents, strategies from the 2019 Salt Lake County Hazard Mitigation Plan, and suggestions from participating communities and their respective stakeholders during workshops and meetings with individual agencies that took place throughout the county in the fall of 2024.

Mitigation Goals

The mitigation planning team has organized resources, assessed hazards and risks, and documented mitigation capabilities. The resulting goals, objectives, and mitigation actions were developed based on these tasks. The team held a series of meetings designed to develop mitigation strategies as described further in this section. The goals for this mitigation plan are statements that accomplish the following:

- Represent the desires of the entire community
- Include all members of the community, both public and private
- Are achievable in the future, whether near-term or long-term

Goals form the basis for objectives and actions to be taken and are not dependent on implementation feasibility. The following are Salt Lake County's goals, listed in order of priority:

- **Goal 1:** Protect the lives, health, and safety of the county's citizens before, during, and after a disaster.
- **Goal 2:** Protect and eliminate and/or reduce damage and disruptions to critical facilities, structures, and infrastructure from hazards.
- **Goal 3:** Enhance and protect the communications and warning systems in the county.
- **Goal 4:** Promote education and awareness programs, campaigns, and efforts designed to encourage citizens and both public and private entities to mitigate and become more resilient to disasters.
- **Goal 5:** Ensure and promote ways to sustain government and private sector continuity of services during and after a disaster.
- **Goal 6:** Advocate, support, and promote the continued coordination and integration of disaster planning efforts throughout the county.

DRAFT

- **Goal 7:** Advocate, support, and promote the use of laws and local regulations and ordinances aimed at mitigating hazards and enhancing resilience.
- **Goal 8:** Preserve and protect natural systems, natural resources, and other environmental assets against the effects of hazards.

Mitigation Action Plan

The action plan helps prioritize mitigation initiatives according to a benefit/cost analysis of the proposed projects (44 Code of Federal Regulations [CFR], Section 201.6(c)(3)(iii)). The action plan also provides a framework for how the proposed projects and initiatives will be implemented and administered over the next five years. Countywide mitigation actions will be listed using this table in Volume 1: Mitigation Strategies, while actions for each participating jurisdiction will be listed in their respective annexes in Volume 2. Each mitigation project identified during the 2025 plan update for the county and its jurisdictions has been organized based on the following parameters.

Mitigation Action Benefit Parameters

Benefit ratings were defined as follows:

- **High:** Project will provide an immediate reduction of risk exposure for life and property.
- **Medium:** Project will have a long-term impact on the reduction of risk exposure for life and property or provide an immediate reduction in the risk exposure for property.
- **Low:** Long-term benefits of the project are difficult to quantify in the short term.

Mitigation Action Cost Estimate Parameters

Although the preference is to provide definitive costs (dollar figures) for each mitigation strategy/action, this is not possible for every mitigation strategy/action. Therefore, the estimated costs for the mitigation initiatives identified in this plan were identified as high, medium, or low, using the following ranges:

- **High:** Existing funding will not cover the cost of the project; implementation would require new revenue through an alternative source (for example, bonds, grants, and fee increases). (Estimated over $500,000)
- **Medium:** The project could be implemented with existing funding but would require a reapportionment of the budget or a budget amendment, or the cost of the project would have to be spread over multiple years. (Estimated $50,000–$500,000)
- **Low:** The project could be funded under the existing budget. It is part of or can be part of an ongoing existing program. (Under $50,000)

DRAFT

Mitigation Funding Sources

Potential mitigation funding sources, such as grants, are referenced for each action; however, these are not intended to be an exhaustive list of funding opportunities. As efforts to complete actions progress, the best available funding sources will be evaluated and pursued. When grant funding may be suitable, specific grants are listed. Many actions involve efforts that fall within the regular functions of county and municipal governments and the duties of their staff. The terms city budget or local budget, which refer to local funds and operating budgets, may be utilized where appropriate. Additional relevant funding sources are listed where applicable (denoted by “staff time” or “applicable operating budgets”).

The planning team acknowledges that BRIC was abolished on April 4, 2025. However, as federal policy was actively changing during the development of this plan, references to BRIC were still included in the mitigation actions tables for the county (Table 95) and individual jurisdictional annexes in Volume 2. If BRIC is replaced in the future, projects identified with BRIC should be reviewed for application to the replacement program.

Mitigation Action Time Frame Parameters

Although the preference is to provide definitive project completion dates, this is not possible for every mitigation strategy/action. Therefore, the parameters for the timeline (projected completion date) are as follows:

- **Short Term:** To be completed in 1–3 years.
- **Medium:** To be completed in 3–5 years.
- **Long Term:** To be completed in more than 5 years.
- **Ongoing**: Currently being implemented under existing programs but without a definite completion date.

Mitigation Action Prioritization Process

The action plan must be prioritized according to a benefit/cost analysis of the proposed projects (44 CFR, Section 201.6(c)(3)(iii)). The benefits of proposed projects were weighed against estimated costs as part of the project prioritization process. The benefit/cost analysis was not as detailed as required by FEMA for project grant eligibility under the Hazard Mitigation Grant Program (HMGP) and Pre-Disaster Mitigation (PDM) grant program. A less formal approach was used because some projects may not be implemented for up to 10 years, and associated costs and benefits could change dramatically in that time. Therefore, for each project, a review was conducted of the apparent benefits versus the apparent cost. Parameters were established for assigning subjective ratings (high, medium, and low) to the costs and benefits of these projects.

The priorities are defined as follows:

DRAFT

- **High Priority:** A project that addresses many goals or hazards, has benefits that exceed costs, has funding secured or is an ongoing project, and meets eligibility requirements for the HMGP or PDM grant program. High-priority projects can be completed in the short term (1–5 years).
- **Medium Priority:** A project that addresses multiple goals and hazards, has benefits that exceed costs, and is grant-eligible under HMGP, PDM, or other grant programs, although funding has not yet been secured. The project can be completed in the short term once funding is secured. Medium-priority projects will become high-priority projects once funding is secured.
- **Low Priority:** A project that addresses few goals, mitigates the risk of one or few hazards, has benefits that do not exceed costs or are difficult to quantify, lacks secured funding, is not eligible for HMGP or PDM grant funding, and has a long-term timeline for completion (1–10 years). Low-priority projects may be eligible for other sources of grant funding from other programs.

For many of the strategies identified in this action plan, the partners may seek financial assistance under the HMGP or HMA programs, both of which require detailed benefit/cost analyses. These analyses will be performed on projects at the time of application using the FEMA benefit/cost model. For projects not seeking financial assistance from grant programs that require detailed analysis, the partners reserve the right to define "benefits" according to parameters that meet the goals and objectives of this plan.

Mitigation Strategies and Alternatives

When completing forms for this plan update, participants were also asked to document alternative mitigation actions that were considered. Alternatives considered for Salt Lake County include the following:

Construct avalanche sheds.

Develop a wildfire early warning system.

Develop a countywide emergency management communication system.

Develop green flood protection systems in annual flood areas.

Increase the size of bridges and culverts.

Review of Previous Mitigation Actions

The planning process includes an opportunity to evaluate mitigation actions identified in the last mitigation plan. This enables participants to identify successes of previous actions, challenges that might have impeded progress, and opportunities to expand future mitigation projects. Because the implementation of this plan is critical to creating greater community resilience, the completion of mitigation actions is an important indicator of implementation and activity in the county. Table 94 presents all mitigation actions from the 2015 and 2019 multijurisdictional hazard mitigation plans (MJHMPs) and identifies (a) actions have been completed, (b) those that are either ongoing or are incomplete and will be carried forward into the 2025 mitigation actions, and (c) any that are no longer relevant and will be deleted.

DRAFT

In this section, mitigation actions/projects were updated/amended, identified, evaluated, and prioritized. This section is organized as follows:

- **Status Update of Previous Mitigation Actions:** Table 94 presents a review of mitigation actions and their status from the 2015 and 2019 MJHMPs:
  - **Completed:** Project has been completed in full.
  - **Ongoing:** Work on this action has been initiated and will be continued in 2025.
  - **Incomplete:** Work on this action has not begun due to funding or other limitations and will be carried forward into the Mitigation Action Plan.
  - **Deleted:** This action was not completed and was deleted. These might have been deemed no longer relevant or unfeasible. Some were rewritten as new mitigation actions to address changes in approach.

2025 Mitigation Actions

Table 95 identifies actions carried forward from the previous mitigation plan and new actions identified during this 2025 update process. Actions that have been carried forward might have minor revisions to address new funding sources, new partnerships, changes in priority, or additional clarification.

DRAFT

Table 94:Status of Previous Mitigation Actions from the 2015 and 2019 Multijurisdictional Hazard Mitigation Plans[280]

Action	Hazard(s)	Lead Agency	Support Agency(ies)	Status	Is this action carried forward to the 2025 Mitigation Action Plan?
Develop an enhanced emergency notification communication system for the county.	All hazards	SLCo EM	Local jurisdiction emergency management	Ongoing. SLCo EM preparing IPAWS (Integrated Public Alert and Warning System) templates and identifying streamlined communications platforms.	Yes
Coordinate conservation, preservation, and mitigation actions with community development and community planning divisions to ensure integration of programs across all communities.	Dam/levee failures, drought, earthquakes, floods, hazardous materials incidents (transportation and fixed facility), wildfires	SLCo PW & Municipal Services, MSD	SLCo EM, all participating jurisdictions	Ongoing.	Yes
Enhance security at critical public safety and technology infrastructure sites. Develop and implement a critical infrastructure and key resources (CIKR) security/hardening program.	All hazards	SLCo EM, local jurisdiction emergency management	SLCo PW Operations	Ongoing; have completed security updates to the Emergency Coordination Center (ECC) with card access and cameras. SLCo EM is in the process of creating a new access and lobby management policy. Ongoing; SLCo PW Operations has increased the number and quality of security cameras at public works yards.	Yes, reworded in 2025 action plan
Enhance interoperable radio communications systems throughout the county.	All hazards	SLCo EM, local jurisdiction emergency management	All jurisdictions in the county	Ongoing; SLCo PW Operations is in the process of upgrading two-way radios.	Yes
Elevate and/or mitigate roadways in low-lying areas prone to overland flooding.	Floods (flash and riverine)	SLCo PW & Municipal Services, local PW/engineering departments, MSD		Ongoing; SLCo PW Operations road maintenance/ improvements are ongoing for local jurisdictions.	Yes
Conduct flood-specific impact studies (Eastside Canal and Creek Study).	Floods (flash and riverine), severe thunderstorms	SLCo PW & Municipal Services, local PW/engineering departments, MSD		In progress; 80% complete.	Yes
Work with communities not currently in the National Flood Insurance Program (NFIP) to adopt the program.	Floods (flash and riverine)	SLCo PW & Municipal Services, MSD	SLCo EM, local jurisdiction emergency management	Complete; all newly incorporated cities have joined the NFIP.	No; complete
Develop a countywide program to purchase repetitive loss properties and develop a program to monitor locations of buyouts; encourage local jurisdictions to institute a buyout plan for flood-prone structures or those susceptible to landslides and other geological concerns.	Floods (riverine), earthquakes, landslides	SLCo PW & Municipal Services, MSD	SLCo EM, local jurisdiction emergency management	Incomplete.	Yes
Develop and implement a water conservation plan.	Drought, extreme heat incidents	SLCo Office of Regional Development, SLCo PW & Municipal Services, MSD	SLCo EM, local jurisdiction emergency management	Incomplete.	Yes
Provide information to property owners in flood-prone areas, including the need for NFIP coverage.	Floods (flash and riverine)	SLCo EM, SLCo PW & Municipal Services, local emergency management	Local jurisdictions	Ongoing; SLCo Flood Control maintains Runoff Ready website and social media posts.	Yes

[280] BRIC = Building Resilient Infrastructure and Communities, Department of Natural Resources, EM = Emergency Management, IPAWS = Integrated Public Alert and Warning System, MSD = Municipal Services District, , NFIP = National Flood Insurance Program, NRCS = Natural Resources Conservation Service, PW = Public Works, SLCo = Salt Lake County, UDOT = Utah Department of Transportation, UFA = Unified Fire Authority, UPDES = Utah Pollution Discharge Elimination System

Action	Hazard(s)	Lead Agency	Support Agency(ies)	Status	Is this action carried forward to the 2025 Mitigation Action Plan?
Develop and implement public education programs on disaster awareness.	All hazards	SLCo EM, local jurisdiction emergency management		Ongoing. SLCo EM has conducted earthquake preparedness education campaigns for the public through the Great Utah ShakeOut drill that is held annually.	Yes
Procure generators and transfer switches for schools, public facilities, and critical facilities, including generators/redundant backup power at traffic signals in key locations.	All hazards	SLCo EM, local jurisdiction emergency management	SLCo PW & Municipal Services	Ongoing; UFA did some BRIC work for seismic upgrades that included generators. Generators were installed at stations 103, 107, and 113. Seismic upgrades were completed at stations 107, 109, 110, 112, 115, and 116. Nonstructural upgrades were completed at 20 stations. PW Operations: ongoing. We have a few portable generators but need more.	Yes
Assess and prioritize burying utilities (especially in areas where new development is occurring).	Dam failures, floods (flash and riverine), high winds and tornadoes, landslides, severe thunderstorms, severe winter storms, wildfires	SLCo PW & Municipal Services, MSD	Local jurisdiction PW/ Engineering	Incomplete.	Yes
Commodity flow allocation study for rail and road transportation.	Hazardous materials incidents	SLCo EM, Local Emergency Planning Committee (LEPC)	SLCo Office of Regional Development	Incomplete.	Yes
Move electrical panels, mechanical, and generators above base flood elevation (BFE) in facilities in flood-prone areas.	Floods (flash and riverine)	SLCo PW & Municipal Services, local PW/engineering departments, MSD		Incomplete.	Yes
Enhancement and expansion of green space.	Floods (flash and riverine)	SLCo PW & Municipal Services, local PW/engineering departments, MSD		Incomplete; lack of funding.	Yes
Emergency operations center enhancements for situational awareness and coordination.	All hazards	SLCo EM		Ongoing; WebEOC and Crisis Track integration.	Yes
Integrate WebEOC and other technological enhancements and integration throughout the county.	All hazards	SLCo EM, local jurisdiction emergency management		Ongoing; implementing Crisis Track and WebEOC training for local jurisdictions/agencies.	Yes
Construct snow sheds for avalanche mitigation in Little Cottonwood Canyon.	Avalanches	SLCo PW & Municipal Services, SLCo EM	UDOT	Ongoing; Phase 2 of UDOT's work.	Yes
Enhance and continue to promote the implementation of the community emergency response teams (CERTs) and other related programs.	All hazards	SLCo EM, local jurisdiction emergency management		Ongoing.	Yes
Establish functional and access needs registry or similar program.	All hazards	SLCo EM, local jurisdiction emergency management	Salt Lake County Department. of Human Services	Ongoing; with the Special Needs Registry dissolving, SLCo EM needs to establish a system.	Yes
Mutual aid agreement development and/or updates.	All hazards	SLCo EM, local jurisdiction emergency management	All participating jurisdictions in the county	Ongoing; PW has a mutual aid interlocal agreement; all Salt Lake County municipalities and Salt Lake County have signed it.	Yes
Develop and implement countywide green infrastructure plan.	All hazards	SLCo PW & Municipal Services, MSD	All participating jurisdictions in the county	Incomplete.	Yes

DRAFT

Action	Hazard(s)	Lead Agency	Support Agency(ies)	Status	Is this action carried forward to the 2025 Mitigation Action Plan?
Evaluate capability and capacity for all local governments to provide and sustain emergency power to critical infrastructure resources under their control.	All hazards	SLCo EM, local jurisdiction emergency management	All participating jurisdictions in the county	Ongoing.	Yes
Continue implementing and improving Salt Lake County's disaster recovery program by developing and updating key plans, strategies, and recovery protocols.	All hazards	SLCo EM	All participating jurisdictions in the county	Ongoing.	Yes
Retrofit critical facilities and infrastructure to withstand avalanches.	Avalanches	SLCo PW & Municipal Services, MSD, local governments, ski resorts, private owners	SLCo EM, local jurisdiction emergency management	Ongoing; UDOT installed 16 new remote avalanche control systems (RACS) on Mt. Superior in Little Cottonwood Canyon in summer 2024.	Yes
Bring deficient high-hazard dams up to current industry standards.	Floods (flash and riverine), dam failures	Salt Lake County and all participating jurisdictions	Salt Lake County, local governments, and dam owners	In progress. HHPD grant was used to help rehabilitate the Lake Mary-Phoebe Dam.	Yes
Increase the size of culverts and bridges.	Floods (flash and riverine)	SLCo PW & Municipal Services, local PW/engineering departments, MSD, canal districts		In progress but lacks funding.	Yes
Remove debris and vegetation from floodway and drainage structures through a systematic maintenance program.	Floods (flash and riverine)	SLCo PW & Municipal Services, local PW/engineering departments, MSD, canal districts		Ongoing; lack of funding and personnel. SLCo PW Operations assists.	Yes
Improve flood resistance through enhancement of wing walls, flood barriers, foundations, etc. at likely flood impact points.	Floods (flash and riverine)	SLCo PW & Municipal Services, local PW/engineering departments, MSD, canal districts		Incomplete.	Yes
Construct debris basins, flood retention ponds, and energy flow dissipaters to control the flow and release of floodwaters.	Floods (flash and riverine)	SLCo PW & Municipal Services, local PW/engineering departments, MSD, canal districts		Incomplete; lack of funding.	Yes
Construct temporary debris traps and other flood-mitigating structures in wildfire-burned areas.	Floods (flash and riverine), wildfires	SLCo PW & Municipal Services, local PW/engineering departments, MSD	Utah Department of Natural Resources (DNR), NRCS, UDOT	Incomplete.	Yes
Retrofit critical facilities and infrastructure to withstand earthquakes and other geologic hazards.	Earthquakes	SLCo PW & Municipal Services, local PW/engineering departments, MSD, owners of facilities		UFA station retrofits are ongoing; SLCo PW Operations: master plan for update of PW yard is complete but needs funding to move forward.	Yes
Retrofit businesses, residential structures, infrastructure, and public buildings (especially in historic districts) to withstand moderate earthquakes and other geologic hazards.	Earthquakes	Owners of facilities, SLCo PW & Municipal Services, local PW/ engineering departments, MSD		Incomplete.	Yes
Use flexible piping when extending water, sewer, or natural gas service.	Earthquakes	Utility companies, SLCo PW & Municipal Services, local PW/engineering departments, MSD		Incomplete.	Yes
Install shutoff valves and emergency connector hoses where water mains cross fault lines.	Earthquakes	Utility companies, SLCo PW & Municipal Services, local PW/ engineering departments, MSD		Incomplete.	Yes

DRAFT

Action	Hazard(s)	Lead Agency	Support Agency(ies)	Status	Is this action carried forward to the 2025 Mitigation Action Plan?
Encourage all new construction to meet enhanced standards for wind loading, snow loading, and other weather-related hazards.	Severe weather	Facility owners, SLCo PW & Municipal Services	Local PW/ engineering departments, MSD	Incomplete.	Yes
Plan for and maintain adequate road and debris clearing capabilities.	Severe weather	SLCo PW & Municipal Services	Local PW/ engineering departments, MSD	Ongoing; SLCo PW Operations has an emergency action plan to respond to disasters, including road and debris clearing.	Yes
Install pump stations in strategic locations to mitigate flooding.	Floods (flash and riverine)	SLCo PW & Municipal Services, canal districts	Local PW/ engineering departments, MSD	In progress; currently bidding out City Drain Pump Station.	Yes
Collaborate with private canal companies to mitigate drainage, leakage, and capacity issues.	Floods (flash and riverine)	SLCo PW & Municipal Services, local PW/engineering departments, MSD, canal districts		Incomplete; lack of funding and personnel.	Yes
Conduct levee upgrades and certification.	Floods (flash and riverine)	SLCo PW & Municipal Services	Local PW/ engineering departments, MSD	Ongoing; making progress on the accreditation of the Surplus Canal levee system.	Yes
Assess high-pressure pipelines to ensure that they meet seismic standards; conduct upgrades as needed.	Earthquakes	Utility companies, SLCo PW & Municipal Services	Local PW/ engineering departments, MSD	Incomplete.	Yes
Promote Firewise initiative and develop community wildfire protection plans (CWPP) in at-risk communities.	Wildfires	Salt Lake County UFA	All participating communities in the county	Ongoing.	Yes
Promote the Fix the Bricks program throughout the county.	Earthquakes	Salt Lake County and all participating jurisdictions	State of Utah	Incomplete; Salt Lake City, the State of Utah, and FEMA use the “Fix the Bricks” program to fund residential retrofits of unreinforced masonry dwellings (URMs) in an effort to mitigate the effects of a large-scale earthquake by minimizing the risk of post-earthquake personal injury and reducing the need for outside assistance. Currently this program is primarily focused on Salt Lake City. A similar program or expansion of the existing program would be beneficial to other jurisdictions in the county with URMs.	No
Help county jurisdictions procure Flood Mitigation Assistance (FMA) grants.	Floods	SLCo EM	All participating jurisdictions in the county	Incomplete.	Yes
Assist Emergency Managers in designing pandemic mitigation programs.	Public health epidemics/pandemics	SLCo EM, Salt Lake County Health Department	All participating jurisdictions in the county	Complete; County Health Department updates plans annually for pandemics and infectious diseases. SLCo EM has developed a Public Health Annex as part of its Comprehensive Emergency Management Plan to address pandemics and infectious diseases.	No
Conduct seminar to assist Emergency Managers in public education about radon kits.	Radon	SLCo EM	Salt Lake County Health Department	Incomplete; was not a priority during COVID-19 and there has not been a discussion on radon education since.	Yes

DRAFT

2025 Mitigation Action Plan

Table 95: 2025 Mitigation Action Plan[281]

#	Action	Hazard(s)	Goals	Lead Agency	Potential Partners	Benefits (Losses Avoided)	Cost Estimate	Funding Source	Time Frame	Priority	New or Carried Forward	Comments
1	Enhance interoperable radio communications systems throughout the county.	Avalanches, civil disturbances, dam failures, drought, earthquakes, extreme heat, floods, hazardous materials incidents, heavy rain, high winds, landslides, lightning, public health epidemics, radon, severe winter weather, terrorism, tornadoes, wildfires	2, 3, 5	SLCo Fleet Services, UFA Communications Division, Utah Communications Authority	Partners include but are not limited to the MSD, SLCo EM, UPD, State of Utah, NGO partners, Sheriff's Office	Improved communication between different agencies, common operating platform	Medium	General funds, HSGP grants	Short term	Medium	Carried forward	Additional efforts are needed to continue improving interoperable communications throughout the county and to create redundant systems should the primary communications infrastructure fail. Additional efforts include but are not limited to ensuring enhanced interoperability with local participating jurisdictions, agencies, and key partners. This is especially important for communities in remote or isolated areas.
2	Develop an enhanced emergency notification communication system for the county.	Avalanches, civil disturbances, dam failures, drought, earthquakes, extreme heat, floods, hazardous materials incidents, heavy rain, high winds, landslides, lightning, public health epidemics, radon, severe winter weather, terrorism, tornadoes, wildfires	1, 3	SLCo EM	Partners include but are not limited to the MSD, UFA, UPD, local jurisdiction emergency management, State of Utah, Sheriff's Office, UDOT	Early notification of impending wildfire to decrease loss of life, improved relationships with the public and stakeholders, provide faster delivery of information with templates and plans ready for use	Medium	General funds, HSGP grants, BRIC grant	Short term	High	Carried forward	Estimation of $1 million, with costs shared between local jurisdictions/ agencies and the county. SLCo EM has been working on developing IPAWS templates and identifying streamlined communication.
3	Develop and implement public education programs on disaster awareness.	Avalanches, civil disturbances, dam failures, drought, wildfires, earthquakes, extreme heat, floods, hazardous materials incidents, heavy rain, high winds, landslides, lightning, public health epidemics, radon, severe winter weather, terrorism, tornadoes, wildfires	1, 4, 6, 7, 8	SLCo EM	Partners include but are not limited to local jurisdiction emergency management, UFA, UPD, Sheriff's Office, SLCo PW, State of Utah, local hospitals, local utilities, NGO partners	Improved understanding of local resources, improved relationships with the public and stakeholders, outlined plans/standard operating procedures (SOPs) for programs, improved education and understanding for the public on local hazards and ways in which they can prepare themselves, their home, and loved ones	Low	General funds, HSGP grants, SHSP grant	Short term	Medium	Carried forward	

[281] CERT = Community Emergency Response Team, CWPP = community wildfire protection plan, DNR = Division of Natural Resources, ECC = Emergency Coordination Center, EMPG = Emergency Management Performance Grant, ESPG = energy storage and power generation, HAZMAT = Hazardous materials, HHPD = High Hazard Potential Dam, HMA = Hazard Mitigation Assistance, HSGP = Homeland Security Grant Program, EM = Emergency Management, IT – Information Technology, MSD = Municipal Services District, NGO = Nongovernmental Organizations, NWS = National Weather Service, PW = Public Works, SAIC = Statewide Information & Analysis Center, SHSP = State Homeland Security Program, SLC = Salt Lake City, SLCo = Salt Lake County, Utah DEM = Utah Division of Emergency Management, UDOT = Utah Department of Transportation, UFA = Unified Fire Authority, UPD = Unified Police Department USACE = U.S. Army Corps of Engineers

#	Action	Hazard(s)	Goals	Lead Agency	Potential Partners	Benefits (Losses Avoided)	Cost Estimate	Funding Source	Time Frame	Priority	New or Carried Forward	Comments
4	Integrate WebEOC, Crisis Track, Geographic Information System (GIS), and other technological enhancements throughout the county.	Avalanches, civil disturbances, dam failures, drought, wildfires, earthquakes, extreme heat, floods, hazardous materials incidents, heavy rain, high winds, landslides, lightning, public health epidemics, radon, severe winter weather, terrorism, tornadoes, wildfires	1, 2, 3, 4, 5, 6	SLCo EM	Partners include but are not limited to local jurisdiction emergency management, UFA, UPD, SLCo PW, SLCo Health Department, State of Utah, UDOT, local hospitals, local utilities	Common operating platform for stakeholders, increased situational awareness, improved response time	Low	General funds, HSGP grants, Emergency Operations Center Grant Program	Long term	Medium	Carried forward	Existing software requiring updates to documentation/ training. Revised to include Crisis Track and GIS as additional technologies to consider.
5	Enhance and continue to promote the implementation of CERT and SAFE Hubs.	Avalanches, civil disturbances, dam failures, drought, wildfires, earthquakes, extreme heat, floods, hazardous materials incidents, heavy rain, high winds, landslides, lightning, public health epidemics, radon, severe winter weather, terrorism, tornadoes, wildfires	1, 4, 5	SLCo EM	Local jurisdiction emergency management, State of Utah, NGO partners	Improved awareness of local resources, coordination across jurisdictions and agencies	Low	General funds, municipal budgets	Short term	Medium	Carried forward	Revised to include SAFE Hubs (previously S.A.F.E. Neighborhoods), a rebrand with a new public awareness campaign and information for all partners.
6	Establish access and functional needs registry and improve incorporation of those with access and functional needs in plans.	Avalanches, civil disturbances, dam failures, drought, wildfires, earthquakes, extreme heat, floods, hazardous materials incidents, heavy rain, high winds, landslides, lightning, public health epidemics, radon, severe winter weather, terrorism, tornadoes, wildfires	1, 4	SLCo EM	Partners include but are not limited to local jurisdictions, MSD, UFA, UPD, Sheriff's Office, SLCo Aging and Adult Services, SLCo Health Department	Improved situational awareness for the public and stakeholders, greater understanding of resources available for those with access and functional needs	Low	General funds, HSGP grants	Short term	High	Carried forward	The State of Utah's Access and Functional Needs Registry is dissolving in 2025. The county needs a way to account for those with access and functional needs, including incorporation into plans/SOPs.
7	Implement Emergency coordination center enhancements for situational awareness and coordination.	Avalanches, civil disturbances, dam failures, drought, wildfires, earthquakes, extreme heat, floods, hazardous materials incidents, heavy rain, high winds, landslides, lightning, public health epidemics, radon, severe winter weather, terrorism, tornadoes, wildfires	1, 2, 5	SLCo EM	UFA	Improved situational awareness, improved building security to prevent bad actors, and a shared understanding across different agencies of ECC expectations by position for activations	Medium	General funds, HSGP grants, Emergency Operations Center Grant Program	Ongoing	High	Carried forward	Enhancements may include technological and communication improvements in the Joint Information Center (JIC), Call Center, Plans Room, and Operations Room. The Salt Lake County ECC requires significant enhancements to ensure situational awareness and improved coordination across the valley. These improvements include enhancing our building security, improving situational awareness on various monitors throughout the building, and positioning checklists/ guides for those entering the ECC for an activation.
8	Develop mutual aid agreements and/or updates for sheltering, points of distribution (PODs), and public works.	Avalanches, civil disturbances, dam failures, drought, wildfires, earthquakes, extreme heat, floods, hazardous materials incidents, heavy rain, high winds, landslides, lightning, public health epidemics,	5, 6, 7	SLCo EM	Partners include but are not limited to local jurisdiction emergency management, SLCo Parks and Recreation, SLCo PW	Common understanding of resources available, the regular review of the agreement ensures that it is updated with the latest information and the agreement is in place	Low	General funds	Ongoing	Medium	Carried forward	SLCo PW has established a mutual aid interlocal agreement, signed by all Salt Lake County municipalities and the County PW department itself, to ensure coordinated support and resource sharing. The county also aims to update and initiate memorandums of understanding (MOUs) PODs and facility use for

DRAFT

#	Action	Hazard(s)	Goals	Lead Agency	Potential Partners	Benefits (Losses Avoided)	Cost Estimate	Funding Source	Time Frame	Priority	New or Carried Forward	Comments
		radon, severe winter weather, terrorism, tornadoes, wildfires				before an incident takes place						emergency sheltering to strengthen preparedness and response capabilities.
9	Evaluate capability and capacity for all local governments to provide and sustain emergency power to critical infrastructure resources under their control.	Avalanches, civil disturbances, dam failures, drought, wildfires, earthquakes, extreme heat, floods, hazardous materials incidents, heavy rain, high winds, landslides, lightning, public health epidemics, radon, severe winter weather, terrorism, tornadoes, wildfires	2, 3, 5, 6	SLCo EM	Partners include but are not limited to local jurisdictions emergency management, local utilities, local hospitals, NGO partners	Ensures emergency plans are in place, tests systems before an incident occurs to identify and resolve issues	Medium	General fund, SLCo EM budget, EMPG	Long term	High	Carried forward	
10	Continue implementing and improving Salt Lake County's Disaster Recovery Program by developing and updating key plans, strategies, and recovery protocols.	Avalanches, civil disturbances, dam failures, drought, wildfires, earthquakes, extreme heat, floods, hazardous materials incidents, heavy rain, high winds, landslides, lightning, public health epidemics, radon, severe winter weather, terrorism, tornado, wildfire	1, 5	SLCo EM	Partners include but are not limited to local jurisdiction emergency management, MSD, SLCo PW, SLCo Health Department, SLCo IT, SLCo Sheriff's Office, UPD, UFA, NGO partners, Utah DEM	A recovery program with updated plans and policies will facilitate quicker recovery, minimize long-term social and economic impacts, and provide a unified response and recovery support for incidents through the Emergency Support Functions and Recovery Support Functions to stabilize community lifelines and maintain continuity of essential functions.	Medium	SLCo EM budget, EMPG	Ongoing	High	Carried forward	SLCo EM needs to develop a formal Recovery Plan and collaborate with local, private, and NGO partners. The plan should include training, exercises, and implementation strategies to test and continuously improve its effectiveness.
11	Construct snow sheds for avalanche mitigation in Little Cottonwood Canyon.	Avalanche	1, 2	UDOT	SLCo EM, local jurisdictions, UFA, UPD, State of Utah, local utilities	Diminish road closure time, preserve life and safety from avalanches (personal injuries, car/infrastructure damage, injury to first responders and UDOT staff)	High: $72–$90 million	HMA, general funds	Long term	Medium	Carried forward	
12	Retrofit critical facilities and infrastructure to withstand avalanches.	Avalanche	1, 2	SLCo PW & Municipal Services	Partners include but are not limited to the MSD, local jurisdictions emergency management, ski resorts, private owners, UDOT, SLCo EM, local utilities, State of Utah	Ensures resilience for critical infrastructure in the event of an avalanche, facilitates safe egress/ingress for visitors and first responders on roads, provides shelter in the event of an avalanche	Medium	PDM, ski resort revenue, private funds	Long term	Medium	Carried forward	UDOT installed 16 new Remote Avalanche Control Systems (RACS) on Mt. Superior in Little Cottonwood Canyon, summer 2024.
13	Develop a countywide single source of information-sharing/gathering for intelligence.	Civil disturbance, terrorism	1, 2, 3, 5, 6, 8	SLCo EM	Partners include but are not limited to local jurisdiction public safety agencies, SLCo Sheriff's Office, UPD, SIAC	Improved coordination between local agencies/ jurisdictions	Medium	HSGP grant, general funds	Short term	Medium	New	Have one common operating platform to be used by all agencies in Salt Lake County to collect suspicious activity reports; develop a public awareness campaign to educate the public on how and what to report. $100K

DRAFT

#	Action	Hazard(s)	Goals	Lead Agency	Potential Partners	Benefits (Losses Avoided)	Cost Estimate	Funding Source	Time Frame	Priority	New or Carried Forward	Comments
14	Coordinate conservation, preservation, and mitigation actions with community development and community planning divisions to ensure integration of programs across all communities.	Dam/levee failure, drought, earthquake, flood, hazardous materials incident (transportation and fixed facility), wildfire	1, 4, 5, 6	SLCo EM SLCo PW & Municipal Services, MSD	Partners include but are not limited to local jurisdictions, UFA, UPD, Sheriff's Office, State of Utah, local utilities, local hospitals, local school districts	Common understanding of mitigation efforts, tracking of mitigation efforts over time	Medium	General fund, PDM, BRIC	Ongoing	High	Carried forward	
15	Assess and prioritize the burying of utilities especially in areas where new development is occurring).	Dam failure, flood (flash and riverine), high wind and tornado, landslide, severe thunderstorm, severe winter storm, wildfire	1, 2, 3, 5	SLCo PW & Municipal Services, local utility owners	Partners include but are not limited to the MSD, local PW/ engineering departments, UDOT, State of Utah, local utilities, local hospitals, local school districts	Prevents costly utility damage, lower maintenance costs, aesthetic improvements for Salt Lake County's natural scenery, increased energy capacity	High	Private sector funds, HMA grants	Long term	Medium	Carried forward	
16	Bring deficient high hazard dams up to current industry standards.	Dam failure	1, 2	Dam owners/ water companies, SLCo Flood Control Engineering	Partners include but are not limited to SLCo EM, local jurisdiction emergency management, Utah Dam Safety Section, Utah DEM, Salt Lake City public utilities	Life and safety (personal injuries, safety of first responders), damage to critical infrastructure	High	General funds, HHPD Grant	Long term	High	Carried forward	Salt Lake City completed work on Mountain Dell Dam (5 miles east of Salt Lake City next to Interstate 80) to mitigate existing leaks. Seismic activity is a threat to all of the dams in the county, and retrofitting may be needed to decrease the risk of failure due to an earthquake.
17	Rehabilitate Lake Mary-Phoebe Dam Structure.	Dam Failure	1, 2	Salt Lake City Corporation	Salt Lake County EM, Utah Division of Water Rights Dam Safety Section, Salt Lake City Public Utilities, Local Governments	Reinforce the dam structure, including addressing spalling and deterioration as indicated in dam inspection reports to decrease the risk of failure.	High	Salt Lake County General Fund, HHPD Grant, HMGP Grant	Short term	High	Carried forward from Addendum	
18	Enhance Spillway Capacity of Lake Mary-Phoebe Dam Structure.	Dam Failure	1, 2	Salt Lake City Corporation	Salt Lake County EM, Utah Division of Water Rights Dam Safety Section, Salt Lake City Public Utilities, Local Governments	Upgrade spillway capacity to manage extreme flood events, as suggested in the dam safety inspection and construction reports and reduce potential losses from failure.	High	Salt Lake County General Fund, HHPD Grant, HMGP Grant	Short term	Medium	Carried forward from Addendum	
19	Implement seepage control measures for Lake Mary-Phoebe Dam.	Dam Failure	1, 2	Salt Lake City Corporation	Salt Lake County EM, Utah Division of Water Rights Dam Safety Section, Salt Lake City Public Utilities, Local Governments	Implement pressure grouting to reduce seepage, as outlined in the Lake Mary–Phoebe Dam inspection and annual reports.	Medium	Salt Lake County General Fund, HHPD Grant,	Short term	High	Carried forward from Addendum	
20	Coordinate a project with Brighton Ski Resort and the U.S. Forest Service to improve the downstream channel	Dam Failure	1, 2, 8	Salt Lake City Corporation	Salt Lake County, Local Governments, Salt Lake City Corporation, Utah Division of Water Rights Dam Safety Section, Salt Lake City Public Utilities,	Work is needed on outlet channel to facilitate testing of outlet gates and prevent debris from entering spillway.	High	Salt Lake County General Fund, HHPD Grant, PDM grant	Long term	High	Carried forward from Addendum	According to Lake Mary – Phoebe Dam Annual Engineer Inspection reports, Salt Lake City Public Utilities is unable to release more than 15 cfs under normal conditions from the dam due to downstream limitations.

#	Action	Hazard(s)	Goals	Lead Agency	Potential Partners	Benefits (Losses Avoided)	Cost Estimate	Funding Source	Time Frame	Priority	New or Carried Forward	Comments
	of Lake Mary–Phoebe Dam.				Brighton Ski Resort, U.S. Forest Service							Flows higher than 15 cfs would blow out culverts and severely damage the access trail. This needs to be resolved so that the outlet gates can be tested over their full range annually. Watershed crews will continue to remove debris from the spillway and downstream channel. Special attention needs to be paid to maintaining the log boom so that debris does not enter the spillway. Significant work is needed for the outlet channel as woody vegetation continues to encroach on the channel and has potential to obstruct flows.
21	Conduct risk studies or engineering assessments to determine approaches to address issues identified in dam safety inspection reports.	Dam Failure	1, 2	SLCo EM	Salt Lake County Public Works Flood Control Engineering, Utah Division of Water Rights Dam Safety Section, Salt Lake City Public Utilities, Local Governments	Reduce potential losses from failure of HHPDs.	Medium	Salt Lake County General Fund, HHPD Grant, HMGP Grant	Medium	Medium	New	HHPDs with a safety condition rating of fair: SLCO Chandler Drive #13, SLCO Scott Ave., SLCO Shriners #12, SLCO Federal Heights #1a, SLCO Creekside Park, SLCO Rotary Glen Park, SLCO Big Cottonwood, White Pine, Jordan Valley Water Purification Upper, and Sandy City Storm Mountain. HHPDs with a safety condition rating of poor: Lake-Mary Phoebe, Red Pine, and Mountain Dell.
22	Rehabilitate or complete other safety projects for high hazard dams based on dam safety reports or risk studies.	Dam Failure	1, 2	SLCo EM	Salt Lake County Public Works Flood Control Engineering, Utah Division of Water Rights Dam Safety Section, Salt Lake City Public Utilities, Local Governments	Reduce potential losses from failure of HHPDs.	High	Salt Lake County General Fund, HHPD Grant, HMGP Grant	Long term	High	New	See above.
23	Xeriscape government-owned properties.	Drought	2, 8	SLCo Facilities Management	Partners include but are not limited to water companies/ districts, local jurisdictions, MSD, State of Utah, UFA, UPD, Sheriff's Office, local utilities	Decreased cost of landscape irrigation, decreased water use	High	General funds, SLCo Facilities Management, State of Utah, local jurisdictions, MSD	Short term	Low	New	
24	Develop and implement a water conservation plan.	Drought, extreme heat	2, 4, 5	SLCo PW	Partners include but are not limited to SLCo PW & Municipal Services, MSD, SLCo EM, SLCo Office of Regional Development, local jurisdictions, State of Utah, UFA, UPD, local hospitals, local utilities, local school districts	Decreased water use, improved tracking/ understanding of where water is going, and greater education on how water can be conserved on an individual, department, or agency level	Low	General funds	Short-term	Medium	Carried forward	A Water Element is being added to the General Plan, which might integrate with a water conservation plan. SLCo Regional Planning and Transportation Director would be a point of contact for this.
25	Develop and implement countywide plan to track green	Drought, extreme heat, flood, heavy rain	2	SLCo Office of Regional Development	Partners included but are not limited to the MSD, SLCo PW, Municipal	Central repository of information on green infrastructure projects in	High	General funds, HMA grants	Long term	Medium	Carried forward	Revised from 2019 plan to include tracking of green infrastructure projects in an effort to improve

#	Action	Hazard(s)	Goals	Lead Agency	Potential Partners	Benefits (Losses Avoided)	Cost Estimate	Funding Source	Time Frame	Priority	New or Carried Forward	Comments
	infrastructure projects and improve energy efficiency throughout the county.			(Environmental Sustainability), Facilities Management	Services District, local jurisdictions, State of Utah, UFA, UPD, local hospitals, local utilities, local school districts	Salt Lake County, improved energy efficiency, improved water and air quality						energy efficiency throughout the county.
26	Retrofit critical facilities and infrastructure to withstand earthquakes and other geologic hazards.	Earthquake	1, 2, 5	MSD	Partners include but are not limited to local PW/engineering departments, facility owners, UFA, SLCo EM, UPD, State of Utah, local hospitals, local utilities, local school districts	Improved facility/ infrastructure resilience, expanded lifespan, maintaining building codes/standards, saves lives, can maintain essential services in the event of an incident, reduces economic impact if it were to go down	High	PDM, HMGP, capital improvement budgets, bonds, state and local funds		High	Carried forward	Ongoing UFA fire station retrofits. For SLCo PW Operations, the master plan for the update of the yard is complete but more funding is needed to move forward.
27	Retrofit businesses, residential structures, infrastructure, and public buildings (especially in historic districts) to withstand moderate earthquakes and other geologic hazards.	Earthquake	1, 2, 5	MSD, Municipal Governments	Partners include but are not limited to facility owners, local PW/ engineering departments, local utilities, local hospitals, local school districts, State of Utah, Salt Lake Chamber of Commerce	Improved facility/ infrastructure resilience, expanded lifespan, maintaining building codes/standards, saving lives, maintaining essential services in the event of an incident, reducing economic impact	High	PDM, HMGP, capital improvement budgets, bonds, state and local funds	Ongoing	High	Carried forward	
28	Use flexible piping when extending water, sewer, or natural gas service to reduce damage from ground motion.	Earthquake	1, 2, 5	SLCo PW & MSD	Partners include but are not limited to the local utility companies, water districts, local PW/ engineering departments, UFA, UPD, State of Utah, SLCo EM, local hospitals,	Easier installation, versatility, reduced leak potential, durability, cost savings	High	PDM, HMGP, capital improvement budgets, bonds, state and local funds, utility companies	Ongoing	High	Carried forward	
29	Consider funding sources and development of programs for retrofitting unreinforced masonry structures, similar to Salt Lake City's "Fix the Bricks" program.	Earthquake	1, 2	MSD	Partners include but are not limited to the State of Utah, UFA, UPD, local jurisdictions, SLCo, local utilities, local hospitals, local school districts	Reduce structural damage, reduce personal injury from structural damage in an earthquake, reduce need for outside assistance post-earthquake	High	BRIC, PDM, HMGP, Community Development Block Grant Mitigation (CDBG-MIT)	Ongoing	High	New	Salt Lake City, the State of Utah, and FEMA use the "Fix the Bricks" program to fund residential retrofits of URMs in an effort to mitigate the effects of a large-scale earthquake by minimizing post-earthquake personal injury and requirement for outside assistance. Currently this program is primarily focused on Salt Lake City. A similar program or expansion of an existing program would be beneficial to other jurisdictions in the county with URMs.
30	Install shutoff valves and emergency connector hoses where water mains cross fault lines.	Earthquake	1,2, 5	Local Water Districts	Partners include but are not limited to the SLCo PW, Municipal Services, MSD, utility companies, local PW/ engineering departments, local utilities, local school districts, State of Utah, local hospitals	Backup of water supply, prevents water waste if a pipe were to be damaged, ensures that valves and connector hoses are up to code	High	PDM, HMGP, capital improvement budgets, bonds, state and local funds, utility companies	Ongoing	High	Carried forward	

DRAFT

#	Action	Hazard(s)	Goals	Lead Agency	Potential Partners	Benefits (Losses Avoided)	Cost Estimate	Funding Source	Time Frame	Priority	New or Carried Forward	Comments
31	Assess high-pressure pipelines to ensure that they meet seismic standards, and conduct upgrades as needed.	Earthquake	1, 2, 3, 5	Local pipeline companies, MSD Engineering Division	Partners include but are not limited to the SLCo PW, MSD, local utility companies, local PW/ engineering departments	Ensures pipelines are up to code and regularly reviewed, identifies a way to perform inspections and track pipelines over time for everyone's awareness	High	Private sector funds, HMA grants	Long term	Medium	Carried forward	
32	Procure generators and transfer switches for schools, public facilities, and critical facilities.	Extreme heat, extreme cold	2, 5	SLCo EM	Partners include but are not limited to SLCo Facilities Management, local school districts, NGO partners, local utilities, local hospitals, water districts, MSD, State of Utah, UFA, UPD, Sheriff's Office	Provides backup generators for cooling centers and code blue centers, accurate inventory of what the county must provide to other agencies or jurisdictions as needed	Medium	General funds, HMA grants	Long term	Medium	Carried forward	
33	Elevate and/or mitigate roadways in low-lying areas that are prone to overland flooding.	Flooding (flash and riverine)	2, 5	SLCo PW, UDOT, Office of Regional Development	Partners include but are not limited to the MSD, local PW/ engineering departments, State of Utah, SLCo EM, water districts	Keeps roads open for locals and emergency services, ensures adequate egress/ingress, increases resilience in the event of flooding	High	PDM, HMGP, FMA, NRCS, capital improvement budgets, bonds, state and local funds	Long term	High	Carried forward	SLCo PW Operations road maintenance/ improvements are ongoing for local jurisdictions.
34	Conduct flood-specific impact studies (Eastside Canal and Creek Study).	Flooding (flash and riverine), severe thunderstorm	1, 2, 4, 6	SLCo PW & Municipal Services Flood Control and Engineering	Partners include but are not limited to local PW, SLCo EM, water districts, local utilities	Improves understanding of flood impacts on areas throughout the county, provides blueprint for mitigation activities in those areas for improved resilience	Medium	PDM, HMGP, FMA, NRCS, capital improvement budgets, bonds, state and local funds		High	Carried forward	
35	Provide information and the need for NFIP coverage to property owners in flood-prone areas.	Flooding (flash and riverine)	4	SLCo EM	Partners include but are not limited to SLCo PW & Municipal Services, MSD, local jurisdiction emergency management	Improved education and resilience in flood-prone areas, greater understanding of flood risk by locals, managed inventory of who does or does not have NFIP coverage	Low	General funds, HMA grants		Medium	Carried forward	
36	Move electrical panels, mechanical equipment, and generators above base flood elevation (BFE) in facilities in flood-prone areas.	Flooding (flash and riverine)	2, 5	SLCo Facilities Management, SLC0 PW & Municipal Services	Partners include but are not limited to the MSD, local PW/ engineering departments, local school districts, local hospitals, local utilities, State of Utah, SLCo EM	Improved resilience in flood-prone areas, better educated on flood-proofing critical infrastructure/ facilities	Medium	PDM, HMGP, FMA, capital improvement budgets, bonds, state and local funds	Short term	High	Carried forward	
37	Enhance and expand green space, particularly in areas of past flooding.	Flooding (flash and riverine), heavy rain	1, 2	Salt Lake County Real Estate	Partners include but are not limited to the SLCo PW, Municipal Services Flood Control Engineering division, MSD, local PW/ engineering departments, SLCo EM, UFA, UPD, State of Utah, water districts, local utilities,	Reduced costs (from not having to rebuild the area post-flooding), improved tracking/ monitoring of areas prone to flooding	High	General funds, HMA grants	Long term	Medium	Carried forward	

#	Action	Hazard(s)	Goals	Lead Agency	Potential Partners	Benefits (Losses Avoided)	Cost Estimate	Funding Source	Time Frame	Priority	New or Carried Forward	Comments
					local school districts, local hospitals							
38	Improve flood resistance through enhancement of wing walls, flood barriers, foundations, etc. at likely flood impact points.	Flooding (flash and riverine)	1, 2	SLCo PW & Municipal Services Flood Control and Engineering	Partners include but are not limited to the MSD, local PW/ engineering departments, canal districts, water districts, local school districts, local hospitals, local utilities, State of Utah, UDOT	Erosion control/ support ensures that roads are clear for emergency services and locals near flood-prone areas, reduces likelihood of costly repairs, easy to install, long-lasting	High	PDM, HMGP, FMA, capital improvement budgets, bonds, state and local funds	Long term	High	Carried forward	
39	Construct temporary debris traps and other flood-mitigating structures in wildfire-burned areas.	Flooding (flash and riverine), wildfire, heavy rain	1, 2	SLCo PW & Municipal Services Flood Control and Engineering	Partners include but are not limited to the MSD, local PW/ engineering departments, canal districts, Utah DNR, NRCS, UDOT, local school districts, local utilities, UFA, local fire departments, State of Utah	Keeps roads open for emergency services, ensures adequate egress/ingress, improves community resilience, prevents further damage to areas downstream from flooding, reduces recovery/damage costs	High	PDM, HMGP, FMA, capital improvement budgets, bonds, state and local funds	Long term	High	Carried forward	Example: constructing a diversion at Millcreek to a drainage area.
40	Increase the size of culverts and bridges in areas SLCo has identified as past or potential flooding concerns.	Flooding and Heavy Rain	1, 2	SLCo PW & Municipal Services Flood Control Engineering	Partners include but are not limited to SLCo EM, local PW/ engineering departments, water districts, local utilities, MSD, State of Utah, UDOT	Allows for larger runoff during spring melt season, reduces the amount of debris buildup	High	PDM, HMGP, FMA, NRCS, capital improvement budgets, bonds, state and local funds	Long term	Medium	Carried forward	
41	Help local jurisdictions procure FMA grants.	Flooding	1, 2, 4, 6	SLCo EM, Utah DEM	Local jurisdictions, SLCo PW, MSD, local school districts, local hospitals, State of Utah, water districts, local utilities, private dam owners, SLCo EM	Improved understanding of available grants and how money can be used for mitigation efforts	Low	FMA	Long term	Medium	Carried forward	SLCo EM will track mitigation activities on their website for the public and local agencies/ jurisdictions to see what work is underway. This will help in seeing what has occurred over time for the next plan update.
42	Conduct Surplus Canal rehabilitation to address deficiencies.	Flooding		SLCo PW & Municipal Services–Flood Control Engineering	FEMA, State of Utah, Salt Lake City, MSD, Salt Lake City airports, SLCo EM, water districts, local utilities	Improve the 300 deficiencies identified in 2017	High: $500K+	FEMA's BRIC grant, State of Utah, SLCo, local jurisdictions	Long term	High	New	SLCo Flood Control is working to bring the Surplus Canal levees back into USACE compliance, determine all encroachments on property currently owned by the county or other government entities, acquire property within 10 feet of the landside toe of the levee, relocate fences outside USACE jurisdiction, and remove all encroachments on the newly acquired property.
43	Remove debris and vegetation from floodway and drainage structures through a systematic maintenance program.	Flooding	1, 2	SLCo PW & Municipal Services Flood Control Engineering	Partners include but are not limited to the MSD, local PW/ engineering departments, canal districts, State of Utah, local utilities, water districts, SLCo EM	Improved tracking/ maintenance of debris and vegetation in floodway/ drainage structures	Medium	PDM, HMGP, FMA, capital improvement budgets, bonds, state and local funds	Ongoing	Medium	Carried forward	Lack of funding and personnel. SLCo PW Operations assists.

DRAFT

#	Action	Hazard(s)	Goals	Lead Agency	Potential Partners	Benefits (Losses Avoided)	Cost Estimate	Funding Source	Time Frame	Priority	New or Carried Forward	Comments
44	Install pump stations in strategic locations to mitigate flooding.	Flooding	1, 2	SLCo PW & Municipal Services Flood Control and Engineering	Partners include but are not limited to the MSD, local PW/ engineering departments, canal districts	Redundancy, prevents further damage, reduces recovery costs	Medium	PDM, HMGP, FMA, NRCS, capital improvement budgets, bonds, state and local funds	Ongoing	High	Carried forward	SLCo PW currently bidding out City Drain Pump Station.
45	Construct debris basins, flood retention ponds, and energy flow dissipaters to control the flow and release of floodwaters.	Flooding (flash and riverine)		SLCo PW & Municipal Services Flood Control and Engineering	Local PW/ engineering departments, MSD, canal districts, water districts, local utilities, SLCo EM	Redundancy, prevents further damage, reduces recovery costs	High	FMA, capital improvement budgets, HMGP, PDM	Ongoing	Medium	Carried forward	
46	Collaborate with private canal companies to mitigate drainage, leakage, and capacity issues.	Flooding, dam failure, levee failure	1, 2	SLCo PW & Municipal Services Flood Control and Engineering	MSD, local PW/ engineering departments, canal districts, water districts, State of Utah, private dam owners, SLCo EM	Prevents further damage, reduces recovery costs, enables a common understanding of the issues between relevant parties	High	PDM, HMGP, FMA, NRCS, capital improvement budgets, bonds, state and local funds	Ongoing	High	Carried forward	Lack of funding and personnel.
47	Conduct levee upgrades and certification.	Flooding, dam failure (levee failure)	1, 2	SLCo PW & Municipal Services Flood Control and Engineering	MSD, local PW/ engineering departments, SLCo EM, State of Utah, water districts, local utilities, UDOT	Reduces flooding, keeps roads open for emergency services, preserves critical infrastructure/ historical structures, lowers recovery costs	High	PDM, HMGP, FMA, NRCS, capital improvement budgets, bonds, state and local funds	Long term	High	Carried forward	Making progress and the accreditation of the Surplus Canal levee system. The levees along the Surplus Canal do not currently meet FEMA levee certification criteria as defined in the CFR Section 65.10 using the current effective FEMA base flood magnitude of 4,500 cfs. Levee upgrades and improvements include, but are not limited to: Storm drainpipes that penetrate the levees should be provided with closure devices per FEMA standards to prevent river water from flooding land behind levee enclosures. This action should be given a high priority to increase levee performance during a flood event and to facilitate certifying the levees. In certain locations, channel dredging activities have destabilized the toe of the canal banks, which has destabilized the reaches of the canal banks. To stabilize the canal banks, the canal banks should be modified and future channel dredging should be performed in a manner that will not destabilize the banks.

DRAFT

#	Action	Hazard(s)	Goals	Lead Agency	Potential Partners	Benefits (Losses Avoided)	Cost Estimate	Funding Source	Time Frame	Priority	New or Carried Forward	Comments
48	Conduct public awareness campaign on Tier 2 reporting software for chemical reporting.	Hazardous materials incidents	1, 2, 4, 5, 6, 7, 8	SLCo EM, LEPC	Partners include but are not limited to UFA, UPD, local jurisdictions, Sheriff's Office, Rio Tinto, State of Utah, SLCo Health Department, Utah Department of Environmental Quality, water districts, local utilities, local school districts, local fire departments	Improved understanding of Tier 2 reporting and how local agencies/ jurisdictions can find and submit information, a common operating platform for hazardous materials reporting	Low	General funds, SLCo EM, LEPC, local jurisdictions, State of Utah	Long term	Medium	New	
49	Conduct a commodity flow allocation study for rail and road transportation.	Hazardous materials incidents	2, 5	SLCo EM, LEPC	Partners include but are not limited to local jurisdiction emergency management, SLCo Planning and Transportation, SLCo Housing and Community Development, SLCo Economic Development, UFA, UPD, local fire departments, State of Utah, local utilities, water districts, SLCo Health Department	Improved situational awareness, greater preparation in the event of a HAZMAT incident, improved response plans	Medium	General funds, HSGP grants	Short term	Low	Carried forward	A commodity flow allocation study will help identify potential sources of hazardous materials and where incidents may occur. It will also address the communication gap between intelligence groups, fire agencies, and local jurisdictions. The study will improve coordination between different agencies, which will then strengthen emergency response plans throughout the county.
50	Ensure that all new construction meets enhanced standards for wind loading, snow-loading, and other weather-related hazards.	High wind, heavy snow, heavy rain, tornado.	1, 2, 5	MSD and SLCo Public Works & Municipal Services	MSD, utility companies, local public works/engineering departments, local school districts, State of Utah, UFA, UPD	Ensure that new construction is up to code, increased community resilience, reduced recovery costs	Medium	General funds, HMA grants	Ongoing	Medium	Carried forward	
51	Enact countywide regulations and codes for development to reduce landslide and slope failure damage to critical infrastructure and buildings.	Landslides, slope failures	1, 2, 4, 7, 8	MSD	SLCo EM, UFA, SLCo Office of Regional Development, local jurisdictions, local fire departments, local utilities, school districts	Reduce the likelihood of landslides and critical infrastructure/ building damage, ensure that future development is up to code and follows policy to avoid repetitive loss properties	Medium	SLCo, MSD, State of Utah	Long term	Medium	New	
52	Leverage WebEOC and GIS to track the spread of contagious disease.	Public health epidemics/ pandemics	1, 2, 5, 6, 8	SLCo Health Department	SLCo EM, UFA, MSD, UPD, Sheriff's Office, local jurisdictions	Use GIS and WebEOC software to maintain situational awareness and track illnesses throughout the county	Low	SLCo EM, local jurisdictions, SLCo Health Department, UT Department of Environmental Quality	Short term	Medium	New	County/local jurisdictions already have existing software; improved training/documentation required.

DRAFT

#	Action	Hazard(s)	Goals	Lead Agency	Potential Partners	Benefits (Losses Avoided)	Cost Estimate	Funding Source	Time Frame	Priority	New or Carried Forward	Comments
53	Create public awareness campaigns and public education programs on radon risks and increase public support for home testing for radon.	Radon	1, 2, 4, 8	SLCo EM, SLCo Health Department	Partners include but are not limited to Aging & Adult Services, SLCo Health Department, local jurisdictions, State of Utah	Decrease radon-caused cancer deaths, increase engagement/ understanding with the public on what SLCo can do or help with	Low	SLCo Health Department, local jurisdictions, State of Utah	Short term	Low	New	
54	Conduct seminar to assist Emergency Managers in public education about radon kits.	Radon	1, 4	SLCo EM, SLCo Health Department	State of Utah, local jurisdictions, Aging & Adult Services	Increased understanding of radon risk and ways in which emergency management agencies can assist/educate the public	Low	SLCo EM operating budget	Short term	Low	Carried forward	SLCo EM will conduct a half-day seminar to help Emergency Managers educate their citizens about procuring radon testing kits. Salt Lake County Health Department will provide a presentation. This goal wasn't a priority for the SLCo Health Department during the COVID-19 pandemic, and there has not been a discussion on radon education since.
55	Develop a road resurfacing project that includes permeable pavement for areas with rain-based flooding to reduce roadway flooding.	Heavy Rain	1, 2, 5, 8	SLCo PW & Municipal Services, MSD	SLCo Parks and Recreation, local jurisdictions, UDOT, State of Utah	Reduce pollutants discharged in runoff, reduce road maintenance time/costs, improve traction on roads	High	SLCo, UDOT, FMA, HMGP	Long term	Low	New	
56	Create a public education program for property owners to learn about tree maintenance and high-strength windows.	High Winds	1, 4	SLCo EM	Partners include but are not limited to Aging & Adult Services, SLCo PW, UFA, local jurisdictions, MSD, State of Utah, NWS	Reduce damage to critical infrastructure during high wind events, prevent personal injuries (people driving on roads or walking in the neighborhood), improve relationships with stakeholders and the public	Low	SLCo PW, SLCo EM, UFA	Short term	Low	New	
57	Plan for and maintain adequate road and debris clearing capabilities.	Severe weather: high wind, heavy rain, tornado	1, 2, 5	SLCo PW & Municipal Services	MSD, local PW/ engineering departments, UDOT	Ensures roads are open for emergency services	Medium	General funds, HMA grants, state funds, UDOT	Ongoing	Medium	Carried forward	SLCo PW Operations has an emergency action plan to respond to disasters, including road and debris clearing.
58	Develop a severe winter weather mitigation program to maintain access to primary roadways and evacuation routes.	Severe winter weather: heavy snow, blizzards	1, 2, 5, 8	SLCo PW & Municipal Services, MSD	SLCo EM, local jurisdictions, UDOT	Emergency services (e.g., police, fire, and paramedics) can utilize roads to provide their services	Medium	MSD, local jurisdictions	Short term	High	New	A severe winter storm with heavy snowfall requires roadway clearance for the public and emergency vehicles. The primary efforts will be to keep the roads open by clearing snow.

DRAFT

#	Action	Hazard(s)	Goals	Lead Agency	Potential Partners	Benefits (Losses Avoided)	Cost Estimate	Funding Source	Time Frame	Priority	New or Carried Forward	Comments
59	Improve communication to the public and stakeholders on available resources when a Code Blue alert is in effect during severe winter weather.	Severe winter weather	1, 3, 4, 6, 7	SLCo EM, SLCo Office of Homelessness and Criminal Justice Reform	Partners include but are not limited to local jurisdiction emergency management, MSD, State of Utah, NWS	Prevent further damage to critical infrastructure, ensure that homeless individuals have warming resources available, reduce pressure on local homeless resource providers with standard protocols to follow during a Code Blue alert	Low	SLCo EM, SLCo Health Department, State of Utah	Short term	Low	New	
60	Conduct public awareness campaign about lightning safety.	Severe weather: lightning	1, 2, 4	SLCo EM	Partners include but are not limited to NWS, SLCo Parks and Recreation, UFA, SLCo PW, local jurisdictions, MSD, State of Utah	Lightning strike awareness for the public	Low	SLCo, MSD, local jurisdictions, NWS	Short term	Low	New	
61	Enhance security at critical public safety and technology infrastructure sites.	Terrorism	1, 2, 3, 5, 6	SLCo EM	Local jurisdictions, UPD, UFA, MSD, SLCo IT, SLCo PW, SLCo Clerk's Office, Sheriff's Office	Increased security protocols (in both technology and policy) for staff/first responders, clear expectations/ understanding for local jurisdictions and the public	Medium	SLCo EM, local jurisdictions, UPD, Sheriff's Office, UFA, MSD, general funds, HSGP grants	Short term	Medium	Carried forward	Revised verbiage from previous mitigation action that addressed the CIKR Security/Hardening Program.
62	Improve outreach for "see something, say something" QR code to deter terrorist acts.	Terrorism (including cyberattacks)	1, 2, 4, 5, 6, 7, 8	SLCo EM,	Partners include but are not limited to SLCo Sheriff's Office, UPD, UFA, MSD, local jurisdictions, SLCo IT	Ensure that residents and local agencies/ jurisdictions are aware of local intelligence resources and how to report suspicious activity, encourage QR code use/ outreach at special events in the county	Low	SLCo EM, local jurisdictions	Short term	Medium	New	
63	Develop a countywide intelligence group/ division to monitor and analyze threats in advance of an incident.	Terrorism (including cyberattacks)	1, 2, 4, 5, 6, 7, 8	SLCo EM	Local jurisdictions, SLCo Sheriff's Office, SIAC, Department of Homeland Security (DHS), Bureau of Alcohol, Tobacco, Firearms and Explosives (ATF), Federal Bureau of Investigation (FBI)	Central group to collect and analyze information, development of SOPs for intelligence, greater collaboration	Low	Energy Storage and Power Generation (ESPG) grant, SHSP	Short term	Medium	New	This would be a core group of stakeholders who meet on a regular basis to share and collaborate on intelligence data.
64	Review critical infrastructure facilities to ensure that building materials are up to code and tornado resistant.	Tornadoes	1, 2, 5, 7, 8	MSD	Partners include but are not limited to the SLCo EM, local jurisdictions, SLCo PW, State of Utah, UFA, UPD, SLCo Facilities Management	Ensure that critical infrastructure facilities are operational/ functional in the event of a disaster, preserve life and safety	Medium	SLCo EM, MSD, local jurisdictions, UFA	Short term	Low	New	
65	Promote the Firewise initiative and regularly review/update the community wildfire protection plans (CWPPs) for at-risk communities.	Wildfires	1, 2, 4, 6	Salt Lake County Fire Warden	Partners include but are not limited to UFA, SLCo EM, local jurisdictions, State of Utah	Increased awareness of plans (for the public and stakeholders), improved eligibility for grants/other funding sources, regular review of CWPP	Low	SLCo EM, MSD, local jurisdictions, Community Wildfire Assistance Grant, Fire Prevention and Safety Grant	Short term	Medium	Carried forward	

DRAFT

NFIP-Specific Mitigation Actions and Implementation

The following mitigation strategy demonstrates Salt Lake County and its participating jurisdictions' continued support and compliance with National Flood Insurance Program (NFIP) requirements, as appropriate.

- Countywide Action—Help County Jurisdictions Procure FMA Grants

Other priorities in Salt Lake County related to NFIP participation include:

1. Increased Community Rating System (CRS) participation throughout the county
2. Increase in the number of flood insurance policies
3. Increased number of Certified Floodplain Managers (CFMs) in the county
4. Post-flood damage estimate training for county and municipal staff
5. Acquisition of severe repetitive loss and repetitive loss properties
6. Higher regulatory standards, including higher freeboard, cumulative substantial damage and substantial improvement threshold, and enforcing floodplain regulations in areas of known urban, typically shallow depth, flooding.

NFIP participation, compliance, and status information for each participating jurisdiction can be found in Volume 2 in the respective capability assessments.

DRAFT

Plan Implementation and Maintenance

Evaluating, updating, and monitoring this plan are critical to maintaining its value and success in the county's hazard mitigation efforts. A hazard mitigation plan must present a plan maintenance process that includes the following (44 Code of Federal Regulations [CFR] Section 201.6(c)(4)):

- A section describing the method and schedule of monitoring, evaluating, and updating the mitigation plan over a five-year cycle
- A process by which local governments incorporate the requirements of the mitigation plan into other planning mechanisms, such as comprehensive or capital improvement plans, when appropriate
- A discussion on how the community will continue public participation in the plan maintenance process

This section details the formal process that will ensure that the Salt Lake County Multi-Jurisdictional Hazard Mitigation Plan remains an active and relevant document and that the planning partners maintain their eligibility for applicable funding sources. The plan's format allows sections to be reviewed and updated when new data become available, resulting in a plan that will remain current and relevant.

Plan Implementation

The effectiveness of the hazard mitigation plan depends on its implementation and incorporation of its action items into partner jurisdictions' existing plans, policies, and programs. Salt Lake County Emergency Management will assume lead responsibility for **implementation** and **monitoring** of this plan maintenance strategy. Although the county will have primary responsibility, plan implementation and **evaluation** will be a shared responsibility among all planning partners and agencies identified as lead agencies in the mitigation action plans. Completion of this strategy is the responsibility of each planning partner. This was conveyed to each planning partner as an expectation at the beginning of the planning process. Many of the mitigation actions developed by the participating jurisdictions include elements of mitigation implementation including the National Flood Insurance Program (NFIP), the Utah Wildland-Urban Interface Code, the Building Code Effectiveness Grading System (BCEGS), and Community Rating System (CRS), all of which have been implemented.

Incorporation into Other Planning Mechanisms

Plan integration is the process by which the prior and current mitigation plans are incorporated into other planning mechanisms. These can include efforts to manage local land use development and community decision-making, such as budgets, comprehensive plans, capital improvement plans, economic development plans, and other long range or strategic plans.

The plan participants identified which planning mechanism the 2019 mitigation plan was integrated into in the jurisdictional annexes. Salt Lake County identified previous plan integration as shown in Table 96.

DRAFT

Table 96: Previous Plan Integration for Salt Lake County

Plan	Description
Comprehensive Emergency Management Plan (CEMP)	The CEMP incorporated information from the previous HMP update as far as operations, planning, and coordination between various departments/agencies. The HMP update will also inform additional annexes of the CEMP for damage assessments, terrorism, etc.
Salt Lake County West General Plan	The West General Plan included information on hazards specific to the west side of Salt Lake County as far as land use, housing, the environment, water, transportation, utilities, and the economy.

Once the Salt Lake County Multi-Jurisdictional Hazard Mitigation Plan is promulgated, participating jurisdictions will include this plan's information in existing programs and plans. These could include the general or master plan, emergency response or operations plans, municipal codes, capital improvements plan, or community design guidelines, among others. All municipal planning partners are committed to creating a linkage between this hazard mitigation plan and their jurisdiction-specific plans. The jurisdictional annexes in Volume 2 provide additional detail regarding into which local plans the participants have incorporated information from the previous mitigation plan, and those in which they may incorporate information from this updated mitigation plan. Potential future integration options for Salt Lake County are in Table 97.

Table 97: Future Plan Integration for Salt Lake County[282]

Plan	Description
Community Wildfire Protection Plan (CWPP) Update	The HMP update can be integrated into the 2025 update of the CWPP to incorporate mitigation actions. This will help in accountability and the continuous discussion of mitigation. SLCo EM and the UFA's wildland division will be the main points of contact.
Comprehensive Emergency Management Plan – Damage Assessment Annex	Hazard information along with key stakeholders/agencies identified in the HMP update can inform the damage assessment annex to provide a framework for city/county program integration. SLCo EM will be the main point of contact.
County General Plan – Water Element	SB passed in 2022 and SB 76 passed in 2023 require counties to develop a water use and preservation element that is integrated with their land use planning and development (General Plan). This could integrate information or actions relating to drought.
Salt Lake County Resource Management Plan	Identifies goals and objectives for managing natural resources on public lands and potential mitigation actions for hazards.
Wasatch Canyons General Plan	Long range plan for the development of communities in the Wasatch Canyon areas of Salt Lake County.

The information on hazard, risk, vulnerability, and mitigation in this plan is based on the best science and technology available at the time this plan was prepared. The comprehensive plans of participating jurisdictions are considered to be integral parts of this plan. The county and partner municipalities have

[282] SLCo EM = Salt Lake County Emergency Management, UFA = Unified Fire Authority.

also planned for the impact of natural hazards through adoption of zoning ordinances. The plan development process provided the county and the municipalities with the opportunity to review and expand on policies in these planning mechanisms. The planning partners used their comprehensive plans (when applicable) and the hazard mitigation plan as complementary documents that work together to achieve the goal of reducing risk exposure to the citizens of the planning area. An update to a comprehensive plan may trigger an update to the hazard mitigation plan.

Some action items do not have to be implemented through regulation. Instead, they may be implemented through the creation of new educational programs, continued interagency coordination, or increased public participation. As information becomes available from other planning mechanisms that can enhance this plan, that information will be incorporated through the update process.

Maintenance Schedule and Evaluation Process

Periodic monitoring and updates of this plan are required to ensure that the plan's goals are kept current and that local mitigation strategies are being carried out. This portion of the plan outlines the procedures for completing revisions and updates. The plan will also be revised to reflect lessons learned or to address specific hazard incidents arising from a disaster.

Annual Review Procedures

County jurisdictions will be responsible for annual reviews of the mitigation strategies described in this plan, as required by Utah DEM, or as situations dictate, such as following a disaster declaration. Salt Lake County Emergency Management, which will regularly monitor the plan, is responsible for making revisions and updates to Volume 1 of this plan. SLCo EM will notify plan participants when annual reviews will take and provide opportunity for them to participate. This process may include the county organizing a mitigation planning committee composed of individuals from the jurisdictions and organizations responsible for implementing the described mitigation strategies. Each participating jurisdiction will be responsible for tracking the status of mitigation actions identified in their annex.

Progress toward the completion of the strategies will be assessed and adjustments may be made, as needed. If Salt Lake County Emergency Management, the participating jurisdictions, or Utah DEM determines that a modification of the plan is warranted, an amendment to the plan may be initiated as described below.

PLAN EFFECTIVENESS EVALUATION

Appendix D has a form for supporting plan maintenance. The participating jurisdictions of the mitigation plan can use this form to evaluate the effectiveness of the plan during the five-year update cycle. If recommended changes are identified, plan participants can amend the plan or integrate the finding into the next plan update.

DRAFT

Plan Amendments

The Salt Lake County Emergency Management Hazard Mitigation Officer, the Local Mitigation Committee, or the Mayor/City Manager of an affected community will initiate amendments and updates to the Plan.

Upon initiation of an amendment to the plan, Salt Lake County Emergency Management will forward information on the proposed amendment to all interested parties including but not limited to all affected city or county departments, residents, and businesses. Depending on the magnitude of the amendment, the full planning committee may be reconstituted.

At a minimum, the information will be made available through public notice in a newspaper of general circulation or on the Salt Lake County Emergency Management website. The review and comment period for the proposed plan amendment will last for no less than 30 days.

At the end of the comment period, the proposed amendment and all review comments will be forwarded to participating jurisdictions for consideration. If no comments are received from the reviewing parties in the specified review period, such will be noted accordingly. Salt Lake County Emergency Management will review the proposed amendment along with comments received from other parties and submit a recommendation to the Utah State Hazard Mitigation Officer and FEMA in 60 days of the end of the comment period.

In determining whether to recommend approval or denial of a plan amendment request, the following factors will be considered:

- There are errors or omissions made in the identification of issues or needs during the preparation of the plan.
- New issues or needs have been identified which were not adequately addressed in the plan.
- There has been a change in information, data, or assumptions from those on which the plan was based.
- The nature or magnitude of risks has changed.
- There are implementation problems, such as technical, political, legal, or coordination issues with other agencies.

Upon receiving the recommendation of Salt Lake County Emergency Management, a public hearing will be held. Salt Lake County Emergency Management will review the recommendation (including the factors listed above) and any oral or written comments received at the public hearing. Following that review, Salt Lake County Emergency Management will take one of the following actions:

1. Adopt the proposed amendment as presented.
2. Adopt the proposed amendment with modifications.
3. Defer the amendment request for further consideration and/or hearing.

DRAFT

4. Reject the amendment request.

Five-Year Plan Review

Local hazard mitigation plans must be reviewed, revised if appropriate, and resubmitted for approval to remain eligible for benefits under the Disaster Mitigation Act (44 CFR, Section 201.6(d)(3)). The planning partnership intends to update the hazard mitigation plan on a five-year cycle from the date of initial plan adoption. This cycle may be accelerated to less than five years based on the following triggers:

- A Presidential Disaster Declaration that impacts the planning area
- A hazard event that causes loss of life
- A comprehensive update of the county's or participating municipality's comprehensive plan

Typically, the same process that was used to create the original plan will be used to prepare the update. The update will, at a minimum, include the following elements:

- The update process will be convened through a steering committee.
- The hazard risk assessment will be reviewed and, if necessary, updated using best available information and technologies.
- The action plans will be reviewed and revised to account for any actions completed, dropped, or changed and to account for changes in the risk assessment or new partnership policies identified under other planning mechanisms (such as the comprehensive plan).
- The draft update will be sent to appropriate agencies and organizations for comment.
- The public will be given an opportunity to comment on the update before adoption.
- The partnership governing bodies will adopt their respective portions.

Continued Public Involvement

Public involvement in the planning process has been and will be critical to the development of the plan and its updates. The plan will be available on the Salt Lake County Emergency Management website to provide opportunities for public participation and comment. The plan will also be available for review at the office of Salt Lake County Emergency Management.

Salt Lake County Emergency Management has been designated as the lead agency in preparing and submitting the Salt Lake County Multi-Jurisdictional Hazard Mitigation Plan, which includes coverage for all areas in Salt Lake County. Limited resources make it difficult to identify and individually contact all the people and agencies that may stand to benefit from the plan. Because of this, the following course of action has been established and will include all jurisdictions and special districts in the planning area.

- **Step 1:** Salt Lake County Emergency Management will publicly advertise all requests for input and meetings directly related to the mitigation planning process. Meetings of the Mitigation Planning Team where plan items are discussed and where actions are taken will not receive special notifications as

they are already advertised according to set standards. All interested parties are welcome and invited to attend such meetings and hearings, because they are public and open to all.

- **Step 2:** The county has established a mailing list of many local agencies and individuals that might have an interest in the plan. Each identified agency or person will be mailed a notice of the hearings and open houses.
- **Step 3:** Comments, both oral and written, will be solicited and accepted from any interested party. Comments, as far as possible, will be included in the final draft of the plan. However, Salt Lake County Emergency Management reserves the right to limit comments that are excessively long, due to the size of the plan.
- **Step 4:** Specific to risk assessment and hazard mitigation, needs analysis, and capital investment strategies, Salt Lake County Emergency Management will also make initial contact and solicitation for input from each incorporated jurisdiction in the region. All input is voluntary. Staff time and resources may not allow personal contact with other agencies or groups; however, comments and strategies are welcomed as input to the planning process from any party by regular mail, fax, email, and phone call. In addition, every public jurisdiction advertises and conducts public hearings on their planning and budget, where most of these mitigation projects are initiated. Input can be received from these prime sources by the region as well.

Each plan participant will be responsible for advertising this opportunity to continue to participate in the plan maintenance and update process. SLCo EM will send out biannual outreach reminders to the plan participants and discuss this component of the plan maintenance process in the county emergency managers meeting, which includes all city, county, school, and special district emergency managers. At a minimum, the plan participants will share information on social media. The plan participants will evaluate if any of the information should be incorporated into the plan during the annual review process and the plan update process (see Table 98).

Table 98: Strategies for Continued Public Involvement by Plan Participants

Plan Participant	Continued Public Involvement Methodology
Salt Lake County	• Maintain the mitigation plan on the Salt Lake County website, including specific information for the public on how to provide input on the plan to the Salt Lake County Emergency Management. • Remind plan participants biannually via email and at the county emergency managers meeting to solicit public input on the mitigation plan. • Work with the PIO associates from participating cities and stakeholders to coordinate social media post information and resources. • Twice a year, use social media to share the link to the hazard mitigation plan, including the public feedback contact information. • Publish a StoryMap to educate the public about hazards and provide updates on the mitigation action status. • Share wildfire information and encourage feedback on the hazard mitigation plan at classes on WUI mitigation, including defensible space and home hardening.

Plan Participant	Continued Public Involvement Methodology
	• Work with the Salt Lake County Health Department to develop and host public education campaigns for vulnerable populations, including classes and posting flyers in public locations, and document feedback.
Town of Alta	• Twice a year, use social media or the website to share the link to the hazard mitigation plan, including the feedback email address. • Incorporate the hazard mitigation plan and the opportunity to provide feedback into public awareness and education campaigns on weather-related hazards. • Once a year, post notices about the hazard mitigation plan in an email newsletter used to communicate with residents.
Town of Brighton	• Twice a year, use social media, the website, or community newsletter to share the link to the hazard mitigation plan, including the public feedback contact information. • Share the mitigation plan link and request feedback during public education awareness campaigns on extreme cold or other hazards. • Share the hazard mitigation plan and request feedback in the town email newsletter.
Bluffdale	• Twice a year, use social media (Facebook) or the website to share the link to the hazard mitigation plan, including the public feedback contact information. • Share information about the hazard mitigation plan and opportunities to provide feedback through Bluffdale's Prep & Prosper preparedness classes.
Copperton	• Twice a year, use social media, the website, or community newsletter to share the link to the hazard mitigation plan, including the public feedback contact information. • Share information about the hazard mitigation plan, including the request for public feedback at Copperton Town Days or a similar event.
Cottonwood Heights	• Twice a year, use social media or the website to share the link to the hazard mitigation plan, including the public feedback contact information. • Add information on hazards, including linking to the hazard mitigation plan and requesting public feedback, in the city newsletter.
Draper City	• Twice a year, use social media (Facebook), the website, or community newsletter (Draper Forward) to share the link to the hazard mitigation plan, including the public feedback contact information. • Share information with homeowners and renters as part of the hazard public education campaign for weather-related hazards.
Emigration Canyon	• Twice a year, use social media or the website to share the link to the hazard mitigation plan, including the public feedback contact information. • Promote mitigation, including soliciting feedback on the mitigation plan during community wildfire prevention events and outreach campaigns to residents.
Herriman	• Twice a year, use social media (Facebook), the website, or community newsletter to share the link to the hazard mitigation plan, including the public feedback contact information. • Share public education about hazards and the opportunity to submit feedback on the mitigation plan through the Herriman Connection newsletter included in the utility bill.

DRAFT

Plan Participant	Continued Public Involvement Methodology
Holladay	• Twice a year, use social media (Facebook, Instagram) or the website to share the link to the hazard mitigation plan, including the public feedback contact information. • Share the hazard mitigation plan at CERT trainings and during the annual emergency preparedness fair and solicit feedback. • Share public education campaign information through the city e-newsletter or the Emergency Preparedness website and monthly messages and provide an opportunity for public feedback.
Kearns	• Twice a year, use social media or the website to share the link to the hazard mitigation plan, including the public feedback contact information. • Share the hazard mitigation plan and request public feedback through public education and awareness campaigns in the city newsletter.
Magna	• Twice a year, use social media or the website to share the link to the hazard mitigation plan, including the public feedback contact information. • Share the link to the hazard mitigation plan and information on how to provide feedback via the monthly online newsletter.
Midvale	• Twice a year, use social media (Facebook, Instagram), the website, or City Journal newsletters to share the link to the hazard mitigation plan, including the public feedback contact information. Share the mitigation plan and request public feedback via the public awareness program.
Millcreek	• Twice a year, use social media (Facebook, Instagram, and X) or the website to share the link to the hazard mitigation plan, including the public feedback contact information. • Share mitigation information, including a link to the hazard mitigation website, which includes the request for public feedback, in either the weekly e-newsletter or the monthly Millcreek News mailed to residents. • Encourage public feedback on the mitigation plan at community trainings with Unified Fire Authority, St. Mark's Hospital, University of Utah Health, and CERT classes. • Share the mitigation plan and request public feedback via the public awareness program for hazards, such as drought, extreme heat, and radon.
Murray	• Twice a year, use social media (Facebook, Instagram, etc.), the website, or a community newsletter to share the link to the hazard mitigation plan, including the public feedback contact information. • Share the mitigation plan and solicit feedback through public awareness campaigns on weather hazards, dam failure, wildfires, and more. This can include the city newsletter, social media, or in-person training such as CERT. • Share mitigation information and solicit feedback on the current plan during the Emergency Operations Plan update, community outreach, and at an Emergency Fair.
Riverton	• Twice a year, use social media to share the link to the hazard mitigation plan, including the public feedback contact information. • Share the mitigation plan and solicit feedback on the plan through an education campaign conducted via social media, the Riverton Connect App, the Riverton Recap email newsletter, and the Riverton Review included in the utility bill, and include information about hazards, such as

Plan Participant	Continued Public Involvement Methodology
	dam failure, earthquake, extreme cold, high wind, lightning, radon, severe winter weather, tornado, and wildfire.
Salt Lake City	• Twice a year, use social media or the website to share the link to the hazard mitigation plan, including the public feedback contact information. • Use a monthly Featured News post on the website to share information about the hazard mitigation plan with residents, including options to provide feedback. • Include the hazard mitigation plan link at public training events such as CERT classes.
Sandy City	• Twice a year, use social media, the website, and a community newsletter (Sandy Journal) to share the link to the hazard mitigation plan, including the public feedback contact information. • Share information about the mitigation plan through Be Ready Sandy and encourage feedback.
South Salt Lake	• Twice a year, use social media or the website to share the link to the hazard mitigation plan, including the public feedback contact information. • Use city "On the Move" newsletter and the Emergency Management "Monthly Preparedness Tips" to share information about the hazard mitigation plan and public education campaigns for hazards • Include a link to the hazard mitigation plan and feedback information at CERT and amateur radio classes.
Taylorsville	• Twice a year, use social media (X, Facebook, Instagram) or the website to share the link to the hazard mitigation plan, including the public feedback contact information. • Share information about the hazard mitigation plan and educational materials about hazards, such as drought, earthquake, flooding, and severe weather in an email newsletter and the printed Taylorsville Newsletter mailed with the City Journal.
West Jordan	• Provide a link to the hazard mitigation plan and request for feedback via social media (Facebook) and the website. Share a reminder at least twice a year. • Share information about the hazard mitigation plan at Citizen Readiness Corps meetings.
White City	• Twice a year, use social media (Facebook) or the website to share the link to the hazard mitigation plan, including the public feedback contact information.
West Valley City	• Twice a year, use social media (Facebook and X) or the website to share the link to the hazard mitigation plan, including the public feedback contact information. • Share information about the mitigation plan via the Neighborhood Network newsletter or at an in-person event like WestFest.
Salt Lake Community College	• Twice a year, use social media or the website to share the link to the hazard mitigation plan, including the public feedback contact information. • Share the mitigation plan and request public feedback on the SLCC Mobile app during a public education campaign on earthquake, wildfire, and other hazards. • Integrate hazard mitigation information as part of other

DRAFT

Plan Participant	Continued Public Involvement Methodology
Jordan School District	• Twice a year, use social media (Facebook, Instagram, and X) or the website to share the link to the hazard mitigation plan, including the public feedback contact information. • Twice a year, use the parent portal (Skyward) or Jordan School Safety to conduct a public awareness campaign and include the hazard mitigation plan link and information with the request for public feedback to be sent to Salt Lake County Emergency Management. • Use the Skyward parent portal and district website (Jordan School Safety) to share hazard mitigation information with parents and students.
Canyons School District	• Twice a year, use social media, the website, and the newsletter to share the link to the hazard mitigation plan, including the public feedback contact information. • Use Parent Square email, text, app notifications and in-person meetings with Community Councils or via the S.A.F.E. Neighborhoods Program to share hazard mitigation information with parents and students. • Share information on how to promote safety at home and school via social media.

Overarching Policies

The following policies will guide Salt Lake County Emergency Management staff in making access and input to the Salt Lake County Multi-Jurisdictional Hazard Mitigation Plan as open and convenient as possible.

PARTICIPATION

All citizens of the region are encouraged to participate in the planning process, especially those who may reside in identified hazard areas. Salt Lake County Emergency Management will take whatever actions possible to accommodate individuals including the impaired, non-English speaking, persons of limited mobility, and others with special needs.

ACCESS TO MEETINGS

Adequate and timely notification to all area residents will be given as outlined above to all hearings, forums, and meetings.

ACCESS TO INFORMATION

Citizens, public jurisdictions, agencies and other interested parties will have the opportunity to receive information and submit comments on any aspect of the plan, and/or any other documents prepared for distribution by Salt Lake County Emergency Management that may be adopted as part of the plan by reference. Salt Lake County Emergency Management may charge a nominal fee for printing of documents that are longer than three pages.

DRAFT

TECHNICAL ASSISTANCE

Residents and local jurisdictions may request assistance in accessing the program and interpretation of mitigation projects. Salt Lake County Emergency Management staff will assist to the extent practical; however, limited staff time and resources may prohibit staff from giving all the assistance requested. Salt Lake County Emergency Management will be the sole determiner of the amount of assistance given all requests.

FUTURE REVISIONS

Future revisions of the plan shall include the following:

- Continuation of the search for more specific mitigation actions
- An analysis of progress of the plan as it is revised

Jurisdiction Profile

Date of Incorporation

August 1970

Location and Description

The town of Alta is a small mountain community in Little Cottonwood Canyon in the Wasatch–Cache National Forest. The town is 4.5 square miles in area and is between 7,500 and 9,500 ft. above sea level. It is accessed via State Highway 210, a designated scenic byway. Much of Alta is public lands, part of the Uinta–Wasatch–Cache National Forest. The Lone Peak Wilderness and Twin Peaks Wilderness Areas are nearby. Alta is also in the Salt Lake City watershed area. The town administration recognizes the importance of protecting natural resources and supports protection of the watershed while facilitating

DRAFT

nearby recreation opportunities through interpretive signs, restroom facilities, personnel, and trail maintenance.

Population

The 2022 American Community Survey 5-Year Estimate from the U.S. Census Bureau records the population of the town of Alta as 337 people.

Demographics

Most of the 337 residents are between the ages of 20 and 34, with a median age of 30.2; 289 are male (approximately 86%) and 48 are female (14%)[1]. English is the primary language in 98.1% of homes, with 1.9% other Indo-European languages.[2]

Brief History

Alta was founded to house miners when silver claims were staked in Little Cottonwood Canyon during the 1860s. By 1872, several thousand seasonal residents lived in the community. Economic factors and natural disasters, including wildfire and avalanches, led to a decline in the settlement. In 1927, resident George Watson deeded 1800 acres of his land for the development of a ski area, which opened its first lift in 1938. The town was officially incorporated in 1970 with Lee Bronson as the first “president” of the town for 2 years. He was elected Mayor in 1972 when the Alta Planning Commission was appointed. The town also established an emergency dispatch center, a Marshal’s Office, and a Justice Court. A culinary water system was added in 1978. In 1984 the Alta Fire Station was completed to house the volunteer fire department, which is now staffed by the Unified Fire Authority (UFA). The Alta Ski Area is the centerpiece of Alta’s economy and is one of the world’s foremost skiing destinations.

Climate

Alta fluctuates between a humid continental and a subalpine climate. Due to its high elevation, it receives an average of 500 inches of snowfall, typically between November and May. This snowfall is influenced by the Great Salt Lake, which can generate heavy “lake effect” snow. Average annual precipitation is 47.08 inches, predominantly occurring in the winter months. January temperatures range from an average daily low of 15°F to an average daily high of 30.7°F. Summer temperatures are mild, with an average low of 50.3°F and average high of 72.9°F.

DRAFT

Public Services

The Alta Marshal's Office is the law enforcement agency for the town. Alta Central Dispatch provides emergency dispatch services. Fire, EMS and HazMat response are contracted through UFA. Alta Ski Patrol also provides first aid response to guests of the ski area.

Salt Lake County Service Area #3 (SA3) is a government water/sewer district in Little Cottonwood Canyon at Snowbird. SA3 provides drinking water and wastewater services to Snowbird Ski Resort and many residences along the Alta Bypass Road. It also manages the Town of Alta's water system through an interlocal agreement. Other partner agencies include Salt Lake County, the Utah Department of Transportation (UDOT), the Utah Avalanche Center, Salt Lake City Public Utilities, the Salt Lake Valley Health Department, Uinta–Wasatch–Cache National Forest Salt Lake Ranger District, Salt Lake County Sheriff's Office, the Cottonwood Canyons Foundation, the Central Wasatch Commission, and the Utah Transit Authority.

Governing Body

The governing body of the town consists of a Mayor and a four-member Town Council. This council serves as the municipal/local government, performing executive functions of different natures. Members of this governing body are elected by the people.

Development Trends

The Town of Alta is not experiencing residential growth. The 2016 Commercial Core Plan expresses interest in commercial development to support the creation of an identifiable Town Center to enhance year-round commercial activity. Significant discussion regarding transportation development in Little Cottonwood Canyon has occurred. UDOT studies of transportation demand in Little Cottonwood Canyon have considered enhanced bus service, tolling or other restrictions on single-occupancy vehicles, improvements in trailhead and roadside parking, and a possible gondola.

Jurisdiction-Specific Hazards and Risk

The Calculated Priority Risk Index (CPRI) is a comprehensive assessment tool for evaluating and prioritizing risks in a given context. It considers various factors, such as probability, impact, and urgency, to determine the level of risk associated with events or situations. The results for each hazard, including its risk factor (RF) value, are shown in Table 3. The results are based on the criteria in Table 4 and the equation that follows it. The CPRI helps organizations and individuals make informed decisions about risk management and mitigation strategies. It provides a systematic approach to identifying and addressing potential issues, allowing for a more efficient allocation of resources and proactive risk prevention. With the CPRI, stakeholders can prioritize their focus on the most critical risks, leading to more effective risk management and, ultimately, better outcomes.

DRAFT

Table 3: Calculated Priority Risk Index Values for the Town of Alta

Type of Hazard Event	Probability of Future Events	Spatial Extent	Severity of Life/ Property Impact	Warning Time	Duration	Response Capacity	Risk Factor Value
Avalanche	4	1	3	4	2	2	3
Drought	3	4	2	1	2	2	2.4
Earthquake	3	3	2	4	2	1	2.5
Extreme Heat	2	3	2	1	1	1	1.8
Extreme Cold	4	3	3	2	1	2	2.9
Flooding	2	1	2	2	1	1	1.7
Landslide/ Slope Failure	2	1	2	4	1	2	2
Radon	4	4	1	1	4	1	2.5
Heavy Rain	4	3	3	2	2	1	2.9
High Wind	4	3	3	3	2	1	3
Lightning	4	2	3	4	2	1	3
Heavy Snow/ Blizzard	4	4	4	3	4	2	3.7
Tornado	1	2	1	4	2	2	1.6
Wildfire	3	1	2	2	2	1	2.1
Dam Failure	1	2	2	4	1	2	1.8
Civil Disturbance	1	1	1	2	2	2	1.3
Cyberattack	2	1	1	4	1	1	1.6
Hazardous Materials Incident (Transportation & Fixed Facility)	3	1	2	4	1	1	2.2
Public Health Epidemic/ Pandemic	3	4	3	1	3	1	2.7
Terrorism	1	1	2	4	2	1	1.7

DRAFT

Table 4: Criteria for the Calculated Priority Risk Index

Risk Index Factor	Degree of Risk Level		Criteria	Factor Weight for Degree of Risk Level
Probability of Future Events	1	Unlikely	Less than 1 percent probability of occurrence in the next year or a recurrence interval of greater than every 100 years.	30%
	2	Occasional	1 to 10 percent probability of occurrence in the next year or a recurrence interval of 11 to 100 years.	
	3	Likely	11 to 90 percent probability of occurrence in the next year or a recurrence interval of 1 to 10 years.	
	4	Highly Likely	91 to 100 percent probability of occurrence in the next year or a recurrence interval of less than 1 year.	
Spatial Extent	1	Limited	Less than 10% of the planning area could be impacted.	10%
	2	Small	10%–25% of the planning area could be impacted	
	3	Significant	25%–50% of the planning area could be impacted.	
	4	Extensive	50%–100% of the planning area could be impacted.	
Severity of Life/Property Impact	1	Negligible	Less than 5% of the affected area's critical and non-critical facilities and structures are damaged/destroyed. Only minor property damage and minimal disruption of life. Temporary shutdown of critical facilities.	30%
	2	Limited	More than 5% and less than 25% percent of property in the affected area is damaged/destroyed. Complete shutdown of critical facilities for more than one day but less than one week.	
	3	Critical	More than 25% and less than 50% of property in the affected area was damaged/destroyed. Complete shutdown of critical facilities for over a week but less than one month.	
	4	Catastrophic	Over 50% of critical and non-critical facilities and infrastructures in the affected area are damaged/ destroyed. Complete shutdown of critical facilities for more than one month.	
Warning Time	1	Self-defined	More than 24 hours	10%
	2	Self-defined	12 to 24 hours.	
	3	Self-defined	6 to 12 hours.	
	4	Self-defined	Less than 6 hours.	
Duration	1	Brief	Up to 6 hours.	10%
	2	Intermediate	Up to one day.	

DRAFT

Risk Index Factor	Degree of Risk Level		Criteria	Factor Weight for Degree of Risk Level
	3	Extended	Up to one week.	
	4	Prolonged	More than one week.	
Response Capacity	1	High	Significant resources and capability to respond to this kind of event; staff are trained, experienced, and ready.	10%
	2	Medium	Some resources and capability to respond to this kind of staff; some staff may be trained, experienced, and ready while others may need additional support.	
	3	Low	Limited resources and capability to respond to this kind of event; additional staff or staff training needed.	
	4	None	No resources and capability to respond this kind of event; additional outside support would be required.	

RISK FACTOR (RF) EQUATION

RF Value = [(Probability x 0.30) + (Spatial Extent x 0.10) + (Severity of Life/Property Impact x 0.30) + (Warning Time x 0.10) + (Duration x 0.10) + (Response Capacity x 0.10)]

Hazards with an RF value greater than or equal to 2.5 are considered high risk. Those with RF values of 2.0 to 2.4 are considered moderate risk hazards, and those with an RF value less than 2.0 are considered low risk. The highest possible RF value is 4.

Hazard Event History

Examining hazard event histories provides valuable insights to inform decision making and help prioritize resources for risk prevention and response efforts. For almost all hazard events, the most significant vulnerability in the town of Alta is the potential for isolation from the rest of the Salt Lake Valley. Alta sits at the top of Little Cottonwood Canyon—a box canyon accessible only by SR-210. With only one road into and out of Alta (which is frequently affected by various weather conditions), the town runs the risk of isolation from partner agencies, leaving it in standalone operations with very limited resources. The elderly and medically fragile populations are most at risk, as there are very limited medical resources in the town, but all residents, commuters, and visitors are affected if the supply of medical care, food, fuel, and other essential supplies is cut-off.

Table 5 lists the hazard events impacting the town of Alta planning area since the 2019 plan update.

DRAFT

Table 5: History of Hazard Events in the Town of Alta[3]

Type of Hazard Event	FEMA Disaster #	Date(s)	Damage or Impacts	Description
Avalanche		Regularly occurring over the last 5 years, highlighted by the winter season of 2022–2023 which produced historic avalanche events and hazards in Alta.	Generally negligible, except one instance in which an avalanche (triggered as a result of mitigation work) impacted a private residence and injured an occupant of the building. Another significant event was a roof slide avalanche that resulted in the full burial of a minor. The community is impacted by the need to shelter in place. These occurrences have significant financial impacts on the business community and regularly strain the resources of the first responder staff. Another impact is being isolated from critical support like medical care, ambulances, food, fuel, and supplies during avalanche closures. These times of isolation also cut the town off from partner agencies in the valley, leaving it in standalone operations.	Avalanche mitigation is a regular occurrence in Alta that results in intentionally triggered/ managed avalanches. Naturally occurring avalanches are less common. However, both types present a significant risk of property damage, injury, and loss of life.
Drought			The town monitors along with county ECC, but is not directly impacted	
Earthquake	DR-4548-UT	March 18, 2020	Monitors along with county ECC, no direct impacts	
Extreme Heat			NA	NA
Extreme Cold			Occurrence coincides with avalanche problem	
Flooding			Some instances of localized heavy rain (see below)	
Landslide/ Slope Failure			Heavy rains can affect SR-210. Mitigation is done alongside UDOT. Can impact access in and out of town and some residential areas.	
Radon				

[3] ECC = Emergency Coordination Center, SLC = Salt Lake City, UDOT = Utah Department of Transportation

DRAFT

Type of Hazard Event	FEMA Disaster #	Date(s)	Damage or Impacts	Description
Heavy Rain		Multiple	Debris flow in roadway (See Landslide)	
High Wind			Occurs regularly; no catastrophic events observed	
Lightning			Localized lightning strikes with minimal/no impacts	
Heavy Snow/ Blizzard		Multiple	Occurs frequently! (See Avalanche.) Some structures have been compromised by snow load.	
Tornado		N/A	N/A	NA
Wildfire			Occurs frequently; sporadic localized wildfires	
Dam Failure		Cecret Lake Dam	Structural issues addressed and repairs completed by SLC Public Utility.	
Civil Disturbance		N/A		
Cyberattack		N/A		
Hazardous Materials Incident (Transporta-tion & Fixed Facility)			Numerous natural gas leaks, mostly associated with snow load	
Public Health Epidemic/ Pandemic	DR-4525-UT	COVID-19 pandemic	Affected local businesses and ski resorts in the canyon	
Terrorism		N/A		

National Flood Insurance Program Summary

The town of Alta participates in the Nation Flood Insurance Program (NFIP). Table 6 and Table 7 present statistics related to the NFIP. The town of Alta does not participate in the Community Rating System.

Table 6: National Flood Insurance Program Status for the Town of Alta[4]

Init FHBM Identified	Initial FIRM Identified	Current Effective Map Date	Adopted Date	Date Joined NFIP	Tribal
N/A	09/21/01	9/25/2009 (NSFHA)	N/A	12/02/09	No

[4] FIRM = Flood Insurance Rate Map, FHBM = Flood Hazard Boundary Map, NSFHA = Non-Special Flood Hazard Area

DRAFT

Table 7: National Flood Insurance Policies for the Town of Alta

Community ID	Number of Losses	Total Net Payment	Active Policies	Total Coverage
490251	0	$0	0	$0

The Town Manager is appointed as the floodplain administrator for Alta. The town's Flood Damage Prevention Ordinance was adopted 3/11/2010 and amended 4/12/2023. The current effective FIRM is dated 9/25/2009. There is no identified Special Flood Hazard Area (SFHA). Therefore, Alta does not issue permits in the SFHA. If a SFHA were to be identified in the future, the Building Department would be responsible for issuing permits in accordance with the specifications outlined in the Flood Damage Prevention Ordinance. Since there is no SFHA, Alta also cannot issue substantial damage or substantial improvement determinations given that both of these terms are applicable only to structures in the SFHA.

Jurisdiction-Specific Vulnerabilities and Impacts

Table 8 provides information on the vulnerable assets in the town of Alta, including its critical facilities, highlighting the town's vulnerability to identified hazards. By understanding the risks associated with these assets, local authorities can develop proactive strategies to mitigate vulnerabilities and ensure that the safety and functionality of these important assets during hazard events. These data are invaluable for decision-making and prioritizing resources for emergency response and preparedness efforts, ultimately contributing to more effective risk management and greater resilience in the community.

Assets vulnerable in the Town of Alta include facilities such as the Town Marshal's office, the Town EOC, the town library, and UFA Station 113, which lies just outside of the city boundary but serves the town and canyon areas. A one-room classroom is located within the Goldminer's Daughter Lodge and is served by Granite School District. Little Cottonwood Canyon Road/SR 210 is the only access road to the town and connects it to the rest of Salt Lake County. Two ski resorts, Alta and Snowbird, and associated businesses are significant to the economy within the town and the region. The area has many trails for summer recreation as well. The natural resources include forest and other vegetation, Little Cottonwood Creek and tributaries, wildlife, and the scenic appeal of the mountains.

Table 8: Jurisdiction-Specific Vulnerabilities and Impacts in the Town of Alta[5]

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
Avalanche	People	Alta is world renowned for a variety of winter recreation activities in the area and backcountry skiing. People are widely dispersed and frequently subject to snow instability. Avalanche rescue is resource heavy and time consuming, and it frequently results in loss of life. Skiers and other outdoor recreationists, ski patrol, and resort staff may be at risk. Residents are also at risk from roof avalanches which are big slabs of snow sliding off of steep roofs. UDOT workers and other officials may be at risk while clearing Highway 210.

[5] UDOT = Utah Department of Transportation

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
	Structures	Potential for catastrophic and complete damage to structures from natural and human-made avalanches. According to the Utah State Hazard Mitigation plan, Alta has 95 structures in avalanche paths: 56 are commercial (worth $54,647,250), 1 is government ($183,696), and 38 are residential ($2,869,264)
	Economic Assets	The community is heavily dependent on access to winter recreation. Naturally occurring avalanche cycles can result in prolonged closures for local business and government, leaving them highly vulnerable economically.
	Natural, Historic, and Cultural Resources	Wildlife habitats and forested areas can suffer from habitat destruction and erosion when avalanches occur. Historic sites and structures, often lacking modern protections, also are at risk if they are in avalanche-prone regions.
	Critical Facilities and Infrastructure	Communications: police, fire, EMS, and public utility infrastructure can be threatened by avalanche conditions.
	Community Activities	Activities like skiing, snowboarding, and snowmobiling are vulnerable to avalanches due to heavy snowfall and participants' lack of safety knowledge. Backcountry hiking and community events in winter sports areas also increase risk. In addition, residential areas near mountains face threats from snow-laden hillsides. Highway 210 also has the highest avalanche hazard rating of any major roadway in the country. At times when UDOT and Alta agree that conditions are unsafe, the town goes into an Interlodge Alert, meaning all occupants of the town (including visitors and residents) must remain indoors until conditions are deemed safe. During large storm cycles, an Interlodge alert can last days until the storm cycle is over and proper avalanche control work has been performed.
Drought	People	*Vulnerability*: All residents are vulnerable to drought. *Impacts*: Drought can lead to decreased water quantity and quality and increased incidence of illness and and/or disease. Drought can have adverse effects on air quality and increase people's risk during recreational activities.
	Structures	*Vulnerability*: Structures are vulnerable to drought, leading to potential restrictions to growth. *Impacts*: Due to Utah's climate, drought can significantly impact structures. Foundations can crack due to drying and contracting soil, leading to potential issues like uneven floors, misaligned doors and windows, and damage to sewer pipes. This is particularly concerning in areas with expansive soils, which shrink and swell with changes in moisture levels.
	Economic Assets	*Vulnerability*: Skiing-oriented businesses are highly vulnerable to drought. *Impacts*: Economic costs from drought can be impacted by supply and demand. Utah is one of the fastest-growing states in the U.S., and this has put a strain on local water management and increased the risk of drought. This can drive up costs, including fixing and updating structures damaged by drought. Drought can adversely impact visitation and spending in and near national parks; regional

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		businesses such as ski resorts, hotels, and restaurants; and job creation in the private sector.
	Natural, Historic, and Cultural Resources	*Vulnerability*: Vegetation, wildlife, habitat, and ecosystems are vulnerable to reduced snowfall and stream flow. *Impacts*: Drought can weaken trees, making them more susceptible to pests and disease. Dry conditions can increase the risk of wildfires, which can destroy forests, trails, and infrastructure. Many plant and animal species in Alta's high-altitude environment rely on consistent moisture, and prolonged drought can lead to a decline in species. Alta is also known for its abundant snowfall, which supports recreation and water resources. A decline in snowpack can impact the water supply and reservoir storage that supports the Salt Lake valley and ski tourism. Historical buildings, such as old mining structures and lodges in Alta, can suffer from foundation cracks, and dry conditions may accelerate erosion around historic sites.
	Critical Facilities and Infrastructure	*Vulnerability*: In Utah, drought can impact critical infrastructure, such as water treatment plants, wastewater systems, power generation facilities, and fire suppression capabilities. *Impacts*: Water systems may be affected by decreased water supply and water quality. Reduced water supply may affect hydropower facilities. Fire departments may struggle with wildfire management due to increased risk and limited water resources.
	Community Activities	*Vulnerability*: Recreation, outdoor events, and landscaping are vulnerable to drought. *Impacts*: Recreational spaces may be affected. Households and businesses may encounter restrictions and costs for landscaping and pools. Drought affects skiing, hiking, and tourism, which are central to Alta's identity and economy. Drought can lead to shorter ski seasons, creating economic challenges. Events, festivals, and traditions that rely on Alta's natural setting can be disrupted.
Earthquake	People	*Vulnerability*: All residents are vulnerable to earthquakes. *Impacts*: Residents could be injured by objects shaking or falling during an earthquake or if buildings collapse. People would also be affected by disruptions to water, communications, and power systems.
	Structures	*Vulnerability*: Earthquake vulnerability may differ in the canyon communities compared to the valley. Ground shaking may not be as severe in the Town of Alta, but structures are still vulnerable. *Impacts*: Older buildings and those not designed to resist seismic activity in the Town of Alta could suffer partial or complete collapse. Even well-built structures may experience cracked foundations, broken windows, and damaged roofs and driveways. Alta is in a mountainous area, making buildings or houses on steep slopes vulnerable to landslides triggered by seismic shaking. Alta's ski lodges and resort infrastructure, such as chairlifts and gondolas, could be damaged or become inoperable. Shaking could also trigger avalanches, endangering skiers, damaging ski runs and blocking access to roads. Retaining walls may collapse or require repair. Rockfalls from canyon walls could damage homes and roads. Ground shaking could trigger

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		landslides or other slope failures or avalanches, which may create additional vulnerability for structures or infrastructure.
	Economic Assets	*Vulnerability*: An earthquake on the Wasatch Fault could have major economic consequences because of the town's reliance on tourism and skiing. *Impacts*: Damage to ski resorts and lodges could lead to temporary or long-term closures impacting the local economy. Visitors may cancel trips due to safety concerns or unavailable activities, reducing revenue for local businesses. Rebuilding critical infrastructure and facilities could take months or even years, requiring significant investments. Alta's economy is heavily dependent on skiing. If an earthquake damages lodges, ski lifts, or runts it could shut down operations leading to millions in lost revenue. The number of visitors could plummet due to safety concerns or road closures, impacting hotels, resorts, restaurants, and shops. Ski resort employees could face job losses or reduce income if businesses are forced to close for repairs or are completely damaged. State route 210, the main road into Alta, could suffer landslides, cracks, or complete failure, cutting off access to tourists and workers. Powerlines and water systems may need expensive repairs, delaying economic recovery. Limited access could also increase the cost of supplies and labor needed for rebuilding. Homeowners, businesses, and resorts could see a decline in their property values if an earthquake caused extensive damage. Restaurants, retail shops, and service providers rely on tourism. A prolonged drop in visitors could force some businesses to close permanently. State or federal aid may be necessary, but delays in funding could prolong economic hardship. A major disaster could also lead to stricter building codes and regulations, increasing costs for future construction.
	Natural, Historic, and Cultural Resources	*Vulnerability*: Vegetation, soil, water resources, and wildlife habitat are vulnerable to earthquakes. Historical sites and mining sites are also vulnerable. *Impacts*: Earthquake-induced avalanches can reshape ski slopes, damage forests, and block critical transportation routes such as SR-210. Ground shaking could rupture pipelines or trigger soil erosion, contaminating water resources. Wildlife in Little Cottonwood Canyon, including moose, deer, and mountain lions, could endure losses of their habitats due to landslides, falling trees, and altered landscapes. Alta was also originally a silver mining town, and remnants of the mining operations could collapse or be buried. Houses or historical sites containing mining and skiing memorabilia could experience loss or damage due to the earthquake shaking, fires, and structural failure.
	Critical Facilities and Infrastructure	*Vulnerability*: Transportation networks, power systems, water systems, gas lines, communication systems, and healthcare are all vulnerable to earthquakes. *Impacts*: An earthquake could damage State Route 210 from landslides or rockfalls, blocking access for emergency responders. Road cracks, buckling, or collapse could make it unsafe for travel. Chairlifts and gondolas could suffer structural damage, halting ski resort operations. Electrical and mechanical failures could also make the ski lifts inoperable. Utility systems could be impacted, leading to

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		power outages and—depending on the severity of the earthquake—restoring electricity in mountainous areas could take days, weeks, or even months. Water systems could fail if underground water pipes rupture, leading to the loss of clean water and localized flooding. Damaged gas lines pose a fire risk, especially in homes, lodges, and restaurants. Gas accumulated in confined spaces could explode. Communications systems and cell towers could be damaged, cutting off emergency communications systems and internet access and delaying rescue/emergency response and coordination efforts. Alta does not have a hospital, so serious injuries would require transport to Salt Lake City. If roads are inoperable, access to urgent medical care could be delayed. Alta clinics or first aid stations could be damaged or lack power, limiting their ability to treat injuries. If the fire station is structurally compromised, emergency response could be delayed. Broken sewage pipes could contaminate water sources. Depending on the severity of the earthquake, rebuilding critical infrastructure could take months to years.
	Community Activities	*Vulnerability*: Recreation and community access are vulnerable to earthquakes. *Impacts*: Transportation in and out of the canyon may be affected if roads are damaged near the valley. Depending on the damage, skiing and outdoor recreation could be disrupted, and ski resorts might have to close. Backcountry skiing and hiking could be unsafe, and popular trails might be closed because of earthquake-induced avalanches and landslides. SR-210 could become impassible, preventing access to ski areas and trails. Ski events, festivals, and local meetings and gatherings could be postponed or canceled.
Extreme Heat	People	*Vulnerability*: Extreme heat is unlikely in Alta, but physically vulnerable populations (the elderly, pregnant individuals, and those with respiratory conditions, etc.) are at risk from extreme heat. *Impacts*: Vulnerable populations can be more susceptible to heat-related illnesses, such as dehydration, heat exhaustion, or heat stroke when combined with the high elevation.
	Structures	*Vulnerability*: Structures throughout Alta could be vulnerable to damage from extreme heat. *Impacts*: Heat can strain electrical wiring, causing shorts and power outages, and may cause fires in buildings and other infrastructure. Houses and lodges built with wood can dry out, crack, or warp from extreme heat. Shingles and other roofing materials can degrade faster. Heat can also lead to thermal expansion in materials like concrete, leading to cracks in building foundations, sidewalks, and roads.
	Economic Assets	*Vulnerability*: Businesses throughout Alta are vulnerable to the impacts from extreme heat. *Impacts*: Buildings may need better cooling systems to adapt to rising temperatures. If extreme heat becomes more frequent, snow may melt earlier in the season, reducing ski tourism and impacting Alta's economy. Resorts, restaurants, and lodges may need to upgrade cooling systems, leading to higher operational costs.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
	Natural, Historic, and Cultural Resources	*Vulnerability*: Forest and vegetation health are vulnerable to extreme heat, which also increases the risk of wildfire. Water resources are vulnerable to the effects of extreme heat. *Impacts*: Extreme heat can contribute to increased wildfire risk. Drier forests and vegetation in Little Cottonwood Canyon could ignite more easily, threatening homes, ski lodges, and wildlife. Alta relies on heavy snowfall for skiing, but extreme heat could cause earlier snowmelt, shortening the ski season. Less snow and higher temperatures could affect local water sources, impacting drinking water supply and alpine ecosystems. Some alpine plant species and animals are adapted to cold weather and may struggle to survive in hotter conditions
	Critical Facilities and Infrastructure	*Vulnerability*: Power supply, water supply, and transportation networks are vulnerable to the impacts of extreme heat. *Impacts*: If residents and businesses rely heavily on conditioning or cooling systems, it can strain the power supply. Extreme heat can evaporate water from reservoirs and pipelines, reducing water pressure and availability. With drought, water restrictions could impact homes and businesses. High temperatures can also cause the asphalt to soften and buckle, creating potholes and cracks in the road. Metal parts in ski lifts may expand, affecting stability and requiring maintenance.
	Community Activities	*Vulnerability*: Outdoor recreation, hiking, and summer events are vulnerable to extreme heat. *Impacts*: Temperatures are typically lower in Alta due to its higher elevation; however, hiking and other outdoor recreations are popular summer activities. Hiking at elevation combined with higher temperatures can increase the risk of heat exhaustion, heat stroke, and dehydration. If extreme heat cuts short ski activities, the town could try to promote summer tourism activities. However, extreme heat could make these outdoor activities less enjoyable or even dangerous in the high-altitude terrain. Outdoor activities may also be moved to early morning hours or held indoors to avoid the extreme heat of midday, disrupting traditional schedules and reducing participation. Community events could also be rescheduled or canceled because of high temperatures
Extreme Cold	People	*Vulnerability*: Residents in older homes, unhoused individuals, and lower-income households are vulnerable to the effects of extreme cold. *Impacts*: Extreme cold raises health and safety concerns, such as hypothermia and frostbite. Socially vulnerable populations may be more susceptible to cold-related illnesses. Those who are unhoused, those in older homes with less-efficient heating, and lower-income households that may have difficulty paying heating costs may experience more negative effects from extreme cold.
	Structures	*Vulnerability*: All structures in Alta are vulnerable to damage from extreme cold. *Impacts*: Extreme cold can lead to frozen pipes, building damage, and more frequent breakdowns in infrastructure like roads, power lines, and heating systems.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
	Economic Assets	*Vulnerability*: Travel-related businesses are vulnerable to extreme cold. *Impacts*: Increased demand for heating can drive up energy costs. Extreme cold, if it leads to dangerous travel conditions like road closures, can discourage tourists from visiting. A decline in visitors would affect ski resorts, hotels, and local shops that rely on tourism. Tourists who do visit may alter their spending behavior. Businesses and residents will incur higher maintenance and repair costs to keep properties and infrastructure operational. Extreme cold can coincide with severe winter weather. The additional fuel and labor to clear roads and maintain access to Alta could be costly. Businesses and residents will also face higher energy costs to keep buildings heated. The increased demand for energy during extreme cold spells can drive up the cost of electricity, gas, and heating, affecting both residents and businesses. Extreme cold, if it leads to dangerous travel conditions like road closures, can discourage tourists from visiting. A decline in visitors would affect ski resorts, hotels, and local shops that rely on tourism. Tourists who visit may alter their spending behavior. People may also avoid going out, resulting in lower daily sales and income for businesses that depend on customers visiting in person.
	Natural, Historic, and Cultural Resources	*Vulnerability*: Cultural events are vulnerable to the effects of extreme cold. *Impacts*: Extreme cold may limit participation in outdoor cultural events, such as ski competitions and festivals like Oktoberfest which bring tourists to the town.
	Critical Facilities and Infrastructure	*Vulnerability*: Water delivery, power systems, and emergency response services are vulnerable to extreme cold. *Impacts*: Below-freezing temperatures can cause water pipes to burst, leading to water shortages and property damage. Extreme cold can lead to power failures due to frozen lines or damage to electrical infrastructure. Power outages can also impact heating systems. Cold weather combined with snow and ice can make it difficult for emergency services to reach people in need if roads are impassible. Also, Alta is in a relatively remote area, and its emergency services may be limited during extreme weather, resulting in increased response times
	Community Activities	*Vulnerability*: Recreation and events are vulnerable to extreme cold. *Impacts*: Given the local focus on skiing and outdoor recreation in the winter, people are more likely to be outside in Alta during extreme cold events than they might be in other jurisdictions. Extreme cold can disrupt local events and traditions in the town of Alta and at the ski resorts.
Flooding (and Heavy Rain)	People	*Vulnerability*: Residents and visitors to Alta are vulnerable to flooding near waterways or low-lying areas. *Impacts*: Due to Alta's steep terrain, heavy rain can quickly lead to flash floods, especially in areas with poor drainage or snowmelt runoff. Fast-moving water can be dangerous for hikers, skiers, and drivers, increasing the risk of injuries or fatalities.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
	Structures	*Vulnerability*: There are no special flood hazard areas in the town of Alta. No structures are known to be at risk from flooding. *Impacts*: Localized flooding may occur during heavy rain events. Basements and lower floors are vulnerable in areas with poor drainage.
	Economic Assets	*Vulnerability*: Tourism-related businesses are vulnerable to flooding impacts. *Impacts*: Hazardous travel conditions or damage to infrastructure could deter visitors, leading to revenue losses for resorts and local businesses. Washed-out roads or infrastructure damage can delay the delivery of food, fuel, and other necessary items, impacting business and life-safety operations.
	Natural, Historic, and Cultural Resources	*Vulnerability*: Soil, vegetation, wildlife habitats, and water quality are vulnerable to flooding and heavy rain. *Impacts*: Heavy rain can cause soil erosion and landslides, damaging the natural alpine environment and disrupting wildlife habitats. Flooding and heavy rain can introduce pollutants into local rivers and streams, such as those in Little Cottonwood Canyon, and negatively impact the watershed and surrounding ecosystems.
	Critical Facilities and Infrastructure	*Vulnerability*: Road networks, stormwater systems, power distribution systems, and communication systems are vulnerable to flooding and heavy rain. *Impacts*: Flooding can erode roads such as SR-210, leading to expensive repairs and restricting access to the town. Flooding and heavy rain can also overwhelm drainage systems, leading to contamination and costly repairs. Damage to power lines and internet services can impact businesses, emergency services, and the overall economic stability of the town of Alta.
	Community Activities	*Vulnerability*: Recreation and community events are vulnerable to flooding and heavy rain. *Impacts*: Little Cottonwood Creek runs alongside popular hiking/walking trails and the main pedestrian thoroughfare. Hiking, skiing, and other outdoor activities may be canceled or limited due to unsafe conditions or damage. Local events and community meetings may be postponed or relocated. Resources may be diverted to deal with the flooding and/or heavy rain event that results in damage, reducing the town's ability to respond to other community needs.
Landslide/ Slope Failure	People	*Vulnerability*: Most of Alta is in a moderate to high landslide susceptibility area. All residents are vulnerable to landslides. *Impacts*: Landslides can damage and bury homes and buildings and cause injuries and fatalities. In the steep mountain terrain, landslides can behave like avalanches—moving downhill and trapping people. The remote location and high altitude may delay emergency response rescue efforts, and road closures could isolate residents, workers, and visitors.
	Structures	*Vulnerability*: Many structures in Alta are in moderate to high susceptibility areas and are vulnerable to landslides. *Impacts*: Landslide paths are likely to mirror avalanche paths, leaving some municipal structures vulnerable.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
	Economic Assets	*Vulnerability*: Ski industries and outdoor recreation businesses are vulnerable to landslides and slope failures. *Impacts*: Landslides and slope failures could impact ski slopes, hiking trails, and scenic areas, which could lead to a decline in visitor numbers, affecting the local economy. The town and local businesses may need to invest in rebuilding infrastructure and stabilizing slopes.
	Natural, Historic, and Cultural Resources	*Vulnerability*: Soil stability, water quality, and wildlife habitats are vulnerable to landslides and slope failures. *Impacts*: Landslides can disturb soil and introduce debris into the local watershed, affecting the quality of drinking water. The altered landscape from a landslide or slope failure could also alter ecosystems and force wildlife out of their natural habitats.
	Critical Facilities and Infrastructure	*Vulnerability*: Road and utility networks are vulnerable to landslides. *Impacts*: Landslides could impact Highway 210 and disrupt transportation in and out of the canyon to Alta. They could also impact power, water, and communications systems.
	Community Activities	*Vulnerability*: Outdoor activities and recreation are vulnerable to landslides and slope failures. *Impacts*: Landslides and slope failures could disrupt outdoor recreation activities, blocking or destroying trails and limiting access to recreational areas. Unstable slopes may make certain backcountry areas unsafe for outdoor activities. Depending on the time of year, local events, festivals, and town meetings may be canceled or relocated if key venues or roads are inaccessible.
Radon	People	*Vulnerability*: Between 37% and 54% of homes tested in Alta have dangerous levels of radon gas. Alta's mountainous geographic location and geology contribute to elevated natural radon levels, especially in residential areas developed along slopes or with limited ventilation. *Impacts*: Radon exposure increases the risk of lung cancer. Given the area's cold climate, homes and lodges are often adequately sealed during the winter months, increasing the potential for indoor radon accumulation.
	Structures	*Vulnerability*: Older structures and buildings with crawl spaces or basements are vulnerable to radon exposure. *Impacts*: Buildings in Alta, such as ski lodges, rental cabins, and employee housing, may have been constructed before radon mitigation was common practice. Structures built on hillsides or with crawl spaces/basements are especially vulnerable. This may increase occupants' exposure to radon.
	Economic Assets	*Vulnerability*: Tourism businesses are vulnerable to the effects of radon. *Impacts*: Alta's economy relies heavily on tourism. If radon is identified as a widespread concern, it could cause tourism in the area to decline and impact rental occupancy rates. Testing and mitigation efforts in commercial buildings may also represent a significant burden for small business owners.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
	Natural, Historic, and Cultural Resources	*Vulnerability*: Groundwater and historic or cultural sites are vulnerable to radon exposure. *Impacts*: Alta's natural environment, including Albion Basin and surrounding watersheds, could be impacted by radon leaching into the soil or groundwater. Confined groundwater pathways and soil under trails or campgrounds may pose localized risks. The integrity of historic lodges and cultural sites may also be at risk if structural ventilation upgrades are required for mitigation.
	Critical Facilities and Infrastructure	*Vulnerability*: Water and utility infrastructure are vulnerable to radon accumulation. *Impacts*: Underground infrastructure is limited in Alta, but includes key components such as utility lines, crawl spaces, and potentially aging water or stormwater infrastructure. These confined underground spaces may accumulate radon gas if not ventilated.
	Community Activities	*Vulnerability*: Radon is not likely to cause immediate disruptions to recreational or municipal activities. However, its long-term health implications warrant community education in Alta.
High Wind	People	*Vulnerability*: All Alta residents are vulnerable to the effects of high winds. *Impacts*: Flying debris, falling trees, and damaged structures can pose direct risks to residents, workers, and visitors. People could end up without electricity, heat, or emergency communications systems. Strong winds can cause respiratory issues by stirring up dust and pollen, worsening air quality, and affecting those with respiratory issues.
	Structures	*Vulnerability*: All structures are vulnerable to high winds. *Impacts*: High wind can break windows and damage roofs, and other structural elements. Falling trees can contribute to structural damage.
	Economic Assets	*Vulnerability*: Ski-related businesses are vulnerable to high winds. *Impacts*: High winds can disrupt ski lift operations and extended high wind events could result in economic losses. Strong winds can shut down ski lifts, deterring visitors and leading to revenue losses. Increased claims for wind damage could lead to higher insurance rates and financial burdens for property owners.
	Natural, Historic, and Cultural Resources	*Vulnerability*: Trees, wildlife, and soil are vulnerable to high winds. *Impacts*: High winds can uproot trees, disrupt wildlife, and contribute to erosion. Older buildings may be more susceptible to wind damage. High winds can also damage trails and make outdoor areas unsafe for public use.
	Critical Facilities and Infrastructure	*Vulnerability*: Communication systems, transportation access, and power lines are vulnerable to high winds. *Impacts*: Communications towers are generally situated in wind-protected areas, but they are not immune to high-wind events. Communications could be compromised if towers sustain damage from high winds. Wind-driven debris and fallen trees can block SR-210, limiting access to Alta. High winds can damage power lines and cause power outages

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		in homes, businesses, and critical facilities. Ski lifts may have to shut down, and other infrastructure could be damaged.
	Community Activities	*Vulnerability*: Outdoor events and recreation are vulnerable to high winds. *Impacts*: Outdoor events and festivals may be canceled or postponed due to safety concerns. Strong winds may lead to ski lift closures.
Lightning	People	*Vulnerability*: All populations are equally affected, but hikers and other outdoor recreationists are at greater risk from lightning strikes. *Impacts*: Lighting can cause injury or death to those close to a strike.
	Structures	*Vulnerability*: All buildings may be vulnerable to lightning. *Impacts*: Lightning could cause localized wildfires, which may compromise nearby property. Electrical systems could be damaged by power surge.
	Economic Assets	*Vulnerability:* All businesses are vulnerable to lightning-related impacts. *Impacts*: Some communications infrastructure is on exposed ridgelines, potentially making it more susceptible to lightning strike. Power outages or fire damage can halt operations, leading to financial losses for the Town of Alta and its local ski resorts.
	Natural, Historic, and Cultural Resources	*Vulnerability*: Forests, ecosystems, and cultural artifacts are vulnerable to lightning *Impacts*: Lightning is a major cause of wildfires, which can destroy forests, ecosystems, and cultural artifacts.
	Critical Facilities and Infrastructure	*Vulnerability*: Communication systems, electrical systems, and emergency response are vulnerable to lightning. *Impacts*: Communications towers and internet systems may be temporarily knocked out, affecting emergency response and everyday communication. Lightning can also strike electrical grids and power lines, which can lead to power outages and wildfires.
	Community Activities	*Vulnerability*: Outdoor events and recreation are vulnerable to lightning risks. *Impacts*: Outdoor gatherings, festivals, and sports events may be postponed or canceled due to lightning risks.
Severe Winter Weather	People	*Vulnerability*: All Alta residents are vulnerable to severe winter weather. *Impacts*: Heavy snow/blizzard conditions can result in shelter-in-place protocols, cutting people off from outside resources like food, medicine, and fuel. Power outages or reliance on indoor heating methods (e.g., generators, wood stoves) can increase the risk of carbon monoxide poisoning. Cold, dry air conditions combined with the high altitude can exacerbate respiratory illnesses. People can be injured in falls or experience coronary health problems from the exertion of shoveling heavy snow.
	Structures	*Vulnerability*: All buildings in Alta are vulnerable to severe winter weather.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		Impacts: Water pipes could freeze, leading to water damage, and ice buildup on roofs can pose danger to people and cause water infiltration, leading to structural issues. Heavy snow accumulation can weaken roofs and cause buildings to collapse, particularly in older structures. Air vents, natural gas lines, and power lines can become damaged or disrupted by heavy snow and significant snow loads.
	Economic Assets	*Vulnerability*: All businesses in Alta, particularly those involved in winter recreation tourism, are vulnerable to severe winter weather. *Impacts*: The town's economy is reliant on consistent snowfall, but it is possible to have "too much of a good thing." The heavy snowfall year of 2022–2023 led to dangerous spring-time avalanche conditions, resulting in nearly complete closure of SR 210 for several weeks. These closures greatly impacted ski area visitation and caused major economic losses for the town's largest businesses.
	Natural, Historic, and Cultural Resources	*Vulnerability*: Vegetation and wildlife habitat are vulnerable to severe winter weather. *Impacts*: Heavy snow and ice can cause tree limbs to break, disrupt ecosystems, and damage local wildlife habitats.
	Critical Facilities and Infrastructure	*Vulnerability*: Transportation, power and water infrastructure, and emergency response are vulnerable to severe winter weather. *Impacts*: Snow accumulation and avalanche threats can shut down SR 210, cutting off access to Alta. Heavy snow can also bring down power lines, leaving homes and businesses without heat and electricity if they do not have backup generators or enough fuel to get through the canyon closure. Frozen pipes and infrastructure damage could lead to water shortages and sanitation issues. First responders, medical clinics/personnel, and snow removal crews may be stretched thin or tapped out during a severe winter weather event.
	Community Activities	*Vulnerability:* There is low risk to community events from severe winter weather. *Impacts:* Given the local focus on skiing and outdoor recreation in the winter, people are more likely to be outside during heavy snow/blizzard events than they might be in other jurisdictions.
Tornado	People	*Vulnerability*: Although tornadoes are rare in the town of Alta, they are not impossible. All residents are vulnerable tornadoes if one occurs. *Impacts*: A tornado could cause injuries and fatalities, displace residents and tourists, and take a psychological and emotional toll on residents, tourists, and businesses.
	Structures	*Vulnerability*: The likelihood is low, but all structures in Alta would be at risk if a tornado occurs. *Impacts*: Tornadoes can severely damage homes, hotels, ski lodges, and public or critical facilities. High winds can break windows and compromise building integrity.
	Economic Assets	*Vulnerability*: The risk is low, but all businesses in Alta would be vulnerable if a tornado occurs. *Impacts*: Tornado damage could close ski resorts, restaurants, and hotels, harming the local economy. The financial burden of repairs and insurance claims could strain homeowners and business owners.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
	Natural, Historic, and Cultural Resources	*Vulnerability*: Trees and habitats are vulnerable to tornadoes. *Impacts*: Tornadoes can uproot trees, destroy habitats, and disrupt the town of Alta's alpine ecosystem.
	Critical Facilities and Infrastructure	*Vulnerability*: Transportation, including SR-210, power and communication systems, and emergency response are vulnerable to tornadoes. *Impacts*: Downed power lines could leave the town without electricity. Debris could block SR-210, cutting off access to the town. Communications towers and internet infrastructure could be damaged, disrupting emergency services and communication. Infrastructure damage could compromise access to clean water and wastewater treatment.
	Community Activities	*Vulnerability*: Community events and competitions are vulnerable to tornado impacts. *Impacts*: Tornado damage could postpone or cancel community activities, such as ski competitions, festivals, and other public gatherings.
Wildfire	People	*Vulnerability*: Wildfire risk in Alta is moderate to high, and all residents are vulnerable to wildfires. *Impacts*: The potential for wildfire affecting SR210 and blocking access/egress is the biggest vulnerability. Evacuation could be problematic. Smoke can cause respiratory problems, particularly for children, the elderly, and those with pre-existing conditions like asthma. Losing homes and businesses could lead to long-term psychological trauma.
	Structures	*Vulnerability*: Structures throughout Alta could be vulnerable to wildfires, particularly those with flammable materials or lacking defensible space. *Impacts*: Localized property loss could occur during wildfire events.
	Economic Assets	*Vulnerability*: Businesses throughout Alta are vulnerable to wildfire impacts. *Impacts*: Same applies to local businesses and the economy. Wildfires could lead to long-term closures of ski resorts, hiking trails, and lodges significantly impacting the local economy. Homeowners, businesses, and the government would face high costs for rebuilding and repairing damaged areas.
	Natural, Historic, and Cultural Resources	*Vulnerability*: Vegetation, wildlife habitat, soil, water quality, and scenic value are vulnerable to wildfires. *Impacts*: Alta is situated on National Forest Land—a wildfire could impact the forest flora and fauna, affecting habitats. Burned vegetation leaves soil exposed, increasing erosion and the risk of landslides and water contamination. The town's cultural connection to skiing and outdoor recreation could suffer if natural landscapes and infrastructure are destroyed.
	Critical Facilities and Infrastructure	*Vulnerability*: Power infrastructure, roads, and emergency response are vulnerable to wildfires. *Impacts*: Wildfires can damage power lines, leading to blackouts and impacting emergency services, businesses, and homes. If roads like

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		SR-210 become impassable due to fire, fallen trees, or debris, first responders and evacuations can be delayed. Firefighters, police, and medical personnel may be overwhelmed or exhausted, leading to increased response times for other emergencies.
	Community Activities	*Vulnerability*: Outdoor recreation is vulnerable to wildfire impacts. *Impacts*: Wildfires could shut down Alta's ski resorts, hiking trails, and outdoor recreational areas for months. If homes and businesses are lost, some may be forced to leave permanently, altering the town's population and culture.
Dam Failure	People	*Vulnerability*: Alta lies downstream of Cecret Lake Dam, an earthen dam that was upgraded in 2018 using concrete and grout. The town could also be affected by the failure of Red Pine Lake Dam. *Impacts*: A sudden release of water could create flash flooding, which is a threat to the safety of individuals in the inundation area. Contaminated waters from dam failure could also spread disease. Red Pine Dam inundation maps show that Little Cottonwood Canyon Road would be impacted at the mouth of the canyon, which could close SR-210 for an unknown period of time. This would disrupt transportation into and out of Alta.
	Structures	*Vulnerability*: Ski area base facilities could be inundated in a catastrophic dam failure of Cecret Lake Dam, but other businesses and residences are unlikely to be affected. *Impacts*: Ski facilities could be damaged or destroyed.
	Economic Assets	*Vulnerability*: All businesses in Alta are vulnerable to the effects of a dam failure. *Impacts*: A complete closure of SR 210 in the canyon could greatly impact Alta Ski Area visitation, resulting in major economic losses for Alta's largest businesses.
	Natural, Historic, and Cultural Resources	*Vulnerability*: A dam failure could flood Little Cottonwood Creek and impact natural resources. *Impacts*: Excessive sediment, debris, and pollutants from the flood could harm the local watershed and impact water quality.
	Critical Facilities and Infrastructure	*Vulnerability*: Transportation routes, power infrastructure, and water treatment facilities are vulnerable to dam failure. *Impacts*: SR-210, Little Cottonwood Canyon Road, the primary access route to Alta, could be washed out or blocked by the failure of Red Pine Lake Dam, cutting off the town from emergency services and supplies like food and fuel. Damage to electrical infrastructure could also occur, leaving residents and businesses without power for an extended period. Floodwaters could overwhelm local water treatment systems, leading to shortages and contamination, and first responders may struggle to access affected areas. Cecret Lake Dam does not have a mapped inundation area. However, due to its smaller size and capacity, it is not anticipated to cause damage to roadways or other infrastructure.
	Community Activities	*Vulnerability*: Community events and festivals are vulnerable to dam failure impacts.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		Impacts: Events could be postponed or canceled due to damage or unsafe conditions.
Civil Disturbance	People	The local police department is small and has limited resources to respond to a major civil disturbance. A timely response from law enforcement partners in the valley would be essential, but several hazards noted above could impact transportation through the canyon.
	Structures	Civil disturbance could involve damage to private and public property.
	Economic Assets	Although a civil disturbance is less common in a small, tourism-based town like Alta, it could still have significant effects on the local economy. Any civil unrest, such as a protest or labor strike, could deter tourists and reduce revenue for local businesses and ski resorts.
	Natural, Historic, and Cultural Resources	Protests or riots could involve damage to local businesses and natural/historic sites.
	Critical Facilities and Infrastructure	Local emergency services would be strained. But as noted above, a timely response from law enforcement partners in the valley would be essential.
	Community Activities	Community events could be canceled because of safety concerns, impacting residents, visitors, and workers. A civil disturbance could also create tension amount residents, reducing participation in community events.
Cyberattack	People	A cyberattack on the government of Alta could have significant consequences for the people in the community. Such attacks can shut down essential services like dispatch/emergency response (911), transportation, and utilities (water and electricity) and compromise sensitive personal information in government databases. If the government fails to protect citizens' data or services, people may lose confidence and trust. Cyberattacks on critical infrastructure (power grids, water treatment plants) could endanger lives.
	Structures	A cyberattack can damage public and private buildings. If private buildings or businesses use HVAC & Smart Building systems, cybercriminals can control heating, ventilation, and security systems making them unsafe or unusable. If 911 systems are compromised, responses to medical emergencies and crimes can be delayed, leading to property damage or loss of life. If a cyberattack triggers a failure in gas, water, or electrical systems, it could lead to fires, flooding, or other property damage as cascading effects.
	Economic Assets	Financial exploitation of local government and businesses may occur. Businesses relying on government contracts or infrastructure (like a shuttle bus service) may suffer financial losses. Government and local businesses in Alta may struggle with transactions, payroll, or supply chain disruptions. A cyberattack on local government systems can shut down services like business licensing, utility billing, and public records access, delaying community operations.
	Natural, Historic, and	

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
	Cultural Resources	
	Critical Facilities and Infrastructure	Disruptions to public safety communications/infrastructure. Limited response capabilities could occur. A cyberattack on the electrical grid can cause widespread blackouts, affecting homes, businesses, clinics, and emergency services. Cyberattacks can also manipulate water treatment facilities, leading to contamination of water or water shortages. Attacks on transportation systems can impact traffic signals and public transit which can create chaos, accidents, or delays.
	Community Activities	If a cyberattack affects online ticketing, security systems, or venue operations, local festivals/events like Octoberfest might be postponed or canceled.
Hazardous Materials Incident (Transporta-tion & Fixed Facility)	People	Exposure to toxic chemicals, flammable substances, or other hazardous materials can cause respiratory issues, burns, poisoning, or long-term health complications whether caused by a transportation accident or a fixed facility release. A spill or gas leak may require evacuations, resulting in the relocation of residents and visitors.
	Structures	Hazardous substances could result in the infiltration of homes, businesses, and public buildings, making them unsafe to occupy. Certain chemicals are also highly flammable and could cause structural damage if ignited.
	Economic Assets	Buildings and/or infrastructure exposed to toxic materials may require extensive cleanup. If an incident results in contamination or road closure, visitors may avoid Alta, resulting in revenue losses for ski resorts, restaurants, and other local businesses. Businesses or transportation companies responsible for the incident may face lawsuits, fines, or compensation claims from affected parties.
	Natural, Historic, and Cultural Resources	Hazardous spills or chemical exposure could harm plants, animals, and fish, affecting local water sources, soil quality, and ecosystems.
	Critical Facilities and Infrastructure	A HazMat spill on SR-210 could shut down the primary access route to Alta, isolating the town and delaying emergency response services. Contamination of local water supplies or power infrastructure could lead to service disruptions for residents, tourists, and businesses. A large-scale exposure incident could overwhelm the limited medical services there.
	Community Activities	Community events such as ski events, festivals, and other gatherings may be postponed or canceled due to safety concerns. Residents and businesses may face restrictions on outdoor activities or water usage due to contamination risks.
Public Health Epidemic/ Pandemic	People	Residents' visitors and workers could face illness, hospitalization, and potential fatalities, especially if healthcare resources are limited. Isolation, anxiety, and financial stress from business closures and potential job losses could lead to increased mental health issues. Illness, quarantines, and travel restrictions could reduce the availability of people to work in ski resorts and hospitality.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
	Structures	Lodges, restaurants, and public buildings may be temporarily or permanently closed due to public health concerns. Buildings may require frequent deep cleanings and ventilation upgrades to reduce the spread of disease. If businesses or public buildings close for extended periods, maintenance and upkeep may be delayed, leading to deterioration.
	Economic Assets	Travel restrictions and fear of the spread of disease could reduce the number of visitors to Alta, impacting the local economy. Local restaurants, ski resorts, and other businesses may experience financial strain, leading to layoffs or permanent closures. Job losses and financial hardships could make it hard for residents to pay rent or mortgages. Delays in food, medical supplies, and other essential goods could make it hard for businesses and residents to obtain necessary items.
	Natural, Historic, and Cultural Resources	Restrictions on gatherings and travel could prevent access to historic sites and cultural events. The Alta Community Center and Library (which also houses the Alta Historical Society Exhibit) would be affected.
	Critical Facilities and Infrastructure	First responders and medical staff may be overwhelmed, leading to slower responses and reduced capacity. Shuttle services, road maintenance, and snow removal efforts may be affected by workforce shortages or funding cuts.
	Community Activities	Festivals, ski competitions, and other public gatherings may be canceled or significantly limited. If schools or childcare facilities close, working parents may face challenges balancing work and home responsibilities.
Terrorism	People	An attack on public places, ski resorts, or transportation systems could result in casualties.
	Structures	Explosions, fires, or other forms of attack could destroy or severely damage public buildings, lodges, etc.
	Economic Assets	Alta's economy relies heavily on tourism. A terrorist attack or even the perception of risk could deter visitors, leading to revenue losses for hotels, restaurants, and ski resorts.
	Natural, Historic, and Cultural Resources	Explosions, fires, or deliberate environmental sabotage could harm Alta's natural environment.
	Critical Facilities and Infrastructure	Attacks on utilities could leave residents and businesses without essential services. A terrorism event would also place significant demand on police, fire, medical personnel, and clinics, potentially overwhelming local resources.
	Community Activities	Large gatherings such as ski races, festivals, and other community celebrations could be canceled or require increased security.

DRAFT

Jurisdiction-Specific Changes in Vulnerability

Hazard events can impact communities, infrastructures, and ecosystems. The severity of these impacts can be influenced by climate change, population patterns, and land use developments. Understanding these factors is crucial for the town of Alta to develop a resilient community and minimize the impacts of hazards. Table 9 displays the unique changes within the community and the related effects on each identified hazard affecting the town of Alta.

DRAFT

Table 9: Jurisdiction-Specific Changes in Vulnerability in the Town of Alta

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
Avalanche	Higher temperatures can lead to more rain, destabilizing snowpack and increasing the risk of wet avalanches. In addition, changes in snowfall can cause denser snow layering on slopes, making them more prone to sliding. Climate change can lead to more frequent or higher intensity snowstorms, which can help destabilize the snowpack and increase avalanche risk.	Residents and tourists are attracted by the high seasonal snowfall totals in Alta and Little Cottonwood Canyon. Residents typically accept avalanche risk as part of the way of life in Alta. Tourists and other seasonal visitors may be less familiar with the risks.	The majority of development in the town of Alta is done by Alta Ski Resort. According to Alta Ski Resort's 2023 master development plan, building development was limited to a couple of storage buildings and two expansions of lodges in Alta. These buildings have been approved by the U.S. Forest Service for implementation and are not at risk from avalanches.	Stayed the same.
Drought	Climate change affects drought incidents by altering precipitation patterns and increasing temperatures. Warmer weather can lead to longer dry periods and more severe droughts, while changes in rainfall can reduce snowpack in nearby mountains, crucial for summer water supply. Higher temperatures also increase evaporation rates, further straining local water resources.	Drought can significantly influence population patterns by impacting economic opportunities and the quality of life. Water scarcity often leads to reduced agricultural productivity, prompting residents to migrate to areas with more stable job prospects. Increased water costs can make living less affordable, driving some residents away. Conversely, efforts to address drought, such as sustainable development or improved water management, may attract newcomers, resulting in changes in the community's demographic composition over time.	Development in the town of Alta is driven by Alta Ski Resort. According to Alta Ski Resort's 2023 Master Development Plan, there has been no excessive development in the past five years that would impact drought. Expansions of the Albion and Watson lodges would primarily provide more seating at restaurants and additional storage, neither of which will impact drought.	Increased
Earthquake	Rising temperatures can lead to glacial melting, which affects pressure on tectonic plates and	Earthquakes can significantly alter population patterns by prompting residents to leave for	The small amount of new development in the town of Alta since the previous plan update	Stayed the same

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	may trigger seismic activity through isostatic rebound. In addition, increased rainfall and flooding can erode soils, weakening structural integrity and heightening vulnerability during earthquakes. Although the direct links between climate change and earthquakes are still under investigation, environmental effects may impact the region's seismic risk.	safer areas after a seismic event. This migration can lead to changes in population density and attract new residents and businesses during the rebuilding process. The perception of the area as a safe place to live may shift, impacting long-term demographics, as some residents return to rebuild while others relocate permanently.	has been constructed in accordance with the 2021 Utah State Building Code. This building code requires that new buildings be adequately protected from earthquake risks.	
Extreme Heat	Climate change significantly impacts extreme heat by increasing the frequency and intensity of heatwaves. Rising global temperatures lead to longer and hotter summers, affecting residents and local infrastructure while heightening health risks, especially for vulnerable populations. Urban heat islands resulting from reduced vegetation and extensive pavement further amplify these effects.	By causing residents to relocate due to damaged homes or safety concerns. Some may move to areas perceived as safer or seek better job opportunities elsewhere. The economic impact and infrastructure damage can also make certain neighborhoods less desirable, leading to shifts in demographics and the socioeconomic landscape as new residents with different backgrounds move in.	Development in the town of Alta has been minimal since the previous plan update, and it is not significantly impacting the town's extreme heat risk.	Increased
Extreme Cold	By increasing the intensity of winter storms. Higher atmospheric temperatures allow for more moisture, resulting in heavier snowfall and potentially lower temperatures during these events. In addition, fluctuations in weather patterns may disrupt seasonal cycles, leading to unpredictable periods of	By driving some residents to relocate to warmer areas. Harsh winters can hinder economic activities and deter new residents and businesses, influencing housing demand and the attractiveness of certain neighborhoods. This may disproportionately affect lower-income families, leading to	Development in the town of Alta has been minimal since the previous plan update, and it is not significantly impacting the town's extreme cold risk.	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	extreme cold mixed with warmer spells.	changes in demographics and socioeconomic stratification in the community.		
Flooding	Higher temperatures increase the frequency and intensity of extreme weather events and alter precipitation patterns. They lead to more intense rainstorms and accelerated snowmelt from nearby mountains, raising water levels in rivers and streams. This combination raises the risk of flooding, especially in areas with inadequate drainage and urban development in flood-prone zones, heightening the potential for damage to homes and infrastructure.	Flooding can significantly alter population patterns by displacing residents from affected areas, leading them to seek shelter elsewhere. This may cause a population decline where flooding occurs, as individuals might hesitate to return due to ongoing risks or property damage. As neighborhoods become less desirable, people may migrate to safer areas, changing demographic trends and putting pressure on housing in those regions. Over time, these shifts can influence urban planning and development, as local governments address flooding risks and changing population needs.	Development in the town of Alta has been minimal since the previous plan update, and it is not significantly impacting the town's risk of flooding. The storage buildings and lodges that have been expanded at the Alta Ski Resort are not near Little Cottonwood Creek, the main source of flooding in the town.	Decreased
Landslide/ Slope Failure	Climate change increases the risk of landslides through heavier rainfall and temperature fluctuations. Intense rain saturates soil, destabilizing slopes, while freeze–thaw cycles weaken the ground. Changes in vegetation can also reduce stability, leading to a higher potential for landslides.	Landslides and slope failures can impact population patterns by making some areas unsafe, leading to displacement and lower property values. This prompts residents to move to safer regions, thereby increasing density in more stable areas. Concerns about future landslides may also deter newcomers from high-risk zones, shaping long-term demographic trends.	Development in the town of Alta has been minimal since the previous plan update, and it is not significantly impacting the town's landslide risk.	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
Radon	Climate change can affect radon levels by altering soil temperatures and moisture conditions. Higher temperatures may increase radon emissions from the ground, while heavy rainfall can change groundwater and soil saturation, impacting radon migration into buildings.	Radon exposure can influence population patterns as increased health awareness may drive families to move away from areas with high radon levels. This shift could particularly affect vulnerable groups, changing demographics and demand in the housing market. Homes with lower radon levels may become more sought after, and public health campaigns can encourage community action, making previously undesirable areas more attractive once mitigation measures are implemented.	Development in the town of Alta has been minimal since the previous plan update, and it is not significantly impacting the town's radon risk.	Stayed the same
Heavy Rain	Climate change increases the frequency and intensity of heavy rain, as higher temperatures allow the atmosphere to hold more moisture. This leads to stronger storms, flash flooding, and overwhelmed drainage systems.	Heavy rain can shift population patterns by pushing residents out of flood-prone areas and attracting them to safer neighborhoods. Frequent flooding may lead to evacuations and economic disruptions, prompting relocations. Over time, ongoing heavy rains can affect housing demand and community stability, altering the town's population distribution.	Development in the town of Alta has been minimal since the previous plan update, and it is not significantly impacting the town's heavy rain risk.	Increased
High Wind	Climate change affects high winds by altering atmospheric patterns and increasing extreme weather events. Rising temperatures may lead to more substantial, unpredictable winds and more frequent	High winds can alter population patterns by making certain areas less desirable. Frequent damage may drive residents to safer neighborhoods, deter newcomers, and slow growth in affected regions.	Development in the town of Alta has been minimal since the previous plan update, and it is not significantly impacting the town's high wind risk.	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	thunderstorms, posing risks to infrastructure and air quality.			
Lightning	Climate change increases temperatures and alters precipitation, leading to more intense thunderstorms and frequent lightning strikes. Urbanization can enhance this effect, posing risks to public safety and infrastructure.	Lightning can influence population patterns by causing property damage and wildfires, leading some residents to relocate. Areas with higher lightning activity may deter new residents, while safer locations could increase migration as people seek protection from severe weather.	Development in the town of Alta has been minimal since the previous plan update, and it is not significantly impacting the town's lightning risk.	Increased
Severe Winter Weather	Climate change impacts severe winter weather by altering precipitation patterns. Higher temperatures can lead to more rain than snow, affecting snowpack levels. In addition, increased storm intensity results in heavier, more unpredictable snowfall.	Increased population equals an increased number of people needing to get to work and quicker snow removal. Heavy snow or blizzards can impact population patterns by influencing where people live and work. Transportation disruptions may lead residents to seek housing closer to jobs, increasing density in some areas while depopulating others. Families might also avoid regions with frequent heavy snowfall, shifting demand to milder areas. Over time, these trends can alter community demographics and economic activity, prompting adjustments in town planning and resource allocation.	Development in the town of Alta has been minimal since the previous plan update, and it is not significantly impacting the town's severe winter weather risk.	Increased
Tornado	Climate change may increase the frequency and intensity of tornadoes. Higher temperatures lead to more moisture in the air,	Tornadoes can influence population patterns by prompting residents to move to safer areas after damage occurs. This can	Development in the town of Alta has been minimal since the previous plan update, and it is	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	creating conditions for severe thunderstorms. Changes in wind patterns and precipitation can also heighten tornado risks, resulting in more destructive storms and greater threats to infrastructure and communities.	decrease density in affected neighborhoods while increasing the demand for housing in safer regions. New residents may also move in for recovery opportunities, altering demographics. Over time, repeated tornado threats might push long-term residents to areas with better disaster preparedness, reshaping the town's population distribution.	not significantly impacting the town's tornado risk.	
Wildfire	By raising temperatures and creating drier conditions, prolonged droughts lead to more dry vegetation, which serves as fuel for fires. Erratic seasons extend the growing period, while more lightning strikes can ignite wildfires. These factors heighten the threat to ecosystems and community safety.	Displaced individuals often seek safer areas, shifting demographics, while declining property values might deter newcomers. Conversely, some may be drawn to rebuilding efforts, impacting long-term growth and community dynamics.	Development in the town of Alta has been minimal since the previous plan update, and it is not significantly impacting the town's wildfire risk.	Increased
Dam Failure	Climate change raises the risk of dam failure by causing heavier rainfall and rapid snowmelt. These changes can overwhelm dams and compromise their integrity, highlighting the need for urgent safety assessments and upgrades to protect communities downstream.	Dam failure tornadoes can impact population patterns by displacing residents and altering demographics. Evacuations can lead to an influx in safer areas, while destruction may deter new residents and contribute to a population decline. Fear of future disasters may also prompt remaining individuals to relocate, changing the community's composition and affecting	Development in the town of Alta has been minimal since the previous plan update, and it is not significantly impacting the town's dam failure risk.	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
		population density and economic activity.		
Civil Disturbance	Climate change can increase civil disturbances by intensifying environmental stresses and social tensions. Rising temperatures may lead to droughts, wildfires, and poor air quality, particularly affecting vulnerable communities. Resource scarcity, especially water, can spark conflicts and protests. In addition, an influx of migrants from harder-hit areas may strain local resources, further escalating tensions. This cycle of unrest is driven by the impacts of climate change on the environment and community dynamics.	By encouraging residents to move for safety, leading to outflows and new arrivals. These events can reveal social issues, impacting community dynamics, employment, and property values, ultimately reshaping demographics, and social cohesion.	Development in the town of Alta has been minimal since the previous plan update, and it is not significantly impacting the town's civil disturbance risk.	Increased
Cyberattack	Possible attack on the industry, which is seen as producing large amounts of greenhouse gases and burning fossil fuels. Climate change can heighten cyberattack risk by increasing vulnerabilities during extreme weather. Disruptions like power outages offer cybercriminals opportunities, but focusing on emergency responses can weaken cybersecurity measures. As organizations adopt new technologies to cope with climate impacts, they may	Cyber-attacks can change population patterns by eroding trust in essential services. Compromised systems may cause residents to leave due to safety concerns, while high-profile incidents can deter businesses, leading to job losses. This perception of vulnerability may also make the town less appealing to newcomers, resulting in demographic shifts and affecting local development.	Development in the town of Alta has been minimal since the previous plan update, and it is not significantly impacting the town's cyberattack risk.	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	unintentionally introduce additional vulnerabilities.			
Hazardous Materials Incident (Transporta-tion & Fixed Facility)	Climate change elevates the risk of hazardous materials incidents by increasing extreme weather events like heavy rain and wildfires. These events can breach storage tanks and heighten material volatility. Vulnerable infrastructure can lead to more spills or accidents, while climate shifts may also introduce new challenges for managing hazardous substances and public health.	By causing evacuations and temporary declines in density. In the long run, unsafe areas may deter new residents, affecting growth and diversity. In addition, negative perceptions can lower property values and economic prospects, leading families to relocate, which impacts local demographics.	Development in the town of Alta has been minimal since the previous plan update, and it is not significantly impacting the town's risk from hazardous materials.	Increased
Public Health Epidemic/ Pandemic	By increasing the spread of vector-borne diseases and raising the risk of waterborne illnesses due to flooding or drought. Worsening air quality can also exacerbate respiratory conditions like asthma, especially in vulnerable populations.	By prompting migration for safety and better healthcare. Vulnerable groups may move to areas with improved services, while economic instability can drive people to seek new employment opportunities. In addition, restrictions like quarantine measures can limit movement and social interactions, reshaping the community's demographics and impacting local economies.	Development in the town of Alta has been minimal since the previous plan update, and it is not significantly impacting the town's pandemic/ epidemic risk.	Increased
Terrorism	Terroristic activity is sometimes centered around climate change. Climate change impacts terrorism incidents by creating conditions of resource scarcity and social unrest. Increased competition for essential resources, such as water, can	Terrorism incidents can alter population patterns by instilling fear and prompting residents to relocate to perceived safer areas, resulting in demographic shifts and potential declines in property values. Some neighborhoods may see an outflow of residents, while others could experience an	Development in the town of Alta has been minimal since the previous plan update, and it is not significantly impacting the town's terrorism risk.	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	fuel tensions, making communities more vulnerable to extremist ideologies. Extreme weather events may disrupt social order and infrastructure, offering terrorist groups opportunities to exploit crises. In addition, climate-driven population displacement can heighten tensions in receiving areas, raising the risk of domestic terrorism. Law enforcement's focus on climate-related challenges can also limit its capacity to address terrorism threats. Ultimately, while climate change may not directly cause terrorism, its effects can create an environment conducive to extremist activities.	influx of people seeking refuge from violence. In addition, increased security measures may deter businesses and residents from certain locations, leading to long-term changes in population density and urban development patterns.		

DRAFT

Additional Public Involvement

The town of Alta provided several opportunities for public participation in the plan. A flyer with a link to the public survey was posted in the city office, and links to the survey were shared on social media and through the community email newsletter. Figure 1 and Figure 2 present examples of public outreach.

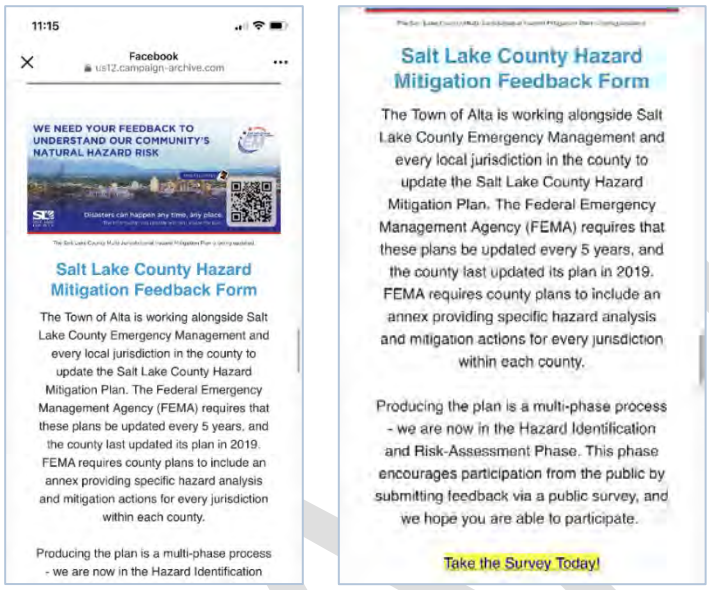

Figure 1: Social Media Post (*left*) and Email Newsletter (*right*) for the Hazard Mitigation Survey

Figure 2: Flyer Posting of the Hazard Mitigation Survey

Plan Integration

Incorporating the underlying principles of the Hazard Mitigation Plan and its recommendations into other plans is a highly effective and low-cost way to expand their influence. All plan participants will use existing

methods and programs to implement hazard mitigation actions where possible. As previously stated, mitigation is most successful when it is incorporated into the day-to-day functions and priorities of government and public service. This plan builds on the momentum developed through previous and related planning efforts and mitigation programs, and it recommends implementing actions where possible through these other program mechanisms. These existing mechanisms include the following:

- Regularity Capabilities
- Administrative Capabilities
- Fiscal Capabilities

Respective planning stakeholders will conduct implementation and incorporation into existing planning mechanisms and will be done through the routine actions of:

- Monitoring other planning/program agendas
- Attending other planning/program meetings
- Participating in other planning processes; and
- Monitoring community budget meetings for other community program opportunities.

The successful implementation of this plan will require constant and vigilant review of existing plans and programs for coordination and multi-objective opportunities that promote a safe, sustainable community. Regular efforts should be made to monitor the progress of mitigation actions implemented through other planning mechanisms. Where appropriate, priority actions should be incorporated into planning updates. Table 11 lists the opportunities for integrating elements of this plan into other plans.

Table 10 lists existing planning mechanisms in which the Hazard Mitigation Plan has been integrated. Table 11 lists the opportunities for integrating elements of this plan into other plans.

Table 10: Integration of Previous Plans by the Town of Alta

Plan	Description
Alta Ski Area Master Development Plan[6]	Addresses avalanche mitigation in ski areas to reduce risk and improve public safety.

Table 11: Opportunities for Integration with Future Plans for the Town of Alta

Plan	Description
Comprehensive Emergency Management Plan	Framework for how the city will prepare for, respond to, recover from, and mitigate hazards.
Community Wildfire Protection Plan	Addresses vulnerabilities and steps to minimize wildfire risk
General Plan	The General Plan was last updated in 2013. New hazard risk information could be incorporated when it is next updated.

DRAFT

Capability Assessment

Local mitigation capabilities are existing authorities, policies, programs, and resources that reduce hazard impacts or could help carry out hazard mitigation activities.

Planning and Regulatory Capabilities

Planning and regulatory capabilities are the plans, policies, codes, and ordinances that prevent and reduce the impacts of hazards.

Table 12: Assessment of the Planning Capabilities of the Town of Alta

Plan	Does it address hazards? (Y/N)	How can it be used to implement mitigation actions?	When was the last update? When is the next update?
General Plan	Yes		2005.Amendment in 2013. Next update unknown
Capital Improvement Plan (CIP)	Yes	As part of the CIP, the town is undergoing both a Facilities Master Planning project and a Water/Sewer Master Planning project. The outcomes of these projects can inform us of vulnerabilities in our facilities and utilities and recommend actions to address hazards. The CIP also includes updates to our communications systems to improve our response capabilities.	
Climate Change Adaptation Plan	N/A	N/A	N/A
Community Wildfire Protection Plan	Yes		Last updated by the town 2022. Now the Unified Fire Authority manages and maintains it for state compliance.
Economic Development Plan	No		
Land Use Plan	Yes		2013 last updated
Local Emergency Operations Plan	Yes		Due to be updated.
Stormwater Management Plan	No		
Transportation Plan	Yes – Wasatch Canyons General Plan	Addresses transportation for Little Cottonwood Canyon/Hwy 210	2020
Substantial Damage Plan	No		

DRAFT

Plan	Does it address hazards? (Y/N)	How can it be used to implement mitigation actions?	When was the last update? When is the next update?
Other? (Describe)			

Table 13: Assessment of the Regulations and Ordinances of the Town of Alta

Regulation/Ordinance	Does it effectively reduce hazard impacts?	Is it adequately administered and enforced?	When was the last update? When is the next update?
Building Code	Yes – Alta has adopted the state version of the International Building Code (IBC 2021, with amendments)	Yes	
Flood Insurance Rate Maps	N/A	N/A	N/A
Floodplain Ordinance	N/A	N/A	N/A
Subdivision Ordinance	Yes	Yes	Nov. 13, 2024
Zoning Ordinance	Yes	Yes	Amendments since inception in 1972
Natural Hazard Specific Ordinance (Stormwater, Steep Slope, Wildfire)	Yes – Steep slope & avalanche design requirement	Yes	2023
Acquisition of Land for Open Space and Public Recreation Use	No		
Prohibition of Building in At-Risk Areas	No		
Other? (Describe)			

Administrative and Technical Capabilities

Administrative and technical capabilities include staff and their skills. They also include tools that can help you carry out mitigation actions.

Table 14: Assessment of the Administrative Capabilities of the Town of Alta

Administrative Capability	In Place? (Y/N)	Is staffing adequate?	Are staff trained on hazards and mitigation?	Is coordination between agencies and staff effective?
Chief Building Official	Yes	Yes	Yes	Yes
Civil Engineer	Yes	Yes	Yes	Yes
Community Planner	Yes	Yes	Yes	Yes
Emergency Manager	Yes	Yes	In Training	Yes

DRAFT

Administrative Capability	In Place? (Y/N)	Is staffing adequate?	Are staff trained on hazards and mitigation?	Is coordination between agencies and staff effective?
Floodplain Administrator	No	N/A	N/A	N/A
Geographic Information System (GIS) Coordinator	No	N/A	N/A	N/A
Planning Commission	Yes	Yes	No	Yes
Fire Safe Council	No	N/A	N/A	N/A
CERT (Community Emergency Response Team)	No	N/A	N/A	N/A
Active VOAD (Voluntary Agencies Active in Disasters)	No	N/A	N/A	N/A
Other? (Please describe.)				

Table 15: Assessment of the Technical Capabilities of the Town of Alta

Technical Capability	In Place? (Y/N)	How has it been used to assess/mitigate risk in the past?	How can it be used to assess/mitigate risk in the future?
Mitigation Grant Writing	Yes	No	
Hazard Data and Information	N/A		
GIS	No		
Mutual Aid Agreements	Yes – Some		
Other? (Please describe.)			

Financial Capabilities

Financial capabilities are the resources to fund mitigation actions. Talking about funding and financial capabilities is important to determine what kinds of projects are feasible, given their cost. Mitigation actions like outreach programs are lower cost and often use staff time and existing budgets. Other actions, such as earthquake retrofits, could require substantial funding from local, state, and federal partners. Partnerships, including those willing to donate land, supplies, in-kind matches, and cash, can be included.

DRAFT

Table 16: Assessment of the Financial Capabilities of the Town of Alta

Funding Resource	In Place? (Y/N)	Has it been used in the past and for what types of activities?	Could it be used to fund future mitigation actions?	Can it be used as the local cost match for a federal grant?
Capital Improvement Project Funding	Yes		Yes	
General Funds	Yes			
Hazard Mitigation Grant Program (HMGP/404)	No			
Building Resilient Infrastructure & Communities (BRIC)	No			
Flood Mitigation Assistance (FMA)	No			
Public Assistance Mitigation (PA Mitigation/406)	No			
Community Development Block Grant (CDBG)	No			
Natural Resources Conservation Services (NRCS) Programs	No			
U.S. Army Corps (USACE) Programs	No			
Property, Sales, Income, or Special Purpose Taxes	Yes			
Stormwater Utility Fee	No			
Fees for Water, Sewer, Gas, or Electric Services	Yes			
Impact Fees from New Development and Redevelopment	No			
General Obligation or Special Purpose Bonds	No			
Federal-funded Programs (Please describe)	Yes	Sisk Act[7] funding for the Alta Marshal's Office to patrol roads in the summer.		
Private Sector or Nonprofit Programs				
Other?				

[7] 16 U.S. Code § 484a – Exchange of lands in national forests to control by a local government or school district.

DRAFT

Education and Outreach Capabilities

Education and outreach capabilities are programs and methods that could communicate about and encourage risk reduction. These programs may be run by a participant or a community-based partner. Partners, especially those who work with underserved communities, can help identify additional education and outreach capabilities.

Table 17: Assessment of the Education and Outreach Capabilities of the Town of Alta

Education and Outreach Capability	In Place? (Y/N)	Does it currently incorporate hazard mitigation?	Could it be used to support mitigation in the future?
Community Newsletter(s)	Yes	Yes	Yes
Hazard Awareness Campaigns (such as Firewise, Storm Ready, Severe Weather Awareness Week, School Programs)	No	N/A	Yes
Public Meetings/Events (Please describe.)	Yes – Annual "Chipper Days" event to mitigate wildfire hazard. Seasonal sandbag events when needed to address potential flooding concerns.	Yes	Yes
Emergency Management Listserv	Yes	Yes	Yes
Local News	No	No	
Distributing Hard Copies of Notices (e.g., public libraries, door-to-door outreach)	Sometimes	Sometimes – Example, we posted the Hazard Mitigation Survey as part of this process	Yes
Insurance Disclosures/ Outreach	No	N/A	N/A
Organizations that Represent, Advocate for, or Interact with Underserved and Vulnerable Communities (Please describe.)	Yes – Safe Place Program	No	No
Social Media (Please describe.)	Yes – Town of Alta and Alta Central	Yes	Yes
Other? (Please describe.)			

Opportunities to Expand and/or Improve Capabilities

Actions that can expand and improve existing authorities, plans, policies, and resources for mitigation include budgeting for mitigation actions, passing policies and procedures for mitigation actions, adopting

and implementing stricter mitigation regulations, approving mitigation updates, and making additions to existing plans as new needs are recognized. Table 18 lists the opportunities for the town of Alta.

Table 18: Opportunities to Expand or Improve the Capabilities of the Town of Alta

Capability	Opportunity to Expand and/or Improve
Planning and Regulation	• Explore adopting Wildland Urban Interface code • Update vegetation management ordinance • Update our development regulations pertaining to Avalanche Hazards • Update wind and snow loading criteria Improvement of local knowledge and capabilities will occur with ongoing exploration and review of unknowns in the context of planning and regulations. A culture of continuous learning and capacity building among local officials, planners, and community members will occur. Alta does not have any ordinances or land use regulations specifically for avalanche hazards. It is beginning to implement avalanche analysis into construction design, and the new Town Hall building was constructed to withstand a 1% annual chance avalanche hazard. The update to Alta Ski Lifts Master Plan does have considerations for avalanche mitigation. This represents an important first step for the town and ski area as their current methods (firing artillery shells) are becoming outdated. In addition, these methods might not be available to them soon—and they are 100% dependent on this method to function as a town and from an economic standpoint. The town has received communication from the U.S. Department of Defense informing them that they must consider alternative methods for control work, as artillery will soon be unavailable.
Administrative and Technical	• Updated GIS data To address the unknowns in administrative and technical capabilities, a thorough assessment of current staffing levels and expansion can be considered. For the Chief Building Official, it is essential to determine if the current levels are adequate. In addition, providing specialized training on hazards and mitigation strategies and enhancing coordination through regular interagency meetings would be beneficial. For the Civil Engineer, evaluating the current workload and staffing needs is crucial. Offering targeted training programs focused on hazard identification and mitigation techniques and enhancing coordination through collaborative projects could improve capabilities. The Community Planner's effectiveness can be boosted by assessing staffing adequacy, implementing continuous professional development programs on hazard and mitigation planning, and fostering better interagency coordination through joint task forces or working groups. For the Emergency Manager, reviewing staffing levels, ensuring that staff are trained on the latest hazard mitigation practices, and creating a centralized communication system to streamline coordination are key steps. The Floodplain Administrator's capabilities can be enhanced by performing a staffing review, introducing training modules covering flood hazards and mitigation measures, and organizing inter-departmental workshops to improve coordination. Hiring or training staff to manage GIS functions effectively, facilitating training sessions on GIS tools, and establishing clear protocols and regular meetings for improved coordination can strengthen the capabilities of the GIS Coordinator role.
Financial	• Pursue Grant Opportunities

DRAFT

Capability	Opportunity to Expand and/or Improve
	• MOU's with ski area and local hotels for feeding and sheltering folks in emergency to have their costs covered To address the unknowns in financial capabilities, several opportunities for improvement and expansion can be considered. It is essential to conduct a comprehensive assessment to identify existing funding resources and their past use. This assessment will provide a clear understanding of which resources have been used for specific activities and can fund future mitigation actions.
Education and Outreach	• Work on increasing our Newsletter Subscriber List • Continue to use Newsletters to share mitigation actions that residents can take • Use new communication tool on new website to increase reach To address the unknowns in education and outreach capabilities, there are several opportunities for improvement and expansion. First, it is essential to conduct an in-depth assessment of current insurance disclosures and outreach practices to understand the integration of hazard mitigation information. Collaborating with insurance companies, including mitigation-related content in their communications to policyholders, can increase awareness and preparedness. Next, identifying and engaging with organizations that represent, advocate for, or interact with underserved and vulnerable communities is crucial. Partnering with these organizations can help tailor hazard mitigation messages to the specific needs of these communities, ensuring that critical information reaches those most at risk. This collaboration can lead to the development of targeted outreach programs and initiatives that effectively address the unique challenges faced by these communities. For social media, a comprehensive strategy should be developed to leverage various platforms. This strategy should include regularly updating content, engaging with the community through interactive posts, and using social media analytics to measure the effectiveness of outreach efforts. Expanding the use of social media to other platforms can also increase the reach and impact of hazard mitigation messages.

Mitigation Strategy

Mitigation strategies provide proactive measures that are designed to minimize the impacts of hazards on the town of Alta. Table 19 shows mitigation action alternatives, and

Table 20 shows the status of previous mitigation activities. Alta plans to retain and carry forward the ongoing or incomplete actions from the previous plan. Table 21 is the 2025 mitigation action plan for the town of Alta.

DRAFT

Table 19: Mitigation Action Alternatives for the Town of Alta[8]

Action	Type of Action	Selected for inclusion in the plan?	If not selected, why not?
Continue to support and collaborate with UDOT and other local orgs that help manage avalanche hazard in Little Cottonwood Canyon		No	Not specific
Research and explore funding opportunities to partner with UDOT on technologies like slope-monitoring radar	Structure and Infrastructure Projects	No	Selected other priority actions.
Monitor compliance with construction regulations for new developments	Local Plans and Regulations	No	Existing capability
Update Ordinance 10-7-22 Avalanche Building Regulations	Local Plans and Regulations	Yes	
Interagency communications		No	Not specific
Routine review of the Interlodge travel restriction ordinance	Local Plans and Regulations	Yes	Non-mitigation
Baseline capabilities assessments of Interlodge		No	Non-mitigation
Conduct avalanche assessment hazards of TOA facilities and incorporate results into facilities planning	Structure and Infrastructure Projects	Yes	
More streamlined information channels throughout town business and properties	Education and Awareness Programs	Yes	Non-mitigation
Avalanche/Interlodge educational videos to be available to town residents and visitors	Education and Awareness Programs	No	Considering other education options
Explore the concept of developing a local ordinance to allow us to impose fire restrictions	Local Plans and Regulations	Yes	
Consider adopting the WUI Code – defensible space landscaping requirements construction materials requirement – inspections	Local Plans and Regulations	Yes	
Pursue Firewise community designation	Education and Awareness Programs	No	Selected other priority wildfire actions
Partner with UFA to conduct community fire awareness/preparedness presentations	Education and Awareness Programs	No	Selected other priority wildfire actions
Assess water system for appropriate fire flows/make enhancements as needed (ongoing)	Structure and Infrastructure Projects	No	Maintenance

[8] TOA = Town of Alta, UDOT = Utah Department of Transportation, UFA = Unified Fire Authority, WUI = Wildland–Urban Interface

Action	Type of Action	Selected for inclusion in the plan?	If not selected, why not?
Support revegetation efforts in areas prone to slope failure	Natural Systems Protection	Yes	
Support ongoing maintenance of storm drain infrastructure in Alta	Structure and Infrastructure Projects	No	Maintenance
Pursue seismic upgrades to TOA facilities	Structure and Infrastructure Projects	Yes	
Get an updated dam failure inundation map including the new Cecret Lake Dam	Natural Systems Protection	No	Other jurisdiction
Update snow load building department requirements	Local Plans and Regulations	Yes	
Continued coordination with UDOT to maintain accessible transportation corridors	Structure and Infrastructure Projects	No	Maintenance
Identify and correct insufficiencies in culinary water infrastructure (drought)	Structure and Infrastructure Projects	Yes	
Provide information and resources to residents about radon testing	Education and Awareness Programs	Yes	
Get TOA facilities tested for radon	Education and Awareness Programs	Yes	

Table 20: Status of the 2019 Mitigation Actions of the Town of Alta[9]

Action	Hazard(s)	Agency Lead	Support Agency(ies)	Status Update
Update TOA Ordinance to promote fuel mitigation and structural defensibility	Wildfire	TOA	UFA	Incomplete. Deleted due to lack of support. Revised action added to 2025 mitigation actions.
Support UFA fuels mitigation on residential/commercial properties	Wildfire	UFA	TOA	Ongoing – Annual chipper days w/ UFA wildland crew

[9] BOR = Bureau of Reclamation, DNR = Department of Natural Resources, SLC = Salt Lake City SLCo = Salt Lake County, SLCo EM = Salt Lake County Emergency Management, SLCo SA#3 = Salt Lake County Service Area #3, TOA = Town of Alta, UDOT = Utah Department of Transportation, UFA = Unified Fire Authority, UGS = Utah Geological Survey, USFS = United States Forest Service, USGS = United States Geological Survey, WSMP = Water and Sewer Master Plan.

Action	Hazard(s)	Agency Lead	Support Agency(ies)	Status Update
Maintain/improve water storage and distribution system	Wildfire, drought, earthquake, etc.	TOA	SLCo SA#3	Ongoing – Small improvements under BOR grant in 2020–2022, WSMP
Improve culverts along SR 210, Michigan City Road, additional stormwater management features	Landslide/ Severe Weather	TOA/ UDOT	USFS	Ongoing – UDOT
Seek best available data regarding the severity shaking during major earthquake	Earthquake	TOA	UGS/FEMA, SLCo EM	Ongoing
Support UDOT Remote Avalanche Control System (RACS) implementation	Avalanche	UDOT	Town, ski areas	Ongoing – UDOT has installed RACS in most major avalanche paths affecting TOA and SR 210 thru Alta
Support UDOT avalanche detection system improvements	Avalanche	UDOT	Town, ski areas	Ongoing – UDOT installed radar facing Mt. Superior, evaluating other options for remote detection
Seek new inundation map for improved Cecret Lake Dam	Dam Failure	SLC/ DNR	Utah Division of Water Resources, Dam Safety Section	Incomplete
Acquire, upgrade, and/or integrate communications equipment and systems as determined by coordinating group	All hazards	TOA	Utah Communications Authority	Ongoing
Identify and implement additional hazard monitoring capabilities. **Install remote avalanche explosive capability in the Canyon.**	All hazards	TOA	State of Utah	Complete UDOT RACS
Compile inventory of mutual aid agreements and MOUs and identify deficiencies	All hazards	TOA		Incomplete
Coordinate with existing public education programs, such as the American Red Cross, Utah Living with Fire, Be Ready Utah, and the National Weather Service	All hazards	TOA		Ongoing CPR class

DRAFT

Action	Hazard(s)	Agency Lead	Support Agency(ies)	Status Update
Continue to encourage water conservation utilizing and promoting outreach material from all water districts in the county	Drought	TOA		Incomplete
Repair, maintain and improve water distribution infrastructure to prevent loss from leakage, breaks, etc.	Drought	TOA	County	Ongoing WSMP
Address identified problems through construction of debris basins, flood retention ponds, energy dissipaters or other flood control structures	Flooding	TOA	Contractors	Incomplete and deleted TOA does not own any infrastructure for flood control etc. or any land to put it on.
Establish maintenance and repair programs to remove debris, improve resistance and otherwise maintain effectiveness of stormwater and flood control systems	Flooding	TOA	Contractors	Incomplete and deleted – see above
Identify and assess structures for deficiencies	Flooding	TOA	Contractors	Incomplete and deleted – see above
Modify structures as needed to address deficiencies	Flooding	TOA	Contractors	Incomplete and deleted – see above
Assist Forest Service Utah Avalanche Forecast Center and other organizations in promoting avalanche hazard awareness for backcountry users	Severe Weather	TOA		Ongoing
Coordinate with the Utah Geological Survey and other agencies to understand current slope failure threats/ potential	Slope Failure	TOA	USGS	Incomplete
Utilize recommendations provided by the State Geological Hazards Working Group to address land use and planning for new developments	Slope Failure	TOA	USGS	Incomplete
Provide waste removal, such as chipping of green waste by public works, following designated fuel clearing day/week	Wildland Fire	TOA	Contractor	Deleted. Combined with other fuel reduction action in 2025 plan – UFA Chipper Days

DRAFT

Action	Hazard(s)	Agency Lead	Support Agency(ies)	Status Update
Work with experts and communities to develop or update evacuation plans	Wildland Fire	TOA	County and state transportation	Incomplete/ ongoing – participating in SLCo evacuation plan
Evaluate transportation network and address needed improvements to facilitate evacuation and emergency response	Wildland Fire	TOA	County and state transportation	Incomplete –See above
Support Current Avalanche Hazard Mitigation Interagency Partnerships	Avalanche	TOA		Ongoing

DRAFT

Table 21: 2025 Mitigation Action Plan for the Town of Alta[10]

#	Action	Hazard(s)	Lead Agency	Potential Partners	Benefits (Losses Avoided)	Cost Estimate	Funding Source(s)	Timeframe	Priority	Comments
1	Test town of Alta (TOA) facilities for radon to protect citizens from the adverse effects of the gas.	Radon	TOA EM	Utah DEQ, SLCo Health Department	Determine radon risk in city facilities and potential action needed to reduce health impacts.	Low	Town of Alta General Fund	Short	High	
2	Update Ordinance 10-7-22 Avalanche Building Regulations to ensure the viability and stability of building in an avalanche prone area.	Avalanche	TOA Town Council	UDOT, MSD	Stronger building codes may reduce structural damage and injuries caused by avalanche.	Low	Town of Alta General Fund	Medium	Medium	
3	Identify and correct insufficiencies in culinary water infrastructure (drought).	Drought	TOA EM	Hansen, Allen & Luce (water system engineering firm)	Reduce water loss to conserve culinary water supply.	Medium	Town of Alta Capital projects fund	Medium	Medium	Ongoing with current Water and Sewer Master Plan
4	Update snow-load building department requirements.	Severe Winter Weather, (Heavy Snow, Blizzard)	TOA	Town Engineer	Increased snow-loading capabilities may minimize structural damage and potential injuries following heavy snow. New construction will be required to be built in compliance with the new snow load requirement.	Low	Town of Alta General Fund	Medium	Medium	
5	Conduct avalanche assessment hazards of TOA facilities and incorporate results into facilities planning.	Avalanche	TOA EM		Less structural damage and fewer injuries caused by avalanches in TOA facilities.	Medium	Town of Alta Capital projects fund	Long	Medium	
6	Consider adopting the WUI code which may include defensible space landscaping requirements or construction materials requirements and conduct inspections.	Wildfire	TOA EM	UFA	Increased preparedness against property damage from wildfire.	Low	Town of Alta General Fund, CWDG	Long	Low	
7	Consider adoption of local ordinance to allow us to enforce fire restrictions.	Wildfire	TOA Town Council	UFA	Enhanced ability to enforce fire restrictions to reduce risky fire behavior.	Low	Town of Alta General Fund	Medium–Long	Medium	
8	Conduct stormwater management infrastructure maintenance and evaluate where improvements/ upgrades may be needed.	Heavy Rain/Flooding	UDOT	TOA	Reduced risk of road flooding.	Medium	UDOT operational budget, Town of Alta General Fund, FMA	Medium	Medium	
9	Complete inventory of mutual aid agreements and MOUs.	All hazards	TOA EM	USFS, UDOT, UFA, Alta Ski Lifts, etc.	Enhanced preparedness to respond to incidents.	Low	Town of Alta General Fund	Short	High	
10	Support revegetation efforts in areas prone to slope failure.	Landslide/ Slope Failure	USFS	TOA	Reduced risk of landslide.	Low	Town of Alta General Fund	Ongoing	Low	
11	Conduct routine review of our Interlodge travel restriction ordinance.	Avalanche, Severe Winter Weather	TOA EM	Ski resorts	Increase safety and enforcement during periods of heavy snow/blizzard/avalanche risk	Low	Town of Alta General Fund	Short	Low	

[10] ARC = American Red Cross, BOR = Bureau of Reclamation, BRIC = Building Resilient Infrastructure and Communities, CWDG = Community Wildfire Defense Grant, DEM = Division of Emergency Management, DEQ = Department of Environmental Quality, DNR = Department of Natural Resources, DPS = Department of Public Safety, DWR = Division of Water Resources, EM = Emergency Management, FEMA = Federal Emergency Management Agency, HSGP = Homeland Security Grants Program, MSD = Municipal Services District, NWS = National Weather Service, RACS = Remote Avalanche Control System, SLC = Salt Lake City, SLCo = Salt Lake County, SLCo EM = Salt Lake County Emergency Management, TOA = Town of Alta, UAC = Utah Avalanche Center, UDOT = Utah Department of Transportation, UFA = Unified Fire Authority, UGS = Utah Geological Survey, USFS = United States Forest Service, USGS = U.S. Geological Survey, WSMP = Water and Sewer Master Plan.

DRAFT

#	Action	Hazard(s)	Lead Agency	Potential Partners	Benefits (Losses Avoided)	Cost Estimate	Funding Source(s)	Timeframe	Priority	Comments
12	Identify and pursue seismic upgrades to TOA facilities.	Earthquake	TOA EM		May reduce structural damage from earthquakes.	Medium-High (contingent on rebuilds)	Town of Alta Capital Projects fund, BRIC	Medium	Medium	
13	Continue monitoring and participation through SIAC partnership for terrorisms, cyberattacks, etc.	Terrorism	TOA EM	DPS, SLCo EM	Increased preparedness to respond to cyberattacks/terrorism.	Low	Town of Alta General Fund	Ongoing	Low	
14	Conduct public outreach programs like “See something, Say something.”	Terrorism	TOA EM	SLCo EM	Community response preparedness.	Low	Town of Alta General Fund, HSGP	Short term	Low	
15	Create public awareness campaigns to educate about risks from severe weather and other hazards. Share via newsletter, website, social media, or in-person town events.	Dam Failure, Extreme Heat, Extreme Cold, Heavy Rain, High Wind, Lightning, Tornado, Severe Winter Weather	TOA EM	SLCo EM, NWS, utilities	Improved education and understanding by the public of local hazards and ways in which they can reduce risk for themselves, their homes, and their loved ones. These campaigns will focus on all citizens via workshops, flyers, surveys, etc. Subjects will include how the populace can weatherize their homes for extreme heat/ cold/severe winter weather, how to avoid flooding from heavy rain, such as by elevating utilities, wind barriers for high winds, tornado risk, and what to do when an alert is sounded. Education on dam failure can make the populace aware of where the inundation areas are.	Low	Town of Alta General Fund	Short term	Medium	
16	Encourage fuels mitigation on residential and commercial properties by providing chipping of green waste and waste removal following designated fuel clearing day/week.	Wildfire	TOA	UFA, SLCo Public Works & Municipal Services	Fuel reduction needs to be completed regularly to maintain effectiveness and reduce risk to property from wildfire. Providing chippers and waste removal facilitates greater participation.	Low	Town of Alta General Fund	Ongoing	Medium	Annual chipper days with UFA wildland crew.
17	Maintain/improve water storage and distribution system.	Wildfire, Drought, Earthquake.	TOA	SLCo Service Area #3	Efforts to maintain functionality of water supply to improve resilience and reduce risks to multiple hazards.	Medium	Town of Alta General Fund, BOR grants, WSMP	Short term	Medium	Small improvements under BOR grant in 2020–2022, WSMP. Additional improvements desired.
18	Improve culverts along SR-210, Michigan City Road, additional stormwater management features.	Flooding, Heavy Rain, Dam Failure, Landslide	TOA	UDOT, USFS	Reduce risk of road damage from flooding and other hazards.	Medium	Town of Alta General Fund, Capital Project Fund, UDOT Operational Budget,	Medium	Medium	
19	Seek best available data regarding the severity of shaking during major earthquake.	Earthquake	TOA	UGS/FEMA, SLCo EM	Improved understanding of risk severity to prioritize mitigation needs	Low	Town of Alta General Fund	Short term	Medium

City of Bluffdale Annex

To participate in this multi-jurisdictional hazard mitigation plan (MJHMP) update for Salt Lake County (SLCo), the governing body of the city of Bluffdale passed a formal resolution, a copy of which is maintained at the local government offices.

Planning Process Contact Information

Table 1 provides information on the point of contact during the updating of the MJHMP.

Table 1: Contact Information for the City of Bluffdale

Name	Contact Information
Bart Barton	**Phone:** 801-254-2200 Ext 746; **email:** babarton@bluffdale.gov

The city of Bluffdale has a fully integrated approach to hazard mitigation planning and program implementation. During the 2024 update process, the MJHMP participation roles in Table 2 were recorded.

Name	Title	Jurisdiction/Agency
Bart Barton	Emergency Manager	City of Bluffdale

Jurisdiction Profile

Date of Incorporation

October 13, 1978

Location and Description

The city of Bluffdale is located 20 miles south from downtown Salt Lake City in the southern portion of Salt Lake County. The city is approximately 11.4 square miles in area and is located approximately 4,436 feet above sea level. Bluffdale is known for its suburban feel with a mix of residential neighborhoods, open spaces, and some commercial areas. The city is bordered by the Jordan River to the west and the Wasatch Mountains to the east providing residents with beautiful natural scenery and outdoor recreational opportunities.

DRAFT

Population

The 2022 American Community Survey 5-Year Estimate from the U.S. Census Bureau records the population of the city of Bluffdale at 18,168 people.

Demographics

Most of the 18,168 people are between the ages of 35 and 44, with a median age of 31.2; 9,214 are males (50.7%) and 8,954 are females (49.3%).

English is the primary language in 93.5% of homes, with 3.5% Spanish, 1.8% Other Ind-European languages, 1.2% Asian and Pacific Islander languages, and less than 0.1% other languages.

Brief History

In 1862, Jens and Rise Madsen became the first permanent settlers on the east side of the Jordan River. Chris Petersen and his family along with Timothy Gilbert and the Spencer Brothers, John and Robert soon followed. The construction of the canal system in 1874 led to an influx of settlers. Bluffdale Precinct was established in 1883 with William Wallace Merrill serving as the first justice of the peace. The community began to grow with a post office being established in 1888, a meetinghouse built between 1887 and 1888, a brick schoolhouse in 1893, and an amusement hall in 1899. The arrival of the Narrow Gauge Railroad in 1876 further connected Bluffdale to the surrounding areas. Bluffdale was officially incorporated in October 1978.

Climate

The city of Bluffdale experiences a humid continental climate (Dfa Köppen classification). This is characterized by hot, dry summers and cold, snowy winters. Average high temperatures are approximately 80–90°F in the summer and in the 20s and 30s in the winter. Rain each year is approximately 20 inches, and snowfall averages 30–40 inches.

Public Services

Because Bluffdale lies at the narrowest point between the Wasatch and Oquirrh mountain ranges, many utilities are located here. These utilities and other critical infrastructure and key resources (CIKR) significantly influence the city's land uses. These include a heavily used Union Pacific Railroad and UTA rail line running north-south; Redwood Road (also running north–south); Interstate-15 and Bangerter Highways; and a major canal that is the effective western boundary of the community. In addition, six other canals, several aqueducts, two major power corridors, regional arterials and highways, and a major gas line corridor create obstacles and shape land use opportunities.

Bluffdale has an established fire department, police department, and also has emergency management, public works, code enforcement, utilities, and building departments.

DRAFT

Governing Body

The city of Bluffdale operates under a six-member council system with a governing body consisting of the Mayor and five council members. The City Council created the position of City Manager through an ordinance who is responsible for the daily operations and management of the city including its employees and services. The City Manager reports directly to both the Mayor and the City Council.

Development Trends

The entire Wasatch Front is under tremendous growth pressure, with the Wasatch Front Regional Council projecting a 67% increase in population by 2040. Bluffdale's 2018 Capital Facilities Plan (CFP) uses a detailed methodology to project population in connection with projected future land use in the city. Based on the CFP, Bluffdale's population will grow to nearly 40,000 by the year 2035. At this point, the city will be at full build-out (given its current future land use planning and the associated dwelling densities). More detailed information about population projections is included in the CFP document. Population growth is expected to increase dramatically with the new housing developments presently under construction. The major population growth center in Bluffdale will be the east side of the city, between I-15 and the railroad tracks, where the heaviest growth is expected to occur between approximately 2015 and 2025, and then tapering off as Bluffdale nears build-out.

Jurisdiction-Specific Hazards and Risk

The Calculated Priority Risk Index (CPRI) is a comprehensive assessment tool for evaluating and prioritizing risks in a given context. It considers various factors, such as probability, impact, and urgency, to determine the level of risk associated with events or situations. The results for each hazard, including its risk factor (RF) value, are shown in Table 3. The results are based on the criteria in

Table 4 and the equation that follows it. The CPRI helps organizations and individuals make informed decisions about risk management and mitigation strategies. It provides a systematic approach to identifying and addressing potential issues, allowing for a more efficient allocation of resources and proactive risk prevention. With the CPRI, stakeholders can prioritize their focus on the most critical risks, leading to more effective risk management and, ultimately, better outcomes.

Table 3: Calculated Priority Risk Index Values for the City of Bluffdale

Type of Hazard Event	Probability of Future Events	Spatial Extent	Severity of Life/ Property Impact	Warning Time	Duration	Response Capacity	Risk Factor Value
Avalanche	4	1	2	4	2	1	2.6
Drought	4	4	2	1	4	1	2.8
Earthquake	3	4	4	4	3	2	3.4
Extreme Heat	4	4	3	1	3	1	3
Extreme Cold	3	4	2	1	3	1	2.4

DRAFT

Type of Hazard Event	Probability of Future Events	Spatial Extent	Severity of Life/ Property Impact	Warning Time	Duration	Response Capacity	Risk Factor Value
Flooding	4	3	3	3	3	1	3.1
Landslide/ Slope Failure	2	1	2	4	1	2	2

Cyberattack	2	3	3	4	3	2	2.7
Hazardous Materials Incident (Transportation & Fixed Facility)	3	1	2	4	1	1	2.2
Public Health Epidemic/ Pandemic	3	4	3	1	4	1	2.8
Terrorism	2	1	3	4	2	1	2.3

Table 4: Criteria for the Calculated Priority Risk Index

Risk Index Factor	Degree of Risk Level		Criteria	Factor Weight for Degree of Risk Level
Probability of Future Events	1	Unlikely	Less than 1 percent probability of occurrence in the next year or a recurrence interval of greater than every 100 years.	30%
	2	Occasional	1 to 10 percent probability of occurrence in the next year or a recurrence interval of 11 to 100 years.	
	3	Likely	11 to 90 percent probability of occurrence in the next year or a recurrence interval of 1 to 10 years.	

DRAFT

Risk Index Factor	Degree of Risk Level		Criteria	Factor Weight for Degree of Risk Level
	4	Highly Likely	91 to 100 percent probability of occurrence in the next year or a recurrence interval of less than 1 year.	
Spatial Extent	1	Limited	Less than 10% of the planning area could be impacted.	10%
	2	Small	10%–25% of the planning area could be impacted	
	3	Significant	25%–50% of the planning area could be impacted.	
	4	Extensive	50%–100% of the planning area could be impacted.	
Severity of Life/Property Impact	1	Negligible	Less than 5% of the affected area's critical and non-critical facilities and structures are damaged/destroyed. Only minor property damage and minimal disruption of life. Temporary shutdown of critical facilities.	30%
	2	Limited	More than 5% and less than 25% percent of property in the affected area is damaged/destroyed. Complete shutdown of critical facilities for more than one day but less than one week.	
	3	Critical	More than 25% and less than 50% of property in the affected area was damaged/destroyed. Complete shutdown of critical facilities for over a week but less than one month.	
	4	Catastrophic	Over 50% of critical and non-critical facilities and infrastructures in the affected area are damaged/destroyed. Complete shutdown of critical facilities for more than one month.	
Warning Time	1	Self-defined	More than 24 hours	10%
	2	Self-defined	12 to 24 hours.	
	3	Self-defined	6 to 12 hours.	
	4	Self-defined	Less than 6 hours.	
Duration	1	Brief	Up to 6 hours.	10%
	2	Intermediate	Up to one day.	
	3	Extended	Up to one week.	
	4	Prolonged	More than one week.	
Response Capacity	1	High	Significant resources and capability to respond to this kind of event; staff are trained, experienced, and ready.	10%
	2	Medium	Some resources and capability to respond to this kind of staff; some staff may be trained,	

DRAFT

Risk Index Factor	Degree of Risk Level		Criteria	Factor Weight for Degree of Risk Level
			experienced, and ready while others may need additional support.	
	3	Low	Limited resources and capability to respond to this kind of event; additional staff or staff training needed.	
	4	None	No resources and capability to respond this kind of event; additional outside support would be required.	

RISK FACTOR (RF) EQUATION

RF Value = [(Probability x 0.30) + (Spatial Extent x 0.10) + (Severity of Life/Property Impact x 0.30) + (Warning Time x 0.10) + (Duration x 0.10) + (Response Capacity x 0.10)]

Hazards with an RF value greater than or equal to 2.5 are considered high risk. Those with RF values of 2.0 to 2.4 are considered moderate risk hazards, and those with an RF value less than 2.0 are considered low risk. The highest possible RF value is 4.

Hazard Event History

Examining hazard event histories provides valuable insights to inform decision-making and help prioritize resources for risk prevention and response efforts. Table 5 lists the hazard events impacting the city of Bluffdale since the 2019 plan update, as recorded in the Storm Events Database from the National Centers for Environmental Information.

Table 5: History of Hazard Events in the City of Bluffdale[1]

Type of Hazard Event	FEMA Disaster #	Date(s)	Damage or Impacts	Description
Avalanche	N/A			The likelihood of avalanches impacting Bluffdale is extremely minimal. There are no adjacent mountains steep enough to be of concern and no historical avalanche activity in our community.
Drought	N/A			Nothing official declared on a city level

[1] UDOT = Utah Department of Transportation.

Type of Hazard Event	FEMA Disaster #	Date(s)	Damage or Impacts	Description
Earthquake	N/A	03/12/2020	No damage to the city reported	5.7 M earthquake with epicenter near Magna. There have been smaller earthquakes in Bluffdale, with 3.7 M in 2019.
Extreme Heat	N/A			
Extreme Cold	N/A			
Flooding		Spring 2023/2024	Individual homes experienced isolated flooding. Some limited damage to native areas on city property Major damage to detention pond/park. A storm took out the two UDOT ponds on Redwood just south of PRB. Both ponds had to be rebuilt—not our facility but was in Bluffdale.	2023/2024 spring runoff
Landslide/ Slope Failure		N/A		
Radon		Statewide	No specific information on the city. 55% of households in Bluffdale are at or above the WHO's mitigation threshold.	Ongoing education via Utah state agencies promoting testing.
Heavy Rain	N/A	08/03/2007	$45,000 property damage	Rainfall of 1.1 inches in 30 minutes inundated storm drains and resulted in many reports of basement flooding.
High Wind	N/A	03/26/2012	$20,000 property damage	63 mph in Bluffdale.
Lightning	N/A			
Severe Winter Weather	N/A	12/13/2015		Over 150 accidents or stranded motorists were reported in Salt Lake Valley, and at least 1,500 customers were without power at some point during the event, with

DRAFT

Type of Hazard Event	FEMA Disaster #	Date(s)	Damage or Impacts	Description
				many of those in Bluffdale and Draper
Tornado	N/A			
Wildfire	N/A	July 8, 2019	Oak Springs Utah Fire	Wildfire near Camp Williams and the NSA data center
Dam Failure	N/A			
Civil Disturbance	N/A			
Cyberattack	N/A			
Hazardous Materials Incident (Transportation & Fixed Facility)	N/A

Terrorism				

National Flood Insurance Program Summary

The city of Bluffdale participates in the National Flood Insurance Program (NFIP). Table 6 displays statistics related to the NFIP. The city of Bluffdale does not participate in the Community Rating System.

Table 6: National Flood Insurance Program Status for the City of Bluffdale[2]

Initial FHBM Identified	Initial FIRM Identified	Current Effective Map Date	Adopted Date	Date Joined NFIP	Tribal
–	09/30/1987	11/19/2021	2021	09/30/1987	No

Table 7: National Flood Insurance Overview for the City of Bluffdale

Community ID	Number of Losses	Total Net Payment	Active Policies	Total Coverage
490247	1	$0	13	$4,215,000

The City Engineer is the designated Floodplain Administrator for the city of Bluffdale. The city's Flood Control Ordinance was adopted on 8/11/2009. The current effective FIRM is dated 11/19/2021. The Building Department is responsible for permitting, including inspecting structures. All development in the Special Flood Hazard Area is required to submit a Floodplain Development Permit, which clearly indicates

[2] FIRM = Flood Insurance Rate Map, FHBM = Flood Hazard Boundary Map

the flood zone and type of work (such as channel improvements, structural development, etc.). Development may not be used or occupied until the Building Department has completed a final inspection, ensuring compliance with applicable FEMA regulations. Substantial damage or substantial improvement determinations are made through the permitting process. When the permit request is submitted, there is the opportunity to indicate whether the structure meets these definitions prior to permit approval and will therefore be required to come into compliance with current code.

Jurisdiction-Specific Vulnerabilities and Impacts

Table 8 provides information on the vulnerable assets in the city of Bluffdale, including its critical facilities, highlighting the city's vulnerability to identified hazards. It also describes the potential impacts on the community arising from those vulnerabilities. By understanding the risks associated with these assets, local authorities can develop proactive strategies to mitigate vulnerabilities and ensure the safety and functionality of these important assets during hazard events. These data are invaluable for decision-making and prioritizing resources for emergency response and preparedness efforts, ultimately contributing to more effective risk management and greater resilience in the community.

Vulnerable assets in Bluffdale include the population of 18,168 and their residences. Critical facilities in Bluffdale include one EOC, two fire stations, one police station, two elementary schools, and four charter schools. Bluffdale City Park, Wardle Fields Regional Park, and Jordan Narrows Park are some of the primary outdoor recreation facilities, as well as the Jordan River Parkway multi-use trail. Bangerter Highway runs along the northern border of the city, I-15 follows much of the eastern border, and Porter Rockwell Blvd, Redwood Road, and 14600/14400 South are primary routes through the city. Although Mountain View Corridor is not within Bluffdale, it closely parallels the southwest border and is a significant route for the city.

Table 8: Jurisdiction-Specific Vulnerabilities and Impacts of the City of Bluffdale

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
Avalanche	People	*Vulnerability:* While Bluffdale is not traditionally known for high avalanche activity compared to Utah's ski regions, individuals who venture into the nearby Wasatch Mountain foothills may face avalanche risks, particularly during the winter months. *Impacts:* Residents who engage in winter recreation in adjacent higher-elevation areas without proper avalanche training, safety gear, or awareness of local conditions are especially vulnerable. Lack of local avalanche education and the assumption that Bluffdale is outside danger zones can contribute to complacency.
	Structures	*Vulnerability:* Structures located along the eastern edges of Bluffdale near hilly or elevated terrain, including those near natural drainages or slopes, may be exposed to avalanche risk if snow conditions and slope characteristics align unfavorably. *Impacts:* Homes with inadequate snow load design, especially in transitional zones between flat and elevated land, may be more susceptible to damage. While direct avalanche impacts are rare, snow

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		accumulation and runoff can exacerbate structural stress or secondary impacts such as localized flooding or debris flow.
	Economic Assets	*Vulnerability:* Economic disruption from avalanches in Bluffdale is generally indirect. However, if avalanche conditions or closures affect nearby recreational areas or transportation routes used by residents or local businesses, economic effects may occur. *Impacts:* Road closures can delay commutes, goods deliveries, or regional commerce. Infrastructure repairs and emergency responses can also lead to financial strain.
	Natural, Historic, and Cultural Resources	*Vulnerability:* The natural landscape in and around Bluffdale, including wildlife corridors and seasonal creeks, is vulnerable to avalanches and related hazards. *Impacts:* Landscapes could be impacted by snow slide events in nearby terrain. Erosion and debris flow following snowmelt or avalanches may degrade habitats and open space areas. Bluffdale's historic sites and community assets near natural slopes may face occasional risks if they are poorly maintained or not protected against heavy snowfall and runoff patterns.
	Critical Facilities and Infrastructure	*Vulnerability:* Bluffdale facilities have low vulnerability to avalanches, but there is some risk to infrastructure systems. *Impacts:* While major critical facilities in Bluffdale are not located in traditional avalanche paths, the city's proximity to hilly terrain necessitates caution. Infrastructure such as power lines, communication towers, and roads leading into or from neighboring elevated areas may be impacted by snow accumulation, secondary slides, or access restrictions during avalanche conditions in the surrounding region.
	Community Activities	*Vulnerability:* Outdoor recreation is vulnerable to avalanche risks. *Impacts:* Residents of Bluffdale frequently engage in outdoor activities in nearby mountainous areas. Winter hiking, snowshoeing, and snowmobiling in areas just outside city boundaries can pose avalanche risks, especially in Little Cottonwood Canyon, Big Cottonwood Canyon, or American Fork Canyon—popular destinations for Bluffdale residents. Seasonal events or recreation near snow-covered terrain should incorporate public awareness of avalanche risks.
Drought	People	*Vulnerability:* All Bluffdale residents are vulnerable to drought. *Impacts:* In Bluffdale, drought conditions can significantly affect daily life, especially for households relying on well water or those using outdoor cooling systems such as evaporative coolers. Residents who maintain gardens or orchards or raise small livestock are particularly impacted by water shortages. Extended drought periods can increase household utility costs, limit water for personal use, and pose challenges for vulnerable populations such as the elderly and lower-income residents.
	Structures	*Vulnerability:* All homes and other structures are vulnerable to drought impacts. *Vulnerability:* Prolonged drought may restrict Bluffdale's residential and commercial development, particularly where landscaping

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		requirements or cooling systems depend heavily on water availability. Homes and businesses may experience increased wear on heating, ventilation, and air-conditioning (HVAC) systems during heat waves, while building materials can degrade faster in extremely dry conditions.
	Economic Assets	*Vulnerability:* Agricultural businesses and outdoor markets are vulnerable to drought impacts. *Impacts:* Agricultural operations and small-scale farming in Bluffdale may suffer economic losses due to limited irrigation supply. Drought can also reduce public attendance at outdoor markets and city-sponsored events, affecting local vendor income and city-generated revenue from permits and fees.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Vegetation and habitats are vulnerable to increased wildfire risk due to drought conditions. *Impacts:* Drought can degrade Bluffdale's natural landscapes, leading to the loss of vegetation, increased wildfire risk, and disruption of local ecosystems. Maintaining stable internal conditions in historic and cultural buildings may become challenging, accelerating material deterioration and limiting public use.
	Critical Facilities and Infrastructure	*Vulnerability:* Bluffdale's water supply infrastructure, including storage tanks and distribution lines, is vulnerable to strain during drought conditions. *Impacts:* Water systems may become strained during drought. Fire suppression capacity may be reduced due to limited water availability, complicating wildfire response. Healthcare and public health services are impacted by potential effects on air and water quality, including increased dust and contaminants in reduced surface water supplies.
	Community Activities	*Vulnerability:* City parks and recreational facilities are vulnerable to drought-related restrictions. *Impacts:* Parks and similar amenities may face water use restrictions, leading to dry fields, closed splash pads, or reduced summer programming. Households may be asked to limit landscape watering or pool use, which could affect residents' quality of life and property maintenance.
Earthquake	People	*Vulnerability:* Earthquake risk along the Wasatch Front is high. All Bluffdale residents are vulnerable. *Impacts:* Bluffdale residents living in older or poorly retrofitted homes face heightened earthquake risks. Vulnerable groups may struggle to respond or evacuate effectively. Because Bluffdale is near the Wasatch Fault Zone, preparedness and structural safety are especially critical.
	Structures	*Vulnerability:* All structures in Bluffdale are vulnerable to earthquake damage. Central Bluffdale also has moderate to high liquefaction susceptibility, which increases the risk. *Impacts:* Buildings constructed before modern seismic codes are most at risk. Bluffdale's rapid development in recent decades means newer construction is often safer, but pockets of older buildings or improperly compacted soils may still be vulnerable. Homes built on alluvial fan

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		deposits or soft soils could experience amplified shaking during a quake.
	Economic Assets	*Vulnerability:* All commercial, retail, and other economic assets are vulnerable to earthquakes. *Impacts:* Commercial buildings, schools, and essential service facilities could suffer severe damage if not built to current seismic standards. Bluffdale's economic base could face serious disruption from building closures and infrastructure failure. Earthquakes may also halt construction or delay city development plans.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Natural features, historic structures, and cultural sites are vulnerable to earthquake damage. *Impacts:* Bluffdale's proximity to fault lines makes natural terrain features and ecosystems susceptible to landslides or shifts during earthquakes. Historic buildings and landmarks, especially those not retrofitted, may face collapse or irreversible damage. Cultural facilities such as event centers or churches may be vulnerable due to their older architectural styles and structural design limitations.
	Critical Facilities and Infrastructure	*Vulnerability:* All critical facilities, public buildings, and infrastructure are vulnerable to earthquakes. *Impacts:* Key public services are susceptible to seismic damage if not adequately fortified. Utility disruptions (e.g., broken water mains, downed power lines) can severely hinder response and recovery efforts. Critical roadways, especially bridges and underpasses, may also be at risk if not seismically reinforced.
	Community Activities	*Vulnerability:* Almost all day-to-day activities will likely be disrupted following a strong earthquake. *Impacts:* Public events, school functions, and civic gatherings in Bluffdale are vulnerable due to potential building damage or crowd safety concerns during seismic events. Closures and cancellations are likely. Earthquakes occurring during high-attendance activities could lead to mass casualties or strain emergency response, particularly if evacuation plans are unclear or buildings lack seismic protection.
Extreme Heat	People	*Vulnerability:* Extreme heat can occur throughout the entire city, so all populations are vulnerable. Some residents may face higher risks. *Impacts:* Extreme heat can cause heat-related illnesses such as dehydration, heat exhaustion and heat stroke, which can be deadly. Vulnerable populations during extreme heat include adults over 65, individuals with pre-existing health conditions, and young children, as they struggle to regulate body temperature. Socioeconomically disadvantaged individuals may lack access to cooling resources, while outdoor workers are at higher risk of heat-related illnesses due to physical labor without adequate hydration and rest. Extreme heat can hinder students' learning.
	Structures	*Vulnerability:* All structures are vulnerable to the effects of extreme heat. *Impacts:* Residential buildings with inadequate insulation and ventilation and commercial buildings lacking reflective roofing and proper shading may be vulnerable. Materials like metal and glass can

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		amplify heat retention, while areas with limited green space typically experience higher temperatures.
	Economic Assets	*Vulnerability:* Agriculture and other outdoor-related and landscaping businesses are vulnerable. *Impacts:* Agricultural operations can have reduced yields and higher water demand due to heat stress. The outdoor recreation industry may see decreased participation during heat waves, affecting local businesses that rely on visitors. In addition, the energy infrastructure could face strain from increased cooling demands, leading to outages.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Parks, plants, wildlife, and historic buildings are vulnerable to extreme heat. *Impacts:* Local plant species and wildlife habitats can suffer from drought conditions, leading to reduced biodiversity. Historic buildings may degrade due to high temperatures, causing materials to deteriorate and paint to peel. In addition, parks and recreational areas may experience overuse and risk their preservation, as residents seek relief from the heat.
	Critical Facilities and Infrastructure	*Vulnerability:* Clinics, city facilities, and transportation systems are vulnerable to extreme heat. *Impacts:* Healthcare facilities may experience increased demand because of heat-related medical issues, while schools can suffer from the strain on cooling resources. Transportation systems are at risk of damage, such as buckling roads and warped train tracks. Power grids may be strained by higher demands for electricity for cooling, leading to potential outages.
	Community Activities	*Vulnerability:* Outdoor events are vulnerable to disruption due to extreme heat conditions. *Impacts:* Activities like outdoor sports, fairs, and agricultural practices are vulnerable to extreme heat. These events can pose risks, particularly for participants such as youth athletes and elderly residents who may suffer from heat-related illnesses. In addition, high temperatures can stress crops, impacting local farming.
Extreme Cold	People	*Vulnerability:* Extreme cold events are frequent and can affect the entire city. All residents are potentially vulnerable; however, some groups may face higher risks. *Impacts:* In Bluffdale, extreme cold events pose particular challenges for older adults, especially those with limited mobility or chronic health conditions that can worsen in freezing temperatures. Children may be vulnerable if they do not have access to adequate winter gear, especially during sudden cold snaps. Residents experiencing economic hardship or housing insecurity may lack access to safe, heated environments during prolonged cold weather, increasing the risk of frostbite, hypothermia, or respiratory illness.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
	Structures	*Vulnerability:* Homes and buildings throughout Bluffdale are at risk, particularly those that are poorly insulated or built before modern energy standards. *Impacts:* Heat loss through unsealed windows or outdated heating systems can make it difficult to maintain safe indoor temperatures. Detached structures like sheds or garages, which are often unheated, are at risk for burst pipes and material damage. Bridges and road surfaces around the city can also become slick or cracked due to freeze–thaw cycles.
	Economic Assets	*Vulnerability:* Agricultural operations and other local businesses are at risk during extreme cold events. *Impacts:* Bluffdale's small-scale farms and agricultural operations may suffer crop and livestock losses if temperatures plunge unexpectedly or stay low for extended periods. Local businesses, particularly those reliant on transportation or utilities, can be affected by icy roads, equipment malfunctions, or power interruptions. Heating costs may rise for energy-intensive facilities, placing strain on operating budgets and reducing revenue during winter months.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Trees, wildlife, historic buildings, and cultural sites are susceptible to damage from extreme cold. *Impacts:* Cold snaps can damage Bluffdale's native vegetation, especially young trees and plants not adapted to sudden temperature drops. Local wildlife may also struggle to find food or shelter during these periods. Historic buildings and community landmarks may experience cracking, paint damage, or moisture intrusion due to freezing conditions. Public art, monuments, and open-air heritage displays are also vulnerable to weathering and ice-related wear.
	Critical Facilities and Infrastructure	*Vulnerability:* Water and sewer systems, roads, and power systems are vulnerable to extreme cold conditions. *Impacts:* Water and sewer systems in Bluffdale can be compromised by frozen pipes, especially in areas with older or exposed infrastructure. Icy conditions on roads increase the chance of traffic accidents and can delay emergency response. Local power infrastructure may be strained by increased demand for heat, and any service disruptions could pose safety risks for vulnerable residents. Buildings not designed for cold resilience may also face heating system breakdowns or fire hazards from unsafe alternative heat sources.
	Community Activities	*Vulnerability:* Community events can be impacted by extreme cold conditions. *Impacts:* Events like youth sports practices, winter markets, or public gatherings can be canceled or poorly attended during extreme cold, limiting social interaction and community connection. For families with limited heating or mobility, these conditions further isolate vulnerable individuals. Inadequately heated community spaces or poorly insulated schools and event venues can struggle to remain operational, reducing access to essential programs during winter.
Flooding (and Heavy Rain)	People	*Vulnerability:* Flooding primarily affects residents in low-lying areas near rivers and streams, especially during heavy rainfall or snowmelt.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		In Bluffdale, this is most likely in flood hazard zones along the Jordan River near the center of the city. *Impacts:* Individuals without reliable transportation may struggle to evacuate quickly, while low-income families often lack resources for flood-prevention measures. The elderly and those with disabilities may face mobility challenges, increasing their risk during emergencies. Overall, factors such as geographic location, economic status, and physical ability contribute to the community's varying levels of vulnerability to flooding.
	Structures	*Vulnerability:* Structures vulnerable to flooding primarily include those in low-lying areas or areas near the Jordan River. *Impacts:* Residential properties in floodplains and commercial buildings without proper drainage systems or flood-resistant designs face significant risks during heavy rain or snowmelt. Older structures may be more susceptible due to outdated construction standards. Overall, a combination of location and construction features contributes to their vulnerability to flooding.
	Economic Assets	*Vulnerability:* Commercial properties, especially retail centers and warehouses near the Jordan River or low-lying areas, are at high risk during heavy rainfall. *Impacts:* Residential developments in flood-prone zones can also suffer damage, impacting property values. Public infrastructure, such as roads and utilities, may experience disruptions, leading to costly repairs. Agricultural land can be affected by excess water, reducing crop yields.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Habitats, historic sites, and cultural sites located near flood zones are at risk. *Impacts:* Natural areas like wetlands and streams are at risk of habitat destruction, while historic sites and landmarks may sustain structural damage. Cultural resources, such as parks and public spaces, can become unusable, affecting community events. Factors contributing to their vulnerability include inadequate flood management, urban development that alters water flow, and the increasing frequency of extreme weather events due to climate change.
	Critical Facilities and Infrastructure	*Vulnerability:* No critical facilities were identified within the 1% or 0.2% flood zones. Infrastructure, however, remains vulnerable. *Impacts:* Although schools and emergency response facilities are not in flood zones, they may be impacted indirectly by disruptions to transportation or power systems. Flooding can disrupt emergency services, require schools to evacuate, block transportation routes, and isolate communities. In addition, inadequate drainage systems and urban development encroaching on floodplains increase these risks.
	Community Activities	*Vulnerability:* Outdoor events located near flood zones are susceptible to flooding. *Impacts:* Due to the area's geography and infrastructure, outdoor events, sports, and farmers' markets are vulnerable to flooding. Parks and open spaces can quickly become inundated during heavy rainfall or rapid snowmelt. Residential neighborhoods near rivers, roads, and bridges are at risk of flash floods, which can disrupt transportation and emergency services.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
Landslide/ Slope Failure	People	*Vulnerability:* Residents on steep slopes or near unstable geological formations are most vulnerable to landslides and slope failures. In Bluffdale, this could occur in the narrows along the Jordan River. *Impacts:* Residents may be at risk from injury or displacement from homes due to landslides. Their risk is heightened by inadequate drainage systems, loose soil conditions due to heavy rainfall or rapid snowmelt, and older structures not designed for such events. A lack of awareness about the signs of impending landslides, along with limited resources for hazard monitoring and emergency preparedness, further increases their susceptibility.
	Structures	*Vulnerability:* Homes, commercial buildings, roads and bridges on or near steep slopes in southern Bluffdale may be vulnerable because of factors like loose soil or rock geology, heavy rainfall, and poor drainage systems. In addition, inadequate construction practices and a lack of erosion control measures can increase the risk of slope failures, particularly for properties not designed with their environmental context in mind.
	Economic Assets	*Vulnerability:* Businesses near landslide areas are at risk. *Impacts:* Businesses could be damaged by landslides or may lose business if roads are blocked or power is disrupted. These assets are at risk due to heavy rainfall, poor drainage systems, and development practices that destabilize slopes.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Natural terrain, ecosystems, wildlife, and water quality are at risk. Historic sites are also vulnerable. *Impacts:* Steep terrain can destabilize local ecosystems, impacting wildlife habitats and water quality. Historic sites, including early settlement structures, face soil erosion and foundation destabilization. In addition, community parks and significant buildings may be damaged during slope failures, threatening the local heritage.
	Critical Facilities and Infrastructure	*Vulnerability:* Roadways and essential services like water supply and power lines may be at risk. Their vulnerability is heightened by steep terrain, unstable soil, heavy rainfall, and poor drainage. In addition, a lack of vegetation can increase the risk of erosion. *Impacts:* Utilities crossing sloped terrain face potential service interruptions or structural compromise from slope failure. Steep areas without robust vegetation or engineered slope protections are more prone to runoff and soil displacement during spring melts or heavy precipitation. Emergency response access can be impeded by road damage or blocked routes following a slide.
	Community Activities	Residential developments on steep hillsides, infrastructure projects like roads and bridges, and recreational activities on sloped trails are vulnerable to landslides and slope failures.
Radon	People	*Vulnerability:* 49% of homes tested in Bluffdale contained dangerous levels of radon. In Bluffdale, residents living in homes with basements or slab-on-grade foundations are more likely to be exposed to radon, especially in older neighborhoods. *Impacts:* Prolonged exposure to high levels of radon is a leading cause of lung cancer in non-smokers. Families with young children or aging relatives may face higher health risks due to prolonged

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		exposure. Residents who are unaware of radon testing and mitigation options may unknowingly live in high-risk environments.
	Structures	*Vulnerability:* Homes and buildings with below-ground levels are at particular risk of radon infiltration, especially if the soil underneath contains natural uranium. Cracks in foundations, gaps around pipes, and poor ventilation increase the potential for radon buildup. Older homes without proper sealing or passive venting systems are more vulnerable. *Impacts:* Weaknesses, cracks, and other vulnerabilities in structures can allow radon to enter and accumulate within them, exposing occupants to health impacts.
	Economic Assets	*Vulnerability:* Property values and costs to businesses are affected by radon presence. *Impacts:* Radon presence in residential and commercial buildings can affect real estate values and complicate property sales in Bluffdale. Businesses operating in basement spaces may face liability concerns if radon levels are not addressed. Costs associated with testing and mitigation can place a financial burden on property owners and impact investment appeal.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Exposure to radon at historic or cultural sites is a concern. *Impacts:* Radon accumulation in soil and groundwater is a concern in parts of Bluffdale with known geological conditions, particularly areas with higher natural uranium content. Historic structures constructed with stone or concrete may retain radon indoors, especially if sealed tightly for preservation. Cultural venues and community centers housed in older buildings may inadvertently expose staff and visitors to elevated radon levels.
	Critical Facilities and Infrastructure	*Vulnerability:* Bluffdale schools, health clinics, and municipal buildings with basements may face radon exposure without adequate ventilation systems. *Impacts:* Facilities built before awareness of radon hazards may not have been tested or mitigated. If undetected, this invisible threat can pose long-term health risks to employees and residents who spend extended time in these environments.
	Community Activities	*Vulnerability:* Indoor gathering spaces are at risk of radon exposure. *Impacts:* Indoor events held in basements or lower levels of homes, schools, or community centers may unknowingly expose participants to radon. Without regular monitoring, high radon concentrations can become a hidden public health issue, particularly in community meeting spaces or daycare facilities with poor airflow.
High Wind	People	*Vulnerability:* All Bluffdale residents are potentially vulnerable to high wind, which can affect the entire city. *Impacts:* Wind can cause injury or death from blowing debris or falling tree limbs. Residents of Bluffdale living in mobile or manufactured homes, or those without basements, face elevated risk during high wind events. Outdoor workers, including utility crews and construction personnel, are particularly vulnerable when storms strike without

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		warning. Older adults or individuals with mobility issues may find it difficult to seek shelter quickly.
	Structures	*Vulnerability:* Structures throughout Bluffdale are potentially exposed to damage from high wind. Single-story homes, commercial buildings, and agricultural facilities such as barns may be at risk. *Impacts:* Homes with aging roofs, large windows, or poorly anchored structures are susceptible to wind damage. Bluffdale's open spaces and limited tree cover in newer developments allow wind to accelerate, increasing exposure. Outbuildings such as barns, sheds, and garages can be heavily damaged or destroyed during windstorms.
	Economic Assets	*Vulnerability:* Agricultural businesses and business exteriors are vulnerable to wind damage. *Impacts:* Agricultural operations in Bluffdale, including equipment sheds and livestock enclosures, are at risk from structural failure during strong winds. Businesses with exterior signs, awnings, or rooftop HVAC systems may face costly repairs. Wind can disrupt supply chains and cause short-term closures if power lines or access roads are affected.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Trees, open spaces, and historic and cultural sites are at risk. *Impacts:* Strong winds can uproot Bluffdale's trees, damage green spaces, and strip topsoil from agricultural lands. Historic buildings may suffer damage to roofs or facades, especially if constructed with older materials. Public art installations or outdoor monuments in exposed areas may be at risk from windborne debris or direct impacts.
	Critical Facilities and Infrastructure	*Vulnerability:* Power, communication, and transportation systems are vulnerable to high winds. *Impacts:* High winds can compromise Bluffdale's power grid, damage communications towers, and bring down utility poles, leading to outages. Bridges and elevated roadways may become unsafe for travel, while emergency services could be delayed by debris-blocked routes. Structures not built to wind-resistant standards may struggle to remain operational during severe events.
	Community Activities	*Vulnerability:* Outdoor events are vulnerable to strong winds. *Impacts:* Parades, sports tournaments, and seasonal markets are at high risk when strong winds occur. Tents and stages may collapse, and loose items can become hazardous projectiles. Public parks and recreation areas may need to close temporarily due to tree damage or debris cleanup.
Lightning	People	*Vulnerability:* Lightning can occur anywhere in Bluffdale, and all residents could be exposed. People who participate in golfing, swimming, and other outdoor sports and recreation activities are exposed to lightning risk. *Impacts:* Outdoor recreationists in Bluffdale are vulnerable to lightning during summer storms. Youth sports teams and spectators at games may not have immediate access to shelter. Residents without weather alert systems or knowledge of lightning safety may delay taking precautions, thereby increasing risk.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
	Structures	*Vulnerability:* Structures anywhere in Bluffdale are vulnerable to lightning. *Impacts:* Lightning poses a threat to tall buildings, church steeples, communication towers, and homes near tall trees. Structures without grounding systems or surge protection are more likely to suffer fire or electrical damage. In rural parts of Bluffdale, barns and metal-roofed buildings are particularly at risk.
	Economic Assets	*Vulnerability:* Businesses and agricultural structures are vulnerable to lightning strikes. *Impacts:* Businesses may lose inventory or suffer data loss from outages. Farms and greenhouses may also be affected if electrical systems fail due to lightning strikes.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Trees, parks, and historic or cultural sites are susceptible to lightning damage. *Impacts:* Lightning can damage mature trees in public parks, which are valued both ecologically and aesthetically. Bluffdale's historic sites and wood-framed structures may ignite if struck directly. Outdoor sculptures and monuments made of conductive materials face the risk of heat or impact damage during thunderstorms.
	Critical Facilities and Infrastructure	*Vulnerability:* Critical facilities and infrastructure such as water pumps, relay stations, and electronic equipment hubs are at risk. *Impacts:* Critical facilities and infrastructure can be damaged by lightning-induced surges. Communications towers, power substations, and utility poles can attract lightning which can contribute to cascading system failures. Schools and medical facilities without proper surge protection or grounding could lose essential systems during a strike. Power disruptions could impair emergency services' response time.
	Community Activities	*Vulnerability:* Outdoor events are vulnerable to lightning storms. *Impacts:* Local events held outdoors, especially in parks and athletic fields, become unsafe during lightning storms. Attendees may be caught in open areas without shelter, and event cancellations can strain scheduling and reduce participation. Water-based activities, such as kayaking or fishing on nearby Jordan River tributaries, increase lightning danger.
Severe Winter Weather	People	*Vulnerability:* Severe winter weather can affect the entire city and all residents are potentially vulnerable. *Impacts:* Residents of Bluffdale face health and safety risks when snowstorms or ice events occur. Seniors and individuals with disabilities may struggle with mobility during icy conditions. Those without access to reliable heat or snow removal equipment are particularly vulnerable, especially in older neighborhoods with limited sidewalk maintenance.
	Structures	*Vulnerability:* All structures are vulnerable, older homes may have a higher risk. *Impacts:* Buildings with flat roofs or poor insulation are susceptible to roof collapse and interior damage from ice dams. Older homes in Bluffdale may have drafty windows and outdated heating systems, leading to frozen pipes or fire hazards from alternative heating

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		methods. Detached garages and sheds may not withstand heavy snow loads.
	Economic Assets	*Vulnerability:* All local businesses are at risk during severe winter weather. *Impacts:* Local businesses may close or reduce hours during winter storms, reducing income and limiting access to goods and services. The construction and transportation sectors are especially impacted, with delays and equipment damage due to snow or ice. Farm operations may face losses if livestock or crops are exposed to prolonged freezing.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Parks, trees, and historic and cultural sites are at risk during severe winter weather. *Impacts:* Heavy snow and ice can stress trees and vegetation in Bluffdale's parks and open spaces, leading to limb breakage or plant death. Historic buildings face structural strain from snow buildup or water intrusion. Public art installations and community spaces may become inaccessible or sustain weather-related wear.
	Critical Facilities and Infrastructure	*Vulnerability:* Roadways, bridges, and utility infrastructure are vulnerable during snow and ice events. *Impacts:* Delayed plowing or salting can hinder emergency access. Public buildings—such as schools and city offices—may temporarily shut down due to power outages or heating failures. Communication systems may also be affected if ice damages towers or lines.
	Community Activities	*Vulnerability:* Community events, school operations, and commuting delays are vulnerable to disruption. *Impacts:* Snowstorms can cancel or limit attendance at public events, school functions, or community meetings. Travel becomes hazardous, and public transit or paratransit may be delayed. Recreation centers and parks may also close temporarily, reducing community engagement during winter months.
Tornado	People	*Vulnerability:* Although tornadoes are relatively rare in Bluffdale, when they do occur, they pose a serious risk to all residents. *Impacts:* Mobile home residents and those in older buildings without storm shelters are at risk of serious injury. Children, the elderly, and individuals with limited mobility may struggle to reach safe areas quickly. Residents lacking awareness of warning systems or shelter locations are at higher risk.
	Structures	*Vulnerability:* Structures with poor anchoring or older construction are vulnerable to tornado damage. *Impacts:* All structures could sustain heavy damage from a tornado. Roofs can be torn from homes, windows broken, and walls damaged and compromised. Bluffdale homes without basements or storm shelters offer limited protection to residents. Warehouses and commercial structures with wide-span roofs may be especially susceptible to collapse.
	Economic Assets	*Vulnerability:* All businesses are vulnerable to tornado damage. *Impacts:* Tornadoes can cause economic losses in Bluffdale through damage to businesses and interruption of economic activity. Retail buildings, warehouses, hotels, restaurants, office complexes, and

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		other businesses can all experience operational downtime or closures due to structural damage or interruption of power or communication systems. Commercial buildings with glass storefronts or weak roof structures may suffer severe losses. Utilities may be disrupted, and road closures can limit economic activity, especially in retail and logistics. Recovery costs can be high for uninsured or underinsured properties.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Trees, parks, open spaces, and historic or cultural sites are at risk during tornadoes. *Impacts:* Tree damage, flooding, and debris can disrupt Bluffdale's open spaces and trail systems. Tornado winds can destroy fragile historic buildings not built to modern standards. Community landmarks or cultural facilities may be temporarily closed or damaged, reducing access and preservation.
	Critical Facilities and Infrastructure	*Vulnerability:* Public buildings and infrastructure are vulnerable to tornado damage. *Impacts:* Schools, clinics, and public buildings not designed for extreme wind events may be unsafe during a tornado. Damage to roads, water systems, or electrical grids can interrupt vital services. Bluffdale's emergency facilities must remain operational, yet could be threatened if tornado paths shift unexpectedly toward the core community.
	Community Activities	*Vulnerability:* All outdoor events are susceptible to tornado impacts. *Impacts:* Outdoor markets, concerts, or sports games may face sudden cancellations or evacuation challenges during tornado warnings. Temporary event structures like tents or stages offer little protection and can collapse or become airborne. Schools and recreation centers must have tornado plans in place to protect students and attendees.
Wildfire	People	*Vulnerability:* Bluffdale retains a slightly rural feel, with developments interspersed with open space. As a result, much of southern and southeast Bluffdale has moderate wildfire risk. Residents close to these areas are most at risk, but areas of risk are found throughout the city, and all residents are vulnerable. *Impacts:* Wildfire can cause injury or death if individuals are unable to get away from spreading fire. Residents can also be displaced from homes due to evacuation and may require public shelter. Residents near the wildland–urban interface (WUI), individuals with physical disabilities or health issues who may struggle to evacuate, and low-income families lacking resources for fire safety measures may be vulnerable. Older adults might have reduced mobility, making them more dependent on others for assistance. Poor air quality from wildfire smoke can affect all residents.
	Structures	*Vulnerability:* Many homes throughout Bluffdale are vulnerable. *Impacts:* Residential homes, especially those made of wood or located in heavily vegetated areas may be vulnerable. Properties near the WUI are at higher risk due to surrounding flammable vegetation. Inadequate defensible space, such as insufficient clearing of dry grass and shrubs, increases susceptibility. Residences are also susceptible to embers, making them vulnerable during dry conditions and high

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		winds. Roofs made of combustible materials and buildings that lack fire-resistant features are particularly at risk during wildfire events.
	Economic Assets	*Vulnerability:* Businesses and commercial assets near the WUI are at risk. *Impacts:* Commercial assets, such as retail centers close to forested regions, can suffer damage from flames and smoke, affecting the local economy. Agricultural lands are also susceptible, as wildfires can destroy crops and livestock, leading to financial losses. Vital infrastructure, such as power lines and water pipelines, can be disrupted, causing further economic repercussions. These vulnerabilities are heightened by dry conditions and high winds, which can facilitate the spread of fires.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Open spaces and natural resources are at risk. Historic and cultural sites are also vulnerable. *Impacts:* Natural resources like forests and grasslands are at risk because dry vegetation and accumulated brush can easily ignite. Historic sites made of wood and cultural landmarks can also be affected, particularly when located near wildland areas. The increasing frequency of drought and extreme heat, exacerbated by climate change, heightens these vulnerabilities. In addition, urban development encroaching on wildland areas increases the risk to these essential resources.
	Critical Facilities and Infrastructure	*Vulnerability:* Schools, clinics, emergency services, and utilities, particularly those near wooded areas, may be vulnerable to wildfires. *Impacts:* Utilities like power lines and gas pipelines are also at risk, as sparks or falling trees can ignite fires. Residential neighborhoods adjacent to natural landscapes are particularly susceptible to embers, making them vulnerable during dry conditions and high winds.
	Community Activities	*Vulnerability:* Outdoor events and recreational activities are vulnerable to wildfires. *Impacts:* Outdoor events like festivals and sports, especially during hot, windy conditions may experience increased risk. Recreational activities, such as hiking and camping near wooded areas, also pose risks from open flames or sparks. In addition, landscaping with dry grasses and shrubs increases susceptibility during fire season, putting local infrastructure, such as schools and neighborhoods, at risk.
Dam Failure	People	*Vulnerability:* A large area in Bluffdale is vulnerable to dam failure due to the proximity of the Jordan Valley Water Purification Reservoirs, 3200 West Pond, Point of the Mountain Raw Water Reservoir, and Black Ridge Reservoir. Residents living in these areas are most at risk if a dam were to breach upstream. *Impacts:* These dams are rated as high hazard, meaning that dam failure can result in loss of life. Fast-moving waters can sweep away individuals caught in their path. Residents may be displaced from homes and require public shelter. In Bluffdale, families with small children, seniors, and individuals with limited mobility may find it more difficult to evacuate quickly during an emergency. Households experiencing financial hardship may lack access to transportation or early warning systems, which increases their vulnerability during a sudden dam-related flood.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
	Structures	*Vulnerability:* Homes and businesses located within dam inundation boundaries are particularly vulnerable to damage from a potential dam failure. *Impacts:* Structures within inundation areas could sustain serious damage in the event of a dam failure. Critical structures such as fire stations, medical clinics, and public schools may be impacted by fast-moving water. Key vulnerabilities include aging development built without consideration for dam break scenarios and insufficient local flood protection systems.
	Economic Assets	*Vulnerability:* Residential and commercial properties downstream face significant flood risks, leading to property damage and economic loss. Agricultural assets, including farmland and livestock, are also highly vulnerable, especially if irrigation systems are compromised. *Impacts:* Businesses located in flood-prone areas may suffer significant losses in equipment, inventory, and income. Bluffdale's agricultural operations are especially sensitive to water infrastructure failures, which can destroy crops or contaminate soils. Local industries that depend on a steady water supply or distribution, including processing or light manufacturing, may face operational shutdowns following a dam incident.
	Natural, Historic, and Cultural Resources	Flooding caused by a dam breach could damage or destroy local riparian habitats, disrupt ecosystems along the Jordan River, and lead to erosion in wetlands and open space areas. Bluffdale's historic canal systems, relics of the area's early agricultural development, may also be at risk. Community gathering places, such as neighborhood parks or historical markers near waterways, may experience flood damage, leading to reduced public access and costly restoration needs.
	Critical Facilities and Infrastructure	*Impacts:* One fire station, one EOC, one police station, and one school are in potential inundation areas. Utilities and other infrastructure are also vulnerable. *Impacts:* Essential services, including Bluffdale's water systems, roads, and communication networks, are highly vulnerable if a dam breach floods the service corridors or power infrastructure. Major roads like Redwood Road and Bangerter Highway, as well as nearby utility lines and service infrastructure, could be severely disrupted by flooding. Schools and healthcare facilities located within flood pathways may need rapid evacuation and could sustain long-term operational damage. A failure event could also disable emergency response routes and delay critical services due to road washouts or structural damage to bridges.
	Community Activities	*Vulnerability:* Community events and recreational activities are at risk from potential flooding caused by a dam breach. *Impacts:* Recreational activities centered around local water bodies may be at direct risk during a dam emergency. Community festivals or events held near flood-prone open spaces could face cancellations or create life-threatening conditions if water levels rise unexpectedly. In Bluffdale, the sudden nature of dam failure presents a challenge for community preparedness, especially when key recreational or transportation areas fall within the downstream hazard zones.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
Civil Disturbance	People	Low-income individuals may lack the resources for safety, while the elderly or disabled may struggle to navigate emergencies. Young people, particularly teenagers, may be drawn into unrest, influenced by social dynamics. In addition, marginalized individuals may feel targeted or compelled to participate. A lack of community cohesion and trust in authorities can further heighten tensions.
	Structures	Government buildings, commercial properties, and infrastructure, such as bridges and transportation hubs may be vulnerable. Government buildings may be targeted for their symbolic authority, while retail stores can attract crowds during protests. Residential neighborhoods also can be affected, especially in areas with heightened tensions. The vulnerability of these structures stems from their visibility and importance to the community, combined with factors such as location and ongoing social issues.
	Economic Assets	Retail establishments, especially shopping centers, are at risk as they often become focal points for protests. Transportation systems can be disrupted by blockades, hindering access to services. Financial institutions may face vandalism or theft, while critical service providers, such as hospitals, could experience strain during unrest. Several economic assets are vulnerable to civil disturbances, primarily due to their visibility and reliance on foot traffic.
	Natural, Historic, and Cultural Resources	Parks and open spaces may suffer from vandalism or destruction during uncontrolled events. Historic sites can become targets, as they symbolize authority or cultural significance. Cultural resources, such as community centers and places of worship, also may be affected, as they play a vital role in community identity. Their vulnerability lies in the potential for damage during protests.
	Critical Facilities and Infrastructure	Governmental buildings, schools, and healthcare facilities may be at risk, since they often symbolize authority and serve as community hubs, making them targets during unrest. Utility infrastructure, such as water and power facilities, is also at risk of disruption. Its visibility and essential services contribute to its vulnerability during civil disturbances.
	Community Activities	Public demonstrations, parades, and local government meetings are particularly vulnerable to civil disturbances. These events often attract large crowds and can become tense, especially around contentious social or political issues. Factors such as the local demographic, economic conditions, and recent events can heighten these vulnerabilities, making it easier for conflicts to arise during passionate public gatherings.
Cyberattack	People	Older adults often lack familiarity with technology and online security, making them easy targets for phishing scams. Individuals engaging in online banking or shopping without strong security measures also face heightened risks. Families with children may be less vigilant about internet safety, allowing cybercriminals to exploit personal information. In addition, small business owners without robust cybersecurity practices are prime targets for attacks that can disrupt operations.
	Structures	Critical infrastructure, such as power plants, water treatment facilities, and transportation systems, often lack robust cybersecurity measures. Commercial businesses, especially financial institutions and

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		healthcare providers, also are at risk due to weaker data protection and employee training. Educational institutions may be vulnerable because of limited funding for cybersecurity and outdated software. Obsolete technology and insufficient training enhance the susceptibility of these structures to cyber threats.
	Economic Assets	Financial institutions, such as banks and credit unions, are at risk of data theft and service disruption. Small and medium-sized businesses often lack robust cybersecurity measures, making them attractive targets. In addition, local government agencies and critical infrastructure, such as water treatment facilities, might have outdated security protocols, posing threats to public safety. The rise of remote work further exacerbates vulnerabilities, as employees accessing networks from home can unintentionally expose systems to risks. Overall, the combination of outdated technology and insufficient cybersecurity practices increases the vulnerability of an area's economic assets.
	Natural, Historic, and Cultural Resources	Natural resources like water management systems and wildlife databases can be compromised, disrupting ecosystems. Historic sites and museums that digitize collections are at risk of losing valuable artifacts and data. In addition, cultural organizations managing events may face threats if their systems lack adequate security. The limited resources of smaller organizations further increase this vulnerability
	Critical Facilities and Infrastructure	Energy and utility services, such as electricity and water systems, which often rely on outdated technology, may be vulnerable. Transportation infrastructure, such as traffic management and public transit, is also at risk due to networked systems. Healthcare facilities that use electronic records and connected medical devices face vulnerabilities that can compromise patient safety.
	Community Activities	Online registration for events, local government services, and educational programs that rely on digital tools may be targeted due to inadequate security measures, outdated software, and insufficient staff training.
Hazardous Materials Incident (Transporta-tion & Fixed Facility)	People	Individuals with pre-existing health conditions, such as respiratory issues, and the elderly are at higher risk due to their compromised health. Children also are more susceptible. Those living near industrial areas or transport routes for hazardous materials face increased exposure risk, while low-income families may lack resources and information to effectively prepare for incidents.
	Structures	Industrial facilities, such as manufacturing plants and warehouses, often store hazardous chemicals which may leak. Residential buildings, schools, and hospitals also are at risk, particularly if located along transportation routes for hazardous materials. Older buildings may lack modern safety features, increasing their vulnerability.
	Economic Assets	Industrial facilities, transportation infrastructure, and nearby commercial properties may be affected. Industrial facilities handling chemicals are at risk of spills or leaks, while roads and railways used for transporting hazardous materials can lead to accidents and contamination. In addition, nearby commercial and residential areas face potential health risks and economic losses.

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
	Natural, Historic, and Cultural Resources	Waterways and habitats are vulnerable to hazardous materials incidents, which can disrupt ecosystems. Historic sites and structures may suffer damage from toxic exposure, leading to degradation over time. In addition, cultural landmarks risk losing their significance due to contamination events. The proximity of these resources to industrial areas or transport routes exacerbates their risk.
	Critical Facilities and Infrastructure	Chemical manufacturing plants, waste treatment facilities, and transportation networks, such as highways and railroads may be at risk. Their vulnerability stems from factors such as proximity to residential areas, aging infrastructure, and inadequate safety measures. Natural hazards, such as flooding and earthquakes, can further increase risks by damaging containment systems.
	Community Activities	Local markets, school events, and outdoor gatherings are vulnerable to hazardous materials incidents if they are near industrial zones and transport corridors. This risk is heightened by inadequate emergency preparedness, lack of public awareness, and the potential for spills during transport. Large crowds at events can complicate evacuation efforts, increasing the risks for participants and nearby residents.
Public Health Epidemic/ Pandemic	People	Individuals with pre-existing health conditions like asthma and heart disease and adults over 65 may be vulnerable. Low-income families may struggle to access healthcare and vaccinations, increasing their risk. Marginalized communities with limited access to information and those living in high-density conditions also are at greater risk due to the rapid spread of diseases and the challenges in implementing preventive measures.
	Structures	Several structures are vulnerable to public health epidemics or pandemics, particularly due to their ability to facilitate the spread of disease. High-density residential areas, such as apartment complexes, are at risk, as close living quarters can lead to faster transmission. Public gathering spaces, such as schools and community centers, also pose significant threats because large groups are in confined spaces. Healthcare facilities can become hotspots for infections if infection control measures are insufficient. In addition, workplaces with high foot traffic, such as retail stores, contribute to vulnerability.
	Economic Assets	Small businesses in retail, hospitality, and food service are particularly vulnerable to public health epidemics or pandemics. These sectors face risks from fluctuating consumer demand and potential operational restrictions. The tourism industry also is affected, as travelers may avoid high-risk areas. Healthcare facilities can become overwhelmed, straining resources and impacting operations. In addition, local supply chains may experience disruptions, leading to shortages and inflation. Overall, the direct effects of illness, along with prolonged shutdowns and consumer hesitance, leave these economic assets exposed to significant downturns.
	Natural, Historic, and Cultural Resources	Natural resources like wildlife and ecosystems can be disrupted by increased human activity, raising the risk of zoonotic diseases. Historic sites may deteriorate due to reduced visitor access and funding, while cultural resources, such as community events, face cancelations, impacting social connections.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
	Critical Facilities and Infrastructure	Public health epidemic or pandemic incidents can affect healthcare facilities, nursing homes, public transportation systems, schools, and food supply chains. Hospitals and clinics may become overwhelmed with patients, while vulnerable populations in nursing homes are at higher risk. Public transportation can facilitate the spread of disease, and schools gather large groups, thereby increasing transmission potential. These facilities often lack adequate resources, including medical supplies and testing capabilities, making them more susceptible to the impacts of a health crisis.
	Community Activities	Large gatherings like festivals and sporting events can facilitate the rapid spread of diseases due to close contact. Public transportation also is at risk, as it serves many people in confined spaces. Schools and childcare facilities are particularly susceptible, given that children can easily transmit infections. In addition, food-related events, such as farmers' markets, can pose risks if hygiene practices are not followed. The interconnectedness of community members and varying adherence to health guidelines further exacerbate these vulnerabilities.
Terrorism	People	Young children and newcomers may lack awareness of potential threats, while the elderly and individuals with disabilities may struggle to respond quickly in emergencies. Marginalized communities often face bias, making them more susceptible to targeting. In addition, those with lower socioeconomic status may lack access to security measures and emergency preparedness resources.
	Structures	Government buildings, transportation hubs, commercial centers, and public spaces are particularly vulnerable to terrorism incidents. Government buildings are symbolic targets, while transportation hubs and commercial centers are attractive due to their potential for high casualties and crowd presence. Public spaces also are at risk due to their open nature and lack of security. Their vulnerability is heightened by inadequate security measures, high occupancy rates, and their locations in densely populated areas, which can amplify the impact of incidents.
	Economic Assets	Infrastructure, commercial establishments, and community facilities may be vulnerable. Critical infrastructure, such as transportation networks and power grids, could disrupt the economy if targeted. Commercial establishments, especially those with high foot traffic, and community facilities like schools and hospitals also are at risk, as they can provoke widespread concern and disruption. Their accessibility and interconnectivity increase vulnerability, meaning that damage to one asset can have a broader economic impact and hinder recovery efforts.
	Natural, Historic, and Cultural Resources	Natural resources like water supplies and parks could be targeted for their significance to the community. Historic sites and cultural resources, such as museums or community centers, also are at risk due to their accessibility and importance to local identity. Their vulnerability is often heightened by inadequate security measures.
	Critical Facilities and Infrastructure	Public transportation systems, healthcare facilities, schools, and utility services like water and power plants may be affected. Their vulnerability arises from high accessibility and the potential impact of

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		an attack, as crowded transportation and public spaces can lead to mass casualties and panic. Attacking utility services could disrupt the city's essential functions, creating chaos.
	Community Activities	Festivals, parades, and sporting events are particularly vulnerable to terrorism incidents. These events attract large crowds, making it easier for perpetrators to inflict harm and instill fear. In addition, community centers and places of worship serve as social hubs, increasing their risk. Factors such as limited security measures and open access to public spaces, contribute to this vulnerability.

Jurisdiction-Specific Changes in Vulnerability

Hazard events can impact communities, infrastructures, and ecosystems. The severity of these impacts can be influenced by climate change, population patterns, and land use development. Understanding these factors is crucial for the city of Bluffdale to develop a resilient community and minimize the impacts of hazards. Table 9 displays the changes within the city and the related effects of each hazard on the city of Bluffdale.

DRAFT

Table 9: Jurisdiction-Specific Changes in Vulnerability in the City of Bluffdale

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
Avalanche	Higher temperatures can lead to more rain, destabilizing snowpack and increasing the risk of wet avalanches. In addition, changes in snowfall can cause denser snow layering on slopes, making them more prone to sliding.	Avalanches can influence population patterns by deterring people from moving to or remaining in high-risk areas, leading to decreased density in these locations. The threat of avalanches prompts many to seek safer environments in urban or lower-risk regions. In addition, when avalanches occur, they can disrupt infrastructure, causing residents to relocate.	Avalanche risk is low in Bluffdale and the increased development since the previous hazard mitigation plan does not change that risk level.	Decreased
Drought	Climate change affects drought incidents by altering precipitation patterns and increasing temperatures. Warmer weather can lead to longer dry periods and more severe droughts, while changes in rainfall can reduce snowpack in nearby mountains, crucial for summer water supply. Higher temperatures also increase evaporation rates, further straining local water resources.	Drought can significantly influence population patterns by impacting economic opportunities and the quality of life. Water scarcity often leads to reduced agricultural productivity, prompting residents to migrate to areas with more stable job prospects. Increased water costs can make living less affordable, driving some residents away. Conversely, efforts to address drought, such as sustainable development or improved water management, may attract newcomers, resulting in changes in the community's demographic composition over time.	The city of Bluffdale has seen significant residential, commercial, and infrastructure growth to keep up with population growth since the previous plan update. This increase in development can exacerbate drought by increasing water demand from new homes and commercial ventures.	Increased
Earthquake	Rising temperatures can lead to glacial melting, which affects pressure on tectonic plates and may trigger seismic activity	Earthquakes can significantly alter population patterns by prompting residents to leave for safer areas after a seismic event.	New residential, commercial, and infrastructure development has led to more facilities that could be impacted by an	Stayed the same

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	through isostatic rebound. In addition, increased rainfall and flooding can erode soils, weakening structural integrity and heightening vulnerability during earthquakes. Although the direct links between climate change and earthquakes are still under investigation, environmental effects may impact the region's seismic risk.	This migration can lead to changes in population density and attract new residents and businesses during the rebuilding process. The perception of the area as a safe place to live may shift, impacting long-term demographics, as some residents return to rebuild while others relocate permanently.	earthquake. However, these facilities have been built to higher standards than earlier construction, meaning that they are less likely to be damaged by small- or medium-scale earthquakes.	
Extreme Heat	Climate change significantly impacts extreme heat by increasing the frequency and intensity of heat waves. Rising global temperatures lead to longer and hotter summers, affecting residents and local infrastructure while heightening health risks, especially for vulnerable populations. Urban heat islands from reduced vegetation and extensive pavement further amplify these effects.	By causing residents to relocate due to damaged homes or safety concerns. Some may move to areas perceived as safer or seek better job opportunities elsewhere. The economic impact and infrastructure damage can also make certain neighborhoods less desirable, leading to shifts in demographics and the socioeconomic landscape as new residents with different backgrounds move in.	The city of Bluffdale has seen increased density as more housing and commercial space has been constructed within the city. This density can increase extreme heat risk through the urban heat island effect.	Increased
Extreme Cold	By increasing the intensity of winter storms. Higher atmospheric temperatures allow for more moisture, resulting in heavier snowfall and potentially lower temperatures during these events. In addition, fluctuations in weather patterns may disrupt seasonal cycles,	By driving some residents to relocate to warmer areas. Harsh winters can hinder economic activities and deter new residents and businesses, influencing housing demand and the attractiveness of certain neighborhoods. This may disproportionately affect lower-income families, leading to	Increased development in Bluffdale has put a strain on the utility grid as there are more facilities running heat during extreme cold events.	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	leading to unpredictable periods of extreme cold mixed with warmer spells.	changes in demographics and socioeconomic stratification in the community.		
Flooding	Higher temperatures increase the frequency and intensity of extreme weather events and alter precipitation patterns. They lead to more intense rainstorms and accelerated snowmelt from nearby mountains, raising water levels in rivers and streams. This combination raises the risk of flooding, especially in areas with inadequate drainage and urban development in flood-prone zones, heightening the potential for damage to homes and infrastructure.	Flooding can significantly alter population patterns by displacing residents from affected areas, leading them to seek shelter elsewhere. This may cause a population decline where flooding occurs, as individuals might hesitate to return due to ongoing risks or property damage. As neighborhoods become less desirable, people may migrate to safer areas, changing demographic trends and putting pressure on housing in those regions. Over time, these shifts can influence urban planning and development, as local governments address flooding risks and changing population needs.	While increased density and more construction have minorly increased flood risk, Bluffdale has also updated stormwater infrastructure near new development to increase capacity during flood events.	Decreased
Landslide/ Slope Failure	Climate change increases the risk of landslides through heavier rainfall and temperature fluctuations. Intense rain saturates soil, destabilizing slopes, while freeze–thaw cycles weaken the ground. Changes in vegetation can also reduce stability, leading to a higher potential for landslides.	Landslides and slope failures can impact population patterns by making some areas unsafe, leading to displacement and lower property values. This prompts residents to move to safer regions, thereby increasing density in more stable areas. Concerns about future landslides may also deter newcomers from high-risk zones, shaping long-term demographic trends.	Development along Bluffdale's eastern border has increased the risk and impact of landslides.	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
Radon	Climate change can affect radon levels by altering soil temperatures and moisture conditions. Higher temperatures may increase radon emissions from the ground, while heavy rainfall can change groundwater and soil saturation, impacting radon migration into buildings.	Radon exposure can influence population patterns as increased health awareness may drive families to move away from areas with high radon levels. This shift could particularly affect vulnerable groups, changing demographics and demand in the housing market. Homes with lower radon levels may become more sought after, and public health campaigns can encourage community action, making previously undesirable areas more attractive once mitigation measures are implemented.	Development has not significantly changed the risk of radon in Bluffdale.	Decreased
Heavy Rain	Climate change increases the frequency and intensity of heavy rain, as higher temperatures allow the atmosphere to hold more moisture. This leads to stronger storms, flash flooding, and overwhelmed drainage systems.	Heavy rain can shift population patterns by pushing residents out of flood-prone areas and attracting them to safer neighborhoods. Frequent flooding may lead to evacuations and economic disruptions, prompting relocations. Over time, ongoing heavy rains can affect housing demand and community stability, altering the city's population distribution.	The increased development in Bluffdale has led to more impervious surfaces. These surfaces increase the risk of heavy rains leading to flash floods.	Increased
High Wind	Climate change affects high winds by altering atmospheric patterns and increasing extreme weather events. Rising temperatures may lead to more substantial, unpredictable winds and more frequent thunderstorms, posing	High winds can alter population patterns by making certain areas less desirable. Frequent damage may drive residents to safer neighborhoods, deter newcomers, and slow growth in affected regions.	Increased development has led to taller buildings in Bluffdale that are more susceptible to damage from high winds.	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	risks to infrastructure and air quality.			
Lightning	Climate change increases temperatures and alters precipitation, leading to more intense thunderstorms and frequent lightning strikes. Urbanization can enhance this effect, posing risks to public safety and infrastructure.	Lightning can influence population patterns by causing property damage and wildfires, leading some residents to relocate. Areas with higher lightning activity may deter new residents, while safer locations could increase migration as people seek protection from severe weather.	Increased development has led to taller buildings in Bluffdale that are more susceptible to damage from lightning.	Increased
Severe Winter Weather	Climate change impacts heavy snow and blizzards by altering precipitation patterns. Higher temperatures can lead to more rain than snow, affecting snowpack levels—additionally, increased storm intensity results in heavier, more unpredictable snowfall.	Increased population equals an increased number of people needing to get to work and quicker snow removal. Heavy snow or blizzards can impact population patterns by influencing where people live and work. Transportation disruptions may lead residents to seek housing closer to jobs, increasing density in some areas while depopulating others. Families might also avoid regions with frequent heavy snowfall, shifting demand to milder areas. Over time, these trends can alter community demographics and economic activity, prompting adjustments in city planning and resource allocation.	Increased development of both residential and commercial structures means more facilities are at risk from heavy snowfall, including roof collapses.	Increased
Tornado	Climate change may increase the frequency and intensity of tornadoes. Higher temperatures lead to more moisture in the air, creating	Tornadoes can influence population patterns by prompting residents to move to safer areas after damage occurs. This can decrease density in affected	Increased development means more structures can potentially be damaged by tornados that strike Bluffdale.	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	conditions for severe thunderstorms. Changes in wind patterns and precipitation can also heighten tornado risks, resulting in more destructive storms and greater threats to infrastructure and communities.	neighborhoods while increasing the demand for housing in safer regions. New residents may also move in for recovery opportunities, altering demographics. Over time, repeated tornado threats might push long-term residents to areas with better disaster preparedness, reshaping the city's population distribution.		
Wildfire	By raising temperatures and creating drier conditions, prolonged droughts lead to more dry vegetation, which serves as fuel for fires. Erratic seasons extend the growing period, while more lightning strikes can ignite wildfires. These factors heighten the threat to ecosystems and community safety.	Displaced individuals often seek safer areas, shifting demographics, while declining property values might deter newcomers. Conversely, some may be drawn to rebuilding efforts, impacting long-term growth and community dynamics.	Increased development in Bluffdale impacts wildfire risk in two ways. First, it densifies the city, reducing vegetation that can fuel a wildfire. Second, it adds more structures to the city that can potentially be lost in the event of a wildfire.	Increased
Dam Failure	Climate change raises the risk of dam failure by causing heavier rainfall and rapid snowmelt. These changes can overwhelm dams and compromise their integrity, highlighting the need for urgent safety assessments and upgrades to protect communities downstream.	Dam failure can impact population patterns by displacing residents and altering demographics. Evacuations can lead to an influx in safer areas, while destruction may deter new residents and contribute to population decline. Fear of future disasters may also prompt remaining individuals to relocate, changing the community's composition and affecting population density and economic activity.	Development in Bluffdale adds more structures that are at risk if a dam failure occurs.	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
Civil Disturbance	Climate change can increase civil disturbances by intensifying environmental stresses and social tensions. Rising temperatures may lead to droughts, wildfires, and poor air quality, particularly affecting vulnerable communities. Resource scarcity, especially water, can spark conflicts and protests. In addition, an influx of migrants from harder-hit areas may strain local resources, further escalating tensions. This cycle of unrest is driven by the impacts of climate change on the environment and community dynamics.	By encouraging residents to move for safety, leading to outflows and new arrivals. These events can reveal social issues, impacting community dynamics, employment, and property values, ultimately reshaping demographics, and social cohesion.	Increased development in Bluffdale does not impact the risk of a civil disturbance.	Increased
Cyberattack	Possible attack on the industry, which is seen as producing large amounts of greenhouse gases and burning fossil fuels. Climate change can heighten cyberattack risk by increasing vulnerabilities during extreme weather. Disruptions like power outages offer cybercriminals opportunities, but focusing on emergency responses can weaken cybersecurity measures. As organizations adopt new technologies to cope with climate impacts, they may unintentionally introduce additional vulnerabilities.	Cyberattacks can change population patterns by eroding trust in essential services. Compromised systems may cause residents to leave due to safety concerns, while high-profile incidents can deter businesses, leading to job losses. This perception of vulnerability may also make the city less appealing to newcomers, resulting in demographic shifts and affecting local development.	Increased development in Bluffdale does not impact the risk of cyberattacks.	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
Hazardous Materials Incident (Transportation & Fixed Facility)	Climate change elevates the risk of hazardous materials incidents by increasing extreme weather events like heavy rain and wildfires. These events can breach storage tanks and heighten material volatility. Vulnerable infrastructure can lead to more spills or accidents, while climate shifts may also introduce new challenges for managing hazardous substances and public health.	By causing evacuations and temporary declines in density. In the long run, unsafe areas may deter new residents, affecting growth and diversity. In addition, negative perceptions can lower property values and economic prospects, leading families to relocate, which impacts local demographics.	Increased development in Bluffdale does not impact the risk of hazardous materials incidents.	Increased
Public Health Epidemic/ Pandemic	By increasing the spread of vector-borne diseases and raising the risk of waterborne illnesses due to flooding or drought. Worsening air quality can also exacerbate respiratory conditions like asthma, especially in vulnerable populations.	By prompting migration for safety and better healthcare. Vulnerable groups may move to areas with improved services, while economic instability can drive people to seek new employment opportunities. In addition, restrictions like quarantine measures can limit movement and social interactions, reshaping the community's demographics and impacting local economies.	Increased development in Bluffdale does not impact the risk of a public health epidemics/pandemics.	Increased
Terrorism	Terroristic activity is sometimes centered around climate change. Climate change impacts terrorism incidents by creating conditions of resource scarcity and social unrest. Increased competition for essential resources, such as water, can fuel tensions, making	Terrorism incidents can alter population patterns by instilling fear and prompting residents to relocate to perceived safer areas, resulting in demographic shifts and potential declines in property values. Some neighborhoods may see an outflow of residents, while others could experience an influx of people seeking refuge from	Increased development in Bluffdale does not impact the risk of terrorist incidents.	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	communities more vulnerable to extremist ideologies. Extreme weather events may disrupt social order and infrastructure, offering terrorist groups opportunities to exploit crises. In addition, climate-driven population displacement can heighten tensions in receiving areas, raising the risk of domestic terrorism. Law enforcement's focus on climate-related challenges can also limit its capacity to address terrorism threats. Ultimately, while climate change may not directly cause terrorism, its effects can create an environment conducive to extremist activities.	violence. In addition, increased security measures may deter businesses and residents from certain locations, leading to long-term changes in population density and urban development patterns.		

DRAFT

Additional Public Involvement

The city of Bluffdale provided several opportunities for public participation. Figure 1 presents examples of public outreach.

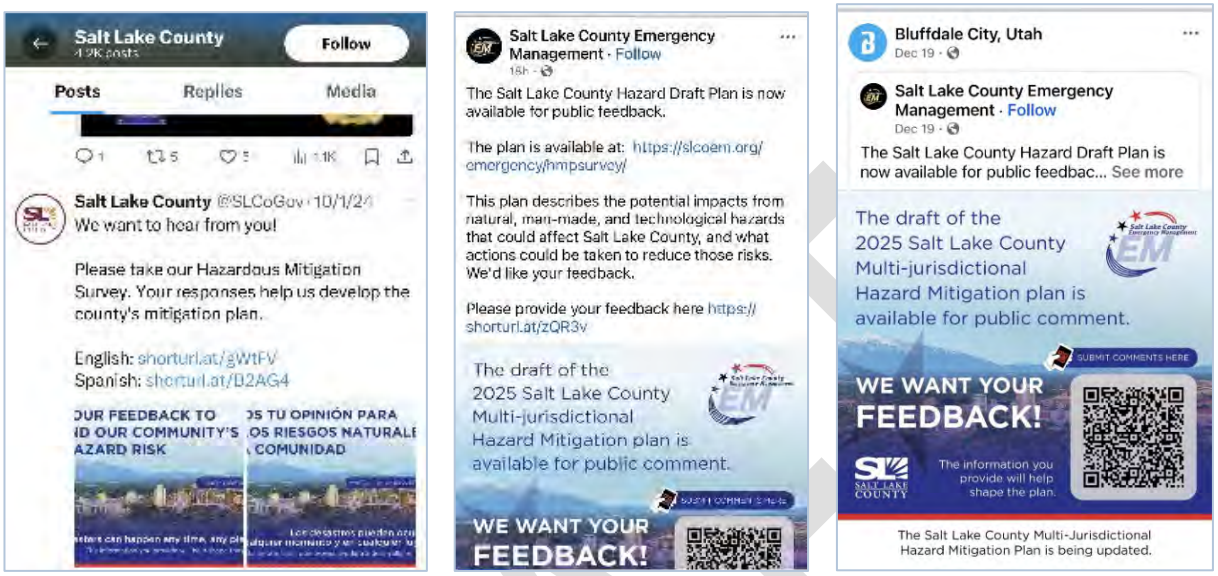

Figure 1: Social Media Posts for the Hazard Mitigation Survey (*left*) and Draft Plan Review (*center* and *right*)

Plan Integration

Incorporating the underlying principles of the Hazard Mitigation Plan and its recommendations into other plans is a highly effective and low-cost way to expand their influence. All plan participants will use existing methods and programs to implement hazard mitigation actions where possible. As previously stated, mitigation is most successful when it is incorporated into the day-to-day functions and priorities of government and public service. This plan builds on the momentum developed through previous and related planning efforts and mitigation programs, and it recommends implementing actions where possible through these other program mechanisms. These existing mechanisms include the following:

- Regularity Capabilities
- Administrative Capabilities
- Fiscal Capabilities

Respective planning stakeholders will conduct implementation and incorporation into existing planning mechanisms and will be done through the routine actions of:

- Monitoring other planning/program agendas
- Attending other planning/program meetings
- Participating in other planning processes; and

DRAFT

- Monitoring community budget meetings for other community program opportunities.

The successful implementation of this plan will require constant and vigilant review of existing plans and programs for coordination and multi-objective opportunities that promote a safe, sustainable community. Regular efforts should be made to monitor the progress of mitigation actions implemented through other planning mechanisms. Where appropriate, priority actions should be incorporated into planning updates. Table 9 lists existing planning mechanisms in which the Hazard Mitigation Plan has been integrated. Table 13 lists the opportunities for integrating elements of this plan into other plans.

Table 10: Previous Plan Integration by the City of Bluffdale

Plan	Description
None	N/A

Table 11: Future Plan Integration Opportunities for the City of Bluffdale

Plan Name	Description
General Plan	Vision for growth and development in Bluffdale.
Transportation Plan	Current conditions of Bluffdale's transportation system and outlines recommendations for future transportation needs.
Water Master Plan – Pressurized Irrigation	Outlines direction and decisions for pressurized irrigation system over the next 5 to 10 years.
Drinking Water Master Plan	Provides recommendations for adequate drinking water based on water use, growth projections, and state standards.
Floodplain Management Plan	Management of flood hazards in the city. Seeks to enhance the community's flood resilience, withstand a flooding event, minimize damage, and recover rapidly.
Storm Water Master Plan	Examines current and future needs of the city's storm water facilities and conveyance structures.
Stormwater Management Plan	Seeks to limit the discharge of pollutants in storm drain system
Impact Fee Facility Plan	Evaluates the current level of service for each utility and potential future needs. Provides information on the impact fee and associated public facility costs in the city
Parks, Trails, and Open Space Master Plan	Overview of parks, trails, and open space initiatives for the city

Capability Assessment

Local mitigation capabilities are existing authorities, policies, programs, and resources that reduce hazard impacts or could help carry out hazard mitigation activities.

Planning and Regulatory Capabilities

Planning and regulatory capabilities are the plans, policies, codes, and ordinances that prevent and reduce the impacts of hazards.

Table 12: Assessment of the Planning Capabilities of the City of Bluffdale

Plan	Does it address hazards? (Y/N)	How can it be used to implement mitigation actions?	When was the last update? When is the next update?
General Plan	Y	Goals can be incorporated into mitigation actions	2022
Capital Improvement Plan	Y	Funding sources and projects can incorporate mitigation actions	March 2024
Climate Change Adaptation Plan	N/A	N/A	N/A

Mitigation Grant Writing	Y	Hasn't been used yet	Can be used in grant applications to support mitigation actions
Hazard Data and Information	Y	Identified areas of concern for specific hazards	Can be used to prioritize areas that need mitigation work
GIS	Y	Used to map out high hazard areas	Can be used to identify or prioritize areas for mitigation
Mutual Aid Agreements	Y	Used to assist in completing mitigation actions	Oversight and accountability of mitigation actions
Other? (Please describe.)			

Financial Capabilities

Financial capabilities are the resources to fund mitigation actions. Talking about funding and financial capabilities is important to determine what kinds of projects are feasible, given their cost. Mitigation actions like outreach programs are lower cost and often use staff time and existing budgets. Other actions, such as earthquake retrofits, could require substantial funding from local, state, and federal partners. Partnerships, including those willing to donate land, supplies, in-kind matches, and cash, can be included.

DRAFT

DRAFT

Education and Outreach Capabilities

Education and outreach capabilities are programs and methods that could communicate about and encourage risk reduction. These programs may be run by a participant or a community-based partner. Partners, especially those who work with underserved communities, can help identify additional education and outreach capabilities.

Table 17: Assessment of the Education and Outreach Capabilities of the City of Bluffdale

Opportunities to Expand and/or Improve Capabilities

Actions that can expand and improve existing authorities, plans, policies, and resources for mitigation include budgeting for mitigation actions, passing policies and procedures for mitigation actions, adopting and implementing stricter mitigation regulations, approving mitigation updates, and making additions to existing plans as new needs are recognized. Table 18 lists the opportunities for the city of Bluffdale.

Table 18: Opportunities to Expand or Improve the Capabilities of the City of Bluffdale

Capability	Opportunity to Expand and/or Improve
Planning and Regulation	Bluffdale can expand its planning and regulatory mitigation capabilities by integrating the mitigation actions in this plan into the Capital Improvement Plan, Economic Development Plan within the General Plan, Land Use Plan, and Transportation Plan, which is in the process of being updated. Aligning these planning mechanisms with the mitigation plan will increase the odds of successfully implementing the identified projects.
Administrative and Technical	Bluffdale can expand partnerships for mitigation, including identifying and acting upon any deficiencies identified during a review of mutual-aid agreements and memoranda of understanding (MOUs). Partnerships can help when developing grant applications and project implementation through either financial or in-kind support, letters of support, or time and materials. Other local governments and agencies in hazard mitigation as well as nonprofits and community-based organizations can be effective mitigation partners. Partners can also provide technical skills, such as GIS, which Bluffdale does not have in-house. Further, bringing the right partners together and establishing a Coordinating Group can ensure effective communications.
Financial	Bluffdale can apply for new grants which fund hazard mitigation actions including but not limited to the Hazard Mitigation Grant Program (HMGP/404), Flood Mitigation Assistance (FMA), and Public Assistance Mitigation (PA Mitigation/406).
Education and Outreach	Bluffdale can expand current public outreach methods by developing programs to target specific groups which may be at higher risk of disaster impacts or able to implement hazard mitigation measures including homeowners, developers, schools, and people with special needs. This may include direct training and education of developers, professionals, and representatives of people with special needs. Additional outreach could incorporate community leaders who are familiar with each of these populations, as well as newsletters to homeowners with information on the hazards that could impact their area and how they can reduce their risk such as through home retrofits.

Mitigation Strategy

Mitigation strategies provide proactive measures that are designed to minimize the impacts of hazards on the city of Bluffdale. Table 19 shows mitigation action alternatives, and

Table 20 shows the status of previous mitigation activities. Table 21 is the 2025 mitigation action plan for the city of Bluffdale.

Table 19: Mitigation Action Alternatives for the City of Bluffdale

Action	Type of Action	Selected for inclusion in the plan?	If not selected, why not?
Update the evacuation plan for the city.	All Hazards	Y	
Identify and map shelters throughout the city.	All Hazards	Y – incorporated into a mitigation action	

DRAFT

Table 20: Status of Prior Mitigation Actions of the City of Bluffdale[3]

Action	Hazard(s)	Agency Lead	Support Agency(ies)	Status Update
Conduct a slope study.	Landslide/Slope Failure	City of Bluffdale	UDOT	Complete An inclinometer and a piezometer have been installed to measure water and earth movement. The slope is below a canal and train tracks owned by Union Pacific and the Utah Transit Authority.
Increase drinking water storage.	All hazards, Extreme Heat, Wildfire	City of Bluffdale	JVWCD	Ongoing Adding drinking water storage to the city's water system is a high priority. Bluffdale purchases water from JVWCD. As the city continues to grow, the need for water has increased. There has been the recent completion of approximately 22,400 linear feet of water line, one pump station, two metering stations and one 3 million-gallon storage tank. The city will build two new drinking water storage tanks at two different locations. This project will take several years and have many phases.
Conduct a hazmat flow study.	Hazardous Materials Release	City of Bluffdale	Local utility companies	Incomplete
Conduct training and awareness activities on communications equipment, tools, and systems.	All hazards	Bluffdale EM	SLCo EM, VECC, UCA	Complete Bluffdale participates in training and exercises designed to practice using communications tools and equipment. The city uses its amateur radio volunteers.
Establish agreements to share communications equipment between	All hazards	Bluffdale EM and Communications	SLCo EM, VECC, UCA, NGO partners	Ongoing Bluffdale continues to expand these agreements.

[3] Bluffdale EM = Bluffdale Emergency Management, EM = Emergency Management, FD = Fire Department, JVWCD = Jordan Valley Water Conservancy District, MSD = Municipal Services District, NWS = National Weather Service, NGO = nongovernmental organization, PD = Police Department, PSAP = Public Safety Answering Point, SLCo = Salt Lake County, SLCo EM = Salt Lake County Emergency Management, UDEM = Utah Division of Emergency Management, UDOT = Utah Department of Transportation, UCA = Utah Communications Authority, VECC = Valley Emergency Communications Center.

DRAFT

Action	Hazard(s)	Agency Lead	Support Agency(ies)	Status Update
agencies involved in emergency operations.				
Establish redundancy for dispatch centers and other critical communications.	All hazards	Bluffdale EM and Communications	VECC	Complete Bluffdale relies on VECC for dispatch services. It coordinates with other Public Safety Answering Points to provide redundancy.
Establish a coordinating group to address long-term communications needs and implementation strategies.	All hazards	Bluffdale EM and Communications	SLCo EM, NGO partners	Ongoing
Acquire, upgrade, and/or integrate communications equipment and systems as determined by coordinating group.	All hazards	Bluffdale EM and Communications	SLCo EM, VECC, NGO partners	Complete Bluffdale has upgraded existing equipment and purchased new equipment to maintain operability.
Integrate existing hazard monitoring networks in emergency operations centers. Use sensors, such as weather stations, stream gauges, seismograph stations, and road conditions.	All hazards	Bluffdale EM and Communications	NWS, SLCo EM, NGO partners	Ongoing New technologies have been added to the emergency operations center, and the city is exploring new options.
Implement improvements to address concerns identified in assessment.	All hazards	Bluffdale EM	SLCo EM	Ongoing
Compile inventory of mutual-aid agreements and memoranda of understanding (MOU) and identify deficiencies.	All hazards	Bluffdale EM	SLCo EM, SLCo Public Works, SLCo Flood Control, MSD	Complete

DRAFT

Action	Hazard(s)	Agency Lead	Support Agency(ies)	Status Update
Pursue and implement needed mutual-aid agreements.	All hazards	Bluffdale EM	MSD, SLCo EM, SLCo Public Works, SLCo Flood Control	Ongoing
Provide education regarding all natural hazards through live trainings and web-based, print, and broadcast media.	All hazards	Bluffdale EM	SLCo EM, NWS	Ongoing Bluffdale EM provides several public education classes for groups to discuss the hazards in the community and what residents can do to be prepared.
Develop education programs to target specific groups, including homeowners, developers, schools, and people with special needs.	All hazards	Bluffdale EM	Jordan School District, SLCo EM	Ongoing Bluffdale's education programs are customizable for all kinds of groups and available to all members of the community.
Coordinate with existing public education programs, such as the American Red Cross, Utah Living with Fire, Be Ready Utah, and the National Weather Service (NWS).	All hazards	Bluffdale EM and Communications	SLCo EM, NGO partners, NWS	Ongoing Bluffdale has worked with Be Ready Utah, the American Red Cross and other groups to present to the citizens of our community.
Establish and enforce appropriate planning, zoning, and building code ordinances.	All hazards	Bluffdale EM and Zoning		Ongoing Bluffdale enforces all ordinances and building codes, including those for Flood Damage Prevention and Land Disturbance.
The emergency managers will coordinate with local water districts/public utilities to support ongoing conservation efforts.	Drought	Bluffdale EM	Local water districts, local utility companies, SLCo EM, Public Works	Ongoing

DRAFT

Action	Hazard(s)	Agency Lead	Support Agency(ies)	Status Update
Investigate feasibility of implementing an incentive program to encourage the use of low-flow appliances and fixtures in homes and businesses.	Drought	Bluffdale EM and Public Works	SLCo EM, water districts, local utility companies	Ongoing Bluffdale has implemented several projects including using secondary and reuse water to irrigate public parks instead of culinary water.
Implement water-saving devices and practices in public facilities.	Drought	Bluffdale EM and Public Works	SLCo EM, water districts, local utility companies	Complete Bluffdale has a variety of incentive programs that it offers to its residents related to water conservation. It has a tiered pricing structure to promote conservation.
Repair, maintain, and improve water distribution infrastructure to prevent loss from leakage, breaks, etc.	Drought	Bluffdale EM and Public Works	SLCo EM, local utility companies, water districts	Complete The Bluffdale Water Division responds immediately to all reports of leaks and performs regular system maintenance, including actively monitoring for leaks, theft of services, etc.
Coordinate public safety water use, such as hydrant testing.	Drought	Bluffdale EM, Public Works, and Fire department		Complete The Bluffdale Water Division coordinates all water use, including the testing of hydrants in partnership with the fire department.
Coordinate with water districts to plan for, develop, and/or expand secondary water.	Drought	Bluffdale EM and Public Works	Water districts, SLCo EM	Ongoing Bluffdale continues to encourage the development of secondary water, where feasible. With every road project it adds reuse lines.
Encourage active participation in the NFIP.	Flooding	Bluffdale EM	SLCo EM, SLCo Flood Control	Ongoing Bluffdale actively participates in the National Flood Insurance Program (NFIP).
Determine potential flood impacts and identify areas in need of additional flood control structures.	Flooding	Bluffdale EM, Engineering, and Public Works	SLCo Flood Control, SLCo EM	Ongoing The City Engineer and Public Works Director regularly review the impact of development and the need for flood control infrastructure and make recommendations as needed.

DRAFT

Action	Hazard(s)	Agency Lead	Support Agency(ies)	Status Update
Address identified problems through construction of debris basins, flood retention ponds, energy dissipaters, or other flood control structures.	Flooding	Bluffdale EM, Engineering, and Public Works	SLCo Flood Control	Ongoing The City Engineer and Public Works Director oversees the construction of flood control structures.
Establish maintenance and repair programs to remove debris, improve resistance, and otherwise maintain effectiveness of stormwater and flood control systems.	Flooding	Bluffdale EM, Engineering, and Public Works	SLCo Flood Control	Ongoing The Division of Public Works continues to maintain and repair all drainage systems in the city.
Identify and assess structures for deficiencies.	Flooding	Bluffdale EM, Engineering, and Public Works		Incomplete.
Modify structures as needed to address deficiencies.	Flooding	Bluffdale EM and Public Works	Water districts, local utility companies	Ongoing The City Engineering Division, in cooperation with the Public Works Department, makes needed repairs to deficient structures.
Assist NWS in making other agencies and departments aware of available resources.	Severe Weather	Bluffdale EM	NWS, SLCo EM, Public Works, Engineering, PD, FD	Ongoing Bluffdale supports NWS's efforts for education and outreach and makes internal departments aware of NWS resources.
Use recommendations from the State Geological Hazards Working Group to address land use and planning for new developments.	Slope Failure	Bluffdale EM, Public Works, Engineering, and GIS	UDEM, SLCo EM	Ongoing Bluffdale supports the efforts for education and outreach.

DRAFT

Action	Hazard(s)	Agency Lead	Support Agency(ies)	Status Update
Work with experts and communities to develop or update evacuation plans.	Wildland Fire	Bluffdale EM	SLCo EM, local jurisdictions, PD, FD, Public Works	Ongoing The city is working with Salt Lake County and the cities of Herriman, Riverton, and South Jordan, reviewing and updating evacuation planning with GIS mapping.
Determine potential flood impacts and identify areas in need of additional flood control infrastructure. **Address identified problems through construction of debris basins, flood retention ponds, energy dissipaters, or other flood control structures.** **Provide maintenance, repairs, and improvements to drainage structures, stormwater systems, and flood control structures. Establish maintenance and repair programs to remove debris, improve resistance and otherwise maintain effectiveness of stormwater and flood control systems. Reduce threat of unstable or inadequate flood control structures Identify, assess, and modify as needed.**	Flooding	Public Works, Planning, Engineering	SLCo EM, SLCo Flood Control	Ongoing

DRAFT

Action	Hazard(s)	Agency Lead	Support Agency(ies)	Status Update
Educate home and property owners regarding the risks of flooding. **Identify potential flooding of Wood Hollow, Beef Hollow, and Rose Creek drainages.** **Continue to enforce floodplain regulations as they apply to new housing developments.**				
Continue our work to prepare our community to be storm ready, including the following: 1. **Receive information from NWS annually about new services and alerts as available.** 2. **Include in our Neighborhood Emergency Plan the importance of caring for our older residents who will need help during severe weather.** 3. **Continue to educate all residents about how to prepare for severe weather.**	Severe Weather	Bluffdale EM, Public Works, FD		Ongoing The city is working with SLCo and the cities of Herriman, Riverton, and South Jordan, reviewing and updating Evacuation planning with GIS Mapping.

DRAFT

Action	Hazard(s)	Agency Lead	Support Agency(ies)	Status Update
Continue to urge resident preparation through seasonal articles in the monthly newsletter. **Create evacuation plans for high-risk areas.** **Continue to assess water flow capabilities and address deficiencies.** **Continue to keep Wildland-Urban Interface as an important element to our development and ensure that developers follow our city code for road accessibility and availability of water flow for fire response.**	Wildfire	Bluffdale EM, Public Works, PD, FD		Ongoing The city is working with SLCo and the cities of Herriman, Riverton, and South Jordan, reviewing and updating Evacuation planning with GIS Mapping.

Table 21: 2025 Mitigation Action Plan for the City of Bluffdale[4]

#	Action	Hazard(s)	Lead Agency	Potential Partners	Benefits (Losses Avoided)	Cost Estimate	Funding Source(s)	Timeframe	Priority	Comments
1	Conduct training and awareness activities on communications equipment, tools, and systems.	Avalanche, Civil Disturbance, Dam Failure, Drought, Wildfire, Earthquake, Extreme Heat, Extreme Cold, Flooding, Hazardous Materials Incident, Heavy Rain, High Wind, Landslide, Lightning, Public Health Epidemic, Radon, Severe Winter Weather Terrorism, Tornado, Wildfire	Bluffdale EM and Communications	SLCo EM, Bluffdale FD, Bluffdale PD, NWS, VOAD	Ensures key departments and agencies are in the same loop	Low	Bluffdale General Fund	Ongoing	Medium	Bluffdale participates in training and exercises designed to practice using communications tools and equipment.
2	Establish agreements to share communications equipment between agencies involved in emergency operations.	Avalanche, Civil Disturbance, Dam Failure, Drought, Wildfire, Earthquake, Extreme Heat, Extreme Cold, Flooding, Hazardous Materials Incident, Heavy Rain, High Wind, Landslide, Lightning, Public Health Epidemic, Radon, Severe Winter Weather Terrorism, Tornado, Wildfire	Bluffdale EM and Communications	SLCo EM, Bluffdale FD, Bluffdale PD, neighboring jurisdictions, NWS, VOAD	Ensures coordination between different agencies and organizations	Low	Bluffdale General Fund, SLCo EM General Fund, BRIC grant, HMGP grant	Ongoing	Medium	Bluffdale continues to expand these agreements.
3	Establish a coordinating group to address long-term communications needs and implementation strategies.	Avalanche, Civil Disturbance, Dam Failure, Drought, Wildfire, Earthquake, Extreme Heat, Extreme Cold, Flooding, Hazardous Materials Incident, Heavy Rain, High Wind, Landslide, Lightning, Public Health Epidemic, Radon, Severe Winter Weather Terrorism, Tornado, Wildfire	Bluffdale EM and Communications	SLCo EM, Bluffdale FD, Bluffdale PD, Bluffdale Public Works, Utilities	Identifies communication needs and solutions for the city	Low	Bluffdale General Fund, SLCo EM General Fund	Long term	Medium	These meetings are ongoing.
4	Integrate existing hazard monitoring networks in emergency operations centers. Utilize sensors, such as weather stations, stream gauges, seismograph stations, road conditions, etc.	Avalanche, Civil Disturbance, Dam Failure, Drought, Wildfire, Earthquake, Extreme Heat, Extreme Cold, Flooding, Hazardous Materials Incident, Heavy Rain, High Wind, Landslide, Lightning, Public Health Epidemic, Radon, Severe Winter Weather Terrorism, Tornado, Wildfire	Bluffdale EM and Communications	SLCo EM, NWS, UGS, UDEM, neighboring jurisdictions, NWS	Increased understanding and utilization of local resources to improve situational awareness	Medium	Bluffdale General Fund, NWS, SLCo EM General Fund, BRIC grant, HMGP grant	Long term	Medium	New technologies have been added to the Emergency Operations Center and exploring new options.
5	Implement improvements to address concerns identified in assessment.	Avalanche, Civil Disturbance, Dam Failure, Drought, Wildfire, Earthquake, Extreme Heat, Extreme Cold, Flooding, Hazardous Materials Incident,	Bluffdale EM	Bluffdale Public Works, SLCo EM, neighboring jurisdictions	Improved understanding of gaps and ways in which they can be	High	Bluffdale General Fund, Bluffdale Capital Improvement Fund,	Short term	High	

[4] ARC = American Red Cross, Bluffdale EM = Bluffdale Emergency Management, BRIC = Building Resilient Infrastructure and Communities, FD = Fire Department, FFSL = Division of Forestry, Fire, and State Lands, HMGP = Hazard Mitigation Grant Program, JVWCD = Jordan Valley Water Conservancy District, MSD = Municipal Services District, NWS = National Weather Service, NFIP = National Flood Insurance Program, NGO = nongovernmental organization, PD = Police Department, PIO = Public Information Officer, PSAP = Public Safety Answering Point, SHSP = State Homeland Security Program, SLCo = Salt Lake County, SLCo EM = Salt Lake County Emergency Management, UDEM = Utah Division of Emergency Management, UGS = Utah Geological Survey, VECC = Valley Emergency Communications Center, VOAD = Voluntary Agencies Active in Disasters.

#	Action	Hazard(s)	Lead Agency	Potential Partners	Benefits (Losses Avoided)	Cost Estimate	Funding Source(s)	Timeframe	Priority	Comments
		Heavy Rain, High Wind, Landslide, Lightning, Public Health Epidemic, Radon, Severe Winter Weather Terrorism, Tornado, Wildfire			addressed at the local level		HMGP grant, BRIC grant,			
6	Pursue and implement needed mutual-aid agreements.	Avalanche, Civil Disturbance, Dam Failure, Drought, Wildfire, Earthquake, Extreme Heat, Extreme Cold, Flooding, Hazardous Materials Incident, Heavy Rain, High Wind, Landslide, Lightning, Public Health Epidemic, Radon, Severe Winter Weather Terrorism, Tornado, Wildfire	Bluffdale EM	SLCo EM, Bluffdale FD, Bluffdale PD, neighboring jurisdictions, VOAD, NWS, UDEM	Strengthened relationships with local jurisdictions, agencies, and organizations for assistance, outlined options for assistance depending on the incident	Low	Bluffdale General Fund, SLCo EM General Fund, SLCo Public Works	Short term	Medium	
7	Provide education regarding all natural hazards through live trainings and web-based, print, and broadcast media.	Avalanche, Civil Disturbance, Dam Failure, Drought, Wildfire, Earthquake, Extreme Heat, Extreme Cold, Flooding, Hazardous Materials Incident, Heavy Rain, High Wind, Landslide, Lightning, Public Health Epidemic, Radon, Severe Winter Weather Terrorism, Tornado, Wildfire	Bluffdale EM	Bluffdale PIO, SLCo EM, Be Ready Utah, neighboring jurisdictions	Increased understanding of local hazards and ways in which residents can reduce their risk	Low	Bluffdale General Fund, SLCo EM General Fund, HMGP grant, BRIC grant	Ongoing	High	Bluffdale EM provides several public education classes for groups to discuss the hazards in the community and what residents can do to be prepared. Educational activity needs to be ongoing to maintain effectiveness. Additional hazard-specific materials also contain good information to share with the public on how to reduce their own risk, such as early warning signs, cascading impacts, seismic and non-seismic retrofits (earthquake), rain gardens, utility elevation, and flood-resistant building materials (flooding, dam failure, heavy rain), home weatherization (extreme cold, extreme heat, severe winter weather), tree pruning and wind-resistant building materials (high wind, tornado, lightning), warning signs and vegetation mitigation measures (landslide/slope failure), at-home testing and radon mitigation measures (radon), and defensible space and home hardening (wildfire).
8	Develop education programs to target specific groups including homeowners, developers, schools and people with special needs	Avalanche, Civil Disturbance, Dam Failure, Drought, Wildfire, Earthquake, Extreme Heat, Extreme Cold, Flooding, Hazardous Materials Incident, Heavy Rain, High Wind, Landslide, Lightning, Public Health Epidemic, Radon, Severe Winter Weather Terrorism, Tornado, Wildfire	Bluffdale EM	Bluffdale PIO, SLCo EM, Be Ready Utah, neighboring jurisdictions, school districts	Increased understanding of local hazards and ways in which residents can reduce their risk, increased community relationship and engagement	Low	Bluffdale General Fund, HMGP grant, BRIC grant, Jordan School District, water districts, SLCo EM General Fund	Ongoing	Medium	Bluffdale's education programs are customizable for all kinds of groups and available to all members of the community

DRAFT

#	Action	Hazard(s)	Lead Agency	Potential Partners	Benefits (Losses Avoided)	Cost Estimate	Funding Source(s)	Timeframe	Priority	Comments
9	Coordinate with existing public education programs, such as the American Red Cross, Utah Living with Fire, Be Ready Utah, and the National Weather Service (NWS).	Avalanche, Civil Disturbance, Dam Failure, Drought, Wildfire, Earthquake, Extreme Heat, Extreme Cold, Flooding, Hazardous Materials Incident, Heavy Rain, High Wind, Landslide, Lightning, Public Health Epidemic, Radon, Severe Winter Weather Terrorism, Tornado, Wildfire	Bluffdale EM	SLCo EM, Be Ready Utah, VOAD, neighboring jurisdictions ARC, NWS	Improved coordination with local agencies	Low	Bluffdale General Fund. NGO partners, SLCo EM General Fund, NWS, HMGP grant, BRIC grant	Ongoing	High	Bluffdale has worked with Be Ready Utah, ARC, and other groups to present to the citizens of our community
10	Establish and enforce appropriate planning, zoning, and building code ordinances.	Avalanche, Civil Disturbance, Dam Failure, Drought, Wildfire, Earthquake, Extreme Heat, Extreme Cold, Flooding, Hazardous Materials Incident, Heavy Rain, High Wind, Landslide, Lightning, Public Health Epidemic, Radon, Severe Winter Weather Terrorism, Tornado, Wildfire	Bluffdale EM	Bluffdale Zoning, Bluffdale Code Enforcement, MSD Land Use and Zoning	Improved compliance with local regulations, improved oversight of ordinances to ensure structures are up to code and safe	Low	Bluffdale General Fund	Long term	High	Bluffdale enforces all current ordinances and building codes including ordinances like our Flood Damage Prevention and Land Disturbance ordinances.
11	Increase drinking water storage.	Drought, extreme heat	Bluffdale Public Works	Bluffdale EM, JVWCD		Medium	Bluffdale General Funds, Bluffdale Capital Projects, JVWCD	Medium	Medium	Adding drinking water storage to the city's water system is a high priority. Bluffdale purchases water from JVWCD. As the city continues to grow, the need for water has increased. There has been the recent completion of approximately 22,400 linear feet of water line, one pump station, two metering stations and one 3 million-gallon storage tank. The city will build two new drinking water storage tanks at two different locations. This project will take several years and have many phases.
12	The emergency manager will coordinate with local water districts/public utilities to support ongoing conservation efforts	Drought	Bluffdale EM	SLCo EM, water districts	Improved private/public partnerships	Low	Bluffdale General Fund, water districts operational budget	Ongoing	Medium	
13	Continue implementing an incentive program to encourage the use of low-flow appliances and fixtures in homes and businesses, and pursue other opportunities to encourage efficient water use.	Drought	Bluffdale Public Works	Bluffdale EM, Bluffdale Public Works, Water districts, SLCo EM, SLCo Public Works, Communications	Reduced water usage, encourages water-saving measures and improved resilience to drought	Medium	Bluffdale General Fund and County Funding, BRIC grant, HMGP grant	Long term	Medium	Bluffdale has various incentive programs that it offers to its residents related to water conservation. We have a tiered pricing structure to promote conservation
14	Implement water-saving devices and practices in public facilities.	Drought	Bluffdale Public Works	Bluffdale EM, Communications, SLCo Public Works, SLCo EM, NWS, water districts	Reduced water usage, encourages water-saving measures	Medium	Bluffdale General Fund, SLCo Public Works, BRIC grant, HMGP grant, water districts	Long term	Medium	Bluffdale has implemented several projects including using secondary and reuse water to irrigate public parks instead of culinary water

DRAFT

#	Action	Hazard(s)	Lead Agency	Potential Partners	Benefits (Losses Avoided)	Cost Estimate	Funding Source(s)	Timeframe	Priority	Comments
15	Coordinate with water districts to plan for, develop and/or expand secondary water.	Drought	Bluffdale Public Works	Bluffdale EM, water districts, Utilities, SLCo Public Works	Improved coordination between the public and private sectors	High	Bluffdale General Fund, Bluffdale Capital Improvement Fund, SLCo Public Works, water districts	Short term	Medium	Bluffdale continues to encourage the development of secondary water, where feasible. With every road project we add reuse lines.
16	Continue to actively participate in NFIP.	Flooding	Bluffdale EM	SLCo EM, Water districts, SLCo Public Works	Improved collaboration, increased understanding of the NFIP	Low	Bluffdale General Fund	Short term	High	Bluffdale actively participates in the NFIP
17	Determine potential flood impacts and identify areas in need of additional flood control structures.	Flooding, Heavy Rain, Dam Failure	Bluffdale Engineering	Bluffdale Public Works, Bluffdale EM, SLCo Public Works, water districts	Greater understanding of flood risk	Medium	Bluffdale General Fund, SLCo Flood Control, HMGP grant, BRIC grant	Medium	High	The City Engineer and Public Works Director regularly review the impact of development and the need for flood control infrastructure and make recommendations as needed
18	Address identified problems through construction of debris basins, flood retention ponds, energy dissipaters or other flood control structures	Flooding, Heavy Rain, Dam Failure	Bluffdale Engineering	Bluffdale Public Works, Bluffdale EM, SLCo Flood Control, Utilities, water districts	Ensures safety standards are met for local infrastructure	High	SLCo EM General Fund, Capital Improvement Fund, SLCo Flood Control Capital Funds	Long term	High	The City Engineer and Public Works Director oversee the construction of flood control structures
19	Establish maintenance and repair programs to remove debris, improve resistance and otherwise maintain effectiveness of stormwater and flood control systems	Flooding, Heavy Rain, Dam Failure	Bluffdale, Engineering	Bluffdale Public Works, Bluffdale EM, SLCo Public Works, SLCo Flood Control, water districts, Utilities	Ensures infrastructure is up to code and regularly inspected	High	Bluffdale General Fund, SLCo Flood Control Operational Fund, HMGP grant, BRIC grant	Ongoing	High	The Division of Public Works Department continues to maintain and repair all drainage systems in the City
20	Identify and assess structures for deficiencies and vulnerability to flood.	Flooding, Heavy Rain, Dam Failure	Bluffdale Engineering, and Public Works	Bluffdale EM, SLCo Public Works, water districts, local utility companies	Ensures infrastructure is up to code and regularly inspected	High	Bluffdale General Fund	Ongoing	Medium	
21	Modify structures as needed to address deficiencies.	Flooding, Heavy Rain, Dam Failure	Bluffdale Public Works	Bluffdale EM, SLCo Public Works, Utilities, water districts	Ensures structures meet safety standards	High	Bluffdale General Fund, Bluffdale Capital Improvement Fund, BRIC grant, HMGP grant	Ongoing	High	The City Engineering Division in cooperation with the Public Works Department make repairs as needed to deficient structures
22	Assist NWS in making other agencies and departments aware of available resources.	Flood, Heavy Rain, High Wind, Lightning, Tornado, Severe Winter Storm, Extreme Cold, Extreme Heat	Bluffdale EM	SLCo EM, NWS, local jurisdictions, water districts	Improved community engagement, greater understanding of local resources	Low	SLCo EM General Fund, Bluffdale General Fund, NWS, NGO partners, HMGP grant, BRIC grant	Ongoing	High	Bluffdale supports the NWS efforts for education and outreach and makes internal departments aware of NWS resources

DRAFT

#	Action	Hazard(s)	Lead Agency	Potential Partners	Benefits (Losses Avoided)	Cost Estimate	Funding Source(s)	Timeframe	Priority	Comments
23	Use recommendations from the State Geological Hazards Working Group or similar geological subject matter experts to address land use and planning for new developments.	Landslide/Slope Failure	Bluffdale EM,	Bluffdale Public Works and Engineering, SLCo EM, UGS, Public Works, Engineering, and GIS	Improved understanding of landslide risks to reduce risk.	Medium	Bluffdale General Fund	Ongoing	High	Bluffdale Engineering and Planning reviews recommendations as provided pertaining to development in the city
24	Work with experts and communities to develop or update evacuation plans.	Wildfire	Bluffdale EM	SLCo EM, local jurisdictions, FFSL	Improved understanding of evacuation procedures, improved coordination between local, state, and federal partners	Low	Bluffdale General Fund, SLCo EM General Fund, HMGP grant	Short term	Medium	The city is working with Salt Lake County and the cities of Herriman, Riverton, and South Jordan, reviewing and updating evacuation planning with GIS mapping.
25	Determine potential flood impacts and identify areas in need of additional flood control infrastructure. Continue to enforce floodplain regulations as they apply to new housing developments.	Flood, Heavy Rain, Dam Failure	Bluffdale Public Works	Bluffdale Engineering, Bluffdale EM, SLCo EM, SLCo Flood Control, SLCo Public Works, local jurisdictions, NWS	Improved understanding of flood risk areas, improved coordination/oversight between local agencies	Medium	Bluffdale General Fund, SLCo Flood Control, BRIC grant, FMA, HMGP grant, SLCo EM General Fund	Medium	Medium	The language for this action has been revised from the previous plan for clarity.
26	Provide maintenance, repairs, and improvements to drainage structures, stormwater systems, and flood control structures. to remove debris, improve resistance and otherwise maintain their effectiveness.	Flood, Heavy Rain, Dam Failure	Bluffdale Public Works	Bluffdale Engineering, Bluffdale EM, SLCo EM, SLCo Flood Control, SLCo Public Works, local jurisdictions, NWS	Reduce potential structural losses or loss of life due to flooding.	High	Bluffdale General Fund, SLCo Flood Control, BRIC grant, FMA, HMGP grant, SLCo EM General Fund	Medium	High	
27	Reduce threat of unstable or inadequate flood control structures. Identify, assess, and modify as needed.	Flood, Heavy Rain, Dam Failure	Bluffdale Public Works	Bluffdale Engineering, Bluffdale EM, SLCo EM, SLCo Flood Control, SLCo Public Works, local jurisdictions, NWS	Reduce potential structural losses or loss of life due to flooding.	High	Bluffdale General Fund, Bluffdale Capital Improvement Fund, SLCo Flood Control, BRIC grant, FMA, HMGP grant, SLCo EM	Medium	High	
28	Educate home and property owners regarding the risks of flooding. Identify potential flooding of Wood Hollow, Beef Hollow, and Rose Creek drainages. Also educate about risk of flooding due to dam failure.	Flood, Heavy Rain, Dam Failure	Bluffdale Public Works	Bluffdale Engineering, Bluffdale EM, SLCo EM, SLCo Flood Control, SLCo Public Works, local jurisdictions, NWS	Improved understanding of flood risk areas. Reduce potential structural losses or loss of life due to flooding.	Medium	Bluffdale General Fund	Short term	Medium

DRAFT

Town of Brighton Annex

To participate in this multi-jurisdictional hazard mitigation plan (MJHMP) update for Salt Lake County (SLCo), the governing body of the town of Brighton passed a formal resolution, a copy of which is maintained at the local government offices.

Planning Process Contact Information

Table 1 provides information on the point of contact during the updating of the MJHMP.

Table 1: Contact Information for the Town of Brighton

Name	Contact Information
Jane Martain	**Phone:** 801-554-1007; **email:** janemartain@brighton.utah.gov

The town of Brighton has a fully integrated approach to hazard mitigation planning and program implementation. During the 2024 update process, the MJHMP participation roles in Table 2 were recorded.

Table 2: Participant List for the Town of Brighton

Name	Title	Jurisdiction
Jane Martain	City Manager	Town of Brighton

Jurisdiction Profile

Date of Incorporation

January 1, 2020

Location and Description

The town of Brighton is a newly incorporated community located at the top of Big Cottonwood Canyon. The town is approximately 15.9 square miles in area and is approximately 8,700 feet above sea level. The town of Brighton is the home of the Brighton Ski Resort and the Solitude Mountain Resort. Figure 1 is a map of the town.

DRAFT

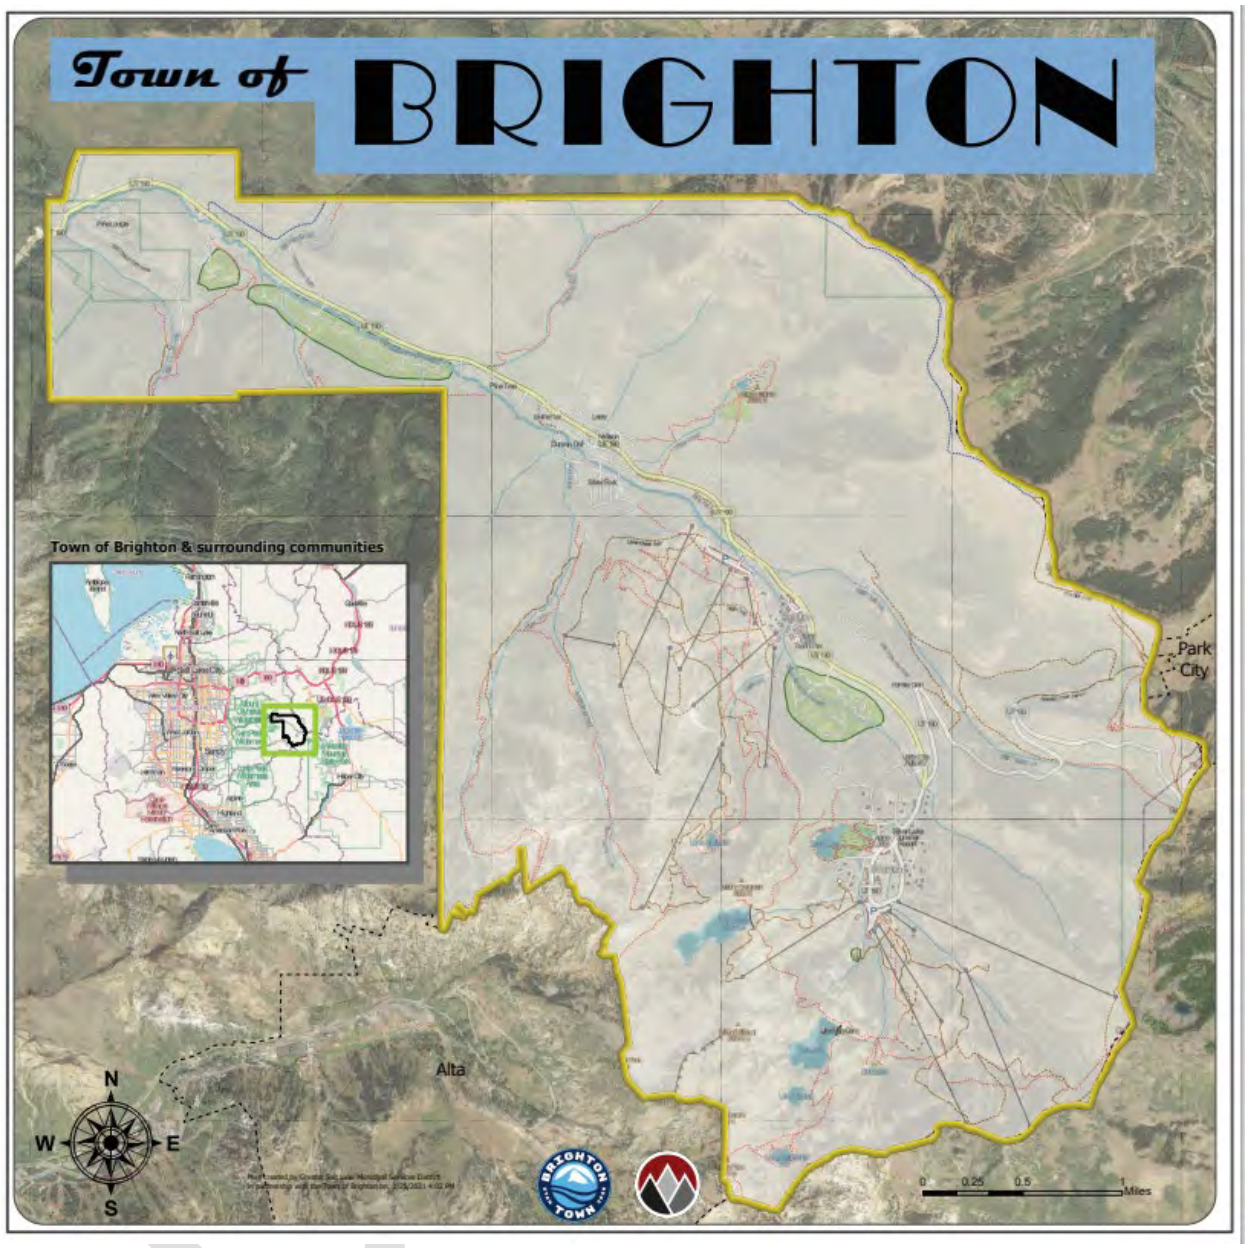

Figure 1: Map of the Town of Brighton[1]

Population

The 2022 American Community Survey 5-Year Estimate from the U.S. Census Bureau records the population of the town of Brighton as 353 people.

[1] Town of Brighton Map. https://www.brighton.utah.gov/media/2491.

Demographics

Most of the 353 people are between the ages of 25 and 34, with a median age of 43.1; 182 (51.6%) are males and 171 (48.4%) are females. English is the primary language in 99.4% of homes,.

Brief History

The town of Brighton boasts a storied history that began in 1871 with its initial settlement by Scottish immigrants William and Catherine Brighton who established a rustic hotel that quickly became a favored spot for visitors enjoying the natural beauty of Big Cottonwood Canyon. In 1936, the Brighton Ski Resort was founded, marking it as one of Utah's earliest ski destinations. As the community grew, residents voted to incorporate the town, with Brighton officially incorporating on January 1, 2020.

Climate

The town of Brighton experiences a continental climate (Dsa Köppen classification), characterized by dry, hot summers and cold winters, with significant temperature variations throughout the year. Average highs are approximately 81°F in the summer and approximately 15°F in the winter. Rain each year is approximately 15.3 inches, and snowfall averages 500 inches.

Public Services

The town of Brighton offers a wide range of public services through the Great Salt Lake Municipal Services District (MSD). MSD provides staffing and administrative support and other services and handles planning and zoning, business licensing, code enforcement, inspections, and emergency planning. Public works services are contracted with SLCo Public Works, which provides construction and maintenance of roads, snow removal, and street lighting.

Governing Body

The governing body—Mayor and four council members—is responsible for making policy decisions, adopting ordinances, and overseeing the administration of the town.

Development Trends

The Brighton Neighborhood Nodes Design Plan aims to increase amenities, commercial/recreational vitality, walking facilities, and sustainability in specific areas.

Jurisdiction-Specific Hazards and Risk

The Calculated Priority Risk Index (CPRI) is a comprehensive assessment tool for evaluating and prioritizing risks in a given context. It considers various factors, such as probability, impact, and urgency, to determine the level of risk associated with events or situations. The results for each hazard, including its risk factor (RF) value, are shown in Table 3. The results are based on the criteria in Table 4 and the

DRAFT

equation that follows it. The CPRI helps organizations and individuals make informed decisions about risk management and mitigation strategies. It provides a systematic approach to identifying and addressing potential issues, allowing for a more efficient allocation of resources and proactive risk prevention. With the CPRI, stakeholders can prioritize their focus on the most critical risks, leading to more effective risk management and, ultimately, better outcomes.

Table 3: Calculated Priority Risk Index Values for the Town of Brighton

Type of Hazard Event	Probability of Future Events	Spatial Extent	Severity of Life/ Property Impact	Warning Time	Duration	Response Capacity	Risk Factor Value
Avalanche	4	1	2	4	2	1	2.6
Drought	4	4	2	1	4	1	2.8
Earthquake	3	4	4	4	3	2	3.4
Extreme Heat	4	4	3	1	3	1	3
Extreme Cold	3	4	2	1	3	1	2.4
Flooding	4	3	3	3	3	1	3.1
Landslide/Slope Failure	2	1	2	4	1	2	2
Radon	4	4	2	1	4	2	2.9
Heavy Rain	4	3	2	3	1	1	2.6
High Wind	4	3	3	3	2	1	3
Lightning	4	2	2	4	1	1	2.6
Severe Winter Weather	4	3	2	2	2	1	2.6
Tornado	2	2	3	4	1	2	2.4
Wildfire	4	3	3	4	3	1	3.2
Dam Failure	2	2	3	2	2	3	2.4
Civil Disturbance	2	1	2	4	2	2	2.1
Cyber Attack	2	3	3	4	3	2	2.7
Hazardous Materials Incident (Transportation & Fixed Facility)	3	1	2	4	1	1	2.2

Terrorism	2	1	3	4	2	1	2.3

DRAFT

Table 4: Criteria for the Calculated Priority Risk Index

Risk Index Factor	Degree of Risk Level		Criteria	Factor Weight for Degree of Risk Level
Probability of Future Events	1	Unlikely	Less than 1 percent probability of occurrence in the next year or a recurrence interval of greater than every 100 years.	30%
	2	Occasional	1 to 10 percent probability of occurrence in the next year or a recurrence interval of 11 to 100 years.	
	3	Likely	11 to 90 percent probability of occurrence in the next year or a recurrence interval of 1 to 10 years.	
	4	Highly Likely	91 to 100 percent probability of occurrence in the next year or a recurrence interval of less than 1 year.	
Spatial Extent	1	Limited	Less than 10% of the planning area could be impacted.	10%
	2	Small	10%–25% of the planning area could be impacted	
	3	Significant	25%–50% of the planning area could be impacted.	
	4	Extensive	50%–100% of the planning area could be impacted.	
Severity of Life/Property Impact	1	Negligible	Less than 5% of the affected area's critical and non-critical facilities and structures are damaged/destroyed. Only minor property damage and minimal disruption of life. Temporary shutdown of critical facilities.	30%
	2	Limited	More than 5% and less than 25% percent of property in the affected area is damaged/destroyed. Complete shutdown of critical facilities for more than one day but less than one week.	
	3	Critical	More than 25% and less than 50% of property in the affected area was damaged/destroyed. Complete shutdown of critical facilities for over a week but less than one month.	
	4	Catastrophic	Over 50% of critical and non-critical facilities and infrastructures in the affected area are damaged/destroyed. Complete shutdown of critical facilities for more than one month.	
Warning Time	1	Self-defined	More than 24 hours	10%
	2	Self-defined	12 to 24 hours.	

DRAFT

Risk Index Factor	Degree of Risk Level		Criteria	Factor Weight for Degree of Risk Level
	3	Self-defined	6 to 12 hours.	
	4	Self-defined	Less than 6 hours.	
Duration	1	Brief	Up to 6 hours.	10%
	2	Intermediate	Up to one day.	
	3	Extended	Up to one week.	
	4	Prolonged	More than one week.	
Response Capacity	1	High	Significant resources and capability to respond to this kind of event; staff are trained, experienced, and ready.	10%
	2	Medium	Some resources and capability to respond to this kind of staff; some staff may be trained, experienced, and ready while others may need additional support.	
	3	Low	Limited resources and capability to respond to this kind of event; additional staff or staff training needed.	
	4	None	No resources and capability to respond this kind of event; additional outside support would be required.	

RISK FACTOR (RF) EQUATION

RF Value = [(Probability x 0.30) + (Spatial Extent x 0.10) + (Severity of Life/Property Impact x 0.30) + (Warning Time x 0.10) + (Duration x 0.10) + (Response Capacity x 0.10)]

Hazards with an RF value greater than or equal to 2.5 are considered high risk. Those with RF values of 2.0 to 2.4 are considered moderate risk hazards, and those with an RF value less than 2.0 are considered low risk. The highest possible RF value is 4.

Hazard Event History

Examining hazard event histories provides valuable insights to inform decision making and help prioritize resources for risk prevention and response efforts. Table 5 lists the hazard events impacting the town of Brighton planning area since the 2019 plan update, as recorded in the Storm Events Database from the National Centers for Environmental Information.

DRAFT

Table 5: History of Hazard Events in the Town of Brighton[2]

Type of Hazard Event	FEMA Disaster #	Date(s)	Damage or Impacts	Description
Avalanche			A number of avalanches have occurred over the years.	Impacted travel in the canyon if the road is closed. Affected the local economy (if the resort is closed or people cannot get up/down the canyon). Also, concern about planned detonations and the potential effect on those who are in unfamiliar terrain or unaware of planned detonations.
Drought			Concerns about the watershed if there is not enough snowpack to replenish.	
Earthquake	DR-4548-UT	March 2020	5.7 earthquake near Magna	Magna earthquake had significant impacts in the valley. No damage occurred in Brighton and shake intensity was weak.
Extreme Heat		N/A	N/A	N/A
Extreme Cold		N/A	N/A	N/A
Flooding		2023	Concerns about flooding with the amount of snow melting	Residents stockpiled sandbags and cleaned out creeks to help with water flow.
Landslide/ Slope Failure		August 2021	Debris in road caused closure.	Heavy rain and flash flooding affected the area.
Radon		N/A	N/A	N/A
Heavy Rain		N/A	N/A	N/A
High Wind			High winds can damage powerlines or prevent the lifts from running at resorts.	This has led to injuries and revenue lost at ski resorts. In addition, it might have cascading effects with a potential avalanche.
Lightning		N/A	N/A	N/A
Severe Winter Weather		2023	Death of man from heavy snow/roof collapse.	Roof collapse is a concern if people do not keep up with snow clearing during the winter months. Heavy snow and blizzard conditions are common in Brighton.

[2] EAP = Emergency Action Plan, ML = local magnitude

DRAFT

Type of Hazard Event	FEMA Disaster #	Date(s)	Damage or Impacts	Description
Tornado		N/A	N/A	N/A
Wildfire		2024	There have been smaller wildfires in the forest nearby.	Road closure impacts.
Dam Failure			Lake Mary-Phoebe Dam and Twin Lakes Dam are in Brighton.	The town is behind on needed improvements due to funding/staffing issues. These are rated high hazard dams. EAPs have to be updated.
Civil Disturbance		2024	Brighton resident threatened a snowboarder who came onto his land.	Charged with third-degree felony aggravated assault
Cyberattack		N/A	N/A	N/A
Hazardous Materials Incident (Transporta-tion & Fixed Facility)		N/A	N/A	N/A
Public Health Epidemic/ Pandemic		2020–2023	COVID-19 pandemic	Affected local businesses and ski resorts in the canyon
Terrorism		N/A	N/A	N/A

National Flood Insurance Program Summary

The town of Brighton participates in the National Flood Insurance Program (NFIP). Table 6 displays statistics related to the NFIP. The town of Brighton does not participate in the Community Rating System.

Table 6: National Flood Insurance Program Status for the Town of Brighton[3]

Init FHBM Identified	Initial FIRM Identified	Current Effective Map Date	Adopted Date	Date Joined NFIP	Tribal
N/A	12/18/1985	09/25/2009	2009	10/04/2021	No

Table 7: National Flood Insurance Policies for the Town of Brighton

Community ID	Number of Losses	Total Net Payment	Active Policies	Total Coverage
490237	0	$0	1	$98,000

[3] FIRM = Flood Insurance Rate Map, FHBM = Flood Hazard Boundary Map

DRAFT

The town of Brighton has designated the Director of Planning and Development Services as the Floodplain Administrator. The duties of the Floodplain Administrator are supported by the Greater Salt Lake Municipal Services District (MSD). The current Flood Damage Prevention and Control Ordinance was adopted on 9/14/2021. The current Flood Insurance Rate Map (FIRM) became effective 9/25/2009. The MSD is responsible for issuing floodplain permits in MSD Member Communities, including Brighton. The permits include a description of all work, including the kind and type of construction, proposed intent, and location. Substantial damage/substantial improvement structures are identified through the permitting process. Structures that are determined to be substantially damaged or substantial improvements are required to come into compliance with current codes. The MSD Building Department provides guidance on how to build in accordance with existing building codes.

Jurisdiction-Specific Vulnerabilities and Impacts

Table 8 provides information on the vulnerable assets in the town of Brighton, including its critical facilities, highlighting the town's vulnerability to identified hazards. It also describes the potential impacts on the community arising from those vulnerabilities. By understanding the risks associated with these assets, local authorities can develop proactive strategies to mitigate vulnerabilities and ensure the safety and functionality of these important assets during hazard events. These data are invaluable for decision-making and prioritizing resources for emergency response and preparedness efforts, ultimately contributing to more effective risk management and greater resilience within the community.

Vulnerable assets include the 353 residents and their homes. Brighton has one fire station. Highway 190/Big Cottonwood Canyon Road provides the primary transportation route in and out of Brighton. In the summer, Guardsman Pass Road provides a transportation link to Summit County to the east. Solitude Mountain Resort and Brighton Resort, along with associated businesses, account for significant economic assets in the town that draw significant numbers of visitors and revenue. The area also offers summer recreation through campgrounds and trails. Natural resources include forests and other vegetation, wildlife, lakes, Big Cottonwood Creek and tributaries, and the general scenery of the Wasatch mountains.

Although this number deviates from the 353 residents reported by the 2020 U.S. Census, the Town of Brighton 2025 Community Wildfire Protection Plan reports the following: 432 full-time residents, 185 full-time housing units, 1,200 part-time residents, and 690 seasonal housing units, 875 homes, 900 buildable lots, and 5 commercial entities.

Table 8: Jurisdiction-Specific Vulnerabilities and Impacts in the Town of Brighton

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
Avalanche	People	*Vulnerability:* Backcountry outdoor enthusiasts in Brighton are most vulnerable to avalanches. This includes areas around Brighton Resort or in Big and Little Cottonwood Canyons. *Impacts*: Avalanche rescue is resource-heavy and time consuming, and it frequently results in loss of life. Skiers, other outdoor recreationists, ski patrol, and resort staff may be at risk. Residents are

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		also at risk from roof avalanches, which occur when large slabs of snow slide off steep roofs.
	Structures	*Vulnerability:* Residences and structures located near steep slopes, especially along Guardsman Pass, Silver Fork, or slopes adjacent to the Brighton Resort are at risk from avalanches. *Impacts*: Structures can be damaged or destroyed by natural and human-caused avalanches.
	Economic Assets	*Vulnerability:* Brighton's economy depends heavily on tourism, particularly during the winter season. All local businesses are vulnerable. *Impacts:* Avalanche events can temporarily close Brighton Resort, limit road access via SR-190, and disrupt ski rental shops, lodging businesses, and restaurants. Road closures and power outages can reduce visitation, resulting in lost revenue for the local economy.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Vegetation, habitats, scenery, and historic structures are vulnerable to avalanches. *Impacts:* Avalanches in Brighton can impact alpine meadows, aspen stands, and conifer forests, resulting in habitat disruption and soil erosion. The area's natural beauty, which is a draw for recreation and photography, may suffer visible scarring after large slides. Although not widely known for historical structures, any older lodges or historic cabins in the area could be at risk if they are located in avalanche-prone terrain without modern structural protections.
	Critical Facilities and Infrastructure	*Vulnerability:* SR-190, utility systems, and fuel systems are vulnerable to avalanches. *Impacts:* Brighton's critical infrastructure includes SR-190 (Big Cottonwood Canyon Road), which is the sole access point into and out of the community. This road is frequently closed for avalanche control or recovery operations, which isolates residents and hinders emergency response. Power lines, propane storage, and water systems may also be affected by slides that damage above-ground infrastructure or block maintenance access routes. Brighton's remote location and limited-service infrastructure amplify these vulnerabilities.
	Community Activities	*Vulnerability:* Avalanche risk affects many aspects of community life in Brighton. *Impacts:* Winter events, school transportation for children living seasonally in the area, and recreational outings can be delayed or canceled due to high avalanche danger.
Drought	People	*Vulnerability:* All residents are vulnerable. *Impacts:* In Brighton, prolonged drought conditions can lead to limited access to clean drinking water, particularly for residents and seasonal visitors who rely on local groundwater wells or small-scale municipal systems.
	Structures	*Vulnerability:* Drought imposes restrictions on growth. *Impacts:* Drought indirectly restricts development and infrastructure expansion in Brighton due to limited water supply.
	Economic Assets	*Vulnerability:* Brighton is renowned for its ski resorts, which rely heavily on consistent snowfall.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		Impacts: Drought conditions can lead to reduced snowpack, adversely affecting the ski season's length and quality. Additionally, the diminishing of the Great Salt Lake can reduce lake-effect snowfall, further impacting snow levels. This decline in snowfall can result in decreased tourist visits, affecting revenue for local businesses and employment opportunities within the community. While agriculture is minimal in Brighton itself, regional drought affects food availability and prices, indirectly impacting local businesses.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Drought places significant stress on Brighton's high-elevation vegetation, including wildflowers, aspens, and subalpine forests. *Impacts:* This stress weakens ecosystems and increases vulnerability to pests, such as bark beetles, which thrive in dry conditions.
	Critical Facilities and Infrastructure	*Vulnerability:* Water systems are vulnerable to drought. Brighton has limited public infrastructure, making drought impacts more pronounced. *Impacts*: Local water systems may face reduced recharge rates, affecting both quantity and quality.
	Community Activities	*Vulnerability:* Recreation opportunities and household water usage are vulnerable to drought. *Impacts:* Brighton's recreational spaces such as hiking trails, picnic areas, and campgrounds may suffer from lack of maintenance due to water restrictions or fire closures. Households may face limitations on landscaping, outdoor water use, and recreational water features. These restrictions, though necessary, can affect the community's quality of life and seasonal aesthetics, especially in areas relying on gardens or native landscaping for erosion control and fire mitigation.
Earthquake	People	*Vulnerability:* Brighton is located within a seismically active region of Utah, and all residents are vulnerable. *Impacts:* Although Brighton's population is relatively small, specific groups are more vulnerable to earthquake impacts. These include residents living in older cabins or lodges, many of which were constructed before modern seismic building codes. Families with young children, elderly residents, individuals with mobility or sensory impairments, and seasonal workers living in dense or shared accommodations may face challenges evacuating or accessing emergency services. Brighton residents will also be affected if access to the rest of Salt Lake County is limited by earthquake damage to roads or other lifelines. They may be cut off from outside emergency aid.
	Structures	*Vulnerability:* All structures in Brighton are vulnerable to earthquakes. Many buildings in Brighton, especially historic ski lodges, vacation rentals, and cabins, were built before seismic design standards were adopted statewide. *Impacts:* Earthquakes can cause slight to extensive damage to structures. Structures made from unreinforced masonry or with shallow foundations are particularly vulnerable. Some buildings are perched on steep or unstable slopes, where ground movement during an earthquake could trigger foundation failure or secondary hazards like landslides. Seasonal structures or those constructed for temporary

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		use may also lack the bracing or anchoring needed to withstand seismic shaking.
	Economic Assets	*Vulnerability:* All Brighton businesses and the town economy are vulnerable to earthquakes. Key assets include lodging facilities, restaurants, retail shops, and Brighton Resort. *Impacts:* Brighton's economy relies heavily on tourism and outdoor recreation. An earthquake could severely disrupt these businesses, particularly if access to the area is blocked or buildings are damaged.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Natural scenery, outdoor recreation amenities, and historic structures are vulnerable to earthquakes. *Impacts:* While Brighton is primarily a natural destination, landslides or rockfall triggered by earthquakes could alter scenic vistas, hiking trails, and alpine ecosystems. Historic cabins, community gathering spaces, and older ski infrastructure may lack seismic upgrades and be prone to collapse or structural compromise. These facilities represent important cultural and recreational value to the community and their damage would diminish both heritage and identity.
	Critical Facilities and Infrastructure	*Vulnerability:* Brighton's critical facilities, including emergency access routes, power lines, and water systems, are vulnerable to earthquake-induced disruption. *Impacts:* The community is largely accessed via SR-190 through Big Cottonwood Canyon, which includes steep slopes and rockfall-prone areas that could become impassable after a quake. Any damage to utility systems, especially during winter months, could leave residents and visitors without heat, water, or communication.
	Community Activities	*Vulnerability:* Community life in Brighton, especially during the winter recreation season, is vulnerable due to public events, ski operations, and gatherings at lodges or resorts. *Impacts:* Earthquakes that strike during high visitation periods pose a greater risk of casualties due to crowded spaces and limited evacuation infrastructure. Many public spaces and event venues are in older buildings or set against steep terrain, making them especially hazardous during seismic activity.
Extreme Heat	People	*Vulnerability:* Vulnerable populations during extreme heat include adults over 65, individuals with pre-existing health conditions, and young children, as they struggle to regulate body temperature. *Impacts:* Extreme heat can cause heat related illnesses such as dehydration, heat exhaustion, and heat stroke. Socioeconomically disadvantaged individuals may lack access to cooling resources, while outdoor workers are at higher risk of heat-related illnesses due to physical labor without adequate hydration and rest.
	Structures	*Vulnerability:* Residential buildings with inadequate insulation and ventilation and commercial buildings lacking reflective roofing and proper shading may be vulnerable to extreme heat. Materials like metal and glass can amplify heat retention, while areas with limited green space typically experience higher temperatures. *Impacts:* Structures may retain heat, increasing discomfort or illness for occupants. Increased demand can strain cooling systems and increase costs.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
	Economic Assets	*Vulnerability:* Agriculture and outdoor recreation businesses are vulnerable to extreme heat. *Impacts:* Agricultural operations can have reduced yields and higher water demand due to heat stress. The outdoor recreation industry may see decreased participation during heatwaves, affecting local businesses that rely on visitors. In addition, the energy infrastructure could face strain from increased cooling demands, leading to outages.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Plants, wildlife, historic buildings, and parks are vulnerable to extreme heat. *Impacts:* Local plant species and wildlife habitats can suffer from drought conditions, leading to reduced biodiversity. Historic buildings may degrade due to high temperatures, causing materials to deteriorate and paint to peel. In addition, parks and recreational areas may experience overuse and risk their preservation, as residents seek relief from the heat.
	Critical Facilities and Infrastructure	*Vulnerability:* Transportation, utilities, and healthcare systems are vulnerable to extreme heat. *Impacts:* Healthcare facilities may experience increased demand because of heat-related medical issues, while schools can suffer from the strain on cooling resources. Transportation systems are at risk of damage, such as buckling roads and warped train tracks. Power grids may be strained by higher demands for electricity for cooling, leading to potential outages.
	Community Activities	*Vulnerability:* Activities like outdoor sports, fairs, and agricultural practices are vulnerable to extreme heat. *Impacts:* These events can pose risks, particularly for participants such as youth athletes and elderly residents who may suffer from heat-related illnesses. In addition, high temperatures can stress crops, impacting local farming.
Extreme Cold	People	*Vulnerability:* Brighton frequently experiences extreme cold due to its high elevation and alpine climate, especially during the peak winter season. All residents are vulnerable. *Impacts:* Elderly residents, young children, and seasonal workers are particularly vulnerable, especially if they lack access to proper heating, insulated housing, or winter clothing. Visitors unaccustomed to high-altitude cold may underestimate the risk of frostbite or hypothermia while recreating outdoors. Individuals with pre-existing health conditions, such as respiratory or cardiovascular issues, face elevated health risks during prolonged exposure to sub-zero temperatures.
	Structures	*Vulnerability:* Older structures are vulnerable to extreme cold. *Impacts:* Many buildings in Brighton, including older cabins, seasonal rentals, and ski lodges, may lack modern insulation or energy-efficient heating systems. Homes with drafty windows, aging furnaces, or unsealed gaps are especially prone to heat loss and frozen pipes. Unheated outbuildings like storage sheds or garages are also susceptible to structural damage from frost. Public infrastructure, such as roads and bridges, may become treacherous due to black ice and snow accumulation, posing hazards to both residents and emergency responders.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
	Economic Assets	*Vulnerability:* All businesses in Brighton are vulnerable to extreme cold. *Impacts:* While Brighton has limited agriculture, transportation networks, utility services, and winter tourism businesses are economically vulnerable to extreme cold. Power outages caused by ice accumulation or equipment failure can disrupt operations at lodges, restaurants, and ski facilities, leading to lost revenue and reduced visitor confidence. Icy roads, especially SR-190 through Big Cottonwood Canyon, can impede supply deliveries, employee commutes, and tourist access. Energy costs spike during extended cold periods, increasing operational expenses for businesses reliant on heating systems.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Historic structures, cultural sites, local vegetation, and wildlife habitats are vulnerable to extreme cold. *Impacts:* Historic structures, especially those not built for severe weather, can deteriorate from below-freezing temperatures and ice. Original ski lodges or cabins are at risk if they are not maintained for extreme cold tolerance, potentially leading to foundation damage, ice dams, or roof collapse. Cultural resources, such as memorials or public art installations, may suffer from freeze-related cracking or surface degradation. Local vegetation and wildlife habitats may suffer from plant stress and reduced food availability when faced with prolonged cold.
	Critical Facilities and Infrastructure	*Vulnerability:* Water and power systems and roads are vulnerable to extreme cold. *Impacts:* While Brighton lacks major critical facilities, it does rely on a small-scale utility and water system that can be strained during extreme cold events. Frozen pipes, pump failures, and mechanical malfunctions at pump houses or storage tanks can compromise service delivery. Power infrastructure is also vulnerable, and any outage during winter could be life-threatening due to cold exposure. Emergency response capabilities may be delayed if roads become icy or blocked by snow accumulation, compounding public safety concerns.
	Community Activities	*Vulnerability:* Outdoor events and recreation are vulnerable to extreme cold. *Impacts:* Brighton's community gatherings, outdoor events, and ski resort activities can be significantly disrupted by extreme cold. When temperatures drop dangerously low, recreational programs and seasonal events may be postponed or canceled, affecting tourism and local morale. Vulnerable groups, such as the elderly, young children, and those without adequate indoor heating, may avoid public spaces entirely. Additionally, community centers or lodges that are poorly insulated or under-heated can become uncomfortable or unsafe for group gatherings.
Flooding (and Heavy Rain)	People	*Vulnerability:* Flooding primarily affects residents in low-lying areas near rivers and streams, such as Big Cottonwood Creek, especially during heavy rainfall or snowmelt. *Impacts:* Individuals without reliable transportation may struggle to evacuate quickly, while low-income families often lack resources for

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		flood-prevention measures. The elderly and those with disabilities may face mobility challenges, increasing their risk during emergencies. Overall, factors such as geographic location, economic status, and physical ability contribute to the community's varying levels of vulnerability to flooding.
	Structures	*Vulnerability:* Structures in low-lying areas near the Big Cottonwood Creek or other waterways are vulnerable to flooding. *Impacts:* Residential properties in flood plains and commercial buildings without proper drainage systems or flood-resistant designs face significant risks during heavy rain or snowmelt. Older structures may be more susceptible due to outdated construction standards. Overall, a combination of location and construction features contributes to their vulnerability to flooding.
	Economic Assets	*Vulnerability:* All businesses and economic activity in flood zones, near waterways, or low-lying areas are vulnerable to flooding. *Impacts:* Commercial properties, especially retail centers and warehouses near rivers or low-lying areas, are at high risk during heavy rainfall. Residential developments in flood-prone zones also can suffer damage, impacting property values. Public infrastructure, such as roads and utilities, may experience disruptions, leading to costly repairs. Agricultural land can be affected by excess water, reducing crop yields.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Streams and habitats, as well as cultural sites, are vulnerable to flooding. *Impacts:* Natural areas like wetlands and streams are at risk of habitat destruction, while historic sites and landmarks may sustain structural damage. Cultural resources, such as parks and public spaces, can become unusable, affecting community events. Factors contributing to their vulnerability include inadequate flood management, urban development that alters water flow, and the increasing frequency of extreme weather events due to climate change.
	Critical Facilities and Infrastructure	*Vulnerability:* No critical facilities were identified in the Special Flood Hazard Zone in Brighton. Roads and utilities may be vulnerable. Because Brighton has limited facilities, it may be vulnerable to disruptions to facilities and infrastructure in the valley. *Impacts:* Hospitals, schools, and transportation networks are vulnerable to flooding due to their proximity to rivers and low-lying areas, which can overflow during heavy rain or snowmelt. Flooding can disrupt emergency services, require schools to evacuate, block transportation routes, and isolate communities. In addition, inadequate drainage systems and urban development encroaching on floodplains increase these risks.
	Community Activities	*Vulnerability:* Outdoor recreation and events are vulnerable to flooding. *Impacts:* Due to the area's geography and infrastructure, outdoor events, sports, and farmers' markets are vulnerable to flooding. Parks and open spaces can quickly become inundated during heavy rainfall or rapid snowmelt. Residential neighborhoods near rivers, roads, and bridges are at risk of flash floods, which can disrupt transportation and emergency services.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
Landslide/ Slope Failure	People	*Vulnerability:* In Brighton, residents living in cabins or homes built along steep slopes, especially in areas like Silver Fork, near Guardsman Pass, or along SR-190, are most vulnerable to landslides and slope failures. The risk is particularly elevated during spring snowmelt and periods of heavy rain, when saturated soils become unstable. *Impacts:* Residents may be injured or displaced from homes due to landslides. Many properties in Brighton are older or seasonal and may lack modern drainage systems or slope stabilization features.
	Structures	*Vulnerability:* Homes, commercial buildings, roads, and bridges on or near steep slopes may be vulnerable to landslides because of factors like loose soil or rock geology, heavy rainfall, and poor drainage systems. In addition, inadequate construction practices and a lack of erosion control measures can increase the risk of slope failures, particularly for properties not designed with their environmental context in mind. *Impacts:* Landslide can damage or destroy structures, including homes, businesses, and auxiliary structures like storage sheds. Roads such as SR-190 through Big Cottonwood Canyon may also experience rockslides, roadbed slippage, or debris flows that can damage pavement and reduce safe access to the community.
	Economic Assets	*Vulnerability:* Brighton's economic well-being depends on tourism infrastructure, including ski resort operations, road access, and power service continuity. *Impacts:* Landslides can damage access roads, utility lines, and commercial buildings, causing service interruptions and discouraging visitor access. Homes and vacation rentals located on hillsides may also suffer property damage or depreciation if slope stability is questioned. The cost of repairs or slope stabilization measures can be significant for both public and private landowners, posing financial strain on a tourism-dependent economy.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Natural ecosystems, historic sites, and recreation amenities are vulnerable to landslides and slope failure. *Impacts:* Slope failures in Brighton can lead to soil erosion, vegetation loss, and sediment runoff into alpine streams, affecting water quality and wildlife habitat in the Wasatch Mountains. Areas near historic mining sites or early settlement cabins may be particularly unstable due to old excavation practices and a lack of modern engineering reinforcement. Community assets such as recreation areas, trailheads, and alpine meadows may be damaged or rendered inaccessible by landslide debris or erosion, threatening both ecological integrity and local heritage.
	Critical Facilities and Infrastructure	*Vulnerability:* Key infrastructure in Brighton—including water tanks, culverts, utility lines, and the SR-190 access road—is vulnerable to slope instability. *Impacts:* Erosion or shifting terrain may compromise buried pipes or overhead lines, leading to service outages. Access routes for emergency vehicles may be blocked by debris flows or rockfall, hindering emergency response during storms or post-disaster cleanup.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
	Community Activities	*Vulnerability:* Recreational activities such as hiking, skiing, and mountain biking on sloped terrain are directly affected by landslide risk. *Impacts:* Trails may become unsafe or impassable due to ground instability or debris. Residential areas built along canyon slopes face a heightened risk of slope movement, especially during rapid seasonal changes. Infrastructure projects such as road repair or new construction can also be delayed or jeopardized by unstable soil conditions, limiting progress on critical community improvements.
Radon	People	*Vulnerability:* In Brighton, homeowners and seasonal residents living in older cabins, lodges, and ski chalets are particularly vulnerable to radon exposure due to aging construction and limited ventilation. Many of these homes are located in areas with granitic bedrock and uranium-rich soils, which are known to emit higher levels of radon gas. According to Utahradon.org, 37% of homes tested in the Brighton area (zip code 84121) have dangerous levels of radon. *Impacts:* Families with young children, seniors, and individuals with chronic respiratory conditions face elevated health risks, as prolonged exposure to radon is the second leading cause of lung cancer in the United States. Given Brighton's cold alpine climate, homes are often tightly sealed during winter, which can trap radon indoors and increase exposure.
	Structures	*Vulnerability:* Structures with concrete slabs or basements are particularly vulnerable to radon exposure, as radon can seep in from the soil. Homes in areas with high uranium content are at greater risk, especially in older houses with inadequate ventilation. *Impacts:* Cracks in floors and walls can allow radon to enter. Seasonal cabins and rentals that remain closed for extended periods may have even higher concentrations due to reduced air circulation.
	Economic Assets	*Vulnerability:* Radon exposure poses economic risks to homeowners, property investors, and local business owners in Brighton. *Impacts:* Properties found to have elevated radon levels may experience reduced market value, delays in real estate transactions, or higher insurance and mitigation costs. Commercial buildings such as lodging facilities, retail shops, and short-term rentals can also be impacted, as health concerns or required remediation may deter potential buyers or guests. The tourism-based economy could suffer if radon is perceived as a persistent health issue in indoor accommodations.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Natural environments, historic structures, and cultural sites are vulnerable to radon exposure. *Impacts:* Brighton's natural environment, including its granitic mountain soils and shallow groundwater sources, can accumulate and transport radon gas. Historic structures—such as older ski lodges, community buildings, or cabins built from local stone or concrete—are more likely to retain radon indoors due to limited ventilation and construction practices that predate awareness of radon hazards. Cultural sites used for gatherings or seasonal events may face indoor air quality concerns, impacting both preservation efforts and public health

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
	Critical Facilities and Infrastructure	*Vulnerability:* While Brighton has limited public infrastructure, schools, health clinics, and any future municipal buildings are at risk if built in radon-prone areas without appropriate mitigation. *Impacts:* Children are especially vulnerable due to their developing lungs and time spent indoors, making schools or daycare spaces a priority for radon testing. Healthcare providers and facilities also must ensure adequate air quality for patients and staff, particularly in lower-level spaces. A lack of regular radon monitoring or public awareness campaigns can leave critical facilities unprotected.
	Community Activities	*Vulnerability:* Indoor gatherings are vulnerable to radon exposure. *Impacts:* Community life in Brighton often centers around indoor winter gatherings, such as residential get-togethers, après-ski events, and seasonal functions in lodges or community halls. These activities frequently take place in basements or enclosed lower levels, where radon tends to accumulate. Without proper ventilation or testing, participants may unknowingly face increased exposure.
High Wind	People	*Vulnerability:* In Brighton, all residents and visitors face increased risk from high wind events due to the community's location in Big Cottonwood Canyon, where wind can be funneled and intensified by the surrounding topography. *Impacts:* Elderly individuals and those with mobility impairments may struggle to seek shelter quickly on icy or uneven terrain, while children and tourists may underestimate the dangers posed by falling debris or windblown objects. Seasonal workers and outdoor employees, particularly those working at Brighton Resort or on trail maintenance crews, are especially at risk during sudden wind gusts, which can topple equipment and create hazardous working conditions. Wind events may also occur in conjunction with winter storms, compounding risks.
	Structures	*Vulnerability:* Brighton's structures, including residential cabins, ski lodges, and commercial buildings, are susceptible to damage from strong winds, especially older buildings with flat or low-pitched roofs, aging materials, or large overhangs. *Impacts:* Structures with extensive windows or exposed signage, such as those at the resort base area, are vulnerable to glass breakage and façade damage. While the area does not contain agricultural facilities, storage sheds, equipment enclosures, and lift shacks may be lightweight and lack reinforcement, making them prone to collapse or debris loss. The lack of natural windbreaks in open areas and ridgelines further increases exposure to wind damage.
	Economic Assets	*Vulnerability:* Brighton's economy relies heavily on winter tourism, including the operation of Brighton Resort and supporting businesses such as lodging facilities, restaurants, gear rental shops, and transit services. *Impacts:* High winds can lead to lift closures, temporary business shutdowns, or power outages, causing loss of revenue and service disruptions. Large signs, outdoor seating, and displays are at risk of damage, and older homes may suffer from roofing and siding failures. Windborne debris and falling tree limbs can also damage power

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		infrastructure and canyon access roads, temporarily isolating the community and disrupting business continuity.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Brighton's forested alpine environment is vulnerable to high winds, particularly through treefall and wind erosion. *Impacts:* Uprooted trees can block trails, damage property, and disrupt habitats. Historic ski cabins and early recreational structures, which may not have been retrofitted for severe weather, are susceptible to structural failure.
	Critical Facilities and Infrastructure	*Vulnerability:* Brighton's critical infrastructure is relatively limited, but it includes utility lines, propane tanks, water supply systems, and SR-190, the sole road providing year-round access. *Impacts:* High winds can topple power lines or trees, causing outages and blocking evacuation routes. Communication systems used by emergency responders and ski patrols may also be affected by damaged antennas or lines. Residential and commercial buildings without wind-resistant features or modern design standards may experience structural damage, further complicating response and recovery during severe wind events.
	Community Activities	*Vulnerability:* Brighton's outdoor-focused community life is especially vulnerable to disruption during high wind events. *Impacts:* Wind can force ski lift shutdowns, trail closures, or cancellation of outdoor events, impacting community engagement and visitor experience. Tents, signs, and temporary structures used for special events are particularly prone to being overturned or damaged.
Lightning	People	*Vulnerability:* Brighton's location in the Wasatch Mountains and its strong focus on outdoor recreation make lightning a notable hazard, particularly during summer thunderstorms. All residents and visitors are vulnerable. *Impacts:* Hikers, mountain bikers, and backcountry skiers on exposed ridgelines or alpine meadows are especially at risk when storms move in quickly. Visitors and locals participating in outdoor activities around Brighton Resort or in the adjacent Uinta-Wasatch-Cache National Forest may struggle to find immediate shelter in remote terrain.
	Structures	*Vulnerability:* In Brighton, ski lifts, chair towers, communications antennas, and mountaintop infrastructure are particularly vulnerable to lightning strikes due to their elevation and metal components. Lodges, cabins, and other residential structures located near tall pine and fir trees are also at risk, as lightning can strike a tree and transfer energy to the nearby building. *Impacts:* Structures without proper grounding systems or surge protection, especially older buildings or seasonal homes, are more likely to suffer electrical or fire-related damage from a strike.
	Economic Assets	*Vulnerability:* Brighton's economic engine is its year-round outdoor recreation and tourism, making outdoor venues, resort infrastructure, and electrical systems highly susceptible to lightning-related disruptions. *Impacts:* Power lines and lift systems may experience outages or surges, halting ski operations and affecting hospitality services. Communications towers used for emergency response and ski patrol

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		are also exposed, with damage potentially disrupting coordination during peak tourism periods. Trail closures or safety evacuations due to lightning can lead to lost visitor revenue and additional operational costs for the resort and nearby businesses.
	Natural, Historic, and Cultural Resources	*Vulnerability:* The forests surrounding Brighton contain many tall, mature trees that can attract lightning strikes. *Impacts:* These events can ignite wildfires during dry summer conditions or damage natural trails and ecosystems. Brighton's older ski lodges or historic cabins, particularly those constructed with flammable wood and lacking lightning protection, are vulnerable to ignition or structural damage.
	Critical Facilities and Infrastructure	*Vulnerability:* Though limited, Brighton's critical infrastructure includes ski lift control centers, utility substations, communications towers, and the SR-190 canyon access road. *Impacts:* Lightning strikes can disrupt power and communication, particularly during busy winter or summer seasons when visitor safety depends on real-time coordination.
	Community Activities	*Vulnerability:* Outdoor events and recreation in Brighton are highly susceptible to lightning risk. *Impacts:* Community and resort-hosted events in Brighton, such as outdoor festivals, concerts, and recreational competitions, are highly susceptible to lightning risk due to their exposed, high-elevation settings. These events often occur in areas with minimal shelter options, such as mountaintop lodges, trailheads, or picnic zones. Water-related recreation in nearby areas, such as Silver Lake or streamside trails, increases risk due to water's conductivity.
Severe Winter Weather	People	*Vulnerability:* Brighton experiences long, intense winters marked by heavy snowfall, freezing temperatures, and blizzard conditions, all of which pose risks to all residents and visitors. *Impacts:* Elderly individuals and those with mobility limitations may struggle to navigate snow-covered terrain or safely access medical care. Young children and tourists unfamiliar with mountain conditions may underestimate cold-related hazards like frostbite or whiteout disorientation. People with disabilities or chronic health conditions may be more affected if caregivers or essential services are delayed due to impassable roads.
	Structures	*Vulnerability:* Brighton's older ski lodges, vacation rentals, and residential cabins can be especially vulnerable during severe winter weather. *Impacts:* Flat or low-pitched roofs are prone to dangerous snow accumulation and ice dam formation, which can lead to roof collapse or water intrusion.
	Economic Assets	*Vulnerability:* Severe winter weather significantly impacts Brighton's tourism-driven economy, which depends on resort operations, hospitality, and transportation. *Impacts:* While snow attracts visitors, excessive snowfall or blizzard conditions can shut down lifts, delay travel, and deter tourists, leading to revenue loss. Retail and food service businesses may experience

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		disruptions in supply chains, while staff shortages can occur if employees are snowed in.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Vegetation and habitat, as well as historic and cultural sites, are vulnerable to severe winter weather. *Impacts:* Brighton's forested slopes and alpine habitats are susceptible to treefall, branch breakage, and habitat disturbance under heavy snow. Historic ski lodges and early recreational structures, often constructed with wood, may suffer roof or foundation damage from persistent snow loads. Cultural resources, including outdoor gathering spaces, trailheads, and memorials, may become inaccessible due to deep snow or icy conditions, limiting use during winter events and holidays.
	Critical Facilities and Infrastructure	*Vulnerability:* Brighton's critical infrastructure, including roads and utilities, is particularly sensitive to severe winter weather due to its remote mountain setting and single access route (SR-190). *Impacts:* Heavy snow and icy conditions can block or slow emergency response, supply deliveries, and evacuation routes. Utility infrastructure, including overhead power lines and water systems, may experience outages or freeze damage, especially in older systems.
	Community Activities	*Vulnerability:* Recreation and sport events in Brighton are vulnerable to severe winter weather disruptions. *Impacts:* Community life in Brighton, including ski competitions, winter festivals, and resort-hosted events, is closely tied to outdoor environments and is highly vulnerable to severe weather disruptions. Whiteout conditions, road closures, or avalanche risk can result in event cancellations, low attendance, or dangerous travel conditions.
Tornado	People	*Vulnerability:* While tornadoes are extremely rare in Brighton due to its high elevation and mountainous terrain, residents and visitors are still vulnerable to high wind events or rotational storm activity in nearby valleys that may produce localized damaging winds or downbursts. *Impacts:* Individuals with limited mobility, such as the elderly or people with disabilities, may struggle to find shelter quickly, especially in homes without basements or safe rooms. Families with young children or seasonal visitors unfamiliar with local emergency procedures may be unprepared during fast-moving storm conditions.
	Structures	*Vulnerability:* Brighton's cabins, ski lodges, lift buildings, and commercial structures are not typically designed for tornado-force winds. *Impacts:* Single-story homes and buildings with broad roof spans or flat designs are more vulnerable to uplift and structural damage from wind shear. Older, unreinforced buildings or those not built to current code standards may be at increased risk during intense wind events, especially in open or exposed ridge locations.
	Economic Assets	*Vulnerability:* Brighton's economy relies heavily on recreation and tourism infrastructure, including lodging, ski operations, and seasonal services. *Impacts:* Though a direct tornado strike is unlikely, a high wind event or nearby tornadic activity could damage power lines, roads, or resort buildings, resulting in temporary closures and loss of revenue. Lift

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		systems, communications equipment, and signs are all exposed assets that could be disrupted, while delays in road access (via SR-190) can affect business continuity.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Natural vegetation, and historic and cultural sites are vulnerable to severe storm activity. *Impacts:* The forested slopes and alpine meadows of Brighton could suffer tree damage or debris fallout from severe storm activity, even without a tornado touchdown. Historic ski cabins or older wood-framed structures are at risk due to their age and construction materials, which are often not engineered to withstand extreme wind forces. Outdoor cultural resources, such as community gathering areas, monuments, or interpretive signage, could be damaged by falling trees or flying debris during high wind events.
	Critical Facilities and Infrastructure	*Vulnerability:* Brighton's critical infrastructure is limited but includes power lines, utility sheds, propane storage tanks, and the canyon access road. *Impacts:* A tornado or strong convective windstorm in the canyon could block roads with fallen trees or rockfall, delaying emergency response or evacuation. Communications towers and lift operations could be damaged by wind, disrupting both emergency coordination and resort activity. Emergency shelters are not widely available in Brighton, and many buildings lack designated safe rooms or storm-resilient areas, increasing vulnerability for both visitors and residents.
	Community Activities	*Vulnerability:* Recreation and events in Brighton are vulnerable to severe wind or tornadic activity. *Impacts:* Brighton's seasonal events, outdoor recreation programs, and resort-based gatherings are held primarily in open, exposed environments, making them vulnerable to any severe wind or tornadic activity. Tents, pop-up structures, and open-air gathering spaces provide little protection, and the rapidly changing mountain weather can make it difficult to implement safety protocols in time.
Wildfire	People	*Vulnerability:* All residents of Brighton are vulnerable to wildfire. *Impacts:* Residents near the wildland–urban interface (WUI), individuals with physical disabilities or health issues who may struggle to evacuate, and low-income families lacking resources for fire safety measures may be vulnerable. Older adults might have reduced mobility, making them more dependent on others for assistance. Wildfire smoke and poor air quality can cause respiratory difficulty.
	Structures	*Vulnerability*: Residential homes, especially those made of wood or located in heavily vegetated areas, may be vulnerable. Properties near the WUI are at higher risk due to surrounding flammable vegetation. Inadequate defensible space, such as insufficient clearing of dry grass and shrubs, increases susceptibility. Roofs made of combustible materials and buildings that lack fire-resistant features are particularly at risk during wildfire events. *Impacts*: Property loss can occur during wildfire events. Residences, commercial structures, as well as facilities and equipment at the ski resorts, are also at risk of damage from wildfire.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
	Economic Assets	*Vulnerability:* Much of Brighton has moderate to high wildfire risk, and all structures are vulnerable. *Impacts:* Residential properties near wildland areas are at high risk, especially if they lack defensible space and fire-resistant landscaping. Commercial assets, such as retail centers close to forested regions, can suffer damage from flames and smoke, affecting the local economy. The ski resorts could experience economic losses if structures or equipment are damaged by wildfire. Summer recreation businesses in the resort areas also could be negatively impacted by wildfire, wildfire smoke, and related closures in the area. Agricultural lands also are susceptible, as wildfires can destroy crops and livestock, leading to financial losses. Vital infrastructure, such as power lines and water pipelines, can be disrupted, causing further economic repercussions. These vulnerabilities are heightened by dry conditions and high winds, which can facilitate the spread of fires.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Vegetation, wildlife, and historic sites are vulnerable to wildfire. *Impacts:* Natural resources like forests and grasslands are at risk because dry vegetation and accumulated brush can easily ignite. Historic sites made of wood and cultural landmarks also can be affected, particularly when located near wildland areas. The increasing frequency of drought and extreme heat, exacerbated by climate change, heightens these vulnerabilities. In addition, urban development encroaching on wildland areas increases the risk to these essential resources.
	Critical Facilities and Infrastructure	*Vulnerability:* Power and gas infrastructure, and emergency response services are vulnerable to wildfire. *Impacts:* One fire station in Brighton may be vulnerable to fire damage. If undamaged, its resources could be quickly overwhelmed. Brighton is removed from other critical facilities such as schools, hospitals, and emergency services buildings which may also be vulnerable. Utilities like power lines and gas pipelines also are at risk, as sparks or falling trees can ignite fires. Residential neighborhoods adjacent to natural landscapes are particularly susceptible to embers, making them vulnerable during dry conditions and high winds. Limited routes to and from Brighton may create challenges to provide response resources to the town or to facilitate an evacuation.
	Community Activities	*Vulnerability:* Outdoor events and recreation are vulnerable to wildfire. *Impacts:* Outdoor events like festivals and sports, especially during hot, windy conditions may experience risk. Recreational activities, such as hiking and camping near wooded areas, also pose risks from open flames or sparks. In addition, landscaping with dry grasses and shrubs increases susceptibility during fire season, putting local infrastructure, such as schools and neighborhoods, at risk.
Dam Failure	People	*Vulnerability:* While Brighton itself is located at a higher elevation, there are small reservoirs and water retention systems upstream and within the broader Big Cottonwood Canyon watershed that pose dam-related risks. Dam inundation boundaries from Twin Lakes and Lake Mary-Phoebe pose high risk to Brighton.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		Impacts: In the event of a localized dam or retention structure failure, residents and visitors in lower-lying areas of the canyon, particularly near stream channels such as Big Cottonwood Creek, could be vulnerable to rapid-onset flooding. The dams uphill from Brighton are rated as high hazard, indicating they have the potential to result in loss of life from a failure.
	Structures	*Vulnerability:* Cabins, vacation homes, and resort buildings situated near natural drainages or creek-adjacent areas may be at risk from sudden flooding caused by dam failure. *Impacts:* Structures can experience severe damage from rapid-onset flooding following a dam failure. Bridges along SR-190, culverts, and resort infrastructure near stream crossings could suffer structural failure or erosion. Although Brighton has no large hospitals or schools, its emergency and operational facilities, such as ski patrol buildings or maintenance centers, could be impacted depending on the location and extent of the flood path.
	Economic Assets	*Vulnerability:* Brighton's recreation-based economy depends on reliable access and infrastructure, which could be affected by the vulnerability of the dams in the surrounding area. *Impacts:* A dam failure in the canyon could damage SR-190, cutting off the only access route to the community, thereby disrupting resort operations, lodging services, and deliveries. Power and communication lines running along the canyon could be washed out, compounding disruptions. Though Brighton doesn't have agriculture, resort assets and snowmaking systems could be affected if water intake systems are damaged or silted in. Property damage from fast-moving floodwaters could result in substantial economic losses for homeowners, businesses, and public agencies.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Forests, streams, historic structures, and cultural amenities are vulnerable to dam failure. *Impacts:* A dam failure could significantly impact Brighton's forested landscape and alpine stream systems, causing erosion, sedimentation, and habitat destruction in the Big Cottonwood Creek corridor. Historic structures, including older ski lodges or cabins near the canyon floor, may not withstand floodwater and could suffer structural damage or loss. Parks, trailheads, and community use areas could be rendered unusable or inaccessible, especially those near water features.
	Critical Facilities and Infrastructure	*Vulnerability:* Brighton's critical infrastructure—including SR-190, power lines, water systems, and emergency response stations—are vulnerable to dam failure. *Impacts:* Facilities and infrastructure could be compromised in a dam failure scenario. Downstream flooding could damage culverts, bridges, and roadbeds, isolating the community and delaying emergency response.
	Community Activities	*Vulnerability:* Recreation and events are vulnerable to dam failure. *Impacts:* Recreational activities, such as fishing, hiking, or snowshoeing along creeks and near reservoir areas, could be at risk during or following a dam breach. Community events or resort programming held near the canyon floor or along streambeds may be

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		canceled or disrupted due to safety concerns. Emergency evacuations during a breach would be difficult, especially with only one road in and out of Brighton.
Civil Disturbance	People	Low-income individuals may lack the resources for safety, while the elderly or disabled may struggle to navigate emergencies. Young people, particularly teenagers, may be drawn into unrest, influenced by social dynamics. In addition, marginalized individuals may feel targeted or compelled to participate. A lack of community cohesion and trust in authorities can further heighten tensions.
	Structures	Government buildings, commercial properties, and infrastructure, such as bridges and transportation hubs may be vulnerable. Government buildings may be targeted for their symbolic authority, while retail stores can attract crowds during protests. Residential neighborhoods also can be affected, especially in areas with heightened tensions. The vulnerability of these structures stems from their visibility and importance to the community, combined with factors such as location and ongoing social issues.
	Economic Assets	Retail establishments, especially shopping centers, are at risk as they often become focal points for protests. Transportation systems can be disrupted by blockades, hindering access to services. Financial institutions may face vandalism or theft, while critical service providers, such as hospitals, could experience strain during unrest. Several economic assets are vulnerable to civil disturbances, primarily due to their visibility and reliance on foot traffic.
	Natural, Historic, and Cultural Resources	Parks and open spaces may suffer from vandalism or destruction during uncontrolled events. Historic sites can become targets, as they symbolize authority or cultural significance. Cultural resources such as community centers and places of worship may also be affected, as they play a vital role in community identity. Their vulnerability lies in the potential for damage during protests.
	Critical Facilities and Infrastructure	Governmental buildings, schools, and healthcare facilities may be at risk, since they often symbolize authority and serve as community hubs, making them targets during unrest. Utility infrastructure, such as water and power facilities, is also at risk of disruption. Its visibility and essential services contribute to its vulnerability during civil disturbances.
	Community Activities	Public demonstrations, parades, and local government meetings are particularly vulnerable to civil disturbances. These events often attract large crowds and can become tense, especially around contentious social or political issues. Factors such as the local demographic, economic conditions, and recent events can heighten these vulnerabilities, making it easier for conflicts to arise during passionate public gatherings.
Cyberattack	People	Older adults often lack familiarity with technology and online security, making them easy targets for phishing scams. Individuals engaging in online banking or shopping without strong security measures also face heightened risks. Families with children may be less vigilant about internet safety, allowing cybercriminals to exploit personal information. In addition, small business owners without robust cybersecurity practices are prime targets for attacks that can disrupt operations.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
	Structures	Critical infrastructure, such as power plants, water treatment facilities, and transportation systems, often lack robust cybersecurity measures. Commercial businesses, especially financial institutions and healthcare providers, also are at risk due to weaker data protection and employee training. Educational institutions may be vulnerable because of limited funding for cybersecurity and outdated software. Obsolete technology and insufficient training enhance the susceptibility of these structures to cyber threats.
	Economic Assets	Financial institutions, such as banks and credit unions, are at risk of data theft and service disruption. Small and medium-sized businesses often lack robust cybersecurity measures, making them attractive targets. In addition, local government agencies and critical infrastructure, such as water treatment facilities, might have outdated security protocols, posing threats to public safety. The rise of remote work further exacerbates vulnerabilities, as employees accessing networks from home can unintentionally expose systems to risks. Overall, the combination of outdated technology and insufficient cybersecurity practices increases the vulnerability of an area's economic assets.
	Natural, Historic, and Cultural Resources	Natural resources like water management systems and wildlife databases can be compromised, disrupting ecosystems. Historic sites and museums that digitize collections are at risk of losing valuable artifacts and data. In addition, cultural organizations managing events may face threats if their systems lack adequate security. The limited resources of smaller organizations further increase this vulnerability
	Critical Facilities and Infrastructure	Energy and utility services, such as electricity and water systems, which often rely on outdated technology, may be vulnerable. Transportation infrastructure, such as traffic management and public transit, is also at risk due to networked systems. Healthcare facilities that use electronic records and connected medical devices face vulnerabilities that can compromise patient safety.
	Community Activities	Online registration for events, local government services, and educational programs that rely on digital tools may be targeted due to inadequate security measures, outdated software, and insufficient staff training.
Hazardous Materials Incident (Transporta-tion & Fixed Facility)	People	Individuals with pre-existing health conditions, such as respiratory issues, and the elderly are at higher risk due to their compromised health. Children also are more susceptible. Those living near industrial areas or transport routes for hazardous materials face increased exposure risk, while low-income families may lack resources and information to effectively prepare for incidents.
	Structures	Industrial facilities, such as manufacturing plants and warehouses, often store hazardous chemicals which may leak. Residential buildings, schools, and hospitals also are at risk, particularly if located along transportation routes for hazardous materials. Older buildings may lack modern safety features, increasing their vulnerability.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
	Economic Assets	Industrial facilities, transportation infrastructure, and nearby commercial properties may be affected. Industrial facilities handling chemicals are at risk of spills or leaks, while roads and railways used for transporting hazardous materials can lead to accidents and contamination. In addition, nearby commercial and residential areas face potential health risks and economic losses.
	Natural, Historic, and Cultural Resources	Waterways and habitats are vulnerable to hazardous materials incidents, which can disrupt ecosystems. Historic sites and structures may suffer damage from toxic exposure, leading to degradation over time. In addition, cultural landmarks risk losing their significance due to contamination events. The proximity of these resources to industrial areas or transport routes exacerbates their risk.
	Critical Facilities and Infrastructure	Chemical manufacturing plants, waste treatment facilities, and transportation networks, such as highways and railroads may be at risk. Their vulnerability stems from factors such as proximity to residential areas, aging infrastructure, and inadequate safety measures. Natural hazards, such as flooding and earthquakes, can further increase risks by damaging containment systems.
	Community Activities	Local markets, school events, and outdoor gatherings are vulnerable to hazardous materials incidents if they are near industrial zones and transport corridors. This risk is heightened by inadequate emergency preparedness, lack of public awareness, and the potential for spills during transport. Large crowds at events can complicate evacuation efforts, increasing the risks for participants and nearby residents.
Public Health Epidemic/ Pandemic	People	Individuals with pre-existing health conditions like asthma and heart disease and adults over 65 may be vulnerable. Low-income families may struggle to access healthcare and vaccinations, increasing their risk. Marginalized communities with limited access to information and those living in high-density conditions also are at greater risk due to the rapid spread of diseases and the challenges in implementing preventive measures.
	Structures	Several structures are vulnerable to public health epidemics or pandemics, particularly due to their ability to facilitate the spread of disease. High-density residential areas, such as apartment complexes, are at risk, as close living quarters can lead to faster transmission. Public gathering spaces, such as schools and community centers, also pose significant threats because large groups are in confined spaces. Healthcare facilities can become hotspots for infections if infection control measures are insufficient. In addition, workplaces with high foot traffic, such as retail stores, contribute to vulnerability.
	Economic Assets	Small businesses in retail, hospitality, and food service are particularly vulnerable to public health epidemics or pandemics. These sectors face risks from fluctuating consumer demand and potential operational restrictions. The tourism industry also is affected, as travelers may avoid high-risk areas. Healthcare facilities can become overwhelmed, straining resources and impacting operations. In addition, local supply chains may experience disruptions, leading to shortages and inflation. Overall, the direct effects of illness, along with prolonged shutdowns and consumer hesitance, leave these economic assets exposed to significant downturns.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
	Natural, Historic, and Cultural Resources	Natural resources like wildlife and ecosystems can be disrupted by increased human activity, raising the risk of zoonotic diseases. Historic sites may deteriorate due to reduced visitor access and funding, while cultural resources, such as community events, face cancelations, impacting social connections.
	Critical Facilities and Infrastructure	Public health epidemic or pandemic incidents can affect healthcare facilities, nursing homes, public transportation systems, schools, and food supply chains. Hospitals and clinics may become overwhelmed with patients, while vulnerable populations in nursing homes are at higher risk. Public transportation can facilitate the spread of disease, and schools gather large groups, thereby increasing transmission potential. These facilities often lack adequate resources, including medical supplies and testing capabilities, making them more susceptible to the impacts of a health crisis.
	Community Activities	Large gatherings like festivals and sporting events can facilitate the rapid spread of diseases due to close contact. Public transportation also is at risk, as it serves many people in confined spaces. Schools and childcare facilities are particularly susceptible, given that children can easily transmit infections. In addition, food-related events, such as farmers' markets, can pose risks if hygiene practices are not followed. The interconnectedness of community members and varying adherence to health guidelines further exacerbate these vulnerabilities.
Terrorism	People	Young children and newcomers may lack awareness of potential threats, while the elderly and individuals with disabilities may struggle to respond quickly in emergencies. Marginalized communities often face bias, making them more susceptible to targeting. In addition, those with lower socioeconomic status may lack access to security measures and emergency preparedness resources.
	Structures	Government buildings, transportation hubs, commercial centers, and public spaces are particularly vulnerable to terrorism incidents. Government buildings are symbolic targets, while transportation hubs and commercial centers are attractive due to their potential for high casualties and crowd presence. Public spaces also are at risk due to their open nature and lack of security. Their vulnerability is heightened by inadequate security measures, high occupancy rates, and their locations in densely populated areas, which can amplify the impact of incidents.
	Economic Assets	Infrastructure, commercial establishments, and community facilities may be vulnerable. Critical infrastructure, such as transportation networks and power grids, could disrupt the economy if targeted. Commercial establishments, especially those with high foot traffic, and community facilities like schools and hospitals also are at risk, as they can provoke widespread concern and disruption. Their accessibility and interconnectivity increase vulnerability, meaning that damage to one asset can have a broader economic impact and hinder recovery efforts.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
	Natural, Historic, and Cultural Resources	Natural resources like water supplies and parks could be targeted for their significance to the community. Historic sites and cultural resources, such as museums or community centers, also are at risk due to their accessibility and importance to local identity. Their vulnerability is often heightened by inadequate security measures.
	Critical Facilities and Infrastructure	Public transportation systems, healthcare facilities, schools, and utility services like water and power plants may be affected. Their vulnerability arises from high accessibility and the potential impact of an attack, as crowded transportation and public spaces can lead to mass casualties and panic. Attacking utility services could disrupt the town's essential functions, creating chaos.
	Community Activities	Festivals, parades, and sporting events are particularly vulnerable to terrorism incidents. These events attract large crowds, making it easier for perpetrators to inflict harm and instill fear. In addition, community centers and places of worship serve as social hubs, increasing their risk. Factors such as limited security measures and open access to public spaces contribute to this vulnerability.

Jurisdiction-Specific Changes in Vulnerability

Hazard events can impact communities, infrastructures, and ecosystems. The severity of these impacts can be influenced by climate change, population patterns, and land use developments. Understanding these factors is crucial for the town of Brighton to develop a resilient community and minimize the impacts of hazards. Table 9 displays the changes within the town and the related effects on each hazard to the town of Brighton.

DRAFT

Table 9: Jurisdiction-Specific Changes in Vulnerability in the Town of Brighton

Type of Hazard Event	Description of Potential Impacts	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
Avalanche	Avalanches pose a direct threat to outdoor enthusiasts, leading to injuries or fatalities. Property damage can occur at ski resorts and along transportation routes, disrupting emergency response and logistics. The local economy may suffer, especially businesses reliant on winter tourism, and there can be a psychological toll on the community, along with increased insurance costs.	Higher temperatures can lead to more rain, destabilizing snowpack and increasing the risk of wet avalanches. In addition, changes in snowfall can cause denser snow layering on slopes, making them more prone to sliding.	Avalanches can influence population patterns by deterring people from moving to or remaining in high-risk areas, leading to decreased density in these locations. The threat of avalanches prompts many to seek safer environments in urban or lower-risk regions. In addition, when avalanches occur, they can disrupt infrastructure, causing residents to relocate.	There have been minimal changes in land use and development in the town of Brighton since the previous plan update.	Decreased
Drought	Drought can cause water scarcity, impacting agriculture and reducing crop yields. Recreational activities may decline, harming tourism, while the risk of wildfires increases, threatening safety and property. In addition, lower water levels can lead to water quality issues and public health concerns.	Climate change affects drought incidents by altering precipitation patterns and increasing temperatures. Warmer weather can lead to longer dry periods and more severe droughts, while changes in rainfall can reduce snowpack in nearby mountains, crucial for summer water supply. Higher temperatures also increase evaporation rates, further straining local water resources.	Drought can significantly influence population patterns by impacting economic opportunities and the quality of life. Water scarcity often leads to reduced agricultural productivity, prompting residents to migrate to areas with more stable job prospects. Increased water costs can make living less affordable, driving some residents away. Conversely, efforts to address	There have been minimal changes in land use and development in the town of Brighton since the previous plan update.	Increased

DRAFT

Type of Hazard Event	Description of Potential Impacts	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
			drought, such as sustainable development or improved water management, may attract newcomers, changing the community's demographic composition over time.		
Earthquake	The potential impacts of earthquakes can be substantial. Immediate damage to infrastructure may disrupt essential services such as water, electricity, and transportation, complicating recovery efforts. Homes and businesses might sustain significant structural damage, posing safety risks. In addition, psychological effects, such as increased anxiety, can affect the community. Economically, repairs can lead to high costs, potential declines in property values, and disruptions to local businesses, ultimately impacting job availability and the overall economy.	Rising temperatures can lead to glacial melting, which affects pressure on tectonic plates and may trigger seismic activity through isostatic rebound. In addition, increased rainfall and flooding can erode soils, weakening structural integrity and heightening vulnerability during earthquakes. Although the direct links between climate change and earthquakes are still under investigation, the environmental effects may impact the region's seismic risk.	Earthquakes can significantly alter population patterns by prompting residents to leave for safer areas after a seismic event. This migration can lead to changes in population density and attract new residents and businesses during the rebuilding process. The perception of the area as a safe place to live may shift, impacting long-term demographics, as some residents return to rebuild while others relocate permanently.	There have been minimal changes in land use and development in the town of Brighton since the previous plan update.	Stayed the same

DRAFT

Type of Hazard Event	Description of Potential Impacts	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
Extreme Heat	Extreme heat can significantly affect public health, increasing the risk of heat-related illnesses, especially among vulnerable populations. It also strains energy resources due to higher demand for air-conditioning, potentially leading to power outages. In addition, extreme temperatures worsen air quality by raising ozone levels, which poses respiratory risks. Urban infrastructure also may suffer damage, leading to increased maintenance costs and safety concerns.	Climate change significantly impacts extreme heat by increasing the frequency and intensity of heatwaves. Rising global temperatures lead to longer and hotter summers, affecting residents and local infrastructure while heightening health risks, especially for vulnerable populations. Urban heat islands resulting from reduced vegetation and extensive pavement further amplify these effects.	By causing residents to relocate due to damaged homes or safety concerns. Some may move to areas perceived as safer or seek better job opportunities elsewhere. The economic impact and infrastructure damage can also make certain neighborhoods less desirable, leading to shifts in demographics and the socioeconomic landscape as new residents with different backgrounds move in.	There have been minimal changes in land use and development in the town of Brighton since the previous plan update.	Increased
Extreme Cold	Extreme cold can lead to health risks, such as frostbite and hypothermia, especially among vulnerable populations. Transportation may be disrupted due to icy conditions, affecting commutes and emergency services. Infrastructure is at risk, with water pipes potentially freezing and bursting, resulting in costly repairs. In addition, energy demands surge as residents rely on heating, straining the	By increasing the intensity of winter storms. Warmer atmospheric temperatures allow for more moisture, resulting in heavier snowfall and potentially lower temperatures during these events. In addition, fluctuations in weather patterns may disrupt seasonal cycles, leading to unpredictable periods of extreme cold mixed with warmer spells.	By driving some residents to relocate to warmer areas. Harsh winters can hinder economic activities and deter new residents and businesses, influencing housing demand and the attractiveness of certain neighborhoods. This may disproportionately affect lower-income families, leading to changes in demographics and socioeconomic	There have been minimal changes in land use and development in the town of Brighton since the previous plan update.	Increased

DRAFT

Type of Hazard Event	Description of Potential Impacts	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	electrical grid and increasing utility costs. Cold temperatures can also impact local agriculture and wildlife.		stratification in the community.		
Flooding	Damaging infrastructure, such as roads and utilities, disrupts transportation and essential services. Homes and businesses may experience costly water damage, causing potential displacement. Environmental effects include erosion and contamination of local waterways, impacting wildlife and recreation. Economically, flooding can result in lost income for businesses, increased insurance costs, and declining property values. Public health also may be compromised due to waterborne diseases and stress-related issues.	Higher temperatures increase the frequency and intensity of extreme weather events and alter precipitation patterns. They lead to more intense rainstorms and accelerated snowmelt from nearby mountains, raising water levels in rivers and streams. This combination raises the risk of flooding, especially in areas with inadequate drainage and urban development in flood-prone zones, heightening the potential for damage to homes and infrastructure.	Flooding can significantly alter population patterns by displacing residents from affected areas, leading them to seek shelter elsewhere. This may result in a population decline where flooding occurs, as individuals might hesitate to return due to ongoing risks or property damage. As neighborhoods become less desirable, people may migrate to safer areas, changing demographic trends and putting pressure on housing in those regions. Over time, these shifts can influence urban planning and development, as local governments address both flooding risks and changing population needs.	There have been minimal changes in land use and development in the town of Brighton since the previous plan update.	Decreased

DRAFT

Type of Hazard Event	Description of Potential Impacts	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
Landslide/ Slope Failure	The town's steep terrain is vulnerable, especially during heavy rainfall or rapid snowmelt. Properties on slopes may suffer damage, resulting in displacement and economic losses. Transportation networks can be disrupted, complicating emergency responses. In addition, landslides can harm local ecosystems by displacing vegetation.	Climate change increases the risk of landslides through heavier rainfall and temperature fluctuations. Intense rain saturates soil, destabilizing slopes, while freeze–thaw cycles weaken the ground. Changes in vegetation can also reduce stability, leading to a higher potential for landslides.	Landslides and slope failures can impact population patterns by making some areas unsafe, leading to displacement and lower property values. This prompts residents to move to safer regions, thereby increasing density in more stable areas. Concerns about future landslides may also deter newcomers from high-risk zones, shaping long-term demographic trends.	There have been minimal changes in land use and development in the town of Brighton since the previous plan update.	Increased
Radon	Radon poses significant health risks, particularly lung cancer, as it can enter homes through foundation cracks. Many residents may not test for radon, making them unaware of dangerous levels. Increased awareness and public health initiatives are vital for protection, especially with regard to population growth. Incorporating radon-resistant construction in new developments also is essential for safety.	Climate change can affect radon levels by altering soil temperatures and moisture conditions. Higher temperatures may increase radon emissions from the ground, while heavy rainfall can change groundwater and soil saturation, impacting radon migration into buildings.	Radon exposure can influence population patterns as increased health awareness may drive families to move away from areas with high radon levels. This shift could particularly affect vulnerable groups, changing demographics and demand in the housing market. Homes with lower radon levels may become more sought after, and public health campaigns can encourage community action, making	There have been minimal changes in land use and development in the town of Brighton since the previous plan update.	Decreased

DRAFT

Type of Hazard Event	Description of Potential Impacts	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
			previously undesirable areas more attractive once mitigation measures are implemented.		
Heavy Rain	Heavy rain can cause flash floods, particularly in low-lying areas, disrupting traffic and emergency services. It may also lead to soil erosion, infrastructure damage, and increased landslide risk in hilly regions. In addition, heavy rainfall can overwhelm waterways, resulting in water quality issues from runoff and impacting public safety, local businesses, and agriculture.	Climate change increases the frequency and intensity of heavy rain, as higher temperatures allow the atmosphere to hold more moisture. This leads to stronger storms, flash flooding, and overwhelmed drainage systems.	Heavy rain can shift population patterns by pushing residents out of flood-prone areas and attracting them to safer neighborhoods. Frequent flooding may lead to evacuations and economic disruptions, prompting relocations. Over time, ongoing heavy rains can affect housing demand and community stability, altering the town's population distribution.	There have been minimal changes in land use and development in the town of Brighton since the previous plan update.	Increased
High Wind	High winds can cause property damage to roofs and windows, topple trees and power lines, and lead to power outages. They pose hazards for pedestrians and drivers and can worsen air quality by stirring up dust and pollutants, affecting residents' health.	Climate change affects high winds by altering atmospheric patterns and increasing extreme weather events. Rising temperatures may lead to more substantial, unpredictable winds and more frequent thunderstorms, posing risks to infrastructure and air quality.	High winds can alter population patterns by making certain areas less desirable. Frequent damage may drive residents to safer neighborhoods, deter newcomers, and slow growth in affected regions.	There have been minimal changes in land use and development in the town of Brighton since the previous plan update.	Increased
Lightning	Lightning can have several impacts, primarily posing	Climate change increases temperatures	Lightning can influence population patterns by	There have been minimal changes in land	Increased

DRAFT

Type of Hazard Event	Description of Potential Impacts	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	risks to public safety with the potential for injuries or fatalities. It can spark wildfires in nearby areas, threatening property and the environment. In addition, lightning strikes can damage infrastructure, leading to electrical surges that can cause power outages and service disruptions. This phenomenon also affects outdoor activities and tourism, while the economic burden includes increased insurance claims and repair costs.	and alters precipitation, leading to more intense thunderstorms and frequent lightning strikes. Urbanization can enhance this effect, posing risks to public safety and infrastructure.	causing property damage and wildfires, leading some residents to relocate. Areas with higher lightning activity may deter new residents, while safer locations could increase migration as people seek protection from severe weather.	use and development in the town of Brighton since the previous plan update.	
Severe Winter Weather	Heavy snow or blizzards can disrupt transportation, hinder emergency services, and cause infrastructure damage, such as roof collapses. These conditions can lead to increased municipal costs for snow removal and have a substantial economic impact on businesses, particularly in retail and tourism. Power outages also may occur, affecting heating during cold months.	Climate change impacts heavy snow and blizzards by altering precipitation patterns. Higher temperatures can lead to more rain than snow, affecting snowpack levels—additionally, increased storm intensity results in heavier, more unpredictable snowfall.	Increased population equals an increased number of people needing to get to work and quicker snow removal. Heavy snow or blizzards can impact population patterns by influencing where people live and work. Transportation disruptions may lead residents to seek housing closer to jobs, increasing density in some areas while depopulating others.	There have been minimal changes in land use and development in the town of Brighton since the previous plan update.	Increased

DRAFT

Type of Hazard Event	Description of Potential Impacts	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
			Families might also avoid regions with frequent heavy snowfall, shifting demand to milder areas. Over time, these trends can alter community demographics and economic activity, prompting adjustments in town planning and resource allocation.		
Tornado	Tornadoes can cause serious damage to property and infrastructure, leading to injuries and economic challenges. Urban areas are especially vulnerable, complicating emergency responses and disrupting essential services. The psychological impact can affect community well-being, potentially leading to changes in demographics and land use as residents seek safer locations.	Climate change may increase the frequency and intensity of tornadoes. Higher temperatures lead to more moisture in the air, creating conditions for severe thunderstorms. Changes in wind patterns and precipitation can also heighten tornado risks, resulting in more destructive storms and greater threats to infrastructure and communities.	Tornadoes can influence population patterns by prompting residents to move to safer areas after damage occurs. This can decrease density in affected neighborhoods while increasing demand for housing in safer regions. New residents may also move in for recovery opportunities, altering demographics. Over time, repeated tornado threats might push long-term residents to areas with better disaster preparedness, reshaping the town's population distribution.	There have been minimal changes in land use and development in the town of Brighton since the previous plan update.	Increased
Wildfire	Wildfires pose serious risks, including habitat damage, degraded air quality, and	By raising temperatures and creating drier conditions, prolonged	Displaced individuals often seek safer areas, shifting demographics,	There have been minimal changes in land use and development in	Increased

	health issues for vulnerable populations. They can also lead to economic losses, property damage, and increased erosion that affects water quality.	droughts lead to more dry vegetation, which serves as fuel for fires. Erratic seasons extend the growing period, while more lightning strikes can ignite wildfires. These factors heighten the threat to ecosystems and community safety.	while declining property values might deter newcomers. Conversely, some may be drawn to rebuilding efforts, impacting long-term growth and community dynamics.	the town of Brighton since the previous plan update..	
Dam Failure	Dam failure could lead to severe flooding, damaging homes and infrastructure, isolating communities, and hindering emergency responses. This may result in loss of life, especially among vulnerable groups, and trigger economic losses for local businesses and property values. Long-term effects could affect community stability and public health, while floodwaters may contaminate local waterways and disrupt ecosystems.	Climate change raises the risk of dam failure by causing heavier rainfall and rapid snowmelt. These changes can overwhelm dams and compromise their integrity, highlighting the need for urgent safety assessments and upgrades to protect communities downstream.	Dam failure tornadoes can impact population patterns by displacing residents and altering demographics. Evacuations can lead to an influx in safer areas, while the destruction may deter new residents and contribute to population decline. Fear of future disasters may prompt remaining individuals to relocate, changing the community's composition and affecting population density and economic activity.	There have been minimal changes in land use and development in the town of Brighton since the previous plan update.	Increased
Civil Disturbance	Civil disturbances can result in economic losses for businesses, create social divisions, and increase tensions among community	Climate change can increase civil disturbances by intensifying environmental stresses	By encouraging residents to move for safety, leading to outflows and new arrivals. These events	There have been minimal changes in land use and development in the town of Brighton	Increased

	groups. They may overwhelm law enforcement, leading to fear and mistrust among residents. Essential services could be disrupted, affecting quality of life, while long-term impacts may include changes in community dynamics and public policy.	and social tensions. Rising temperatures may lead to droughts, wildfires, and poor air quality, particularly affecting vulnerable communities. Resource scarcity, especially water, can spark conflicts and protests. In addition, an influx of migrants from harder-hit areas may strain local resources, further escalating tensions. This cycle of unrest is driven by the impact of climate change on both the environment and community dynamics.	can reveal social issues, impacting community dynamics, employment, and property values, ultimately reshaping demographics, and social cohesion.	since the previous plan update.	
Cyberattack	Cyber-attacks can disrupt critical infrastructure like power and water services, complicating emergency responses. Businesses may face financial losses from downtime and data breaches, eroding consumer trust. The public sector's essential services, including law enforcement and public health, could be compromised, leading to fear and reduced community confidence.	Possible attack on the industry, which is seen as producing large amounts of greenhouse gases and burning fossil fuels. Climate change can heighten cyberattack risk by increasing vulnerabilities during extreme weather. Disruptions like power outages offer cybercriminals opportunities, but	Cyber-attacks can change population patterns by eroding trust in essential services. Compromised systems may cause residents to leave due to safety concerns, while high-profile incidents can deter businesses, leading to job losses. This perception of vulnerability may also make the town less appealing to newcomers, resulting in demographic	There have been minimal changes in land use and development in the town of Brighton since the previous plan update.	Increased

DRAFT

Type of Hazard Event	Description of Potential Impacts	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
		focusing on emergency responses can weaken cybersecurity measures. As organizations adopt new technologies to cope with climate impacts, they may unintentionally introduce additional vulnerabilities.	shifts and affecting local development.		
Hazardous Materials Incident (Transporta-tion & Fixed Facility)	Hazardous materials incidents can severely impact public health, the environment, and the economy. Health risks include serious illnesses from exposure, while environmental damage may lead to soil and water contamination. Economically, incidents can cause property damage, lower property values, and disrupt businesses. The community also faces stress from evacuations and anxiety about safety.	Climate change elevates the risk of hazardous materials incidents by increasing extreme weather events like heavy rain and wildfires. These events can breach storage tanks and heighten material volatility. Vulnerable infrastructure can lead to more spills or accidents, while climate shifts may also introduce new challenges for managing hazardous substances and public health.	By causing evacuations and temporary declines in density. In the long run, unsafe areas may deter new residents, affecting growth and diversity. In addition, negative perceptions can lower property values and economic prospects, leading families to relocate, which impacts local demographics.	There have been minimal changes in land use and development in the town of Brighton since the previous plan update..	Increased
Public Health Epidemic/ Pandemic	Epidemics and pandemics can disrupt healthcare by overwhelming facilities and leading to resource shortages, diminishing care for all patients. Economic impacts may include business closures and job losses, particularly in	By increasing the spread of vector-borne diseases and raising the risk of waterborne illnesses due to flooding or drought. Worsening air quality can also exacerbate respiratory conditions	By prompting migration for safety and better healthcare. Vulnerable groups may move to areas with improved services, while economic instability can drive people to seek new employment	There have been minimal changes in land use and development in the town of Brighton since the previous plan update.	Increased

DRAFT

Type of Hazard Event	Description of Potential Impacts	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	hospitality and retail. The strain on public health services can affect routine care, while mental health issues may arise due to isolation and uncertainty. Shifts to remote learning can hinder student development, and vulnerable populations face heightened risks. The erosion of public trust in health authorities might reduce compliance with guidelines.	like asthma, especially in vulnerable populations.	opportunities. In addition, restrictions like quarantine measures can limit movement and social interactions, reshaping the community's demographics and impacting local economies.		
Terrorism	Terrorism incidents can have significant impacts, including loss of life and emotional trauma for the community. Economically, they disrupt local businesses and tourism while creating fear and anxiety that affect social cohesion. Emergency services might be overwhelmed, requiring additional support, and increased security measures can alter daily life and raise concerns about civil liberties. Damage to critical infrastructure necessitates long-term repairs, and such incidents may deepen social divisions	Terroristic activity is sometimes centered around climate change. Climate change impacts terrorism incidents by creating conditions of resource scarcity and social unrest. Increased competition for essential resources like water can fuel tensions, making communities more vulnerable to extremist ideologies. Extreme weather events may disrupt social order and infrastructure, offering terrorist groups opportunities to exploit crises. In addition,	Terrorism incidents can alter population patterns by instilling fear and prompting residents to relocate to perceived safer areas, resulting in demographic shifts and potential declines in property values. Some neighborhoods may see an outflow of residents, while others could experience an influx of people seeking refuge from violence. In addition, increased security measures may deter businesses and residents from certain locations, leading to long-term changes in	There have been minimal changes in land use and development in the town of Brighton since the previous plan update. .	Increased

DRAFT

Type of Hazard Event	Description of Potential Impacts	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	and prompt changes in security policies, highlighting the need for effective preparedness and response strategies.	climate-driven population displacement can heighten tensions in receiving areas, raising the risk of domestic terrorism. Law enforcement's focus on climate-related challenges can also limit its capacity to address terrorism threats. Ultimately, while climate change may not directly cause terrorism, its effects can create an environment conducive to extremist activities.	population density and urban development patterns.		

DRAFT

Additional Public Involvement

The town of Brighton provided several opportunities for public participation. Figure 2 displays examples of public outreach.

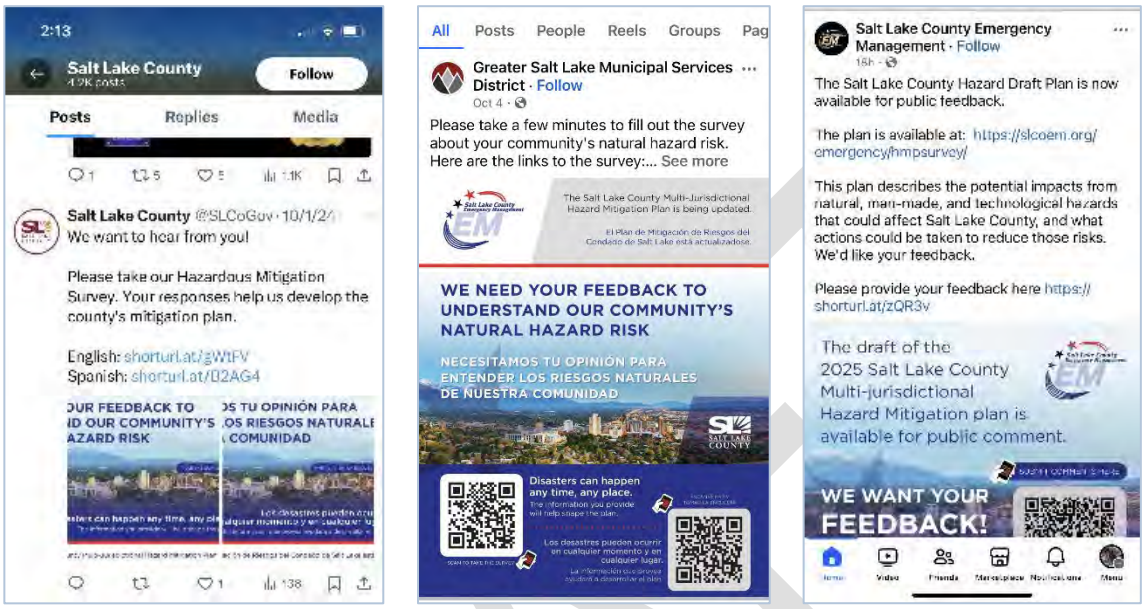

Figure 2: Social Media Posts for the Hazard Mitigation Survey (SLCo – *left*; MSD – *middle*), and the Draft Plan Review (SLCo EM – *right*)

Plan Integration

Incorporating the underlying principles of the Hazard Mitigation Plan and its recommendations into other plans is a highly effective and low-cost way to expand their influence. All plan participants will use existing methods and programs to implement hazard mitigation actions where possible. As previously stated, mitigation is most successful when it is incorporated into the day-to-day functions and priorities of government and public service. This plan builds on the momentum developed through previous and related planning efforts and mitigation programs, and it recommends implementing actions where possible through these other program mechanisms. These existing mechanisms include the following:

- Regularity Capabilities
- Administrative Capabilities
- Fiscal Capabilities

Respective planning stakeholders will conduct implementation and incorporation into existing planning mechanisms and will be done through the routine actions of:

- Monitoring other planning/program agendas
- Attending other planning/program meetings

DRAFT

- Participating in other planning processes; and
- Monitoring community budget meetings for other community program opportunities.

The successful implementation of this plan will require constant and vigilant review of existing plans and programs for coordination and multi-objective opportunities that promote a safe, sustainable community. Regular efforts should be made to monitor the progress of mitigation actions implemented through other planning mechanisms. Where appropriate, priority actions should be incorporated into planning updates. Table 10 lists existing planning mechanisms in which the Hazard Mitigation Plan has been integrated. Table 11 lists the opportunities for integrating elements of this plan into other plans

Table 10: Integration of Previous Plans by the Town of Brighton

Plan	Description
Community Wildfire Protection Plan	Includes goals to protect lives, structures, and watershed, and reduce wildfire intensity and duration and identifies mitigation actions.
Town of Brighton General Plan	Long-range planning guide for the town to address future growth and development. Addresses mitigation for wildfire, protection of waterways, avalanche, climate change and invasive species, transportation, and funding strategies for mitigation. Could be expanded to incorporate other hazards.

Table 11: Opportunities for Integration with Future Plans of the Town of Brighton

Plan	Description
Comprehensive Emergency Management Plan	Framework to prepare for, mitigate, respond to, and recover from the impact of hazards.
Salt Lake City Public Utilities Comprehensive Watershed Management Plan	Guiding document to protect canyon sources of drinking water from pollution.
Continuity Plan for Town of Brighton	Ensures the town is capable of conducting its daily operations under all threats and conditions.
Town of Brighton General Plan	Long-range planning guide for the town to address future growth and development. Addresses mitigation for wildfire, protection of waterways, avalanche, climate change, and invasive species but could incorporate other hazards.
Utah Wildlife Action Plan	Plan for managing native wildlife species and habitat.

Capability Assessment

Local mitigation capabilities are existing authorities, policies, programs, and resources that reduce hazard impacts or could help carry out hazard mitigation activities.

Planning and Regulatory Capabilities

Planning and regulatory capabilities are the plans, policies, codes, and ordinances that prevent and reduce the impacts of hazards.

DRAFT

Financial Capabilities

Financial capabilities are the resources to fund mitigation actions. Talking about funding and financial capabilities is important to determine what kinds of projects are feasible, given their cost. Mitigation actions like outreach programs are lower cost and often use staff time and existing budgets. Other actions, such as earthquake retrofits, could require substantial funding from local, state, and federal partners. Partnerships, including those willing to donate land, supplies, in-kind matches, and cash, can be included.

[7] MSD = Municipal Services District.

Table 16: Assessment of the Financial Capabilities of the Town of Brighton

Funding Resource	In Place? (Y/N)	Has it been used in the past and for what types of activities?	Could it be used to fund future mitigation actions?	Can it be used as the local cost match for a federal grant?

Opportunities to Expand and/or Improve Capabilities

Actions that can expand and improve existing authorities, plans, policies, and resources for mitigation include budgeting for mitigation actions, passing policies and procedures for mitigation actions, adopting and implementing stricter mitigation regulations, approving mitigation updates, and making additions to existing plans as new needs are recognized. Table 18 lists the opportunities for the town of Brighton.

Table 18: Opportunities to Expand or Improve the Capabilities of the Town of Brighton

Capability	Opportunity to Expand and/or Improve
Planning and Regulations	Improvement of local knowledge and capabilities will occur with encourage of ongoing exploration and review of unknowns in the context of planning and regulations. A culture of continuous learning and capacity building among local officials, planners, and community members will occur.
Administrative and Technical	To address the unknowns in the administrative and technical capabilities table, several opportunities for improvement and expansion can be considered. For the Chief Building Official, it is essential to conduct a thorough staffing assessment to determine if the current levels are adequate. In addition, providing specialized training on hazards and mitigation strategies and enhancing coordination through regular interagency meetings would be beneficial. For the Civil Engineer, evaluating the current workload and staffing needs is crucial. Offering targeted training programs focused on hazard identification and mitigation techniques and enhancing coordination through collaborative projects could improve capabilities. The Community Planner's effectiveness can be boosted by assessing staffing adequacy, implementing continuous professional development programs on hazard and mitigation planning, and fostering better interagency coordination through joint task forces or working groups. For the Emergency Manager, reviewing staffing levels, ensuring that staff are trained in the latest hazard mitigation practices, and creating a centralized communication system to streamline coordination are key steps. The Floodplain Administrator's capabilities can be enhanced by performing a staffing review, introducing training modules covering flood hazards and mitigation measures, and organizing inter-departmental workshops to improve coordination. Hiring or training staff to manage GIS functions effectively, facilitating training sessions on GIS tools, and establishing clear protocols and regular meetings for improved coordination can strengthen the capabilities of the GIS Coordinator role.
Financial	To address the unknowns in financial capabilities, several opportunities for improvement and expansion can be considered. It is essential to conduct a comprehensive assessment to identify existing funding resources and their past use. This assessment will provide a clear understanding of which resources have been used for specific activities and can fund future mitigation actions.
Education and Outreach	To address the unknowns in education and outreach capabilities, there are several opportunities for improvement and expansion. First, it is essential to conduct an in-depth assessment of current insurance disclosures and outreach practices to understand the integration of hazard mitigation information. Collaborating with insurance companies, including mitigation-related content in their communications to policyholders, can increase awareness and preparedness. Next, identifying and engaging with organizations that represent, advocate for, or interact with underserved and vulnerable communities is crucial. Partnering with these organizations can help tailor hazard mitigation messages to the specific needs of these communities, ensuring that critical information reaches those most at risk. This collaboration can lead to the development of targeted outreach

DRAFT

Capability	Opportunity to Expand and/or Improve
	programs and initiatives that effectively address the unique challenges faced by these communities. For social media, a comprehensive strategy should be developed to leverage platforms such as Facebook. This strategy should include regularly updating content, engaging with the community through interactive posts, and using social media analytics to measure the effectiveness of outreach efforts. Expanding the use of social media to other platforms can also increase the reach and impact of hazard mitigation messages.

Mitigation Strategy

Mitigation strategies provide proactive measures that are designed to minimize the impacts of hazards on the town of Brighton. The Town of Brighton did not participate as a separate jurisdiction in the previous plan; therefore, no previous mitigation actions were available. Table 19 shows mitigation action alternatives, and Table 21 is the 2025 mitigation action plan for the town of Brighton.

Table 19: Mitigation Action Alternatives for the Town of Brighton

Action	Type of Action	Selected for inclusion in the plan?	If not selected, why not?
Public education	Education and Awareness Programs	Public education	
Severe weather that shuts down roads/ access for residents	Natural Systems Protection	Severe weather that shuts down roads/ access for residents	
Brighton Bridge Improvements	Structure and Infrastructure Projects.	Brighton Bridge Improvements	

Table 20: Status of Prior Mitigation Actions of the Town of Brighton[9]

Action	Hazard(s)	Agency Lead	Support Agency(ies)	Status Update (if ongoing, explain)
Remove debris from the 14 miles of Big Cottonwood Creek to enhance the natural flow.	Flood (Riverine), Flooding (Urban/Flash Flooding), Severe Thunderstorm, Severe Winter Storm	Brighton	Neighboring jurisdictions, Salt Lake County	Ongoing. 2022 cleanup removed debris.
Install three (3) horn notification/ warning systems.	All hazards	Brighton	N/A	Implemented new notification system in 2021 using IPAWS. Action not carried forward to 2025

[9] IPAWS = Integrated Public Alert and Warning System, Unified Fire Authority.

Action	Hazard(s)	Agency Lead	Support Agency(ies)	Status Update (if ongoing, explain)
Bury powerline to decrease power outage potential and to mitigate the potential for wildfires.	All hazards	Brighton	Utilities	Ongoing. 35 miles of lines that will be placed underground.
Continue to participate in Firewise, including strict fire codes and programs within the fire department.	Wildfire	Brighton	UFA	Ongoing
Trim trees to reduce potential to spark fires and decrease power outage potential.	All hazards, especially Wildfire	Brighton	UFA	Ongoing. UFA has regular chipper days and completes home assessments with homeowners.

DRAFT

Table 21: 2025 Mitigation Action Plan for the Town of Brighton[10]

#	Action	Hazard(s)	Lead Agency	Potential Partners	Benefits (Losses Avoided)	Cost Estimate	Funding Source(s)	Timeframe	Priority	Comments
1	Enhance security at critical infrastructure locations to prevent potential for terrorist acts.	Terrorism	Town of Brighton	SLCo EM, UPD, UFA, MSD, SLCo IT, SLCo PW, SLCo Clerk's Office, Sheriff's Office	Increased security protocols (both in technology and policy) for staff/first responders, clear expectations/ understanding for local jurisdictions and the public	Low	Brighton General Fund, UPD, Sheriff's Office, UFA, MSD	Short term	Medium	
2	Develop and implement public education programs on disaster awareness and mitigation.	Avalanche, Civil Disturbance, Dam Failure, Drought, Earthquake, Extreme Heat, Extreme Cold, Flooding, Hazardous Materials Incident, Heavy Rain, High Wind, Landslide, Lightning, Public Health Epidemic, Radon, Severe Winter Weather, Terrorism, Tornado, Wildfire	Town of Brighton, MSD	SLCo EM, UFA, UPD, Sheriff's Office, SLCo PW	Improved understanding of local resources, improve relationships with the public and stakeholders. Outlined plans/SOPs for programs. Share information digitally and in-person on topics such as how to complete non-structural retrofits on homes to reduce the risk of earthquakes and home weatherization for extreme cold/severe winter weather events.	Low	Brighton General Fund, SLCo EM Budget	Short term	Medium	
3	Integrate WebEOC, Crisis Track, GIS, and other technological enhancements throughout the county.	Avalanche, Civil Disturbance, Dam Failure, Drought, Earthquake, Extreme Heat, Flooding, Hazardous Materials Incident, Heavy Rain, High Wind, Landslide, Lightning, Public Health Epidemic, Radon, Severe Winter Weather, Terrorism, Tornado, Wildfire	Town of Brighton, MSD	SLCo EM, UFA, UPD, SLCo PW, SLCo Health Department	Common operating platform for stakeholders, increased situational awareness, improved response time.	Medium	Brighton General Fund, SLCo EM Budget, UFA Budget	Medium Term	Medium	Existing software that we just need to inform documentation/ training on.
4	Enhance and continue to promote the implementation of CERT and SAFE Hubs.	Avalanche, Civil Disturbance, Dam Failure, Drought, Earthquake, Extreme Heat, Extreme Cold, Flooding, Hazardous Materials Incident, Heavy Rain, High Wind, Landslide, Lightning, Public Health Epidemic, Radon, Severe Winter Weather, Terrorism, Tornado, Wildfire	Town of Brighton, MSD	SLCo EM	Improved awareness of local resources	Medium	Brighton General Fund, SLCo EM Budget, UFA Budget,	Short term	Medium	SAFE Hubs (previously S.A.F.E. Neighborhoods) is currently going through a rebrand with new public awareness campaign and information for all partners.
5	Establish an access and functional needs registry and improve incorporation of those with access and functional needs in plans.	Avalanche, Civil Disturbance, Dam Failure, Drought, Earthquake, Extreme Heat, Extreme Cold, Flooding, Hazardous Materials Incident, Heavy Rain, High Wind, Landslide, Lightning, Public Health Epidemic, Radon, Severe Winter Weather, Terrorism, Tornado, Wildfire	Town of Brighton, MSD	SLCo EM, MSD, UFA, UPD, Sheriff's Office	Improved situational awareness for the public and stakeholders, greater understanding of resources available for those with access and functional needs.	Low	Brighton General Fund, SLCo EM Budget, UFA Budget, MSD, State of Utah	Short term	High	The State of Utah's Access and Functional Needs Registry is dissolving in 2025. The county needs a way to account for those with access and functional needs, including incorporation into plans/SOPs.

[10] ATF = Bureau of Alcohol, Tobacco, Firearms and Explosives, CWPP = Community Wildfire Protection Plan, DHS = Department of Homeland Security, FBI = Federal Bureau of Investigation, FMA = Flood Mitigation Assistance, GIS = Geographic Information System, HHPD = High Hazard Potential Dams, LEPC = Local Emergency Planning Committee, MSD = Municipal Services District, NWS = National Weather Service, SIAC = Statewide Information and Analysis Center, SLCo EM = Salt Lake County Emergency Management, SLCo IT = Salt Lake County Information Technology, SLCo PW = Salt Lake County Public Works, SOP = Standard Operating Procedure, UDOT = Utah Department of Transportation, UFA = Unified Fire Authority, UPD = Unified Police Department.

DRAFT

#	Action	Hazard(s)	Lead Agency	Potential Partners	Benefits (Losses Avoided)	Cost Estimate	Funding Source(s)	Timeframe	Priority	Comments
6	Snow sheds – Construct snow sheds for avalanche mitigation in Big Cottonwood Canyon.	Avalanche	UDOT, Town of Brighton	SLCo EM, MSD, UFA, UPD	Diminish road closure time, preserve life and safety from avalanches (personal injuries, car/infrastructure damage, safety of first responders and UDOT staff)	High – $72–$90 million	UDOT Operational Budget, Brighton Capital Improvement Fund	Long term	Medium	
7	Bring deficient high hazard dams up to current industry standards.	Dam Failure	Dam owners/ water companies	Town of Brighton, SLCo EM, MSD	Life and safety (personal injuries, safety of first responders), damage to critical infrastructure	High	SLCo PW, Dam owners, Salt Lake City Public Utilities, Brighton Capital Improvement Fund, State of Utah DWR, HHPD	Long term	High	
8	Procure generators and transfer switches for public facilities and critical facilities.	Extreme Heat, Extreme Cold	Town of Brighton, MSD	SLCo EM, SLCo Parks and Recreation, school districts.	Provide backup generators for cooling centers and code blue centers. Accurate inventory of what the county has to provide to other agencies or jurisdictions as needed.	Medium	Brighton General Fund, SLCo General Fund, MSD General Fund	Long term	Medium	
9	Increase the size of culverts and bridges.	Flooding	SLCo PW, MSD	SLCo EM	Allow for larger runoff during the spring melt season, reduce the amount of debris buildup.	Medium	SLCo PW Capital Projects Fund, UDOT operational budget, MSD		Medium	
10	Coordinate with SLCo EM to understand and procure FMA grants.	Flooding	SLCo EM	Town of Brighton, SLCo PW, MSD	Improved understanding of grants available and how money can be used for mitigation efforts.	Low	SLCo EM General Fund, Brighton General Fund, MSD General Fund, State of Utah	Medium term	Medium	
11	Develop an enhanced emergency notification communication system for the county.	Avalanche, Civil Disturbance, Dam Failure, Drought, Earthquake, Extreme Heat, Flooding, Hazardous Materials Incident, Heavy Rain, High Wind, Landslide, Lightning, Public Health Epidemic, Radon, Severe Winter Weather, Terrorism, Tornado, Wildfire	SLCo EM	Town of Brighton, MSD, UFA, UPD, local jurisdictions, UDOT	Early notification of impending wildfire to decrease loss of life. Improved relationships with the public and stakeholders. Faster delivery of information with templates/plans ready to go.	High – $1 million	SLCo General Fund, MSD General Fund, Brighton General Fund, grant program	Short term	Medium	
12	Promote the Firewise Initiative and regularly review/ update the Community Wildfire Protection Plans (CWPP) for at-risk communities.	Wildfire	UFA	SLCo EM, MSD, Town of Brighton	Increased awareness of plans (for the public and stakeholders), improved eligibility for grants/other funding sources, and regular review of CWPP.	Low	SLCo General Fund, MSD General Fund, Brighton General Fund	Short term	Medium	

DRAFT

#	Action	Hazard(s)	Lead Agency	Potential Partners	Benefits (Losses Avoided)	Cost Estimate	Funding Source(s)	Timeframe	Priority	Comments
13	Conduct public awareness campaign on Tier 2 reporting software for chemical reporting.	Hazardous Materials Incident	UFA	SLCo EM, UPD, Town of Brighton, Sheriff's Office, Rio Tinto	Improved understanding of Tier 2 reporting and how local agencies/jurisdictions can find and submit information. A common operating platform for hazardous materials reporting.	Low	SLCo General Fund, MSD General Fund, Brighton General Fund, State of Utah	Long term	Medium	
14	Enact countywide regulations and codes for development to reduce landslide and slope failure damage to critical infrastructure and buildings.	Landslide and Slope Failure	SLCo Office of Regional Development	SLCo EM, UFA, MSD, Town of Brighton	Reduce the likelihood of landslides and critical infrastructure/building damage. Ensure that future development is up to code and follows policy to avoid repetitive loss properties.	Low	SLCo General Fund, MSD General Fund, Brighton General Fund, State of Utah	Long term	Medium	
15	Leverage WebEOC and GIS to track the spread of contagious disease.	Public Health Epidemic/Pandemic	SLCo Health Department	SLCo EM, UFA, MSD, UPD, Sheriff's Office, Town of Brighton	Use GIS and WebEOC software to maintain situational awareness and track illnesses throughout the county.	Low	SLCo EM General Fund, MSD General Fund, Brighton General Fund, SLCo Health Department (SLCo General Fund), State of Utah	Short term	Medium	This is software that county/ local jurisdictions already have, so they just need to do a better job of training/documentation.
16	Create public awareness campaigns and public education programs on radon risks and provide home testing for radon.	Radon	SLCo EM, Town of Brighton	MSD, Aging and Adult Services, SLCo Health Department, local jurisdictions	Decrease radon-caused cancer deaths. Increase engagement/ understanding with the public about what SLCo can do or help with.	Low	SLCo EM General Fund, MSD General Fund, Brighton General Fund, State of Utah	Short term	Low	
17	Develop a road resurfacing project, including permeable pavement for areas with rain-based flooding.	Heavy Rain	SLCo PW and Municipal Services	SLCo Parks and Recreation Department, MSD, local jurisdictions	Reduce pollutants discharged in runoff, reduce maintenance time/costs on roads, improve traction on roads.	Medium	SLCo PW Capital Projects Fund, UDOT Operational Fund, grant program	Long term	Low	
18	Create a public education program for property owners to learn about tree maintenance and high-strength windows.	High Wind	SLCo EM	Aging and Adult Services, SLCo PW and Municipal Services, UFA, Town of Brighton, MSD	Reduce damage during high wind events to critical infrastructure. Prevent personal injuries (people driving on roads or walking in neighborhoods). Improve relationships with stakeholders and the public.	Low	SLCo PW, SLCo General Fund, MSD General Fund, Brighton General Fund, UFA General Fund	Short term	Low	
19	Develop a severe winter weather mitigation program to maintain access to primary roadways	Severe Winter Weather – Heavy Snow, Blizzard, Extreme Cold	SLCo PW for Municipal Services	SLCo EM, Town of Brighton, MSD, UDOT	Emergency services like police, fire, and paramedics can use roads to provide their services.	Low	MSD, SLCo EM and Town of Brighton General Fund	Short term	High	A severe winter storm with heavy snowfall requires operators and equipment to clear roads and streets for public and emergency vehicle

DRAFT

#	Action	Hazard(s)	Lead Agency	Potential Partners	Benefits (Losses Avoided)	Cost Estimate	Funding Source(s)	Timeframe	Priority	Comments
	and evacuation routes.									access. The primary effort will be to keep the roads open by clearing snow.
20	Conduct a public awareness campaign about lightning safety.	Lightning	SLCo EM, Town of Brighton	SLCo Parks and Recreation, UFA, SLCo PW, MSD	Lightning strike awareness for the public	Low	MSD, SLCo EM and Town of Brighton General Fund	Short term	Low	
21	Improve outreach for "See Something, Say Something" QR code to deter terrorist acts.	Terrorism (including Cyberattack)	SLCo Sheriff's Office	SLCo EM, UPD, UFA, MSD, Town of Brighton, SLCo IT	Ensure that residents and local agencies/jurisdictions are aware of local intelligence resources and ways in which they can report suspicious activity. Encourage QR code use/outreach at special events throughout the county.	Low	MSD, SLCo EM and Town of Brighton General Fund	Short term	Medium	
22	Partner with county to develop a countywide intelligence group/ division to monitor and analyze threats before an incident occurs.	Terrorism (including Cyberattack)	SLCo EM	Town of Brighton, SLCo Sheriff's Office, SIAC, DHS, ATF, FBI		Medium	MSD, SLCo EM and Town of Brighton General Fund	Short term	Medium	This would be a core group of stakeholders that meet on a regular basis to share and collaborate on intelligence data.
23	Code enforcement – Review critical infrastructure facilities to ensure that building materials are up to code and are tornado resistant.	Tornado	SLCo EM	MSD, Town of Brighton, SLCo PW	Ensure that critical infrastructure facilities are operational/ functional in the event of a disaster. Preserve life and safety.	Low	MSD, SLCo EM and Town of Brighton General Fund, UFA General Fund	Short term	Low	
24	Enhance interoperable radio communications systems throughout the county.	Avalanche, Civil Disturbance, Dam Failure, Drought, Earthquake, Extreme Heat, Flooding, Hazardous Materials Incident, Heavy Rain, High Wind, Landslide, Lightning, Public Health Epidemic, Radon, Severe Winter Weather, Terrorism, Tornado, Wildfire	SLCo EM	Town of Brighton, UFA, UPD, Sheriff's Office	Improved communication between different agencies, common operating platform.	Medium	MSD, SLCo EM and Town of Brighton General Fund	Short term	Medium	
25	Develop a countywide single source of information sharing/gathering for intelligence.	Civil Disturbance, Terrorism	SLCo EM	Town of Brighton, SLCo Sheriff's Office, SIAC	Improved coordination between local agencies/jurisdictions.	Medium	MSD, SLCo EM and Town of Brighton General Fund	Short term	Medium	Have one common operating platform to be used by all agencies in Salt Lake County to collect suspicious activity reports. Develop a public awareness campaign to educate the public on how and what to report.
26	Install xeriscaping on government-owned buildings to combat	Drought	SLCo Facilities	Town of Brighton, Water companies/ districts, MSD, State of Utah	Decrease the cost of landscape irrigation, decrease water use	Medium	SLCo Facilities General Fund, State of Utah, local	Short term	Low	

DRAFT

Canyons School District Annex

To participate in this multi-jurisdictional hazard mitigation plan (MJHMP) update for Salt Lake County (SLCo), the governing body of the Canyons School District submitted a commitment letter to participate in the planning process. Upon approval from FEMA, the plan will be adopted by a formal resolution, a copy of which will be maintained at the district offices.

Planning Process Contact Information

Table 1 provides information on the point of contact during the updating of the MJHMP.

Table 1: Contact Information for the Canyons School District

Name	Contact Information
Ryan Jakeman	**Phone**: 801-826-5143 **email:** ryan.jakeman@canyonsdistrict.org

The Canyons School District has a fully integrated approach to hazard mitigation planning and program implementation. During the 2024 update process, the MJHMP participation roles in Table 2 were recorded.

Table 2: Participant List for the Canyons School District

Name	Title	Jurisdiction
Rick Conger	Facility Services Director	Canyons School District
Ryan Jakeman	Facility Coordinator	Canyons School District

Jurisdiction Profile

Location and Description

The Canyons School District is in the southeastern part of Salt Lake County. It serves the municipalities of Alta, Cottonwood Heights, Draper, Midvale, and Sandy (see Figure 1). The district covers 192 square miles and includes 50 schools with approximately 34,000 students. The district offers a range of educational programs, including 29 elementary schools, eight middle schools, five traditional high schools, and eight special programs schools. These special programs include a technical school, a special education school, and a high school for adults in prison. Canyons School District was established in 2007 after residents voted to split from the Jordan School District. It officially started operating on July 1, 2009.

DRAFT

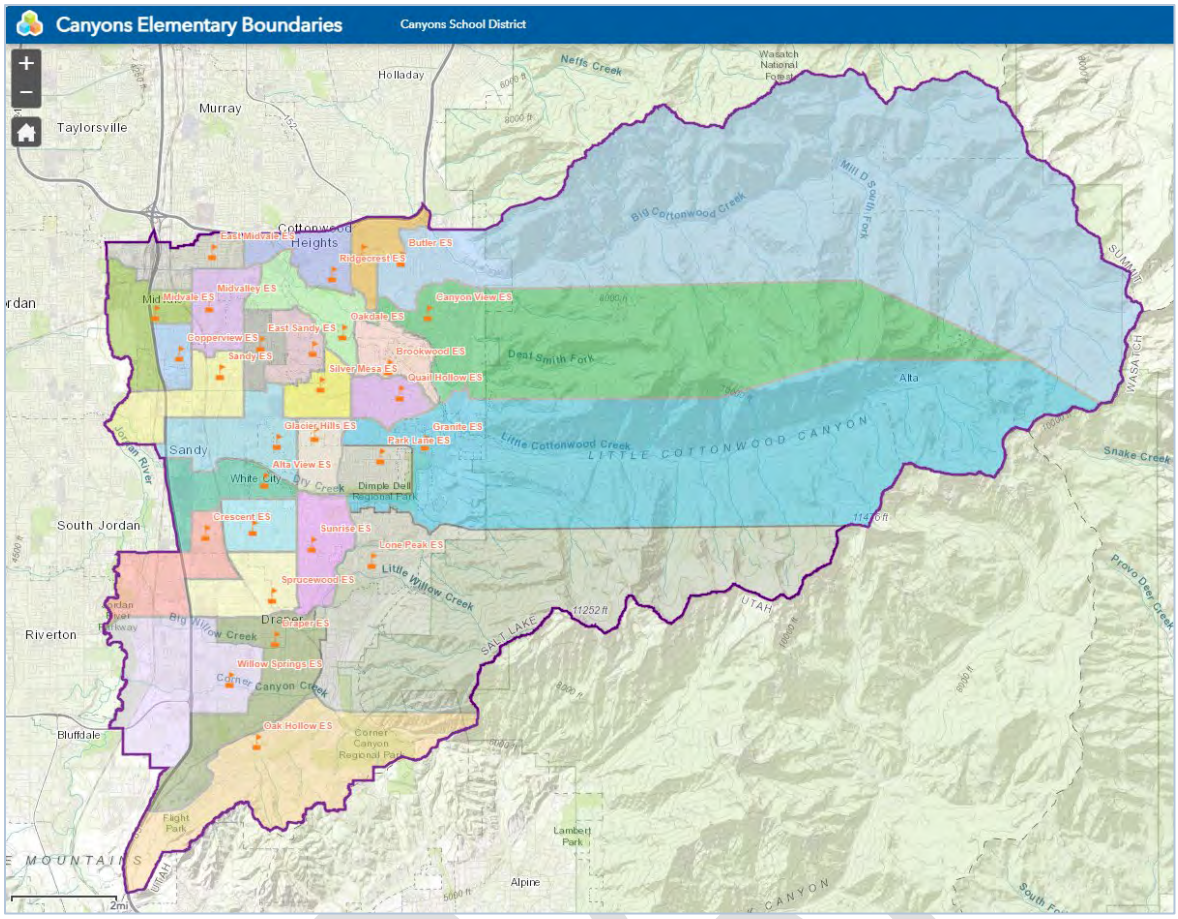

Figure 1: Canyons School District with Elementary School Boundaries[1]

Population

For the 2024–2025 school year, the Canyons School District had 33,386 students enrolled. Figure 2 presents the demographics of the students in the district.

[1] Canyons School District Boundaries. https://www.canyonsdistrict.org/schools/.

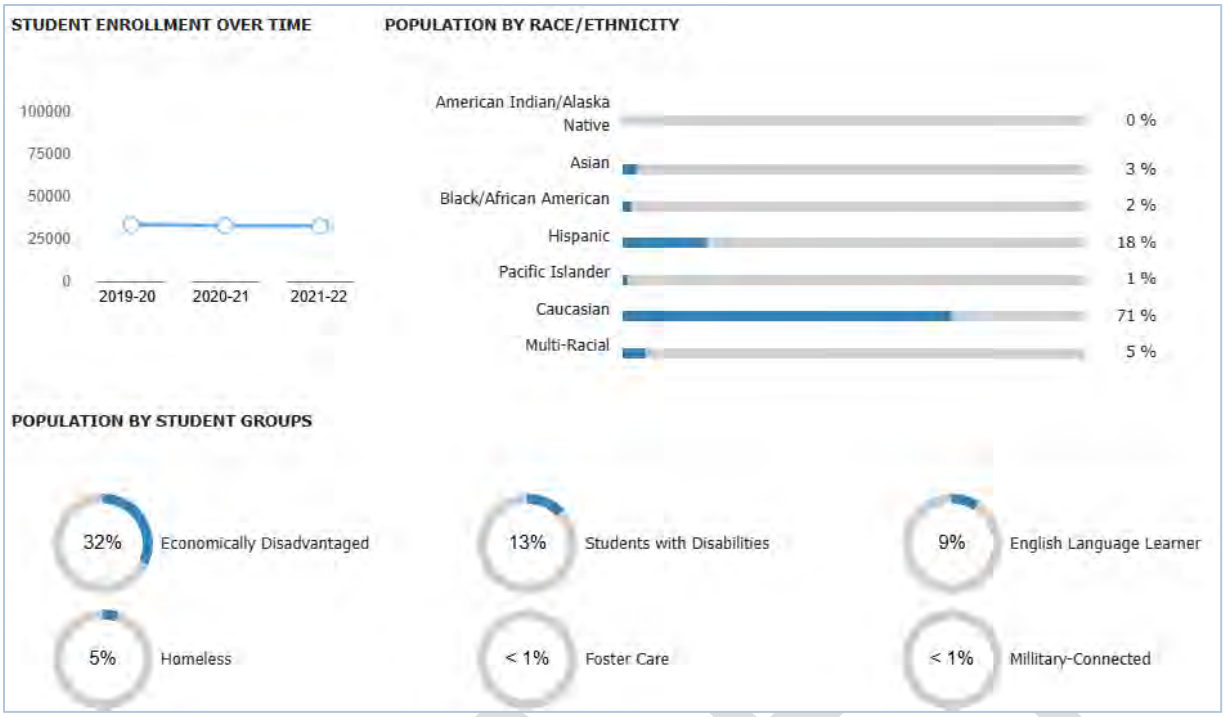

Figure 2: Demographics of Students in the Canyons School District[2]

Brief History

The Canyons School District was established in 2007 after residents in southeastern Salt Lake County voted to split from the Jordan School District. This made Canyons the first new school district created in the state in nearly a century.[3] The district officially began operations on July 1, 2009. David Doty, a former high school Spanish teacher and assistant commissioner for the Utah System of Higher Education, was appointed as the district's first superintendent. Over the years, the district has grown to include 47 schools and approximately 34,000 students.

In 2014, James Briscoe became superintendent, and in 2020, Rick Robins took over the role. The district continues to serve the communities of Alta, Cottonwood Heights, Draper, Midvale, and Sandy.

Climate

Salt Lake County, where Canyons School District is located, experiences a semi-arid climate characterized by hot, dry summers and cold, snowy winters. The region typically has four seasons, with average summer temperatures reaching the 80s to 90s°F (27–37°C). In comparison, winter temperatures can drop into the 20s to 30s°F (-6 to 4°C). Precipitation is relatively low, mostly occurring during the spring and early summer months. Snowfall is common in winter, contributing to the area's overall water supply. The surrounding mountains can influence weather patterns, leading to occasional heavy snowfall

[2] Canyons School District, "Profile." https://reportcard.schools.utah.gov/District/Profile?DistrictID=186056&schoolyearendyear=2022.
[3] Ibid.

in the winter months. The climate impacts various aspects of school life, including potential outdoor activities and commuting conditions.

Public Services

The Canyons School District provides public services to support student education and well-being. These include comprehensive academic programs, extracurricular activities, and specialized support for students with diverse needs. The district offers counseling and mental health services; nutritional programs, such as free and reduced lunch options; and opportunities for advanced placement and career and technical education. In addition, the district emphasizes community engagement through family support services and partnerships that enhance learning environments. These services aim to ensure that students have the necessary resources to thrive academically and personally.

Governing Body

The governing body of the Canyons School District is the Canyons School District Board of Education, which is responsible for setting policies, overseeing the district's budget, and making decisions that affect the educational programs and operations of the district.

Development Trends

The Canyons School District in Utah has experienced several notable development trends. The district is focusing on expanding its Career and Technical Education (CTE) programs to better prepare students for the workforce, with a significant development being the purchase of the former eBay campus in Draper for $50 million to create the Canyons Center of Innovation. This new facility will offer classes in robotics, engineering, business, and other technical fields.

Since its establishment in 2009, the district has rebuilt or renovated 23 schools, addressing seismic issues and modernizing facilities to ensure safety and accommodate growing student populations. Moreover, the district is aligning its development plans with regional economic trends and long-term strategic goals, leveraging the location of new facilities, such as the proximity of the new Center of Innovation to public transportation and the Point Innovation District.

Jurisdiction-Specific Hazards and Risk

The Calculated Priority Risk Index (CPRI) is a comprehensive assessment tool for evaluating and prioritizing risks in a given context. It considers various factors, such as probability, impact, and urgency, to determine the level of risk associated with events or situations. The results for each hazard, including its risk factor (RF) value, are shown in Table 3. The results are based on the criteria in Table 4 and the equation that follows it. The CPRI helps organizations and individuals make informed decisions about risk management and mitigation strategies. It provides a systematic approach to identifying and addressing potential issues, allowing for a more efficient allocation of resources and proactive risk prevention. With the CPRI, stakeholders can prioritize their focus on the most critical risks, leading to more effective risk management and, ultimately, better outcomes.

DRAFT

Table 3: Calculated Priority Risk Index Values for the Canyons School District

Type of Hazard Event	Probability of Future Events	Spatial Extent	Severity of Life/ Property Impact	Warning Time	Duration	Response Capacity	Risk Factor Value
Avalanche	1	1	1	1	1	1	1
Drought	2	2	2	1	3	1	1.9
Earthquake	2	4	4	4	4	2	3.2
Extreme Heat	2	2	1	1	3	1	1.6
Extreme Cold	2	2	1	1	3	1	1.6
Flooding	3	2	2	3	3	1	2.4
Landslide/ Slope Failure	1	1	1	4	1	2	1.4
Radon	3	1	2	1	4	2	2.3
Heavy Rain	3	2	1	2	2	1	1.9
High Wind	2	2	1	2	2	1	1.6
Lightning	2	1	1	4	1	1	1.6
Severe Winter Weather	2	2	1	1	2	1	1.5
Tornado	1	1	1	4	1	2	1.4
Wildfire	2	2	2	2	3	2	2.1
Dam Failure	1	1	1	2	1	2	1.2
Civil Disturbance	1	1	1	3	1	2	1.3
Cyberattack	2	2	1	4	1	2	1.8

Public Health Epidemic/ Pandemic	2	2	1	1	4	1	1.7
Terrorism	1	1	1	2	1	1	1.1

DRAFT

Table 4: Criteria for the Calculated Priority Risk Index

Risk Index Factor	Degree of Risk Level		Criteria	Factor Weight for Degree of Risk Level
Probability of Future Events	1	Unlikely	Less than 1 percent probability of occurrence in the next year or a recurrence interval of greater than every 100 years.	30%
	2	Occasional	1 to 10 percent probability of occurrence in the next year or a recurrence interval of 11 to 100 years.	
	3	Likely	11 to 90 percent probability of occurrence in the next year or a recurrence interval of 1 to 10 years.	
	4	Highly Likely	91 to 100 percent probability of occurrence in the next year or a recurrence interval of less than 1 year.	
Spatial Extent	1	Limited	Less than 10% of the planning area could be impacted.	10%
	2	Small	10%–25% of the planning area could be impacted	
	3	Significant	25%–50% of the planning area could be impacted.	
	4	Extensive	50%–100% of the planning area could be impacted.	
Severity of Life/Property Impact	1	Negligible	Less than 5% of the affected area's critical and non-critical facilities and structures are damaged/destroyed. Only minor property damage and minimal disruption of life. Temporary shutdown of critical facilities.	30%
	2	Limited	More than 5% and less than 25% percent of property in the affected area is damaged/destroyed. Complete shutdown of critical facilities for more than one day but less than one week.	
	3	Critical	More than 25% and less than 50% of property in the affected area was damaged/destroyed. Complete shutdown of critical facilities for over a week but less than one month.	
	4	Catastrophic	Over 50% of critical and non-critical facilities and infrastructures in the affected area are damaged/destroyed. Complete shutdown of critical facilities for more than one month.	
Warning Time	1	Self-defined	More than 24 hours	10%
	2	Self-defined	12 to 24 hours.	
	3	Self-defined	6 to 12 hours.	
	4	Self-defined	Less than 6 hours.	
Duration	1	Brief	Up to 6 hours.	10%
	2	Intermediate	Up to one day.	

DRAFT

	3	Extended	Up to one week.	
	4	Prolonged	More than one week.	
Response Capacity	1	High	Significant resources and capability to respond to this kind of event; staff are trained, experienced, and ready.	10%
	2	Medium	Some resources and capability to respond to this kind of staff; some staff may be trained, experienced, and ready while others may need additional support.	
	3	Low	Limited resources and capability to respond to this kind of event; additional staff or staff training needed.	
	4	None	No resources and capability to respond this kind of event; additional outside support would be required.	

RISK FACTOR (RF) EQUATION

RF Value = [(Probability x 0.30) + (Spatial Extent x 0.10) + (Severity of Life/Property Impact x 0.30) + (Warning Time x 0.10) + (Duration x 0.10) + (Response Capacity x 0.10)]

Hazards with an RF value greater than or equal to 2.5 are considered high risk. Those with RF values of 2.0 to 2.4 are considered moderate risk hazards, and those with an RF value less than 2.0 are considered low risk. The highest possible RF value is 4.

Hazard Event History

Examining hazard event histories provides valuable insights to inform decision-making and help prioritize resources for risk prevention and response efforts. Table 5 lists the hazard events impacting the Canyons School District since the 2019 plan update, as recorded in the Storm Events Database from the National Centers for Environmental Information.

Table 5: Hazard Events Specific to the Canyons School District since 2019

Type of Hazard Event	FEMA Disaster #	Date(s)	Damage or Impacts	Description
Public Health Epidemic/ Pandemic		2020–20XX		COVID-19 Pandemic

DRAFT

Table 6: History of Hazard Events in Salt Lake County[4]

Declaration Date	Event Type	Disaster Number	Deaths	Injuries	Property Damage	Crop Damage
08/14/2021	Fire (Parleys Canyon Fire)	5408	N/A	N/A	N/A	N/A
01/12/2021	Severe storm – (straight-line winds)	4578	N/A	N/A	N/A	N/A
07/09/2020	Earthquake	4548	N/A	N/A	N/A	N/A
04/04/2020	Biological (COVID-19)	4525	N/A	N/A	N/A	N/A
03/13/2020	Biological (COVID-19)	3478	N/A	N/A	N/A	N/A

National Flood Insurance Program Summary

The Canyons School District does not participate in the National Flood Insurance Program (NFIP) or the Community Rating System.

Jurisdiction-Specific Vulnerabilities and Impacts

Table 7 provides information on the vulnerable assets in the Canyons School District, including its critical facilities, highlighting the district's vulnerability to identified hazards. It also describes the potential impacts to the community arising from those vulnerabilities. Impacts are the consequences or effects of each hazard on the assets. By understanding the risks associated with these assets, the district can develop proactive strategies to mitigate vulnerabilities and ensure the safety and functionality of these important assets during hazard events. These data are invaluable for decision-making and prioritizing resources for emergency response and preparedness efforts, ultimately contributing to more effective risk management and greater resilience.

Vulnerabilities include 33,493 students, 7,020 district employees, 28 elementary schools, 8 middle schools, 6 high schools, and 5 other schools, as well as school buses, other vehicles, and other equipment used in educational programs.

Table 7: Jurisdiction-Specific Vulnerabilities and Impacts in the Canyons School District

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
Avalanche	People	N/A—not relevant to Canyons School District (CSD) schools.
Drought	People	*Vulnerability:* All students and staff are vulnerable to drought, lack of drinking/culinary water, and poor air quality. *Impacts:* Droughts can reduce municipal water supplies and water is a critical resource for everyday use, including drinking, cooking, and

[4] FEMA, "Disaster Declarations for States and Counties." https://www.fema.gov/data-visualization/disaster-declarations-states-and-counties.

Hazard	Vulnerable Asset	Description of Vulnerabilities and Impacts
		cleaning. Individuals with underlying health conditions, young children, and other medically vulnerable individuals may be more affected by drought-related poor air quality conditions and dust storms.
	Structures	*Vulnerability:* District building foundations, landscaping, and sports fields are susceptible to damage during drought conditions. *Impacts:* Drought conditions can cause scarcity of water or restrictions on irrigation for landscaping and sports fields at school facilities. During severe or prolonged drought, soil may contract due to decreased soil moisture. This contraction could damage structural foundations or building walls.
	Economic Assets	*Vulnerability:* Increased costs for water pose a vulnerability for the school district. *Impacts:* Drought can lead to water supply shortages for various school activities, resulting in restrictions on use or higher costs.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Schools and schoolyards are vulnerable to changes in water quality. *Impacts:* Droughts can reduce or affect the quality of municipal water supplies, which can damage vegetation on school grounds and limit recreation opportunities.
	Critical Facilities and Infrastructure	*Vulnerability:* Water supply systems are vulnerable during periods of drought. *Impacts:* Utah is the second driest state in the U.S. and drought could affect water supply and delivery systems over large regions, potentially affecting all of Salt Lake County. This could limit the availability of water to the CSD for irrigation and culinary purposes.
	Community Activities	*Vulnerability:* School activities are vulnerable to disruptions due to drought conditions. *Impacts:* CSD schools and properties hold many events each year. Serious drought conditions could impact on the community and/or school use of the facilities.
Earthquake	People	*Vulnerability:* All students and staff are vulnerable to injury and disruption during an earthquake. *Impacts:* Earthquakes can cause interruption and/or displacement of student learning. Possible injuries from falling objects if an earthquake occurs during school hours. Students may be displaced from homes following an earthquake and may be unable to attend school.
	Structures	*Vulnerability:* All schools and district facilities are vulnerable to damage and other disruptions caused by earthquakes. Impacts. Potential collapse/damage to schools and district structures in a seismic event. Classes would be disrupted in a moderate earthquake, and long-term disruptions are likely in a strong earthquake. Although no CSD schools were identified in the K–12 Public Schools Unreinforced Masonry Inventory, they may still require extensive repairs.
	Economic Assets	*Vulnerability:* District budgets are vulnerable due to potential costs for repairs or instructional material replacement. *Impacts:* Repairing or rebuilding damaged schools could be very costly. Reconstruction and retrofitting old buildings is expensive. There

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerabilities and Impacts
		could also be a loss of educational equipment that may get damaged such as computers or lab equipment. Buses and district-owned vehicles could be damaged, leading to a costly replacement or repair. Temporary relocation of students to alternate facilities to provide education may require leasing costs.
	Natural, Historic, and Cultural Resources	*Vulnerability:* CSD buildings are vulnerable because they are often used as community centers to house displaced families during emergencies. *Impacts*: CSD buildings may be unavailable for sheltering or other community activities.
	Critical Facilities and Infrastructure	*Vulnerability:* Utility systems such as water, power, and communication are vulnerable to damage and may become inoperable during an earthquake. Emergency response and medical care may be overwhelmed. *Impacts:* The schools may not be functional if water, power, communication, or other systems are disrupted. Emergency responders may not be available to respond to schools immediately.
	Community Activities	*Vulnerability:* Education and community activities are vulnerable to disruption following an earthquake. *Impacts:* CSD buildings may be unavailable for daily school operations or for other community activities. Schools are often used as community centers or shelters to house displaced families but may be unsafe for use following an earthquake.
Extreme Heat	People	*Vulnerability:* Students and staff are vulnerable to health risks associated with extreme heat conditions. *Impacts:* Extreme heat can contribute to heat-related illnesses for school staff and students as well as attendees at outdoor events/games in the summer. These individuals can experience dehydration, heat exhaustion, and heat stroke if temperatures continue to increase and there are no opportunities to cool off such as air conditioning, shade, water, or adequate resources such as EMS staff. Heat illness can pose significant health issues.
	Structures	*Vulnerability:* School HVAC and power systems, as well as blacktops, parking areas, and sidewalks, are vulnerable to damage from extreme heat. *Impacts:* Extreme heat can place a strain on power grids and lead to interruptions in service. Extreme heat may strain cooling systems and contribute to increased power costs. Pavement can buckle in extreme heat and require repairs.
	Economic Assets	*Vulnerability:* Schools face increased costs due to extreme heat conditions. *Impacts:* Increased energy use raises financial costs for schools, businesses, and residents. Damage to roadways and sidewalks from heat-related buckling can require costly emergency repairs and may cause secondary disruptions while transportation routes are closed.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Air and water quality are vulnerable to degradation due to extreme heat conditions. *Impacts:* Extreme heat can contribute to an increase in evaporation rates, reduce water availability for agriculture, recreation, and culinary

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerabilities and Impacts
		use, and exacerbate the effects of drought and increase wildfire risk. Extreme heat can increase ozone levels which can impact respiratory health.
	Critical Facilities and Infrastructure	*Vulnerability:* Power systems and road/transportation systems are vulnerable to failures and damage due to extreme heat. *Impacts:* One of the most significant secondary hazards associated with excessive heat events is the failure of motorized systems, such as ventilation systems used to control temperatures inside buildings. Extreme heat can increase demand for power resources and has contributed to widespread power outages. Heat can cause roads to buckle and may cause road closures for emergency repairs, which may disrupt transportation to and from schools. Extreme heat can also raise the risk of wildfires as vegetation dries out, which allows fires to ignite and spread more rapidly. Furthermore, extreme heat can exacerbate drought conditions. Extreme heat can increase demand for healthcare services, which can put a strain on providers.
	Community Activities	*Vulnerability:* Community sports and activities are vulnerable to cancellation due to extreme heat. *Impacts:* The district monitors temperature to ensure safe conditions for outdoor activities. Extreme heat can delay, relocate, or postpone outdoor school/sport activities and gatherings.
Extreme Cold	People	*Vulnerability:* Students and staff are vulnerable to extreme cold conditions, especially students who walk to school. *Impacts:* Potential exposure to cold-related health problems for students and faculty, particularly if schools have inadequate heating systems or power is disrupted. Prolonged exposure can lead to hypothermia, frostbite, and death. Windy conditions can increase these risks.
	Structures	*Vulnerability:* Structures face increased demand for HVAC equipment and are vulnerable to issues with water lines during extreme cold. *Impacts:* Structures are not typically directly affected by extreme cold but may be affected by secondary hazards. Extreme cold can freeze water in pipes, causing them to burst. This can damage water delivery systems, structures, and roadways. Extreme cold can also impact power systems through increased demand, which contributes to increased heating costs.
	Economic Assets	*Vulnerability:* Economic assets are vulnerable to increased costs due to extreme cold conditions. *Impacts:* Extreme cold can result in budget impacts from increased heating costs and possible emergency repairs to HVAC systems. Schools could potentially have to close if unable to keep buildings warm, causing students or staff to miss school/work.
	Natural, Historic, and Cultural Resources	Extreme cold is not directly related to CSD but can be harmful to wildlife or other natural systems.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerabilities and Impacts
	Critical Facilities and Infrastructure	*Vulnerability:* Water, power, and transportation systems are vulnerable to disruptions caused by extreme cold. *Impacts:* Freezing temperatures can lead to various infrastructure disruptions. They can cause insulators to fail and conductors to break. Extreme cold can also cause water in pipes to freeze, leading to burst pipes and water damage and service interruptions. School may not be able to stay in session if power, communication, or heating system outages occur, or due to water damage. Transportation may be disrupted due to icy conditions, affecting commutes and emergency services.
	Community Activities	*Vulnerability:* Recess, sports, and school or community events are vulnerable to disruption due to extreme cold. *Impacts:* Sports, school activities, and community gatherings may be postponed or canceled. The district monitors for safe conditions for these activities.
Flooding	People	*Vulnerability:* Students and staff in flood-prone areas are vulnerable to flooding events. *Impacts:* Heavy rain or rapid snowmelt can lead to flooding, particularly if drainage systems are overwhelmed. This could affect school accessibility, disrupt classes, damage facilities, and endanger student safety. The potential for flooding could impact the occupancy of school buildings, or buildings could receive minor to significant damage. Not many buildings are in flood-prone areas. People may be forced to evacuate homes, causing disruptions to education and daily life.
	Structures	*Vulnerability:* School buildings, district vehicles are vulnerable to flooding damage. One elementary school was identified in the 0.2% annual chance flood zone. Other facilities could be affected by localized or flash flooding following heavy rain or other severe weather events. *Impacts:* Buildings or vehicles can be damaged by floodwaters. The potential for flooding could impact the occupancy of school buildings, or buildings could receive minor to significant damage. Electrical and HVAC systems could be damaged, leading to replacement costs. Computers, books, equipment, and classrooms may suffer loss of supplies and learning materials. Athletic facilities and gymnasiums could be damaged requiring repairs.
	Economic Assets	*Vulnerability:* Economic assets are vulnerable to costs associated with flood damage to school assets. *Impacts:* Flooding can damage walls, floors, and roofs, which would require costly repairs. Electrical and HVAC systems could be damaged, leading to replacement costs. Computers, books, equipment, and classrooms may suffer loss of supplies and learning materials. Athletic facilities and gymnasiums could be damaged, requiring repairs. Prolonged disruptions could delay school operations, increasing expenses.
	Natural, Historic, and	*Vulnerability:* School grounds, parks, and playgrounds are vulnerable to damage from floodwaters.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerabilities and Impacts
	Cultural Resources	*Impacts:* Flood damage can result in the inability to use school facilities and grounds during repairs.
	Critical Facilities and Infrastructure	*Vulnerability:* Community lifelines, such as power, communication, and transportation systems, could be damaged or disrupted by floods. *Impacts:* Power outages, broken water mains, and sewage system failures could make schools unsafe for operation. Flooded roads and bridges can block bus routes, making it challenging for students and staff to commute. CSD buildings are often used as community centers to house displaced families during emergencies.
	Community Activities	*Vulnerability:* Education routines and community events held at schools are vulnerable to disruption due to flooding. *Impacts:* The potential for flooding could impact the occupancy of school buildings, and buildings could receive minor to significant damage. Sports, activities, and school gatherings may be postponed or canceled.
Landslide/ Slope Failure	People	*Vulnerability:* There is minimal vulnerability for the CSD school population regarding landslides. *Impacts:* Students and staff are not likely to be affected by a landslide at school, but homes could be affected. Families, students, and staff may need to evacuate affected areas, leading to temporary displacement and disruption of daily life.
	Structures	*Vulnerability:* There is minimal potential to impact JSD schools, as no structures were identified in landslide-susceptible areas. *Impacts:* Schools and district facilities are not likely to be damaged, but homes and other structures located near slopes or unstable terrain may suffer foundation cracks or damage, making buildings unsafe to occupy.
	Economic Assets	N/A—not relevant to CSD schools.
	Natural, Historic, and Cultural Resources	N/A—not relevant to CSD schools.
	Critical Facilities and Infrastructure	*Vulnerability:* Transportation networks and utility systems are vulnerable to damage from landslides. *Impacts:* School buses may be unable to reach students due to road blockages. Students and staff may be unable to travel to school due to the closed roads. Landslides elsewhere in the region could affect utility systems like power, water, or communication, which may disrupt school activities.
	Community Activities	N/A—not relevant to CSD schools.
Radon	People	*Vulnerability:* All students and staff are vulnerable to radon exposure. *Impacts:* Radon could be present in school facilities, and all students and staff could potentially be exposed. Long-term radon exposure is the second leading cause of lung cancer, particularly in enclosed spaces like classrooms and offices. Young children, teachers, and school staff who spend many hours in affected buildings may face

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerabilities and Impacts
		greater health risks. Radon could potentially affect the residences of staff and students.
	Structures	*Vulnerability:* Structures have minimal vulnerability, as radon is primarily a health risk. *Impacts:* Some schools could potentially have high levels of radon that might require foundation repairs or ventilation for radon mitigation.
	Economic Assets	N/A—not relevant to CSD schools.
	Natural, Historic, and Cultural Resources	N/A—not relevant to CSD; radon is primarily a health risk.
	Critical Facilities and Infrastructure	N/A—not relevant to CSD; radon is primarily a health risk.
	Community Activities	N/A—not relevant to CSD schools.
Heavy Rain	People	*Vulnerability:* Students and staff face minimal risk of harm from heavy rain. *Impacts:* Heavy rain can lead to localized flooding, which could impact school buildings. Heavy rain can cause temporary disruptions to education, transportation of students, and daily life. Student safety may be at risk if they encounter fast-moving floodwaters.
	Structures	*Vulnerability:* School facilities and vehicles are vulnerable to damage from heavy rain. *Impacts:* Heavy rain could lead to localized flooding and potentially damage schools including walls, floors, and roofs. Electrical and HVAC systems could be damaged, leading to replacement costs. Computers, books, equipment, and classrooms may suffer loss of supplies and learning materials. Athletic facilities and gymnasiums could be damaged, requiring repairs.
	Economic Assets	*Vulnerability:* Repair costs pose a vulnerability to the district budget. *Impacts:* Flood damage can be costly and affect the district budget. Prolonged disruptions could delay school operations, increasing expenses.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Floodwaters can damage school grounds, parks, and playgrounds. *Impacts:* Activities may be canceled or areas may be unavailable for use.
	Critical Facilities and Infrastructure	*Vulnerability:* Utility networks and transportation systems are vulnerable to damage from heavy rain. *Impacts:* Power outages, broken water mains, and sewage system failures could make schools unsafe for operation. Flooded roads and bridges can block bus routes, making it challenging for students and staff to commute. CSD buildings are often used as community centers to house displaced families. Heavy rain can cause structural damage potentially leading to temporary closures.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerabilities and Impacts
	Community Activities	*Vulnerability:* Daily education operations and other community activities are vulnerable to disruption due to heavy rain. *Impacts:* Heavy rain could impact the occupancy of school buildings, or buildings could receive minor to significant damage. Sports, activities, and school gatherings may be postponed or canceled. Storms may result in flying debris, fallen trees, and structural damage, which pose dangers to students, staff, and the community.
High Wind	People	*Vulnerability:* All students and staff are vulnerable to high winds, which can occur over a large area and may affect the whole district. *Impacts:* Students or staff could be injured by blown debris or falling tree limbs. Classes may be canceled or moved online, impacting the academic calendar.
	Structures	*Vulnerability:* All schools, facilities, and vehicles are vulnerable to damage from high winds. *Impacts:* High winds can damage school buildings and roofs, and break windows. Schools may be inoperable if the damage is severe.
	Economic Assets	*Vulnerability:* Structure or vehicle repair costs pose a vulnerability to the district budget. *Impacts:* Significant budget impacts can result from physical damage to structures and building contents. Debris removal can be costly and may strain local resources.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Schoolyards, playgrounds, and outdoor/indoor recreational facilities are vulnerable to high winds. *Impacts:* Facilities and equipment may be damaged, and areas may be closed for use. Activities may be canceled.
	Critical Facilities and Infrastructure	*Vulnerability:* Utility systems and transportation networks are vulnerable to high winds. *Impacts:* Damaged power lines and communication equipment may interrupt emergency communications and in-person and online learning. School buses may be delayed due to fallen debris or road closures. Transportation disruptions can make it difficult for students or staff to travel to class. Classes may be canceled or moved online, impacting the academic calendar.
	Community Activities	*Vulnerability:* Recreation and sports activities are vulnerable to cancellation due to high winds. *Impacts:* High winds may force the cancellation or delay of school sports, fairs, or other school gatherings.
Lightning	People	*Vulnerability:* All students and staff are vulnerable. A large area is at risk of lightning strikes during every thunderstorm. If thunder can be heard, lightning is close enough to strike and shelter should be sought. Because it is impossible to know where lightning will strike, all people, structures, and infrastructure are considered vulnerable to lightning. *Impacts:* Students or staff could be injured if lightning occurred, particularly during outdoor activities. The district monitors safe conditions for outdoor events.
	Structures	*Vulnerability:* Structures are vulnerable to damage from lightning and power surges.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerabilities and Impacts
		Impacts: Lightning strikes can cause fires, structural damage, or power surges that damage electrical systems in schools.
	Economic Assets	*Vulnerability:* Structures, computers, and electronic equipment are vulnerable. *Impacts:* Damage from lightning can result in expensive repairs to electrical systems, computers, and other infrastructure.
	Natural, Historic, and Cultural Resources	N/A—not relevant to CSD.
	Critical Facilities and Infrastructure	*Vulnerability:* Lightning can contribute to damaged power lines and communication systems. *Impacts*: Power and communication outages can affect operations for schools, homes, businesses, emergency responders, and medical facilities.
	Community Activities	*Vulnerability:* Recreation/extracurricular activities are vulnerable to lightning strikes. *Impacts:* Lightning could lead to delay or cancellation of sports or other outdoor activities.
Severe Winter Weather	People	*Vulnerability:* All students and staff are vulnerable to severe winter weather, occurs over large areas and could affect the entire district. The eastern benches tend to receive higher snow accumulations, and schools near these neighborhoods may have higher vulnerability. *Impacts:* Travel to school facilities may be difficult for students and staff during severe winter weather. Roads may be slick or impassable due to ice, snow, or traffic from collisions. There is a risk of possible injuries at schools from slips and falls. Heavy snowstorms can disrupt transportation, making it difficult for students to commute to class. As a result, classes may be canceled or moved online, impacting the academic calendar.
	Structures	*Vulnerability:* Minimal damage to district facilities is expected. *Impacts:* While possible damage from heavy snow loads on roofs is not expected, there is an increased need for facilities/maintenance staff to clear parking lots and sidewalks.
	Economic Assets	*Vulnerability:* The district is vulnerable to increased costs due to severe winter weather. *Impacts:* Severe winter weather can lead to increased maintenance and repair costs. Schools will have an increase in operational costs to keep buildings warm. In addition, transportation and fuel costs can also increase due to snow plowing, de-icing parking lots and sidewalk
	Natural, Historic, and Cultural Resources	*Vulnerability:* Trees, landscaping, playgrounds, outdoor equipment are vulnerable due to severe winter weather. *Impacts:* Severe winter weather, such as heavy snow, can break tree limbs, which may damage school landscaping and outdoor equipment.
	Critical Facilities and Infrastructure	*Vulnerability:* Utility networks and roads are vulnerable to damage or outages. *Impacts:* Heavy snow can damage power lines, affecting heating, lighting, and communication systems. Heating systems can overload,

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerabilities and Impacts
		leading to failures. Frozen pipes and water breaks can disrupt water access in schools. Snow-covered roads can delay emergency response times and make it harder for school buses to operate safely, leading to delays or snow days.
	Community Activities	*Vulnerability:* School functions are vulnerable to severe winter weather. *Impacts:* Daily school or other gatherings may be postponed or canceled due to unsafe travel conditions. There can be disruptions to learning and class schedules.
Tornado	People	*Vulnerability:* Students and staff are vulnerable to tornadoes. Tornadoes are rare but could occur anywhere in the district. *Impacts:* Flying debris, collapsed structures, and vehicle or bus accidents caused by high winds can lead to injuries or fatalities. Families may be temporarily or permanently displaced due to damaged homes. Student access to education may be interrupted.
	Structures	*Vulnerability:* All district facilities, schools, and vehicles are vulnerable to tornado damage. *Impacts:* Tornadoes can damage or destroy school buildings, homes, vehicles, and businesses. Roofs can be torn off, windows shattered, and buildings leveled.
	Economic Assets	*Vulnerability:* There are vulnerabilities related to costs for district structures and equipment. *Impacts:* There are high costs associated with rebuilding and repairing damaged property, including vehicles and classroom materials.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Trees, landscaping, playgrounds, and recreational facilities are vulnerable to tornadoes. *Impacts:* Landscaping and outdoor equipment may be damaged or destroyed.
	Critical Facilities and Infrastructure	*Vulnerability:* Utility networks are vulnerable to outages, and transportation access can be disrupted. *Impacts:* Damage to electrical grids can occur as well as water systems and communication systems. Debris can block roads and hinder emergency response or transportation to and from school.
	Community Activities	*Vulnerability:* Parks, playgrounds, and sports recreational facilities and fields for schools, as well as community events, are vulnerable. *Impacts:* Outdoor recreation areas may be damaged or littered with debris, making them unsafe or temporarily unusable. Events and activities held at the school may be delayed or canceled.
Wildfire	People	*Vulnerability:* Students and staff are vulnerable to the effects of wildfires. *Impacts:* Smoke and poor air quality from wildfires can affect the whole region, even if fire is not within the district. Smoke can cause respiratory issues, especially for children and those with pre-existing conditions like asthma. This may require the cancellation of outdoor events and necessitate indoor recess. Families in evacuated areas may need to leave their homes, disrupting daily life.
	Structures	*Vulnerability:* No structures were identified in high wildfire risk areas.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerabilities and Impacts
		Impacts: Schools are not expected to be directly impacted by wildfire, but students or staff with homes near the interface might be. The evacuation of students or staff with homes near the wildland-urban interface may disrupt school attendance.
	Economic Assets	*Vulnerability:* Minimal vulnerability to CSD. *Impacts:* Indirect impacts may affect the community. Local businesses may be destroyed or forced to close temporarily. Reconstructing homes, schools, and infrastructure can put a financial strain on residents and government resources.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Watersheds and air quality are at risk. *Impacts:* Smoke pollution can linger for weeks, and burned landscapes can result. Fire can threaten contamination of local water sources.
	Critical Facilities and Infrastructure	*Vulnerability:* Utility systems and emergency response capabilities are vulnerable. *Impacts:* Fires can damage power lines, leaving schools without electricity. Evacuations and road closures can impact transportation to and from school. Resources devoted to fire response may strain emergency response capabilities in the community.
	Community Activities	*Vulnerability:* Daily school activities and other school-related events are vulnerable. *Impacts:* Smoke, evacuations, or direct fire damage may cause schools to close temporarily, affecting student learning. School events or gatherings may be postponed or canceled.
Dam Failure	People	*Vulnerability:* Student and staff risk is minimal while at school, as no schools were identified within dam failure inundation boundaries. However, these individuals may be vulnerable to other impacts from dam failures in the area. *Impacts:* Dam failures can occur suddenly, but those downstream might have some warning. The failure of high-hazard dams may lead to injuries and loss of life for those caught in the resulting floodwaters. Homes may be damaged or destroyed, resulting in potential long-term displacement for residents. Some of these households may require public sheltering assistance. Evacuations or damage to homes may disrupt student access to education.
	Structures	*Vulnerability:* No schools were identified within potential dam inundation areas. *Impacts:* Significant structural and infrastructural losses can result from a dam failure. Although no schools are anticipated to be damaged, students may be affected by damage to homes, businesses, and government service facilities.
	Economic Assets	*Vulnerability:* There is minimal vulnerability for CSD. *Impacts:* Economic losses in the community may have indirect impacts on CSD. In addition to the costs of rebuilding structures, significant economic impacts are likely due to lost inventory or revenue during business closures. Businesses not directly impacted by a dam failure may incur losses due to transportation or other infrastructure interruptions or an inability for employees to return to work.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerabilities and Impacts
	Natural, Historic, and Cultural Resources	*Vulnerability:* There is minimal risk to CSD resources. *Impacts:* While the risk is minimal, community recreation areas, such as parks, playgrounds, and sports recreational facilities, can be damaged.
	Critical Facilities and Infrastructure	*Vulnerability:* Utility networks and transportation systems, including roads, are vulnerable. *Impacts:* School functionality could be disrupted by power outages, communication network outages, or damage to transportation networks. If roads are damaged or blocked, transportation to or from schools could be difficult for students and staff. Power and communication outages could cause delays or lead to the cancellation of school. Disruption of a public water supply or wastewater treatment facility could lead to reduced water quality, water shortages, exposure to sewage, and other health hazards.
	Community Activities	*Vulnerability:* School events are vulnerable to disruptions. *Impacts:* Evacuations and cleanup efforts may cause schools to close temporarily, affecting students' learning. School events or gatherings may be postponed or canceled
Civil Disturbance	People	During a civil disturbance, students and staff can be impacted in several ways. They may experience disruptions to essential services, such as transportation, healthcare, and utilities. There is also potential for personal injury, fatality and emotional distress.
	Structures	Civil disturbances can result in property damage.
	Economic Assets	Civil disturbances can lead to economic repercussions, including loss of income and damage to buildings.
	Natural, Historic, and Cultural Resources	Civil disturbances can have several impacts on the environment. Impacts include increased pollution from burning vehicles, buildings, and other materials and the use of chemical agents to disperse crowds. In addition, large gatherings during civil disturbances can increase the generation of waste, including litter and potentially hazardous materials.
	Critical Facilities and Infrastructure	Schools and other essential facilities may be impacted if they are near or the target of civil disorder or riots. Civil disturbances can lead to various impacts and losses to a community's critical infrastructure. Impacts can include damage to transportation systems, such as roadways, bridges, and public transit facilities, and disruption to communications networks, including phone lines and internet services. In addition, civil disturbances can damage power plants, electrical grids, and water supply systems, leading to power outages and water supply disruptions. These disruptions can significantly impact the daily lives of community members and hinder the delivery of essential services.
	Community Activities	Schools may be impacted if they are near or are the target of civil disorder or riots. As a result, school events or gatherings may be postponed or canceled.
Cyberattack	People	Cyberattacks can expose student and employee data that can be used for identity theft, leading to financial and emotional distress for individuals and families. Teachers may be unable to access lesson

Hazard	Vulnerable Asset	Description of Vulnerabilities and Impacts
		plans, online resources, student records, disrupting the learning environment.
	Structures	A cyberattack can damage public and private buildings. If private buildings or businesses utilize HVAC & Smart Building systems cybercriminals can control heating, ventilation, and security systems, making them unsafe or unusable. If 911 systems are compromised, response times, medical emergencies, or crimes can be delayed leading to property damage or loss of life. If a cyberattack triggers a failure in gas, water, or electrical systems it could lead to a fire, flooding, or other property damage from a cascading effect
	Economic Assets	Financial exploitation of local government and business may occur. School operations may be disrupted, leading to a loss of revenue from events, programs, and other activities.
	Natural, Historic, and Cultural Resources	Vulnerabilities in this area are not currently known for this topic.
	Critical Facilities and Infrastructure	Cyberattacks, especially ransomware, can render critical systems (like computers, email, and school databases) inaccessible.
	Community Activities	A cyberattack can disrupt the student learning environment and can also postpone, delay, or cancel student activities and gatherings.
Hazardous Materials Incident (Transporta-tion & Fixed Facility)	People	Salt Lake County is significantly vulnerable to hazardous materials in various locations, including industrial sites, transportation routes, and waste management facilities. The proximity of residential areas and schools to these sites increases the risk of exposure to toxic substances in the event of accidental releases or spills. Unknown exposure to toxic chemicals, flammable substances, or other hazardous materials can cause respiratory issues, burns, poisoning, or long-term health complications whether caused by a transportation accident or a fixed facility release. A spill or gas leak may require evacuations resulting in the relocation of students and staff.
	Structures	Hazardous substances could result in the infiltration of homes, businesses, and public buildings such as schools making them unsafe to occupy. Certain chemicals are also highly flammable and could cause structural damage if ignited.
	Economic Assets	Buildings and/or infrastructure exposed to toxic materials may require extensive cleanup. Businesses or transportation companies responsible for the incident may face lawsuits, fines, or compensation claims from the affected parties.
	Natural, Historic, and Cultural Resources	hazmat spills can severely damage the environment by contaminating the air, soil, and water. Cleanup can take weeks, months, or even years to complete, depending on the extent of the spill. The immediate financial impact may include emergency response costs, damage to infrastructure, and the potential for long-term environmental rehabilitation. In addition, businesses nearby might face temporary closures, leading to job losses and decreased revenue.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerabilities and Impacts
	Critical Facilities and Infrastructure	Schools may need to be evacuated or closed due to chemical spills, gas leaks, or other toxic exposures. A Hazmat incident on highways or local roads could block access to schools. A chemical spill could contaminate local water supplies, air systems, or power infrastructure which can affect school operations.
	Community Activities	Evacuations, or direct damage may cause schools to close temporarily, affecting student's learning. School events or gatherings may be postponed or canceled.
Public Health Epidemic/ Pandemic	People	In-person student learning/activities might not be available during a public health epidemic/pandemic. Students, teachers, and staff may contract illnesses leading to hospitalizations or fatalities, especially among vulnerable populations.
	Structures	Schools may need physical changes such as ventilation upgrades, sanitation stations, and modified classroom layouts. Schools, buses, and public spaces may require frequent deep cleaning and new health protocols
	Economic Assets	The district may have to spend more money on technology for remote learning, personal protective equipment (PPE), and sanitation supplies.
	Natural, Historic, and Cultural Resources	School performances and activities may be postponed or canceled.
	Critical Facilities and Infrastructure	In-person student learning/activities might not be available during this time. Reduced or modified school bus services may occur due to social distancing requirements. Delays in supply chain might occur affecting school meal programs, shortage in cleaning supplies, PPE, etc.
	Community Activities	In-person student learning/activities might not be available at this event.
Terrorism	People	Educational facilities could be targets for terrorist activities or active shooter scenarios which can result in the loss of life and injuries. Terrorism can impact CSD by increasing security measures and creating anxiety among students and staff, which could lead to decreased enrollment and participation. Such incidents could disrupt academic programs, harm the district's reputation, and create potential financial burdens for enhanced security.
	Structures	Attacks involving explosives, arson, or sabotage could destroy or severely damage school buildings and administrative offices.
	Economic Assets	Implementing enhanced security measures (e.g., security, screening, emergency drills) requires significant funding.
	Natural, Historic, and Cultural Resources	Educational facilities could be targets for terrorist activities or active shooter scenarios.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerabilities and Impacts
	Critical Facilities and Infrastructure	Physical attacks on power grids, communication infrastructure, and water supplies could impact school operations and affect public health.
	Community Activities	Threats or actual attacks could lead to the suspension of sports events or other school activities.

Hazards Not Profiled

Avalanche risk has been omitted from further discussion of hazard impacts and from mitigation actions. As shown in the description in Volume 1, avalanche risk is primarily in the Wasatch Mountains in SLCo. CSD schools and other facilities are not located within known avalanche paths and not near slopes with potential impact from avalanches. No previous occurrences of avalanches have impacted CSD facilities or assets.

Jurisdiction-Specific Changes in Vulnerability

Natural hazards can have a range of specific impacts on the Canyons School District, affecting the school environment and the broader community. The severity of these impacts can be influenced by climate change, population patterns, and land use developments. Understanding these factors is crucial for the Canyons School District to develop a resilient community and minimize the impacts of hazards. Table 8 lists some unique changes within the community and the related effects on each identified hazard to the CSD.

DRAFT

Table 8: Jurisdiction-Specific Changes in Vulnerability in the Canyons School District

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
Avalanche	N/A	N/A	N/A	N/A
Drought	Climate change affects drought incidents by altering precipitation patterns and increasing temperatures. Warmer weather can lead to longer dry periods and more severe droughts.	Drought can influence population patterns. Increased water costs can affect the cost of living. Sustainable development efforts and improved water management may attract newcomers.	Local governments to adjust zoning laws and promote sustainable practices in new projects. As a result, prolonged drought conditions can reshape the area's landscape and influence future development trends.	Same
Earthquake	Unknown	Population growth may contribute to higher student enrollment numbers and to the potential for more residents to be displaced from shelter when a disaster occurs.	Canyons School District may be affected by land use and development changes that may lead to the implementation of new measures to enhance safety and resilience. This could include assessing existing buildings to ensure they meet updated safety standards, leading to renovations or new construction. The district might also develop facilities for emergency preparedness, such as shelters and resource centers, while expanding green spaces for emergency gatherings. Increased collaboration with local government and emergency services would promote community engagement through joint response strategies and educational programs on earthquake preparedness.	Stayed the same
Extreme Heat	Climate change significantly impacts extreme heat by	Some may move to areas perceived as safer or seek better	Rising temperatures may lead government planners to adopt	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	increasing the frequency and intensity of heat waves. Rising global temperatures lead to longer and hotter summers, affecting residents and local infrastructure while heightening health risks, especially for vulnerable populations. Urban heat islands from reduced vegetation and extensive pavement further amplify these effects.	job opportunities elsewhere. The economic impact and infrastructure damage can also make certain neighborhoods less desirable, leading to shifts in demographics and the socioeconomic landscape as new residents with different backgrounds move in.	heat mitigation strategies, such as increasing green spaces and using reflective materials. Zoning regulations might shift to promote mixed-use developments that enhance walkability and reduce vehicle reliance during peak heat. As concerns about heat-related health risks grow, there may be greater demand for improvements like shaded sidewalks and cooling centers, influencing future development toward resilience and sustainability.	
Extreme Cold	Higher atmospheric temperatures allow for more moisture, resulting in heavier snowfall and potentially lower temperatures during these events.	By driving some residents to relocate to warmer areas. Harsh winters can hinder economic activities and deter new residents and businesses, influencing housing demand and the attractiveness of certain neighborhoods. This may disproportionately affect lower-income families, leading to changes in demographics and socioeconomic stratification in the community.	Extreme cold can impact land use and development by shifting priorities toward indoor facilities like shopping centers and community spaces, as outdoor activities are curtailed. Developers may focus on energy-efficient designs to cope with harsh winter conditions, which can lead to increased construction costs and adjusted project timelines.	Same
Flooding	Higher temperatures increase the frequency and intensity of extreme weather events and alter precipitation patterns. They lead to more intense rainstorms and accelerated snowmelt from nearby mountains, raising water levels in rivers and streams.	Population growth may contribute to the potential for more residents displaced from shelter when a disaster occurs.	Flooding can impact land use at Canyons District Schools by requiring zoning changes and limiting construction in flood-prone areas. Existing buildings may need retrofitting, while new facilities might be built on higher ground. Effective drainage and	Same

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	This combination increases the risk of flooding, especially in areas with inadequate drainage and urban development in flood-prone zones, heightening the potential for damage to homes and infrastructure.		resilience planning will be crucial in addressing these challenges.	
Landslide/ Slope Failure	Climate change increases the risk of landslides through heavier rainfall and temperature fluctuations. Intense rain saturates soil, destabilizing slopes, while freeze–thaw cycles weaken the ground. Changes in vegetation can also reduce stability, leading to a higher potential for landslides.	Landslides and slope failures can impact population patterns by making some areas unsafe, leading to displacement and lower property values. This prompts residents to move to safer regions, thereby increasing density in more stable areas. Concerns about future landslides may also deter newcomers from high-risk zones, shaping long-term demographic trends.	Landslides and slope failures can impact land use and development by rendering certain areas unsafe for construction. This often results in stricter zoning laws, pushing developers to focus on more stable regions. Consequently, property values may decline in affected areas, and infrastructure investments shift to increase safety, ultimately guiding growth toward safer locations.	Minimal direct impacts to JSD. May impact other structures or infrastructure systems in community. Transportation networks can be disrupted, complicating emergency responses.
Radon	Climate change can affect radon levels by altering soil temperatures and moisture conditions. Higher temperatures may increase radon emissions from the ground, while heavy rainfall can change groundwater and soil saturation, impacting radon migration into buildings.	Radon exposure can influence population patterns as increased health awareness may drive families to move away from areas with high radon levels. This shift could particularly affect vulnerable groups, changing demographics in the CSD.	Radon can impact land use and development by necessitating site assessments and mitigation, which can increase costs. Developers might prioritize areas with lower radon risks and adopt designs that reduce gas infiltration. This awareness may prompt stricter building codes and zoning regulations, influencing where new projects are located and shaping community planning.	Same
Heavy Rain	Higher temperatures increase the frequency and intensity of	Population growth may contribute to the potential for more	Heavy rain can impact land use at Canyons District Schools by	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	extreme weather events and alter precipitation patterns. They may lead to more intense rainstorms.	residents displaced from shelter when a disaster occurs.	requiring zoning changes and limiting construction in flood-prone areas. Existing buildings may need retrofitting, while new facilities might be built on higher ground. Effective drainage and resilience planning will be crucial in addressing these challenges.	
High Wind	Climate change affects high winds by altering atmospheric patterns and increasing extreme weather events. Rising temperatures may lead to more substantial, unpredictable winds and more frequent thunderstorms, posing risks to infrastructure and air quality.	Population growth may contribute to the potential for more residents to be displaced when a disaster occurs.	High winds could change land use and development in Canyons School District classes by requiring windbreaks, such as trees, to protect buildings and reduce erosion. Outdoor spaces may be redesigned for safety, incorporating sheltered areas. New construction could also focus on better anchoring and resilience against wind, leading to a reevaluation of class planning with an emphasis on sustainability.	Increased
Lightning	Climate change may alter atmospheric patterns a contribute to more extreme events.	Minimal	N/A	Same
Severe Winter Weather	Climate change impacts heavy snow and blizzards by altering precipitation patterns. Higher temperatures can lead to more rain than snow, affecting snowpack levels. Moreover, increased storm intensity results in heavier, more unpredictable snowfall.	The potential for more residents displaced.	Heavy snow or blizzard conditions may prompt changes in land use and development at Canyons School District to enhance safety and accessibility. The district could invest in better snow removal systems and features, such as heated sidewalks, to prevent snow buildup. Parking areas might be redesigned for easier access during winter weather, and	Same

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
			outdoor spaces could be adapted for winter activities. In addition, building layouts may be modified to minimize the impact of snow on entrances and walkways, ensuring that classes remain functional during severe conditions.	
Tornado	Climate change may increase the frequency or intensity of tornadoes.	Not expected to affect the school population.	Unknown.	Same
Wildfire	Climate change contributes to raising temperatures and creating drier conditions, prolonged droughts lead to more dry vegetation, which serves as fuel for fires.	Not expected to affect the school population.	Unknown.	Increased
Dam Failure	Climate change raises the risk of dam failure by causing heavier rainfall and rapid snowmelt. These changes can overwhelm dams and compromise their integrity, highlighting the need for urgent safety assessments and upgrades to protect communities downstream.	Dam failure can impact population patterns by displacing residents and altering demographics. Evacuations can lead to an influx in safer areas, while destruction may deter new residents and contribute to population decline. Fear of future disasters may also prompt remaining individuals to relocate, changing the community's composition and affecting population density.	Dam failure can reshape land use and development by making areas prone to flooding unsuitable for growth. This may lead planners to focus on safer regions and implement stricter zoning laws to enhance resilience. The emphasis on sustainable practices and flood mitigation can ultimately transform the urban landscape, prioritizing disaster preparedness in future developments.	Same
Civil Disturbance	Climate change can increase civil disturbances by intensifying environmental stresses and social tensions. Rising temperatures may lead to droughts, wildfires, and	By encouraging residents to move for safety, leading to outflows and new arrivals. These events can reveal social issues, impacting community dynamics, employment, and property	By shifting community priorities toward safety and stability. Developers may hesitate to invest in troubled areas, leading to a focus on public spaces and community centers. Residents	Same

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	poor air quality, particularly affecting vulnerable communities. Resource scarcity, especially water, can spark conflicts and protests. In addition, an influx of migrants from harder-hit areas may strain local resources, further escalating tensions.	values, ultimately reshaping demographics, and social cohesion.	might also push for zoning changes favoring low-density housing and community-oriented efforts, prompting a reevaluation of land use strategies.	
Hazardous Materials Incident (Transportation & Fixed Facility)	Possible attack on the industry, which is seen as producing large amounts of greenhouse gases and burning fossil fuels. Climate change can heighten cyberattack risk by increasing vulnerabilities during extreme weather. Disruptions like power outages offer cybercriminals opportunities, but focusing on emergency responses can weaken cybersecurity measures.	Cyberattacks can change population patterns by eroding trust in essential services. Compromised systems may cause residents to leave due to safety concerns, while high-profile incidents can deter businesses, leading to job losses. This perception of vulnerability may also make the city less appealing to newcomers, resulting in demographic shifts and affecting local development.	Cyberattacks can impact land use and development by undermining confidence in public infrastructure. If essential systems are compromised, investors may be discouraged, slowing economic activity. Local governments might also redirect funds to increase cybersecurity rather than new infrastructure, altering development timelines and urban planning priorities. This can significantly reshape the city's growth and land use.	Same
Public Health Epidemic/ Pandemic	Worsening air quality can exacerbate respiratory conditions like asthma, especially in vulnerable populations, by increasing the spread of vector-borne diseases and raising the risk of waterborne illnesses due to flooding or drought.	Public health crises, like the COVID-19 pandemic, have notably affected Canyons School District enrollment. There may be increased absenteeism due to illness. Some families may choose to educate at home or other alternative learning options.	Public health considerations may lead to significant changes at Canyons School District, focusing on land use and infrastructure. To enhance well-being, outdoor spaces, such as gardens and recreational areas, could be prioritized. In addition, buildings may be upgraded for better air quality, and new wellness centers could be established, promoting a culture of health among students.	Stayed the same

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
Terrorism/ Cyberterrorism	Terroristic activity is sometimes centered around climate change. Climate change impacts terrorism incidents by creating resource scarcity and social unrest. Increased competition for essential resources like water can fuel tensions, making communities more vulnerable to extremist ideologies. Extreme weather events may disrupt social order and infrastructure, offering terrorist groups opportunities to exploit crises. In addition, climate-driven population displacement can heighten tensions in receiving areas, raising the risk of domestic terrorism. Law enforcement's focus on climate-related challenges can also limit its capacity to address terrorism threats. Ultimately, while climate change may not directly cause terrorism, its effects can create an environment conducive to extremist activities.	Terrorism could lead to a decline in enrollment at Canyons School District due to safety concerns. Potential students might choose other institutions perceived as safer. Following any incident, increased security measures may result in a temporary drop in enrollment.	Changes in land use at Canyons School District due to terrorism could involve enhanced security measures, such as increased surveillance and emergency response facilities. Access points may be redesigned to restrict vehicle entry, and outdoor spaces could be modified to improve safety, limiting gatherings and reshaping the class environment to prioritize security in open communal areas.	Stayed the Same

DRAFT

Additional Public Involvement

The Canyon School District proactively informs students and families about potential hazards and safety issues. The district uses a multi-faceted approach to public outreach, which includes regular communication through newsletters, social media updates, and community meetings. It also provides essential resources on its official website, offering guidelines on how to prepare for and respond to various emergencies, such as natural disasters and health concerns. The school district also collaborates with local emergency services to hold safety drills and workshops, ensuring that families are well-informed and equipped to handle potential threats. This commitment to transparency and education helps foster a safe and informed community for all students and their families.

Plan Integration

Incorporating the underlying principles of the Hazard Mitigation Plan and its recommendations into other plans is a highly effective and low-cost way to expand their influence. All plan participants will use existing methods and programs to implement hazard mitigation actions where possible. As previously stated, mitigation is most successful when it is incorporated into the day-to-day functions and priorities of government and public service. This plan builds on the momentum developed through previous and related planning efforts and mitigation programs, and it recommends implementing actions where possible through these other program mechanisms. These existing mechanisms include the following:

- Regularity Capabilities
- Administrative Capabilities
- Fiscal Capabilities

Respective planning stakeholders will conduct implementation and incorporation into existing planning mechanisms and will be done through the routine actions of:

- Monitoring other planning/program agendas
- Attending other planning/program meetings
- Participating in other planning processes; and
- Monitoring community budget meetings for other community program opportunities.

The successful implementation of this plan will require constant and vigilant review of existing plans and programs for coordination and multi-objective opportunities that promote a safe, sustainable community. Regular efforts should be made to monitor the progress of mitigation actions implemented through other planning mechanisms. Where appropriate, priority actions should be incorporated into planning updates. Canyons School District was not a participant in the previous mitigation plan, so it has not yet integrated hazard mitigation into other existing plans. Table 9 lists existing planning mechanisms in which the MJHMP has been integrated. Table 10 lists the opportunities for integrating elements of this plan into other plans.

DRAFT

Table 9: Integration of Previous Plans by the Canyons School District

Plan	Description
None	N/A

Table 10: Opportunities for Integration with Future Plans of the Canyons School District

Plan	Description
CSD Strategic Plan	The strategic plan is a growth blueprint for the next decade and beyond.
City Building Codes	The school district will work with city planning departments to ensure new school construction aligns with building codes and can withstand local hazards.
Policy 300.05 Emergencies and Safety Procedures	Addresses the safety of students and staff in times of emergency and disaster though collaborative relationships with emergency response agencies and government entities. This could be expanded to integrate hazard mitigation.
Policy 300.09 Facilities Construction, Renovation and Maintenance	Establishes policy for new facility construction, building renovation, small capital facility projects, and bond issuance, which may be used for hazard mitigation purposes.
Capital Projects Plans	Capital projects planning addresses the remodel and renovation of existing facilities to support educational needs. It also provides inspections for life safety needs and the preservation of existing facilities

Capability Assessment

Local mitigation capabilities are existing authorities, policies, programs, and resources that reduce hazard impacts or could help carry out hazard mitigation activities. School districts do not have the same planning obligations and procedures as municipalities. As such, their capabilities will be described in a narrative rather than the table format of the municipal annexes.

Planning and Regulatory Capabilities

Planning and regulatory capabilities are the plans, policies, codes, and ordinances that prevent and reduce the impacts of hazards.

District Policy 300.05 – Emergencies and Safety Procedures addresses the adoption of an emergency response plan and the district's responsibility to assist individual schools to develop safety procedures and a District Emergency Response Plan and to train district and school staff on the roles in the emergency plan.

Canyons School District adheres to federal law and the building codes adopted by the State of Utah from various international and national code organizations. The Facilities Services Department addresses specific code questions.

DRAFT

Administrative and Technical Capabilities

Administrative and technical capabilities include staff and their skills. They also include tools that can help carry out mitigation actions.

District staff includes financial and administrative services, facilities management, and employees who specialize in coordinating with state and federal programs. The external relations department provides efforts in public engagement. It is not known whether these departments are familiar with hazard mitigation. There is potential to expand this capability for district departments to engage in additional mitigation activities.

Financial Capabilities

Financial capabilities are the resources to fund mitigation actions. Talking about funding and financial capabilities is important to determine what kinds of projects are feasible, given their cost. Mitigation actions like outreach programs are lower cost and often use staff time and existing budgets. Other actions, such as earthquake retrofits, could require substantial funding from local, state, and federal partners. Partnerships, including those willing to donate land, supplies, in-kind matches, and cash, can be included.

The financial capabilities of the Canyons School District include management of governmental and proprietary funds. Major funds including the general fund, capital outlay fund, and debt service fund account for 90.7% of government fund expenditures. Specific funds are as follows:

GOVERNMENTAL FUNDS

- General Fund: including activities such student instruction, student services, staff services, district administration, school administration and support services, and student transportation
- Capital Outlay Fund (a major fund): Long-term building program to construct new schools and renovate existing schools
- Debt Service Fund (a major fund): General obligation bonds
- Pass-Through Taxes Fund
- District Activity Fund
- Canyons Education Foundation Fund
- Nutrition Services Fund

PROPRIETARY FUND

- Self-insurance Fund

DRAFT

Education and Outreach Capabilities

Education and outreach capabilities are programs and methods that could communicate about and encourage risk reduction. These programs may be run by a participant or a community-based partner. Partners, especially those who work with underserved communities, can help identify additional education and outreach capabilities.

The Canyons School District communicates with students, parents, and employees through a variety of methods. Information is shared via the district and individual school websites, email newsletters, the ParentSquare messaging system for email, text, and app notifications, social media, and other methods. These communication tools provide opportunities to share information regarding potential mitigation activities.

Opportunities to Expand and/or Improve Capabilities

Actions that can expand and improve existing authorities, plans, policies, and resources for mitigation include budgeting for mitigation actions, passing policies and procedures for mitigation actions, adopting and implementing stricter mitigation regulations, approving mitigation updates, and making additions to existing plans as new needs are recognized. Table 11 lists the opportunities for the CSD to expand or improve.

Table 11: Opportunities to Expand and/or Improve the Capabilities of the Canyons School District

Capability	Opportunity to Expand and/or Improve
Planning and Regulation	Canyons School District can update the District Capital Improvement budget to include hazard mitigation projects, including but not limited to seismic retrofitting projects.
Administrative and Technical	Staff could receive additional training on hazard mitigation, including training on what mitigation grants are available and developing a mitigation grant. State or federal direct technical assistance may help expand this capability.
Financial	The District can apply for new hazard mitigation grants such as the Hazard Mitigation Grant Program (HMGP).
Education and Outreach	The District has the capability to connect with students, parents, and employees through a variety of methods including the website, newsletter, messaging, and social media. These public outreach methods can be expanded to include information on specific hazards including how to mitigate them. Increasing public awareness by sharing seasonal disaster-related information can help community members reduce their own risk as well as garner support for the mitigation measures the District pursues.

Mitigation Strategy

Mitigation strategies provide proactive measures that are designed to minimize the impacts of hazards on the Canyons School District. The Canyons School district did not participate in the previous hazard mitigation plan; therefore, no previous mitigation actions were available for review. Table 12 is the 2025 mitigation action plan for the Canyons School District.

DRAFT

Town of Copperton Annex

To participate in this multi-jurisdictional hazard mitigation plan (MJHMP) update for Salt Lake County (SLCo), the governing body of the town of Copperton passed a formal resolution, a copy of which is maintained at the local government offices.

Planning Process Contact Information

Table 1 provides information on the point of contact during the updating of the MJHMP.

Table 1: Contact Information for the Town of Copperton

Name	Contact Information
Madison Warner	**Phone:** 801-743-7100; **email:** Mwarner@unifiedfire.org

The town of Copperton has a fully integrated approach to hazard mitigation planning and program implementation. During the 2024 update process, the MJHMP participation roles in Table 2 were recorded.

Table 2: Participant List for the Town of Copperton

Name	Title	Jurisdiction
Madison Warner	Municipal Planner at Salt Lake County Emergency Management	Kearns, Copperton, and Magna
Brad Jewett	Intelligence Specialist	Salt Lake County Emergency Management

Jurisdiction Profile

Date of Incorporation

Copperton became a metro township in January 2017, then converted to a town on May 1, 2024.

Location and Description

The town of Copperton is located southwest of Salt Lake City. The town is approximately 0.3 square miles in area and is approximately 5,400 feet above sea level. It is renowned for its picturesque landscapes and historical importance. The Copperton Historic District, which is listed on the National Register of Historic Places, includes over 230 contributing buildings.

DRAFT

Population

The 2022 American Community Survey 5-Year Estimate from the U.S. Census Bureau records the population of the town of Copperton as 865 people.

Demographics

Most of the 865 people are between the ages of 25 and 34, with a median age of 32; 461 are females (53.3%) and 404 are males (46.7%). English is the primary language in 88.4% of homes,, with 7.9% Spanish, and 3.7% other languages.

Brief History

In 1926, Copperton was established by the Utah Copper Company as a residential area and model city for its employees. It was designed to showcase company-subsidized family life featuring model brick and stucco homes, a community park, and amenities like electricity and paved streets. Construction of housing units ended in the 1930s and company-furnished housing ended in 1955. The town was added to the National Register of Historic Places in 1986 preserving its unique history and architecture.

Climate

The town of Copperton experiences a humid subtropical climate (Cfa Köppen classification) characterized by hot, humid summers and mild winters with consistent precipitation throughout the year. Average highs are approximately 78°F in the summer and approximately 33°F in the winter. Annual precipitation is approximately 16 inches annually with snowfall averaging 79 inches annually.

Public Services

The town of Copperton offers a wide range of public services through the Greater Salt Lake Municipal Services District (MSD). The MSD provides staffing and administrative support and other services and handles planning and zoning, business licensing, code enforcement, inspections, emergency planning, and related municipal services. Public works services are contracted with SLCo Public Works, which encompasses the construction and maintenance of roads, snow removal, and street lighting.

Governing Body

The town of Copperton's governing body is the Copperton Council, which includes the Mayor, Deputy Mayor, and three council members.

Development Trends

The community is physically separated from development in nearby communities by mining operation buffer areas.

DRAFT

Jurisdiction-Specific Hazards and Risk

The Calculated Priority Risk Index (CPRI) is a comprehensive assessment tool for evaluating and prioritizing risks in a given context. It considers various factors, such as probability, impact, and urgency, to determine the level of risk associated with events or situations. The results for each hazard, including its risk factor (RF) value, are shown in Table 3. The results are based on the criteria in Table 3 and the equation that follows it. The CPRI helps organizations and individuals make informed decisions about risk management and mitigation strategies. It provides a systematic approach to identifying and addressing potential issues, allowing for a more efficient allocation of resources and proactive risk prevention. With the CPRI, stakeholders can prioritize their focus on the most critical risks, leading to more effective risk management and, ultimately, better outcomes.

Table 3: Calculated Priority Risk Index Values for the Town of Copperton

Type of Hazard Event	Probability of Future Events	Spatial Extent	Severity of Life/ Property Impact	Warning Time	Duration	Response Capacity	Risk Factor Value
Avalanche	0	0	0	0	0	0	0
Drought	3	4	2	1	4	2	2.6
Earthquake	3	4	4	4	4	3	3.6
Extreme Heat	3	4	3	1	4	2	2.9

DRAFT

Type of Hazard Event	Probability of Future Events	Spatial Extent	Severity of Life/ Property Impact	Warning Time	Duration	Response Capacity	Risk Factor Value
Public Health Epidemic/ Pandemic	2	4	3	1	4	2	2.6
Terrorism	1	3	4	4	3	4	2.9

Table 4: Criteria for the Calculated Priority Risk Index

Risk Index Factor	Degree of Risk Level		Criteria	Factor Weight for Degree of Risk Level
Probability of Future Events	1	Unlikely	Less than 1 percent probability of occurrence in the next year or a recurrence interval of greater than every 100 years.	30%
	2	Occasional	1 to 10 percent probability of occurrence in the next year or a recurrence interval of 11 to 100 years.	
	3	Likely	11 to 90 percent probability of occurrence in the next year or a recurrence interval of 1 to 10 years.	
	4	Highly Likely	91 to 100 percent probability of occurrence in the next year or a recurrence interval of less than 1 year.	
Spatial Extent	1	Limited	Less than 10% of the planning area could be impacted.	10%
	2	Small	10%–25% of the planning area could be impacted	
	3	Significant	25%–50% of the planning area could be impacted.	
	4	Extensive	50%–100% of the planning area could be impacted.	
Severity of Life/Property Impact	1	Negligible	Less than 5% of the affected area's critical and non-critical facilities and structures are damaged/ destroyed. Only minor property damage and minimal disruption of life. Temporary shutdown of critical facilities.	30%
	2	Limited	More than 5% and less than 25% percent of property in the affected area is damaged/ destroyed. Complete shutdown of critical facilities for more than one day but less than one week.	
	3	Critical	More than 25% and less than 50% of property in the affected area was damaged/ destroyed. Complete shutdown of critical facilities for over a week but less than one month.	
	4	Catastrophic	Over 50% of critical and non-critical facilities and infrastructures in the affected area are damaged/	

DRAFT

Risk Index Factor	Degree of Risk Level		Criteria	Factor Weight for Degree of Risk Level
			destroyed. Complete shutdown of critical facilities for more than one month.	
Warning Time	1	Self-defined	More than 24 hours	10%
	2	Self-defined	12 to 24 hours.	
	3	Self-defined	6 to 12 hours.	
	4	Self-defined	Less than 6 hours.	
Duration	1	Brief	Up to 6 hours.	10%
	2	Intermediate	Up to one day.	
	3	Extended	Up to one week.	
	4	Prolonged	More than one week.	
Response Capacity	1	High	Significant resources and capability to respond to this kind of event; staff are trained, experienced, and ready.	10%
	2	Medium	Some resources and capability to respond to this kind of staff; some staff may be trained, experienced, and ready while others may need additional support.	
	3	Low	Limited resources and capability to respond to this kind of event; additional staff or staff training needed.	
	4	None	No resources and capability to respond this kind of event; additional outside support would be required.	

RISK FACTOR (RF) EQUATION

RF Value = [(Probability x 0.30) + (Spatial Extent x 0.10) + (Severity of Life/Property Impact x 0.30) + (Warning Time x 0.10) + (Duration x 0.10) + (Response Capacity x 0.10)]

Hazards with an RF value greater than or equal to 2.5 are considered high risk. Those with RF values of 2.0 to 2.4 are considered moderate risk hazards, and those with an RF value less than 2.0 are considered low risk. The highest possible RF value is 4.

Hazard Event History

Examining hazard event histories provides valuable insights to inform decision-making and help prioritize resources for risk prevention and response efforts. Table 5 lists the hazard events impacting the town of Copperton planning area since the 2019 plan update, as recorded in the Storm Events Database from the National Centers for Environmental Information.

DRAFT

Table 5: History of Hazard Events in the Town of Copperton

Type of Hazard Event	FEMA Disaster #	Date(s)	Damage or Impacts	Description
Avalanche	N/A	N/A	N/A	N/A
Drought	N/A	1930s: The Great Salt Lake and streams experienced low water levels 1950s–1960s: The Great Salt Lake experienced even lower water levels than in the 1930s. 2020: Utah experienced its driest year on record, with record dry soils and low snowpack. 2021: The Great Salt Lake reached an all-time record low due to a drought.	Air quality issues, potential for greater ecosystem collapse.	The entire county faces risk of historic drought.
Earthquake	DR-4548-UT	A 5.7M earthquake was felt March 2020. 1962: Magna 5.2M earthquake and the 1992 Western Traverse Mountains 4.2M earthquake[1]. The Magna earthquake caused minor damage to buildings in several cities and towns within one mile	Some structural damage was reported, mostly on the south end of Copperton. Walls were cracked, plaster was knocked off, and lead paint dust was released. The Greater Salt Lake Municipal Services District, which includes Copperton, received 219 damage reports online. Tens of thousands lost power.	The Wasatch Fault is considered overdue for a major earthquake, with a 57% chance of a 6.0M or greater earthquake occurring in the next 50 years. The Copperton quadrangle may experience significant ground shaking due to nearby faults, primarily the West Valley fault zone and the Wasatch fault zone, but also the Harkers fault and an unnamed fault in the southwest part of the quadrangle for which the time of latest movement is not known. Numerous earthquakes greater than 4.0 magnitude have occurred near

[1] Christensen, 1992; University of Utah Seismograph Stations, 2010a; Figure 3.

DRAFT

Type of Hazard Event	FEMA Disaster #	Date(s)	Damage or Impacts	Description
		(1.6 km) to the southwest of the epicenter, which was approximately 5 miles (8 km) north of Copperton.		the Copperton quadrangle over the past century. The proximity of Bingham Canyon Mine is a concern for larger land mass movement due to an earthquake.
Extreme Heat	N/A	Summers of 2020, 2021, 2022, 2023, 2024	Reported 9 deaths in Northern Utah, an upward trend in heat exposure and heat-related deaths since 2015. Excessive heat can also affect infrastructure.	Specific impacts on Copperton were not available, but general impacts include increased risk of heat-related illness and increased power demand for cooling systems.
Extreme Cold	N/A	Winter of 2022 & 2023	2022: 5 people experiencing homelessness died from cold-related exposure in Salt Lake City, but this threat could impact neighboring jurisdictions.	Specific impacts on Copperton were not available, but extreme cold can contribute to hypothermia and other cold-related illness/ . Increased demand for heating systems. Potential for frozen pipes or other service disruptions.
Flooding	N/A	N/A	Some minor flooding reported by residents due to faulty storm drain.	Minor residential and commercial damage occurred.
Landslide/ Slope Failure	N/A	April 10, 2013	No reported damage to the town of Copperton, as this slide was the result of mining activity and took place in a restricted area with controlled access and distance from the town.	Two massive landslides carried about 145 million tons of waste rock into the open pit at Bingham Canyon, the largest copper mine in the U.S.
Radon	N/A	Radon is present in soils.	The specific impacts of radon in the area are not known (i.e., exact count of illnesses known to be caused by radon), but test results have indicated elevated radon levels in the area.	As shown in Figures 147 and 148 in Volume 1, elevated radon levels have been found in the Copperton area.
Heavy Rain	N/A	N/A	N/A	There have been some significant rains, but no major damage associated.

DRAFT

Type of Hazard Event	FEMA Disaster #	Date(s)	Damage or Impacts	Description
High Wind	N/A	September 8, 2020	N/A	Salt Lake County and surrounding areas experienced a severe windstorm with winds exceeding 100 mph in some areas.
Lightning	N/A	N/A	N/A	N/A
Severe Winter Weather	N/A	N/A	N/A	There have been some significant winter storms, but no major damage was associated.
Tornado	N/A	N/A	N/A	N/A
Wildfire		June 17, 2022 July 30, 2019	Barney's Wash fire Small brush fire	This fire got close to Copperton but was handled by UFA, South Jordan, West Jordan, and Rio Tinto. This was a brush fire. Small brush fire in 2019 on private property south of Copperton. There were issues with access as UFA had to wait for Rio Tinto personnel to give them access.
Dam Failure	N/A	N/A	There are three dams near Copperton with significant hazard ratings that could affect the area.	The inundation areas of these dams are southeast of the town but could impact roadways or other infrastructure that are critical to the town.
Civil Disturbance	N/A	N/A	N/A	N/A
Cyberattack	N/A	N/A	N/A	N/A
Hazardous Materials Incident (Transportation & Fixed Facility)	N/A	N/A	N/A	Rio Tinto stores wastewater from the Bingham Canyon Mine, one of the largest open-pit copper mines in the world and a massive source of toxic chemicals. There are TRI facilities nearby
Public Health Epidemic/ Pandemic	DR-4525-UT	January 20, 2020 – May 11, 2023	Unknown degree of damage done to community and local economy	A pandemic of SARS-CoV-2 (also known as COVID-19) killed millions and has many medical repercussions that are still being studied. There is no specific data on Copperton residents who were affected medically or otherwise.
Terrorism	N/A	N/A	N/A	N/A

DRAFT

National Flood Insurance Program Summary

The town of Copperton participates in the National Flood Insurance Program (NFIP). Table 6 displays statistics related to the NFIP. The town of Copperton does not participate in the Community Rating System.

Table 6: National Flood Insurance Program Status for the Town of Copperton[2]

Init FHBM Identified	Init FIRM Identified	Current Effective Map Date	Adopted Date	Date Joined NFIP	Tribal
12/18/85	12/18/85	9/25/09	2009	6/3/20	No

No information was available regarding active NFIP policies, coverage amounts, losses or payments for the Town of Copperton.

Copperton has designated the Director of Planning and Development Services as the Floodplain Administrator. The duties of the Floodplain Administrator are supported by the Greater Salt Lake Municipal Services District (MSD). The current Flood Damage Prevention and Control Ordinance was adopted on 10/20/2021. The current FIRM became effective 9/25/2009. The MSD is responsible for issuing floodplain permits in MSD Member Communities, including Copperton. The permits include a description of all work, including the kind and type of construction, proposed intent, and location. Substantial damage/substantial improvement structures are identified through the permitting process. Structures that are determined to be substantially damaged or substantial improvements are required to come into compliance with current codes. The MSD Building Department provides guidance on how to build in accordance with existing building codes.

Jurisdiction-Specific Vulnerabilities and Impacts

Table 7 provides information on the vulnerable assets in the town of Copperton, including its critical facilities, highlighting the [town's vulnerability to identified hazards. By understanding the risks associated with these assets, local authorities can develop proactive strategies to mitigate vulnerabilities and ensure the safety and functionality of these important assets during hazard events. This data is invaluable for decision-making and prioritizing resources for emergency response and preparedness efforts, ultimately contributing to more effective risk management and greater resilience in the community.

Community assets that may be vulnerable to hazards in Copperton include the 865 residents, 1 fire station, Copperton Park, and the Bingham Canyon Lions Club community center. Primary roads in Copperton are 10200 South, SR 48 (New Bingham Hwy), and SR 209 (Old Bingham Hwy). The Rio Tinto Kennecott copper mine is a significant industry near Copperton. It is accessed through Copperton and the Kennecott office building is just outside the town. Natural resources in the area include the mineral contents in the nearby hills, vegetation and wildlife in the foothills, and Bingham Creek. The Copperton Historic District includes 237 buildings and 2 contributing structures in the town, mainly homes built for

[2] FIRM = Flood Insurance Rate Map, FHBM = Flood Hazard Boundary Map

employees of the Utah Copper Company between 1926 to 1941. Copperton Community Methodist Church is also listed on the NRHP.

Table 7: Jurisdiction-Specific Vulnerabilities and Impacts in the City of Copperton

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
Avalanche	People	N/A
Drought	People	*Vulnerability:* Drought can affect all populations in Copperton. Prolonged drought conditions can pose serious challenges for vulnerable groups, including seniors, children, low-income households, and individuals experiencing homelessness. *Impacts:* These residents may struggle to afford rising water bills, install water-efficient fixtures, or maintain cooling during extreme heat. Limited access to water can increase the risk of heat-related illnesses and worsen air quality as dust and particulates become more prevalent. Additionally, food security may be impacted if locally grown produce becomes scarce or if prices rise due to agricultural strain across the region. Public health can decline due to water rationing and loss/damage to green or natural spaces.
	Structures	*Vulnerability:* All structures in Copperton are vulnerable to drought. *Impacts:* Many homes in Copperton, especially older ones, may have outdated plumbing systems and appliances that use more water than current efficiency standards allow. As drought persists, properties without waterwise landscaping are more likely to contribute to fire risk from dry vegetation near buildings. Without adequate irrigation alternatives, both curb appeal and safety may decline in residential neighborhoods.
	Economic Assets	*Vulnerability:* Local businesses are vulnerable, particularly those that are dependent on a consistent water supply. *Impacts:* Local businesses that depend on a consistent water supply may experience financial setbacks. Restrictions on water use can reduce business activity, increase operational costs, or result in temporary closures. For a small community like Copperton, the ripple effects of even modest economic disruptions can be significant.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Vegetation in foothills and Copperton Park is vulnerable to drought. *Impacts:* Drought can have a visible impact on Copperton's natural environment, reducing the vitality of parks, greenways, and surrounding foothills. Vegetation loss not only affects the look of public spaces but also degrades habitat for local wildlife. Historic properties, especially those with landscaping or irrigation-dependent grounds, may suffer neglect or deterioration. Airborne dust from dry soils can contribute to respiratory issues and affect the enjoyment of outdoor cultural amenities.
	Critical Facilities and Infrastructure	*Vulnerability:* Copperton's culinary water supply is vulnerable to ongoing drought. *Impacts:* Ongoing drought may strain Copperton's culinary water supply, requiring conservation measures or temporary restrictions. Water-dependent operations at facilities such as senior centers, clinics, and schools could be disrupted. Dry conditions also elevate the

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		risk of wildfires, which can threaten key infrastructure like power lines and water treatment systems. Soil degradation from extended dryness can increase flood risk when sudden rainfall occurs, placing pressure on stormwater systems.
	Community Activities	*Vulnerability:* Community events and Copperton Park are vulnerable to the impacts of drought. *Impacts:* Parks and gathering areas in Copperton may become less inviting or safe during drought due to heat stress, dry grass, and limited irrigation. Community events may be scaled back or canceled during peak summer months to protect public health. Public outreach is essential to promote water conservation strategies, encourage heat safety practices, and educate residents about drought-tolerant landscaping options.
Earthquake	People	*Vulnerability:* All Copperton residents are vulnerable. Vulnerable populations, including the elderly, young children, low-income individuals, and unsheltered persons, may be more affected by an earthquake. *Impacts:* Health impacts can be severe, especially if people are trapped under collapsed homes or other structures.
	Structures	*Vulnerability:* All homes and other structures in Copperton are vulnerable. The 2020 earthquake highlighted the risk, and the brick houses that are predominant in Copperton are historically known to fail during earthquakes. *Impacts:* Unreinforced masonry structures are likely to experience extensive damage from a moderate or strong earthquake. This is a significant concern, as not all residents have the tools or the funds to improve their homes or businesses to withstand a significant earthquake. Residents may be injured and are likely to be displaced if homes are damaged.
	Economic Assets	*Vulnerability:* Businesses throughout the region are vulnerable. *Impacts:* Economic impacts could be great due to direct damage to businesses and service disruptions. Failure of utility and transportation systems can affect businesses' ability to function. In addition, recovery for the community and businesses may be lengthy. Access to emergency services, such as police, fire, and emergency medical services (EMS), may be disrupted.
	Natural, Historic, and Cultural Resources	*Vulnerability:* The Historic District and the environment are vulnerable to earthquakes. *Impacts:* The resources could be severely damaged due to an earthquake. Unreinforced masonry buildings could be affected. Local vegetation and wildlife could be impacted by an earthquake.
	Critical Facilities and Infrastructure	*Vulnerability:* The fire station and all town infrastructure could be negatively affected due to physical damage, utilities failure, and medical surges. *Impacts:* Access to emergency services, such as fire stations, police stations, or medical facilities, could be compromised.
	Community Activities	*Vulnerability:* Community events are vulnerable to earthquakes.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		Impacts: Community gatherings could lead to an increased risk to public safety if an earthquake were to occur in the middle of an event. Future events may be canceled.
Extreme Heat	People	*Vulnerability:* Extreme heat can affect all Copperton residents *Impacts:* In Copperton, extended periods of high temperatures pose a serious health risk. Outdoor workers and residents without access to reliable air conditioning face the highest risk of heat exhaustion or heat stroke. As summer temperatures rise, especially during midday, hospital visits may increase, while outdoor recreation decreases due to the unsafe conditions. Residents will face increased energy costs for cooling systems.
	Structures	*Vulnerability:* All structures in Copperton are vulnerable to extreme heat. *Impacts:* Prolonged heat can stress buildings and infrastructure in Copperton. Roads and pavements may crack, and roofing materials can deteriorate under intense sunlight. Structures lacking proper insulation or cooling systems may become dangerously hot inside, placing residents at risk and overloading electrical systems.
	Economic Assets	*Vulnerability:* All businesses in Copperton are vulnerable to extreme heat. *Impacts:* Businesses in Copperton face rising cooling costs during periods of extreme heat. Companies reliant on outdoor services may need to limit work hours or reduce output, resulting in lost revenue. Recreational venues, including parks and local outdoor markets, could see a drop in attendance, especially during the hottest parts of the day.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Copperton Park is vulnerable to extreme heat. *Impacts:* Local parks and green spaces may suffer from drying vegetation and declining wildlife activity, especially if heat is paired with limited water supply. Trees and plants may become more vulnerable to disease or fire. Additionally, prolonged heat may accelerate the weathering of historic structures, public monuments, and art installations.
	Critical Facilities and Infrastructure	*Vulnerability:* Community centers and power infrastructure are vulnerable to extreme heat. *Impacts:* Essential facilities such as clinics, senior centers, and community shelters in Copperton may experience spikes in utility use as they work to keep interiors cool. Power demand for air conditioning can strain the grid, increasing the risk of localized outages. Fire danger also grows during extreme heat, particularly in areas with dry vegetation.
	Community Activities	*Vulnerability:* Community events are vulnerable to extreme heat. *Impacts:* Community events held during the summer months are at risk of being delayed, relocated, or canceled if cooling measures are not available. Public participation in outdoor gatherings may decrease, especially during excessive heat warnings, limiting community engagement.
	People	*Vulnerability:* All residents are potentially vulnerable to extreme cold. Severe cold spells can be especially hazardous in Copperton for

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
Extreme Cold		vulnerable groups, including seniors, young children, lower-income families, and individuals without stable housing. *Impacts:* Residents without reliable heating, insulation, or winter clothing may struggle to stay safe. Outdoor workers are also at risk of hypothermia and frostbite if protective gear and shelter are not accessible.
	Structures	*Vulnerability:* All structures are vulnerable to extreme cold. *Impacts:* Cold temperatures can cause pipes to freeze and burst in both older and newer homes lacking proper insulation. Prolonged exposure to cold can weaken roofing materials and compromise structural components, especially when followed by heavy snowfall. Repeated freeze–thaw cycles can deteriorate wood, brick, and metal components of buildings over time.
	Economic Assets	*Vulnerability:* Businesses and household budgets are vulnerable to extreme cold. *Impacts:* Heating expenses tend to spike during winter storms and cold snaps, placing a financial burden on both households and businesses. Companies may need to adjust hours of operation or delay projects due to weather-related barriers. The town may also face increased costs for maintaining warming shelters or assisting residents with heating needs.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Wildlife, vegetation, and the Historic District are vulnerable to extreme cold. *Impacts:* Extreme cold can take a toll on native wildlife in Copperton, particularly species not well adapted to sudden drops in temperature. Vegetation may also suffer, especially if cold is accompanied by wind or ice. Historic properties may be at risk of material damage or structural wear due to the expansion and contraction of building components.
	Critical Facilities and Infrastructure	*Vulnerability:* Cold weather can stress key systems in Copperton, including emergency services, utility lines, and water distribution systems. *Impacts:* Power outages are more likely when ice or snow accumulates on lines. Burst pipes in critical facilities, such as fire stations or clinics, could disrupt service delivery during emergencies.
	Community Activities	*Vulnerability:* Community activities are vulnerable to extreme cold. *Impacts:* Outdoor events and programs may be canceled if temperatures become dangerously low or snow makes travel difficult. Icy roads and unreliable vehicles can prevent residents from attending both recreational and essential services. Without sufficient heating in public spaces, community gatherings may have to be postponed or moved indoors.
Flooding	People	*Vulnerability:* People near Bingham Creek or low-lying areas are vulnerable to flooding. No Special Flood Hazard Zones (SFHZs) are within the town boundaries. *Impacts:* Individuals may need rescuing from high waters. Waterborne hazardous materials from Kennecott Mine could pose an additional risk, especially if they overflow Bingham Creek reservoir. Unsheltered populations, young children, low income, and the elderly are a

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		significant concern. Persons displaced by flooding may need public shelter.
	Structures	*Vulnerability:* No SFHZs are within Copperton. Some structures near Bingham Creek or in low-lying areas may be vulnerable to flooding. *Impacts:* Structures may be affected if they are exposed to floodwaters. Damage can include foundation damage, cracked pipes, damaged electrical systems, and mold. In addition, entire structures can be carried away if the water is moving very fast.
	Economic Assets	*Vulnerability:* Kennecott mine and other businesses are vulnerable to flooding. *Impacts:* Flooding could interrupt commerce and cause major interruptions to Kennecott Mine, particularly if roadways are damaged or closed. Rebuilding structures affected by flooding could be a significant cost for the town if financial assistance is not provided or the homeowner does not have flood insurance.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Wildlife, vegetation, and the Historic District are vulnerable to flooding. *Impacts:* Flooding can impact local wildlife and flora/fauna with the sheer amount of water and debris that move into the area. This could impact historical buildings or infrastructure, especially if they do not have flood insurance or the funds to rebuild.
	Critical Facilities and Infrastructure	*Vulnerability:* Roads and utilities are vulnerable to flooding. *Impacts:* Floodwater could damage roads and utilities, and carry hazardous materials. Access to emergency services like police, fire, and medical facilities would be impacted by flooding.
	Community Activities	*Vulnerability:* Community events and Copperton Park are vulnerable to flooding. *Impacts:* The time it takes for the town to recover from a significant flooding event would impact the ability to have community events. Local parks or businesses may not be able to operate.
Landslide/ Slope Failure	People	*Vulnerability:* The majority of landslide risk is associated with Kennecott Mine. This could include its employees. The slope on the north end of town has moderate susceptibility to landslides and could pose a risk to residents. *Impacts:* People could be injured if caught in a landslide. If the mine is affected, residents could lose wages or experience other impacts from possible closures or inability to work.
	Structures	*Vulnerability:* The majority of landslide risk is associated with Kennecott Mine. This could include its structures. The slope on the north side of town may pose a risk of landslide to nearby structures. *Impacts:* Homes could be damaged, and residents displaced. Repairs may be difficult or costly.
	Economic Assets	*Vulnerability:* The majority of landslide risk is associated with Kennecott Mine. *Impacts:* This could disrupt or halt mine operations and lead to loss of revenue and lost wages for employees.
	Natural, Historic, and	*Vulnerability:* Vegetation and environmental contamination are vulnerable to landslides.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
	Cultural Resources	*Impacts:* Landslide can impact local vegetation with excess debris in certain areas that may affect air or water quality. With Rio Tinto nearby, hazardous materials can seep into the soil or impact local wildlife and vegetation.
	Critical Facilities and Infrastructure	*Vulnerability:* Major roadways in and near Copperton, utilities, and emergency response are in landslide-susceptible areas. *Impacts:* Landslides could disrupt transportation to the town or to those who are employed at the Kennecott Mine. Managing debris after an incident would affect the ability of public works to complete their day-to-day duties. In addition, excess debris could affect essential services like power, water, medical facilities, police, and fire. Road access becomes an issue.
	Community Activities	*Vulnerability:* Community activities are vulnerable to landslides. *Impacts:* Community activities could be impacted if recreation areas, local businesses, or residential homes cannot be rebuilt or restored to their original condition.
Radon	People	*Vulnerability:* There are a significant number of properties throughout Copperton that have high radon levels. Seventy-seven percent of homes tested in the Copperton zip code have dangerous radon levels. *Impacts:* Radon increases risk of lung cancer for people exposed to it.
	Structures	Structures: Radon doesn't directly damage structures, but structural design or deterioration may contribute to radon accumulation. *Impacts:* Radon can seep through cracks in foundations or walls and accumulate in homes, putting occupants at risk of lung cancer. There are properties throughout Copperton with high radon levels. Radon kits are available through the state and other online services, but the cost may prevent people from purchasing them.
	Economic Assets	*Vulnerability:* Businesses and home values are vulnerable to high radon levels. *Impacts:* The cost of remediation for high radon levels and radon monitoring services may prevent people from reducing their radon levels. This can affect overall home prices and the local economy if it is known that the area has high radon levels.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Historical structures and the environment are vulnerable to radon exposure. *Impacts:* Local vegetation and wildlife can be impacted by radon. In addition, historical structures may be affected by radon, especially if it is not mitigated or they have poor ventilation. Older homes may have structural deterioration that contributes to radon entering the home.
	Critical Facilities and Infrastructure	*Vulnerability:* Fire station and community centers are vulnerable to radon. *Impacts:* Critical facilities and infrastructure may be impacted if there are high radon levels because remediation is required. Occupants may be exposed to radon. Radon may also impact access to critical facilities if people have existing health conditions.
	Community Activities	*Vulnerability:* Community activities have minimal vulnerability to radon exposure.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		Impacts: Radon poses a higher risk from long-term indoor exposure. Attendance at community activities, especially those held indoors, could be impacted if radon levels are high. Those who are immunocompromised or have existing health conditions may choose not to attend because of the health risks associated with radon.
Heavy Rain	People	*Vulnerability:* Heavy rain can occur anywhere in the city, and all individuals are potentially vulnerable. *Impacts:* Individuals may need rescuing from high waters. Waterborne hazardous materials from Kennecott Mine could pose an additional risk, especially if the Bingham Creek reservoir overflows. Unsheltered populations, young children, low-income individuals, and the elderly are a significant concern.
	Structures	*Vulnerability:* Structures near low-lying areas or impervious surfaces could be affected by ponding or high runoff during heavy rain. *Impacts:* Structures may be affected if they are exposed to localized flooding. This can include foundation damage, cracked pipes, damaged electrical systems, and mold. In addition, entire structures can be carried away if the water is moving very fast.
	Economic Assets	*Vulnerability:* All businesses in Copperton are vulnerable to heavy rain. *Impacts:* Heavy rain and localized flooding could interrupt commerce and cause major interruptions to Kennecott Mine. Repairs to damaged structures or infrastructure could be a significant cost if financial assistance is not provided or the homeowner does not have flood insurance.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Wildlife, vegetation, and waterways are vulnerable to heavy rain. *Impacts:* Flooding can impact local wildlife and flora/fauna with the sheer amount of water and debris that move into the area. Heavy rain can cause erosion and damage to habitats. Historical homes could also be damaged by flooding.
	Critical Facilities and Infrastructure	*Vulnerability:* Roads, utilities, and emergency response systems are vulnerable to heavy rain. *Impacts:* Localized flooding from heavy rain could damage roads and utilities, and carry hazardous materials. Access to emergency services, such as police, fire, and medical facilities, could be disrupted.
	Community Activities	*Vulnerability:* Outdoor events and recreation are vulnerable to heavy rain. *Impacts:* Outdoor events may be disrupted or canceled due to heavy rain. Local parks or businesses might not be able to operate. It may take significant time for the town to recover from damage caused by heavy rain.
High Wind	People	*Vulnerability:* All residents in Copperton can face risks during high wind events, especially those who are outdoors or near structures and trees. *Impacts:* Blowing debris, falling branches, and damaged infrastructure can cause injuries. Wind-related hazards may be especially dangerous for children, seniors, and individuals with mobility challenges, who may have limited ability to seek shelter quickly.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
	Structures	*Vulnerability:* Buildings in Copperton, particularly older homes, sheds, and fences, are vulnerable to wind-related damage. *Impacts:* Shingles can be lifted, windows shattered, and trees or utility poles may fall onto roofs or vehicles. Wind can also loosen signs and lightweight materials from commercial properties, creating additional hazards.
	Economic Assets	*Vulnerability:* Copperton businesses are vulnerable to high wind. *Impacts:* Storm damage can temporarily or permanently shut down small businesses, especially those without adequate insurance coverage. Clean-up costs and service disruptions can affect local commerce. Businesses that depend on consistent access to customers or transportation routes may experience revenue losses.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Copperton Park and historic homes are vulnerable to high wind. *Impacts:* Strong winds can damage trees, wildlife habitats, and park infrastructure in Copperton's green spaces. If historic landmarks or cultural sites are impacted and lack proper insurance or funding for repair, it may be difficult to restore them to their original condition.
	Critical Facilities and Infrastructure	*Vulnerability:* Power lines, roads, and emergency response systems are vulnerable to high wind. *Impacts:* Windstorms can down power lines, damage utility systems, and scatter debris across local roads, making emergency response more difficult. Disruptions to road access can delay fire, EMS, and law enforcement operations. Public infrastructure like water systems and electrical grids may also be affected, particularly in more remote parts of the community.
	Community Activities	*Vulnerability:* Outdoor events and recreation are vulnerable to high wind. *Impacts:* Outdoor gatherings, such as fairs or sporting events, may need to be canceled or delayed due to safety concerns during high wind events. Without proper shelter or medical staff on-site, the risk of injury during these storms increases.
Lightning	People	*Vulnerability:* Lightning presents a direct danger to anyone caught outside during storms, which potentially includes all Copperton residents. Those involved in recreation or outdoor work are most vulnerable. *Impacts:* Those in proximity to a lightning strike can be seriously injured or killed. Individuals may also be harmed by secondary effects of lightning, such as structure fires, electrical surges, or when lightning strikes water or conductive surfaces nearby.
	Structures	*Vulnerability:* Homes, barns, and outbuildings may be struck by lightning. *Impacts:* Lightning strikes can cause fires or electrical damage. Buildings without proper lightning protection systems are at higher risk, especially if they have outdated electrical infrastructure or are located in exposed areas.
	Economic Assets	*Vulnerability:* All Copperton businesses are vulnerable to lightning.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		Impacts: Fires or damage resulting from lightning strikes can cause costly repairs for local businesses. Prolonged closures may follow if critical systems are damaged. If such incidents are publicized, they may also impact the community's reputation for safety and deter new residents or business development.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Environment, wildfire risk, and risk to historic homes to lightning. *Impacts:* Lightning can ignite dry vegetation in Copperton, potentially sparking wildfires that damage ecosystems. Public safety and infrastructure, transportation, and other local resources may be overwhelmed by cascading effects like wildfires or medical surges. Historic buildings and cultural landmarks may be especially difficult to repair if they are not insured or if restoration resources are limited.
	Critical Facilities and Infrastructure	*Vulnerability:* Lightning can damage power infrastructure, communication towers, and electrical substations. *Impacts:* Damage to utilities can result in power outages or electrical surges. Medical responders could experience increased demand if lightning strikes cause injuries, and response efforts may be delayed if infrastructure is compromised.
	Community Activities	*Vulnerability:* Outdoor events, recreation, sports, and markets are vulnerable to lightning. *Impacts:* Outdoor events may be canceled due to lightning risks, particularly if shelter options are limited. Repeated interruptions during summer events could reduce attendance and engagement in community programs.
Severe Winter Storm	People	*Vulnerability:* All residents are potentially vulnerable. Cold snaps and snowstorms pose significant risks in Copperton, particularly for seniors, young children, low-income households, and unsheltered residents. *Impacts:* Individuals working outdoors, such as construction crews or service workers, are vulnerable to frostbite and hypothermia if safety precautions are not in place. Snow accumulation can also isolate residents who lack the means or ability to clear paths or driveways.
	Structures	*Vulnerability:* All structures are vulnerable to severe winter storms. *Impacts:* Buildings with flat or poorly maintained roofs are susceptible to collapse under heavy snow or ice loads. In older structures, pipes may freeze and burst during prolonged cold periods. Fluctuating temperatures can cause expansion and contraction of building materials, leading to gradual structural wear.
	Economic Assets	*Vulnerability:* All Copperton businesses to severe winter storms. *Impacts:* Local commerce may slow or halt altogether if roads remain uncleared or if facilities cannot maintain heat. Heating costs may rise for residents and businesses alike. Snow events may also interrupt operations for delivery services, contractors, and tourism-related businesses.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Parks, mature trees, and historic homes are vulnerable to severe winter storms. *Impacts:* Parks and trees can suffer from broken limbs and root damage due to ice buildup. Historical structures may also face

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		increased stress during severe weather, especially if roofs or foundations are not built to handle significant snow weight.
	Critical Facilities and Infrastructure	*Vulnerability:* Utilities, roads, and emergency response systems are vulnerable to severe winter storms. *Impacts:* Utilities in Copperton can be interrupted by ice or snow. If public works teams are unable to clear roads in a timely manner, emergency responders may be delayed. Extended exposure to cold can strain community infrastructure such as heating centers, water towers, and substations.
	Community Activities	*Vulnerability:* Community events are vulnerable to severe winter storms. *Impacts:* Outdoor events during the winter months may be canceled if snow removal and heating support are unavailable. Residents may be unable to attend community gatherings or access essential services if roads become impassable or cars fail to start in subzero temperatures.
Tornado	People	*Vulnerability:* Though rare, tornadoes remain a possibility in Copperton and all residents are at risk. *Impacts:* Tornadoes can cause serious injury or death. People in mobile homes or older, unreinforced structures are at greater risk. A tornado strike can disrupt transportation and limit access to hospitals, schools, and other essential services. Emergency responders may face increased demands due to injuries and displacement.
	Structures	*Vulnerability:* Homes, businesses, and public buildings are all vulnerable to tornadoes. *Impacts:* Structures may experience roof damage, shattered windows, or even full structural collapse during a tornado. Buildings without basements or safe rooms provide less protection. Recovery time can be lengthy, especially if damage is widespread.
	Economic Assets	*Vulnerability:* All Copperton businesses are vulnerable to tornadoes. *Impacts:* Businesses may close temporarily or permanently following a tornado, particularly if they lack insurance coverage or emergency funds. Job loss and economic disruption can follow, especially in small communities where businesses are tightly woven into local infrastructure and services.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Parks, natural plants and wildlife, and historic homes are vulnerable to tornadoes. *Impacts:* Tornadoes can damage vegetation, parks, and wildlife corridors in and around Copperton. Historical buildings made of older materials are especially vulnerable and may be difficult to restore. Loss of cultural spaces like community halls or public landmarks can have lasting emotional and economic effects.
	Critical Facilities and Infrastructure	*Vulnerability:* Utilities and emergency facilities, such as the fire station, are vulnerable to tornado damage. *Impacts:* Water and power services can be interrupted if distribution lines are affected. Blocked roads may prevent timely access for ambulances, fire trucks, or police vehicles. Re-establishing power and communications could take days, depending on the extent of destruction.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
	Community Activities	*Vulnerability:* Community centers and events are vulnerable to tornadoes. *Impacts:* Community centers and recreation facilities may be shut down for repairs, limiting access to programs and services. Outdoor events would need strong contingency plans or cancellations if tornado risks increase. Rebuilding efforts may take priority, reducing the availability of public spaces for months following a disaster.
Wildfire	People	*Vulnerability:* Copperton is located near the foothills of the Oquirrh mountains where wildfires are more likely than more urban areas. All residents are potentially at risk. *Impacts:* Urban interface wildfire areas can pose a health and safety hazard due to unpredictable or fast-moving fires. Residents may be evacuated from homes. Limited transportation routes to town could increase risk. There are health concerns about hazardous materials exposure if the fire starts at Rio Tinto and moves into Copperton. Wildfire smoke contributes to unhealthy air quality, which may impact Copperton residents even if the fire is not nearby.
	Structures	*Vulnerability:* All structures in Copperton are in close proximity to a moderate to high wildfire risk area and are at risk. Those closest to the foothills are at the highest risk. *Impacts:* Wildfire can damage structures and affect emergency services. If people do not have insurance, they may not be able to afford residential repairs.
	Economic Assets	*Vulnerability:* Local businesses could suffer if they do not have the funds to repair damage. If the area is prone to burning, there is also the reputational impact, where people do not want to visit if it is not safe or high risk.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Natural spaces and resources, such as vegetation and wildlife, as well as historic homes, are vulnerable to wildfires. *Impacts:* Wildfires can lead to the loss of natural spaces and wildlife habitats and may increase erosion. Historic buildings would need to be rebuilt. The extensive open space surrounding Copperton raises concerns about small brush fires that could grow. Nearby Rio Tinto land poses a risk, as any fire or chemical leak could impact Copperton's vegetation and wildlife.
	Critical Facilities and Infrastructure	*Vulnerability:* Fire station, utilities, and roadways are vulnerable to wildfires. *Impacts:* Interruptions to utilities and transportation are possible. Power could be turned off if it is deemed unsafe by Rocky Mountain Power. Road access and communications are concerns if emergency services cannot reach residents. Medical services would be impacted if they have to run on a generator or other limited power source.
	Community Activities	*Vulnerability:* Community activities and events are vulnerable to wildfires. *Impacts:* Events may be disrupted or possibly canceled, especially in outdoor areas like parks, if there is high wildfire risk. Areas with a lot of brush or natural vegetation present a high risk, which may deter people from engaging in recreation in those areas.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
Dam Failure	People	*Vulnerability:* There are three dams in Copperton, one ranked as high hazard and two rated as significant hazard—Kennecott Mine Bingham Creek, Kennecott Mine Small Reservoir, and Large Bingham Reservoir Distilling Basin. *Impacts:* The dams are located downslope of most residences and are not likely to directly impact people. However, access to emergency services, such as police, fire, or medical, support could be disrupted if the Kennecott Mine Bingham Creek Dam has a sunny day failure that spills into West Jordan. Public health could be impacted if there is no clean drinking water or if there is a power failure.
	Structures	*Vulnerability:* The Kennecott Mine Bingham Creek sunny day failure for dam inundation would impact surrounding jurisdictions. Direct vulnerability to Copperton structures is low. *Impacts:* Significant flooding could occur, impacting emergency vehicle access to and from Copperton.
	Economic Assets	*Vulnerability:* Business disruptions throughout Copperton are possible. *Impacts:* Flooding could cause substantial travel delays for residents and local businesses, which impacts the economy. Recovery efforts are tied to the amount of money or insurance people have to be able to rebuild after a dam failure. In addition, further inspections may be required for structures that are affected by a dam failure if there are any hazardous materials in the Rio Tinto-owned dams.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Vegetation, wildlife, and historic homes are vulnerable to dam failure. *Impacts:* Local vegetation and wildlife could be impacted if there is a dam failure. Historical buildings are at risk, especially if an insurance policy or adequate funds are not available to make repairs after flooding or other damage from a dam failure.
	Critical Facilities and Infrastructure	*Vulnerability:* Roads and downstream critical facilities are vulnerable to dam failure. *Impacts:* The Kennecott Mine Bingham Creek sunny day failure for dam inundation would impact surrounding jurisdictions. It could cause significant flooding and impact emergency vehicle access to and from Copperton.
	Community Activities	*Vulnerability:* All community events are vulnerable to dam failure. *Impacts:* Community activities would be affected, especially outdoor events, due to impacts on local vegetation, particularly if exposed to chemicals or other hazardous materials from the dam failure. Plants may not grow in certain areas, and it can also affect air quality.
Civil Disturbance	People	Possible risk to health or safety. A civil disturbance could overwhelm local resources and potentially impact access to emergency services if people are injured.
	Structures	Looting or damage to buildings is possible.
	Economic Assets	Theft or interruption of services/transportation. It can affect Copperton from a reputation standpoint if people are afraid to visit or live in the area after a civil disturbance. They may also be concerned about crime.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
	Natural, Historic, and Cultural Resources	Local business owners may be impacted if they cannot afford repairs associated with property damage.
	Critical Facilities and Infrastructure	Service/transportation interruption. Power and water service could be affected if they are struck or shut down. Police and fire could be impacted if roads are inaccessible.
	Community Activities	Outdoor community activities would be impacted if it is not safe or vandalism is likely.
Cyberattack	People	Communication interruptions or power failure is a concern for vulnerable populations.
	Structures	A cyberattack could impact the physical security of buildings or residential homes if the security system can be hacked into. In addition, a cyberattack could affect fire suppression systems or evacuation methods, which would exacerbate the issue.
	Economic Assets	Flow of commerce could be interrupted. This could impact payroll or other virtual systems for emergency services, local businesses, government services, or residential homes (like paying a mortgage or utility bill). If people cannot use the internet or are locked out a specific account, it is challenging to pay bills, complete projects, or access information.
	Natural, Historic, and Cultural Resources	Natural, historic, and cultural resources could be impacted if the cyberattack accesses critical infrastructure like water or power. This could disrupt the energy grid by manipulating data or overriding emergency systems. It could flood areas, redirect emergency services, or shut off power.
	Critical Facilities and Infrastructure	Delivery of utilities could be affected. In addition, critical infrastructure could be compromised if the hacker is asking for a ransom or the cyberattack cannot be resolved in a reasonable time for power/water infrastructure to come online. Shelters would have to be set up to provide essential services.
	Community Activities	Community activities can be impacted from a reputational perspective if there is no public trust. The public may not want to go to certain areas or visit local businesses in Copperton if they are affected by a cyberattack.
Hazardous Materials Incident (Transporta-tion & Fixed Facility)	People	High risk of exposure due to the proximity of the industrial mining operation. This can include respiratory illnesses or other health impacts from exposure.
	Structures	Could require people to evacuate or shelter in place. Structures would have to complete HazMat cleanup if they were exposed to hazardous materials or in the area affected by an incident.
	Economic Assets	Mainly would affect operations at Rio Tinto but could also affect small businesses in the town. Local businesses may not financially recover from business loss after hazmat clean up, whether that's from a reduction in customers or the amount of time they were closed.
	Natural, Historic, and	Could severely damage local vegetation. Natural, historical, and cultural resources would be affected by the exposure to hazardous materials. Remediation or ventilation may be needed.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
	Cultural Resources	
	Critical Facilities and Infrastructure	Possible interruption of essential services like fire, police, and EMS. Access to medical facilities could be impacted if there are significant road closures.
	Community Activities	Outdoor community activities could be impacted if the local vegetation was affected by the hazardous materials. Outdoor recreation may be a concern for vulnerable populations.
Public Health Epidemic/Pandemic	People	Direct risk due to contagious/severe illnesses. Vulnerable populations are especially at risk if they are exposed, which could overwhelm medical facilities or create a medical surge.
	Structures	If medical facilities are overwhelmed, additional local facilities or temporary structures may have to be identified to accommodate patients.
	Economic Assets	Interruptions of normal business operations, potential reduction in the workforce, and social distancing restrictions that can impact local businesses.
	Natural, Historic, and Cultural Resources	Increased use of outdoor spaces as seen with the COVID-19 pandemic. Restricted access to outdoor areas or historical buildings if social distancing is required. This can also impact the visitation to those areas if people do not want to socially distance or are afraid of the potential exposure.
	Critical Facilities and Infrastructure	Increased use of public health resources, leading to a medical surge. Illness for public safety or healthcare professionals if they are working with or exposed to patients experiencing symptoms.
	Community Activities	Community activities and events would be impacted by social distancing requirements. People may opt for virtual instead of in-person activities.
Terrorism	People	People could be scared to recreate outside due to previous terrorism events or could sustain injuries from a terrorism event.
	Structures	Structures could sustain damage from a terrorism event and the owner's financial situation could affect their ability to make repairs. If it is commercial property, they may be concerned about future terrorism events and choose to relocate.
	Economic Assets	The reputation of the area post-terrorism event could affect the local businesses, whether those are existing or new. A new business may not want to move into the area if the land or building was previously affected by a terrorism event. In addition, the terrorism event could be costly for a resident or local business to make needed damage repairs.
	Natural, Historic, and Cultural Resources	Historic buildings or cultural resources could be impacted if there is lower visitation by locals or tourists. Local wildlife may migrate into a different area if there is significant activity in where they typically go.
	Critical Facilities and Infrastructure	Critical facilities and infrastructure would be affected by a targeted terrorism event. Essential employees may not be able to perform their

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		job duties and water/power infrastructure could be shut down or damaged.
	Community Activities	Community activities could be affected by a terrorism event if the reputation of the area declines. If it is deemed unsafe or if there are multiple incidents in the same area, people won't want to recreate or attend events.

Hazards Not Profiled

Avalanche has been omitted from further discussion of hazard impacts and from mitigation actions. As shown in the description in Volume 1, avalanche risk is primarily in the Wasatch Mountains in SLCo. No previous occurrences of avalanche have impacted Copperton.

Jurisdiction-Specific Changes in Vulnerability

Hazard events can impact communities, infrastructures, and ecosystems. The severity of these impacts can be influenced by climate change, population patterns, and land use developments. Understanding these factors is crucial for the town of Copperton to develop a resilient community and minimize the impacts of hazards.

Table 8 displays the unique changes within the community and the related effects on each identified hazard affecting the town of Copperton.

Table 8: Jurisdiction-Specific Changes in Vulnerability in the Town of Copperton

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
Avalanche	N/A	N/A	N/A	N/A
Drought	Extreme or unusual weather, lack of rainfall, decreased snowpack	An increased population has led to greater need for water resources, such as for cooling, landscape maintenance, commercial businesses, and emergency services. Population has increased since 2019.	Increased development in Rio Tinto may also increase its water needs.	Increased due to climate change and population growth
Earthquake	Extreme or unusual weather patterns, increased greenhouse gas emissions, and	Increased road use with an increased population.	Increased development at Rio Tinto could increase the risk of seismic events in Copperton.	Same

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	rising sea levels can trigger seismic activity.			
Extreme Heat	Extreme or unusual weather, drought, less local vegetation, wildlife, and snowpack Increases in extreme heat can be closely related to increased impacts of drought and wildfire.	An increased population requires more water use for essential services, local businesses, and landscaping. In addition, resources like cooling facilities for vulnerable populations are needed.	There have been minimal changes in land use and development in Copperton since the previous hazard mitigation plan update.	Increased due to climate change and the increased population
Extreme Cold	Extreme or unusual weather, reduction in local vegetation and wildlife	The increased population may place a strain on local resources, such as power and water infrastructure to run essential services or the staffing needed at warming centers for vulnerable populations.	There have been minimal changes in land use and development in Copperton since the previous hazard mitigation plan update.	Increased due to climate change and the increased population
Flooding	Extreme/ unusual weather (like heavy rain events, preventing the soil from absorbing moisture), excess debris, contamination and disease	Vulnerable populations (the elderly, young children, and unsheltered) may be impacted by flooding if they cannot seek shelter or get out of the flood zone in time. The increased population can also impact essential services, creating a medical surge if people are injured.	There have been minimal changes in land use and development in Copperton since the previous hazard mitigation plan update.	Increased due to climate change and the increased population
Landslide/ Slope Failure	Drought, decreased snowpack, variable rain patterns can all contribute to changes in soil moisture and slope stability.	The number of workers at Rio Tinto could impact evacuation procedures and overwhelm Copperton if people are moving into the area. There could be a medical surge due to population growth in Copperton.	The increased development at the neighboring Rio Tinto site could impact Copperton through landslide and/or slope failure.	Increased due to climate change and population growth

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
Radon	Greater exposure to radon if we continue to see higher temperatures (permafrost thawing allows radon to seep through).	The continued activity in Rio Tinto as well and the population growth in Copperton places mores people at risk.	There have been minimal changes in land use and development in Copperton since the previous hazard mitigation plan update.	Same but population growth increases the number of people exposed to hazard
Heavy Rain	Extreme or unusual weather, flooding, landslides, soil or crop damage, water quality	Heavy rain could cause flooding which would impact residential areas and local businesses. It could also disrupt or prevent timely response from emergency vehicles if roadways are flooded or blocked by debris.	There have been minimal changes in land use and development in Copperton since the previous hazard mitigation plan update.	Increased due to climate change and population growth.
High Wind	Extreme or unusual weather, air quality, water quality, soil erosion	Vulnerable populations (the elderly, young children, and unsheltered) would be impacted if they cannot seek shelter. They would also be the most affected by poor air or water quality.	Materials from increased development at Rio Tinto could be pushed into Copperton, affecting water, soil, and air quality.	Increased due to climate change
Lightning	Extreme or unusual weather, increased likelihood of fires, air pollution, greenhouse gas emissions	Vulnerable populations (the elderly, young children, and unsheltered) may not be able to find or take shelter.	There have been minimal changes in land use and development in Copperton since the previous hazard mitigation plan update.	Increased due to climate change and population growth
Severe Winter Weather	Extreme or unusual weather, less outdoor recreation or investment in local economy (not going out to eat, attending community events, or commuting in/out of town)	The population growth places socially vulnerable groups at risk, especially if heavy snow is associated with a Code Blue alert where shelters must increase their capacity. Heavy snow can also place a strain on fire, police, and EMS if there are car accidents or falls.	There have been minimal changes in land use and development in Copperton since the previous hazard mitigation plan update.	Increased due to climate change and population growth

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
Tornado	Possible increase in severe thunderstorms; diminished quality of air, water, and soil	Vulnerable populations (the elderly, young children, and unsheltered) are most at risk of serious injury.	There have been minimal changes in land use and development in Copperton since the previous hazard mitigation plan update.	Same
Wildfire	Extreme or unusual weather, soil erosion, landslides, drought, lack of vegetation, higher temperatures	Rebuilding is a concern for local homeowners if they do not have the funds or an insurance policy.	There have been minimal changes in land use and development in Copperton since the previous hazard mitigation plan update.	Increased due to climate change and population growth
Dam Failure	Increased precipitation, soil erosion, air quality, water quality, reduction in local wildlife and vegetation	Dam failures could spill into surrounding jurisdictions, affecting access to and from Copperton. This can place a strain on emergency services (police, fire, and EMS)	There have been minimal changes in land use and development in Copperton since the previous hazard mitigation plan update.	Same
Civil Disturbance	N/A	A civil disturbance can overwhelm emergency services (police, fire, and EMS), and affect road access to and from Copperton, especially if there is debris.	There have been minimal changes in land use and development in Copperton since the previous hazard mitigation plan update.	Same
Cyberattack	N/A	In an increasingly digital world, Copperton is vulnerable to cyberattacks on critical infrastructure, which would impact water and power. In addition, police and fire systems could be disrupted. Payroll for local employees or businesses could be hacked into.	There have been minimal changes in land use and development in Copperton since the previous hazard mitigation plan update.	Same
Hazardous Materials Incident (Transporta-	N/A	Increased activity on roads presents a greater risk to the population. If roads are	Increased development at Rio Tinto could expose Copperton to	Same

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
tion & Fixed Facility)		inaccessible due to a hazmat incident, it prevents emergency vehicles from responding quickly.	hazardous materials, which would impact air, water, and soil quality.	
Public Health Epidemic/ Pandemic	N/A	Essential services could become overwhelmed, preventing timely medical response.	There have been minimal changes in land use and development in Copperton since the previous hazard mitigation plan update.	Same
Terrorism	N/A	If roads are blocked or inaccessible, it prevents timely public safety response.	There have been minimal changes in land use and development in Copperton since the previous hazard mitigation plan update.	Same

Additional Public Involvement

The town of Copperton provided several opportunities for public participation. Figure 1 and Figure 2 present examples of public outreach.

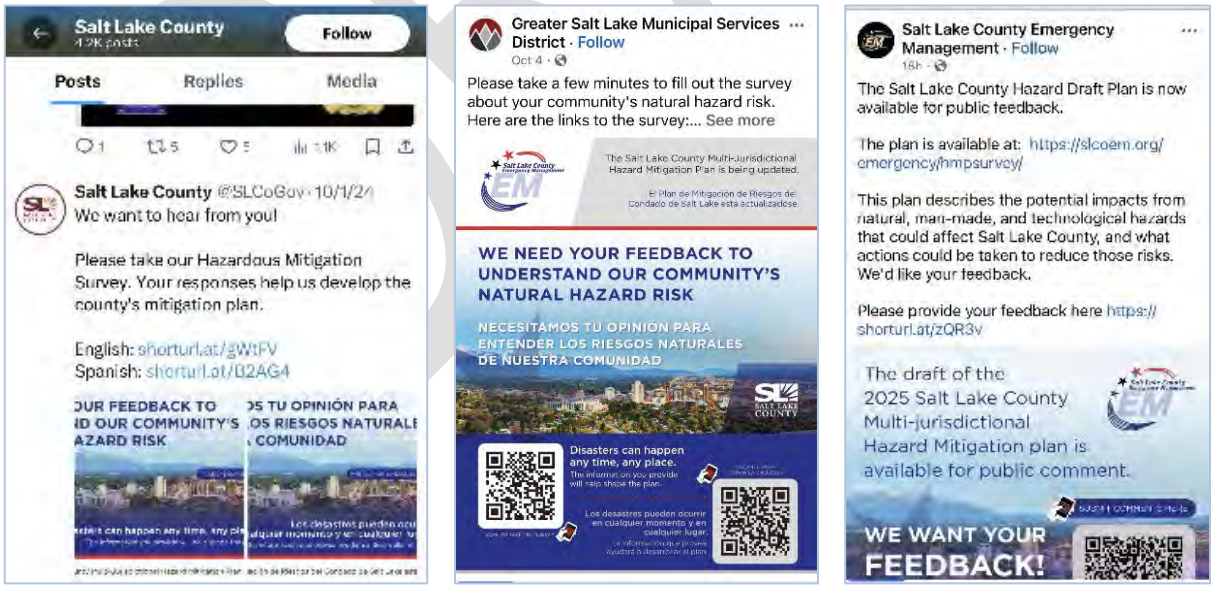

Figure 1: Social Media Posts for the Hazard Mitigation Survey (*left*), from the Municipal Services District (*middle*), and for the Draft Plan Review (*right*)

Figure 2: Mitigation Survey at Copperton Park Community Event

Plan Integration

Incorporating the underlying principles of the Hazard Mitigation Plan and its recommendations into other plans is a highly effective and low-cost way to expand their influence. All plan participants will use existing methods and programs to implement hazard mitigation actions where possible. As previously stated, mitigation is most successful when it is incorporated into the day-to-day functions and priorities of government and public service. This plan builds on the momentum developed through previous and related planning efforts and mitigation programs, and it recommends implementing actions where possible through these other program mechanisms. These existing mechanisms include the following:

- Regularity Capabilities
- Administrative Capabilities
- Fiscal Capabilities

Respective planning stakeholders will conduct implementation and incorporation into existing planning mechanisms and will be done through the routine actions of:

- Monitoring other planning/program agendas
- Attending other planning/program meetings
- Participating in other planning processes; and
- Monitoring community budget meetings for other community program opportunities.

The successful implementation of this plan will require constant and vigilant review of existing plans and programs for coordination and multi-objective opportunities that promote a safe, sustainable community. Regular efforts should be made to monitor the progress of mitigation actions implemented through other

DRAFT

planning mechanisms. Where appropriate, priority actions should be incorporated into planning updates. Table 9 lists existing planning mechanisms in which the Hazard Mitigation Plan has been integrated.

Table 10 lists the opportunities for integrating elements of this plan into other plans.

Table 9: Integration of Previous Plans by the Town of Copperton

Plan	Description
Community Wildfire Protection Plan	Addresses wildfire vulnerability and potential mitigation actions.

Table 10: Opportunities for Integration with Future Plans of the Town of Copperton

Plan	Description
CEMP – Comprehensive Emergency Management Plan	Framework to prepare for, mitigate, respond to, and recover from hazards
Copperton General Plan	This document guides future development for Copperton and sets goals for the community
Copperton Active Transportation Plan	Creating safe local and regional connections for people walking, biking, and rolling.

Capability Assessment

Local mitigation capabilities are existing authorities, policies, programs, and resources that reduce hazard impacts or could help carry out hazard mitigation activities.

Planning and Regulatory Capabilities

Planning and regulatory capabilities are the plans, policies, codes, and ordinances that prevent and reduce the impacts of hazards.

Table 11: Assessment of the Planning Capabilities of the Town of Copperton

Plan	Does it address hazards? (Y/N)	How can it be used to implement mitigation actions?	When was the last update? When is the next update?
General Plan	Y	Review the actions identified in the general plan and how they can be updated or incorporated into the hazard mitigation plan.	2020
Capital Improvement Plan	Y	Master storm drain plan study can inform hazards like flooding.	Updated in the MSD 2024 Strategic Plan
Climate Change Adaptation Plan	N	N/A	N/A

Table 12: Assessment of the Regulations and Ordinances of the Town of Copperton

Regulation/ Ordinance	Does it effectively reduce hazard impacts?	Is it adequately administered and enforced?	When was the last update? When is the next update?
Building Code	Building codes ensure that structures are built to standard and brought up to code when remodeling occurs. Copperton has several commercial buildings. The town has adopted the International Building Code (IBC 2021) and International Residential Code (IRC 2021) as adopted by the state with amendments as well as Appendix C, Group U and Appendix K of the IBC.	Unknown	2023
Flood Insurance Rate Maps	Y	Yes	2022
Floodplain Ordinance	N	Yes	2023
Subdivision Ordinance	Varies	Yes	2024
Zoning Ordinance	Varies	Yes	2023

Regulation/ Ordinance	Does it effectively reduce hazard impacts?	Is it adequately administered and enforced?	When was the last update? When is the next update?
Natural Hazard-Specific Ordinance (Stormwater, Steep Slope, Wildfire)	Y – Wildfire & Stormwater No steep slopes in Copperton (outside copper mine)	Yes	Will be updated in 2025.
Acquisition of Land for Open Space and Public Recreation Use	Copperton is built out to its boundaries in all directions. New growth is only when land is rezoned or repurposed.	Yes	2023
Prohibition of Building in At-Risk Areas	Y	Yes	2023
Other? (Describe)			

Administrative and Technical Capabilities

Administrative and technical capabilities include staff and their skills. They also include tools that can help carry out mitigation actions.

Table 13: Assessment of the Administrative Capabilities of the Town of Copperton[3]

Administrative Capability	In Place? (Y/N)	Is staffing adequate?	Are staff trained on hazards and mitigation?	Is coordination between agencies and staff effective?
Chief Building Official	Y via MSD	Yes	Yes	Yes
Civil Engineer	Y (MSD)	Yes	Yes	Yes
Community Planner	Y(MSD)	Yes	Yes	Yes
Emergency Manager	Y, MSD-appointed	Yes; however, the appointee might have other job duties	Yes	Yes
Floodplain Administrator	Y, MSD	Yes	Yes	Yes
Geographic Information System (GIS) Coordinator	Y, MSD	Yes	Yes	Yes
Planning Commission	Y	Yes	Yes	Yes
Fire Safe Council	N – UFA is their fire department.	N/A	N/A	N/A

[3] LDS = Church of Jesus Christ of Latter-Day Saints, MSD = Municipal Services District, UFA = Unified Fire Authority.

Administrative Capability	In Place? (Y/N)	Is staffing adequate?	Are staff trained on hazards and mitigation?	Is coordination between agencies and staff effective?
CERT (Community Emergency Response Team)	N	N/A	N/A	N/A
Active VOAD (Voluntary Agencies Active in Disasters)	Y	No, more is needed. Work with LDS, Southern Baptist Disaster Relief, Salvation Army, and Habitat for Humanity.	Yes	Could be improved.

Table 14: Assessment of the Technical Capabilities of the Town of Copperton[4]

Technical Capability	In Place? (Y/N)	How has it been used to assess/mitigate risk in the past?	How can it be used to assess/mitigate risk in the future?
Mitigation Grant Writing	Y, MSD	Copperton is part of the MSD. All services are currently contracted out – UFA, UPD, public works, or through the MSD.	Copperton can apply for hazard mitigation grant funding to complete projects or studies.
Hazard Data and Information	Y, MSD	Provide information for studies and inform Copperton, the MSD, and the general public of different hazards that affect the community to drive change.	Actions from the general plan that identified known hazards and issues can information mitigation actions in the hazard mitigation plan update.
GIS	Y, MSD	Maps were created to show different hazards in the General Plan and the stormwater master plan.	The maps and GIS data can inform mitigation actions for the hazard mitigation plan update to reduce risk.
Mutual Aid Agreements	Y, MSD and SLCo	Mutual aid agreements for police (UPD), fire (UFA), public works (SLCo PW)	Mutual aid agreements strengthen Copperton's resilience.
Other? (Please describe)			

Financial Capabilities

Financial capabilities are the resources to fund mitigation actions. Talking about funding and financial capabilities is important to determine what kinds of projects are feasible, given their cost. Mitigation

[4] MSD = Municipal Services District, SLCo PW = Salt Lake County Public Works, UFA = Unified Fire Authority, UPD = Unified Police Department.

actions like outreach programs are lower cost and often use staff time and existing budgets. Other actions, such as earthquake retrofits, could require substantial funding from local, state, and federal partners. Partnerships, including those willing to donate land, supplies, in-kind matches, and cash, can be included.

Table 15: Assessment of the Financial Capabilities of the Town of Copperton

Funding Resource	In Place? (Y/N)	Has it been used in the past and for what types of activities?	Could it be used to fund future mitigation actions?	Can it be used as the local cost match for a federal grant?
Capital Improvement Project Funding	Y	Yes, Master Storm Drain Plan	Yes	Unknown
General Funds	Y	Unknown	Unknown	Unknown
Hazard Mitigation Grant Program (HMGP/404)	N	Could apply for funding but have not in the past.	Yes	Unknown
Building Resilient Infrastructure & Communities (BRIC)	N	Could apply for funding but have not in the past.	Yes	Unknown
Flood Mitigation Assistance (FMA)	N	Could apply for funding but have not in the past.	Yes	Unknown
Public Assistance Mitigation (PA Mitigation/406)	N	Could apply for funding but have not in the past.	Unknown	Unknown
Community Development Block Grant (CDBG)	N	Could apply for funding but have not in the past.	Yes	Unknown
Natural Resources Conservation Services (NRCS) Programs	N	Could have done studies related to the Bingham Canyon Mine.	Unknown	Unknown
U.S. Army Corps (USACE) Programs	N	Unknown	Unknown	Unknown
Property, Sales, Income, or Special Purpose Taxes	Y	Unknown	Unknown	Unknown
Stormwater Utility Fee	Y	Copperton Improvement District manages.	Unknown	Unknown
Fees for Water, Sewer, Gas, or Electric Services	Y	Unknown	Unknown	Unknown
Impact Fees from New Development and Redevelopment	Y	Unknown	Unknown	Unknown

Funding Resource	In Place? (Y/N)	Has it been used in the past and for what types of activities?	Could it be used to fund future mitigation actions?	Can it be used as the local cost match for a federal grant?
General Obligation or Special Purpose Bonds	Unknown	Unknown	Unknown	Unknown
Federal-funded Programs (Please describe)	Unknown	Unknown	Unknown	Unknown
Private Sector or Nonprofit Programs	Wasatch Front Regional Council	Provided a $73,500 grant to fund an Active Transportation Plan and Connectivity Ordinance	Yes	Unknown
Other?				

Education and Outreach Capabilities

Education and outreach capabilities are programs and methods that could communicate about and encourage risk reduction. These programs may be run by a participant or a community-based partner. Partners, especially those who work with underserved communities, can help identify additional education and outreach capabilities.

Table 16: Assessment of the Education and Outreach Capabilities of the Town of Copperton[5]

Education and Outreach Capability	In Place? (Y/N)	Does it currently incorporate hazard mitigation?	Could it be used to support mitigation in the future?
Community Newsletter(s)	Y	Unknown	Yes
Hazard Awareness Campaigns (such as Firewise, Storm Ready, Severe Weather Awareness Week, School Programs)	Y	Yes	Yes
Public Meetings/Events (Please Describe)	Y	Yes	Yes
Emergency Management Listserv	Y, through MSD/UFA	Yes	Yes
Local News	Y	Yes	Yes
Distributing Hard Copies of Notices (e.g., public libraries, door-to-door outreach)	Y	Unknown	Yes

[5] IPAWS = Integrated Public Alert and Warning System, MSD = Municipal Services District, SLCo EM = Salt Lake County Emergency Management, UFA = Unified Fire Authority.

Education and Outreach Capability	In Place? (Y/N)	Does it currently incorporate hazard mitigation?	Could it be used to support mitigation in the future?
Insurance Disclosures/Outreach	N	N	N
Organizations that Represent, Advocate for, or Interact with Underserved and Vulnerable Communities (Please Describe)	Y	Yes	Yes
Social Media (Please Describe)	Y	Facebook and Instagram. Use Wireless Emergency Alert (WEA) for emergency alerts and coordinate with SLCo EM for an IPAWS.	Yes
Other? (Please Describe)			

Opportunities to Expand and/or Improve Capabilities

Actions that can expand and improve existing authorities, plans, policies, and resources for mitigation include budgeting for mitigation actions, passing policies and procedures for mitigation actions, adopting and implementing stricter mitigation regulations, approving mitigation updates, and making additions to existing plans as new needs are recognized. Table 17 lists the opportunities for the town of Copperton.

Table 17: Opportunities to Expand or Improve the Capabilities of the Town of Copperton[6]

Capability	Opportunity to Expand and/or Improve
Planning and Regulations	Copperton can adopt the CEMP created by the SLCo EM/MSD planners. In addition, the CEMP will have annexes added to it that address specific hazards. To address the unknowns in planning and regulatory capabilities, there are several opportunities for improvement and expansion. First, it is essential to conduct a detailed review of the General Plan, Capital Improvement Plan, Community Wildfire Protection Plan, and other relevant plans to update them. This will help in understanding how these plans can be better used to implement mitigation actions. For the Capital Improvement Plan, the integration of the master storm drain plan can be expanded to include broader flood hazard mitigation measures. This can help inform future infrastructure investments and improve overall community resilience to flooding. The Land Use Plan provides a historical context that can inform future efforts and mitigation actions. By updating the plan with recent data and trends, the community can better anticipate and manage future risks. Similarly, the CEMP should continue to be regularly updated, with the vulnerabilities and hazards identified being used to inform targeted mitigation strategies.

[6] CEMP = Comprehensive Emergency Management Plan, MSD = Municipal Services District, SLCo EM = Salt Lake County Emergency Management

Capability	Opportunity to Expand and/or Improve
	For the Stormwater Management Plan, which was last updated in 2022, regular reviews and updates are needed to ensure that it remains effective in addressing flooding-related hazards. The Transportation Plan, due for an update in 2024, should include considerations for public safety and mitigation actions related to transportation infrastructure. In terms of regulations and ordinances, assessing the Building Code's effectiveness in reducing hazard impacts and ensuring that it is adequately administered and enforced is crucial. This includes understanding the last update and planning for future updates. The same approach should be applied to the Flood Insurance Rate Maps, Floodplain Ordinance, Subdivision Ordinance, and Zoning Ordinance, with a focus on identifying and addressing any gaps in hazard mitigation.
Administrative and Technical	Many positions and technical capabilities that support effective mitigation action implementation are coordinated by the MSD on Copperton's behalf. One local opportunity to expand capabilities is through engaging community-based organizations, such as voluntary agencies active in disasters. By engaging the LDS, Southern Baptist Disaster Relief, Salvation Army, and Habitat for Humanity, Copperton can leverage volunteer resources to build safer homes, implement hazard awareness campaigns and increase community resilience.
Financial	To address the unknowns in financial capabilities, there are several opportunities for improvement and expansion. First, conducting a comprehensive assessment to identify existing funding resources and their past use is crucial. This will provide clarity regarding which resources have been used for specific activities and their potential to fund future mitigation actions. For instance, evaluating the use of Capital Improvement Project Funding and General Funds in past activities will help determine their effectiveness and how they can be leveraged for future mitigation efforts. Next, exploring opportunities to apply for various grant programs, such as the Hazard Mitigation Grant Program (HMGP/404), Building Resilient Infrastructure and Communities (BRIC), Flood Mitigation Assistance (FMA), Public Assistance Mitigation (PA Mitigation/406), and Community Development Block Grant (CDBG), can significantly enhance financial capabilities. These grants, although not previously used, can provide substantial funding for mitigation actions if successfully obtained. Engaging with state and federal partners, as well as private sector and nonprofit organizations, can open doors to additional funding resources. For example, partnerships with the Natural Resources Conservation Service (NRCS) and the U.S. Army Corps of Engineers (USACE) can be explored for studies and projects related to specific hazards, such as the Bingham Canyon Mine. Similarly, the Wasatch Front Regional Council's grant for the Active Transportation Plan and Connectivity Ordinance demonstrates the potential for securing funds from regional entities. For revenue-generating options, such as property, sales, income, or special purpose taxes, and fees for water, sewer, gas, or electric services, it is essential to evaluate their contribution to mitigation actions and their potential to serve as local cost matches for federal grants. Understanding the role of these resources in supporting mitigation efforts will help in planning and allocating budgets effectively. Regularly reviewing and updating the financial capability assessment will ensure that the community remains well-equipped to handle future challenges. By addressing these opportunities, the community can strengthen its financial capabilities, making it more feasible to implement a wide range of mitigation actions and enhance overall resilience to hazards.

DRAFT

Capability	Opportunity to Expand and/or Improve
Education and Outreach	Copperton can develop more hazard-specific public outreach and engagement programs. In addition, evaluating the effectiveness of methodologies of public outreach such as the distribution of hard copies of notices and exploring ways to enhance this method, such as increasing distribution points or collaborating with local organizations, can improve outreach efforts. Insurance disclosures and outreach are currently unknown, presenting an opportunity to collaborate with insurance companies to integrate hazard mitigation information into their communications with policyholders. This can help raise awareness and encourage proactive risk-reduction measures among residents. For social media, developing a comprehensive strategy that includes regular updates on hazard mitigation, interactive posts, and the use of analytics to measure effectiveness can enhance outreach capabilities. Expanding the use of social media platforms beyond Facebook and Instagram can also increase the reach and impact of mitigation messages.

Mitigation Strategy

Mitigation strategies provide proactive measures that are designed to minimize the impacts of hazards on the town of Copperton. Table 18 shows mitigation action alternatives, and

Table 19 shows the status of previous mitigation activities. Table 20 is the 2025 mitigation action plan for the town of Copperton.

Table 18: Mitigation Action Alternatives for the Town of Copperton

Action	Type of Action	Selected for inclusion in the plan?	If not selected, why not?
Continue social media engagement	Education and Awareness Programs		
Adopt new building codes as they are approved to bring some existing structures up to current codes	Structure and Infrastructure Projects		

Table 19: Status of Prior Mitigation Actions of the Town of Copperton

Action	Hazard(s)	Lead Agency	Support Agency(ies)	Status Update
Conduct seismic retrofitting and implement a program for residents similar to the "Fix the Bricks" initiative.	Earthquake	Copperton	Municipal Services District (MSD)	Ongoing, not yet completed
Provide additional education and materials to the public regarding the earthquake risk and potential mitigation actions that can be taken.	Earthquake	Copperton	MSD	Ongoing

DRAFT

Table 20: 2025 Mitigation Action Plan for the Town of Copperton[7]

#	Action	Hazard(s)	Lead Agency	Potential Partners	Benefits (Losses Avoided)	Cost Estimate	Funding Source(s)	Timeframe	Priority	Comments
1	Enhance security at critical infrastructure locations to prevent potential terrorist acts.	Terrorism	MSD	Copperton, SLCo EM, UPD, UFA, SLCo IT, SLCo PW, SLCo Clerk's Office, SLCo Sheriff's Office	Increases security protocols (both in technology and policy) for staff/first responders, clarifies expectations/understanding for local jurisdictions and the public.	High	MSD General Fund–Copperton, SLCo EM General Fund, UPD General Fund, SLCo Sheriff's Office General Fund, UFA General Fund, SHSP grant	Short term	Medium	
2	Develop and implement public education programs on disaster awareness and mitigation.	Civil Disturbance, Dam Failure, Drought, Wildfire, Earthquake, Extreme Heat, Flooding, Hazardous Materials Incident, Heavy Rain, High Wind, Landslide, Lightning, Public Health Epidemic, Radon, Severe Winter Weather, Terrorism, Tornado, Wildfire	Copperton	MSD, UFA, UPD, SLCo Sheriff's Office, SLCo PW, SLCo EM	Improves understanding of local resources and strengthens relationships with the public and stakeholders. Outlines plans/SOPs for programs. Shares information digitally and in person on topics such as how to complete non-structural retrofits on homes to reduce the risk of earthquakes and home weatherization for extreme cold/severe winter weather events.	Low	MSD General Fund–Copperton, SLCo EM General Fund	Short term	Medium	
3	Integrate WebEOC, Crisis Track, GIS, and other technological enhancements.	Civil Disturbance, Dam Failure, Drought, Wildfire, Earthquake, Extreme Heat, Flooding, Hazardous Materials Incident, Heavy Rain, High Wind, Landslide, Lightning, Public Health Epidemic, Radon, Severe Winter Weather, Terrorism, Tornado, Wildfire	Copperton	MSD, SLCo EM, UFA, UPD, SLCo PW, SLCo Health Department	Provides a common operating platform for stakeholders, increases situational awareness, and improves response time.	Low	MSD General Fund–Copperton, SLCo EM General Fund, UFA General Fund	Medium term	Medium	Copperton already has this software; need to improve training and documentation.
4	Enhance and continue to promote the implementation of CERT and SAFE Hubs.	Civil Disturbance, Dam Failure, Drought, Wildfire, Earthquake, Extreme Heat, Flooding, Hazardous Materials Incident, Heavy Rain, High Wind, Landslide, Lightning, Public Health Epidemic, Radon, Severe Winter Weather, Terrorism, Tornado, Wildfire	Copperton	MSD, SLCo EM	Improves awareness of local resources.	Low	MSD General Fund–Copperton, SLCo EM General Fund, State of Utah DEM General Fund	Short term	Medium	SAFE Hubs, previously S.A.F.E. Neighborhoods, is going through a rebrand with a new public awareness campaign and information for all partners.
5	Establish access and functional needs registry and improve incorporation of those with access and functional needs in plans.	Civil Disturbance, Dam Failure, Drought, Wildfire, Earthquake, Extreme Heat, Flooding, Hazardous Materials Incident, Heavy Rain, High Wind, Landslide, Lightning, Public Health Epidemic, Radon, Severe Winter	Copperton	SLCo EM, MSD, UFA, UPD, SLCo Sheriff's Office	Improves situational awareness for the public and stakeholders, provides greater understanding of resources available for those with access and functional needs.	Low	MSD General Fund–Copperton, SLCo EM General Fund, State of Utah DEM staff time	Short term	High	The state of Utah's Access and Functional Needs Registry is dissolving in 2025. The county needs a way to account for those with access and functional needs, including

[7] ATF = Bureau of Alcohol, Tobacco, Firearms and Explosives, BRIC = Building Resilient Infrastructure and Communities, CWDG = Community Wildfire Defense Grant, DEM = Department of Emergency Management, DHS = Department of Homeland Security, EMPG = Emergency Management Performance Grant, FBI = Federal Bureau of Investigation, FEMA = Federal Emergency Management Agency, FMA = Flood Mitigation Assistance, HHPD = High Hazard Potential Dam, HMA = Hazard Mitigation Assistance, HMGP = Hazard Mitigation Grant Program, LEPC = Local Emergency Planning Committee, MSD = Municipal Services District, NWS = National Weather Service, SIAC = Statewide Information and Analysis Center, SHSP = State Homeland Security Program, SLC = Salt Lake City, SLCo EM = Salt Lake County Emergency Management, SLCo IT = Salt Lake County Information Technology, SLCo PW = Salt Lake County Public Works, SOP = Standard Operating Procedure, UDOT = Utah Department of Transportation, UFA = Unified Fire Authority, UPD = Unified Police Department

#	Action	Hazard(s)	Lead Agency	Potential Partners	Benefits (Losses Avoided)	Cost Estimate	Funding Source(s)	Timeframe	Priority	Comments
		Weather, Terrorism, Tornado, Wildfire								incorporation into plans/SOPs.
6	Bring deficient high hazard dams up to current industry standards.	Dam Failure	Dam owners	Water companies, SLCo EM, MSD, Copperton	Preserves life and safety (personal injuries, safety of first responders), reduces damage to critical infrastructure.	High	MSD General Fund- PW Operations Copperton, MSD Capital Projects Fund, SLCo PW Operations Fund, dam owners, water districts, State of Utah DWR General Fund and staff time, HHPD grant	Long term	High	
7	Procure generators and transfer switches for critical facilities.	Extreme Heat	MSD	Copperton, SLCo EM, SLCo Facilities Management, local public utilities, Rio Tinto	Provides backup generators for cooling centers and Code Blue centers. Ensures accurate inventory of what the county has to provide to other agencies or jurisdictions as needed.	Medium	SLCo PW General Fund, MSD General Fund– Copperton, HMA grant	Long term	Medium	
8	Increase the size of culverts and bridges.	Flooding	MSD	SLCo EM, SLCo PW, Copperton	Allows for larger runoff during spring melt season, reduces the amount of debris buildup.	High	SLCo PW General Fund, UDOT Operational Fund, MSD Capital Projects– Copperton, HMGP, FMA grant	Long term	Medium	
9	Procure Flood Mitigation Assistance (FMA) grants.	Flooding	SLCo EM	Copperton, SLCo PW, MSD	Improves understanding of grants available and how money can be used for mitigation efforts.	Low	HMGP, FMA grant, SLCo EM General Fund, MSD General Fund–Copperton, State of Utah DEM staff time	Long term	Medium	
10	Develop an enhanced emergency notification communication system for Copperton.	Civil Disturbance, Dam Failure, Drought, Earthquake, Extreme Heat, Flooding, Hazardous Materials Incident, Heavy Rain, High Wind, Landslide, Lightning, Public Health Epidemic, Radon, Severe Winter Weather, Terrorism, Tornado, Wildfire	SLCo EM	MSD, UFA, UPD, UDOT	Provides early notification of impending wildfires to decrease loss of life. Improves relationships with the public and stakeholders. Ensures faster delivery of information with templates and plans ready to go.	Medium	MSD General Fund– Copperton, SLCo EM General Fund, Next Generation Warning System grant, EMPG	Short term	Medium	
11	Promote the Firewise Initiative and regularly review/ update the Community Wildfire Protection Plan (CWPP).	Wildfire	UFA	SLCo EM, MSD, Copperton, FFSL	Increases awareness of plans (for the public and stakeholders), improves eligibility for grants or other funding sources, ensures regular review of CWPP.	Low	MSD General Fund– Copperton, SLCo EM General Fund CWDG grant, UFA General Fund	Short term	Medium	
12	Conduct public awareness campaign on Tier 2 reporting software for chemical reporting.	Hazardous materials incident	SLCo EM	LEPC, UFA, UPD, Copperton, SLCo Sheriff's Office, Rio Tinto	Improves understanding of Tier 2 reporting and how Copperton can find and submit information. Provides a common operating platform for hazardous materials reporting.	Low	MSD General Fund– Copperton, SLCo EM General Fund, LEPC, State of Utah DEM staff time, UFA General Fund	Long term	Medium	

DRAFT

#	Action	Hazard(s)	Lead Agency	Potential Partners	Benefits (Losses Avoided)	Cost Estimate	Funding Source(s)	Timeframe	Priority	Comments
13	Enact local regulations and codes for development to reduce landslide and slope failure damage to critical infrastructure and buildings.	Landslide and slope failure	MSD	SLCo EM, UFA, Copperton	Reduces the likelihood of landslides and critical infrastructure/building damage. Ensures that future development is up to code and follows policy to avoid repetitive loss properties.	Low	SLCo General Fund, MSD General Fund – Code Enforcement, MSD General Fund-Copperton, State of Utah staff time, HMGP	Long term	Medium	
14	Leverage WebEOC and GIS to track the spread of contagious disease.	Public Health Epidemic/Pandemic	SLCo Health Department	SLCo EM, UFA, MSD, UPD, Sheriff's Office, Copperton	Uses GIS and WebEOC software to maintain situational awareness and tracks illnesses throughout the county.	Low	SLCo EM General Fund, MSD General Fund–Copperton, SLCo Health Department General Fund, State of Utah DEM staff time	Short term	Medium	Copperton already has this software through SLCo EM and the MSD; need to improve training and documentation.
15	Create public awareness campaigns and public education programs on radon risks and provide home testing for radon.	Radon	SLCo EM	SLCo Health Department, SLCo Aging and Adult Services, Copperton, MSD	Decreases radon-caused cancer deaths. Increases engagement/ understanding with the public on what SLCo can do or help with.	Low	SLCo General Fund–Health Department, SLCo General Fund–Aging and Adult Services, MSD General Fund–Copperton, Utah Department of Environmental Quality General Fund	Short term	Low	
16	Develop road resurfacing project including permeable pavement for areas with rain-based flooding.	Severe Weather – Heavy Rain	MSD	UDOT, SLCo PW, Copperton	Reduces pollutants discharged in runoff, reduced maintenance time/costs on roads, improved traction on roads.	High	MSD Capital Projects–Copperton, MSD General Fund–Copperton, SLCo PW General Fund, UDOT Operational or Capital Fund, HMA grant	Long term	Low	
17	Create a public education program for property owners to learn about tree maintenance and high-strength windows.	Severe Weather – High Wind	MSD	SLCo EM, SLCo Aging and Adult Services, NWS, SLCo PW, Copperton	Reduces damage during high wind event to critical infrastructure. Prevents personal injuries (people driving on roads or walking in neighborhoods). Improves relationships with stakeholders and the public.	Low	SLCo PW General Fund, MSD General Fund–Copperton, SLCo EM General Fund,	Short term	Low	
18	Develop a severe winter weather mitigation program to maintain access to primary roadways and evacuation routes.	Severe Winter Weather – Heavy Snow, Blizzard	SLCo PW and Municipal Services	MSD, SLCo EM, Copperton, UDOT, NWS	Ensures emergency services like police, fire, and EMS can use roads to provide their services.	Medium	MSD General Fund–Copperton, NWS Operational Fund, SLCo EM General Fund, UDOT Operational Fund	Short term	High	A severe winter storm with heavy snowfall requires our operators and equipment to be used to clear roads and streets for the public and emergency vehicles to use. The primary efforts will be to keep the roads open by clearing snow.
19	Conduct public awareness campaign about lightning safety.	Severe Weather – Lightning	Copperton	SLCo EM, NWS, UFA, SLCo PW	Increases lightning strike awareness for the public.	Low	SLCo EM General Fund, MSD General Fund–Copperton, NWS	Short term	Low	

DRAFT

#	Action	Hazard(s)	Lead Agency	Potential Partners	Benefits (Losses Avoided)	Cost Estimate	Funding Source(s)	Timeframe	Priority	Comments
							Operational Fund, UFA General Fund			
20	Improve outreach for "see something, say something" QR code to deter terrorist acts.	Terrorism (including cyberattacks)	SLCo EM	UPD, UFA, MSD, Copperton, SLCo IT, SLCo Sheriff's Office	Ensures that residents and local agencies/jurisdictions are aware of local intelligence resources and ways in which they can report suspicious activity. Encourages QR code use/outreach at special events throughout the county.	Low	SLCo EM General Fund, MSD General Fund–Copperton, UPD General Fund, SLCo Sheriff's Office General Fund, SHSP grant	Short term	Medium	
21	Be a part of the countywide intelligence group/ division to monitor and analyze threats before an incident occurs.	Terrorism (including cyberattacks)	SLCo EM	Copperton, SLCo Sheriff's Office, SIAC, DHS, ATF, FBI	Increases situational awareness.	Low	SHSP grant, SLCo EM General Fund, MSD General Fund–Copperton, SLCo Sheriff's Office General Fund, SIAC General Fund	Short term	Medium	This would be a core group of stakeholders that meet on a regular basis to share and collaborate on intelligence data.
22	Code Enforcement – Review critical infrastructure facilities to ensure that building materials are up to code and are tornado resistant.	Tornado	MSD	Copperton, SLCo PW, SLCo EM	Ensures that critical infrastructure facilities are operational/functional in the event of a disaster. Preserves life and safety.	Medium	SLCo EM General Fund, MSD General Fund–Copperton, UFA General Fund	Short term	Low	
23	Enhance interoperable radio communications systems throughout the county.	Civil Disturbance, Dam Failure, Drought, Earthquake, Extreme Heat, Flooding, Hazardous Materials Incident, Heavy Rain, High Wind, Landslide, Lightning, Public Health Epidemic, Radon, Severe Winter Weather, Terrorism, Tornado, Wildfire	Copperton	MSD, UFA, UPD, SLCo Sheriff's Office, SLCo EM	Improves communication between different agencies and provides a common operating platform.	Medium	SLCo EM General Fund, MSD General Fund–Copperton, SLCo Sheriff's Office General Fund	Short term	Medium	
24	Develop a countywide single source of information sharing/gathering for intelligence.	Civil Disturbance, Terrorism	SLCo EM	Copperton, SLCo Sheriff's Office, SIAC, MSD	Improves coordination between local agencies/jurisdictions.	Medium	SHSP Grants, SLCo General Fund, MSD General Fund–Copperton	Short term	Medium	Have one common operating platform to be used by all agencies in SLCo to collect suspicious activity reports. Develop a public awareness campaign to educate the public on how and what to report.
25	Install xeriscaping on government-owned buildings.	Drought	Copperton	SLCo Facilities, Water companies/ districts, Copperton, MSD, state of Utah, SLCO EM	Decreases the cost of landscape irrigation and decreases water use.	High	SLCo General Fund-Facilities, MSD General Fund–Copperton	Short term	Low	
26	Improve communication to the public and stakeholders on	Severe Winter Weather	SLCo EM	Copperton, SLCo Office of Homeless and Criminal Justice Reform,	Prevents further damage to critical infrastructure, ensures that homeless individuals have warming resources available,	Low	SLCo EM General Fund, SLCo General Fund-Health Department, State of Utah General Fund–	Short term	Low	

DRAFT

City of Cottonwood Heights Annex

To participate in this multi-jurisdictional hazard mitigation plan (MJHMP) update for Salt Lake County (SLCo), the governing body of the city of Cottonwood Heights passed a formal resolution, a copy of which is maintained at the local government offices.

Planning Process Contact Information

Table 1 provides information on the point of contact during the updating of the MJHMP.

Table 1: Contact Information for the City of Cottonwood Heights

Name	Contact Information
Paul Brenneman	**Phone**: 801-944-7100 **email:** pbrenneman@ch.utah.gov
Lance Bess	**Phone:** 801-944-7100 **email:** lbess@ch.utah.gov

The city of Cottonwood Heights has a fully integrated approach to hazard mitigation planning and program implementation. During the 2024 update process, the MJHMP participation roles in Table 2 were recorded.

Date of Incorporation

January 14, 2005

Location and Description

The city of Cottonwood Heights is in central Salt Lake County. The city is approximately 9.2 square miles in area and is located approximately 4,800 feet above sea level. Geographically, Cottonwood Heights is characterized by a prominent ridge that separates the Big and Little Cottonwood Creek valleys. Suburban

DRAFT

housing covers the ridge while commercial development is found mainly in the lower areas north of the ridge.

Population

The 2022 American Community Survey 5-Year Estimate from the U.S. Census Bureau records the population of the city of Cottonwood Heights as 32,984 people.

Demographics

Most of the 32,984 people are between the ages of 35 and 44, with a median age of 39.1; 16,608 are females (50.4%) and 16,376 are males (49.6%). English is the primary language in 90.9% of homes, with 2.2% Spanish, and 6.9% other languages.

Brief History

In 1849, eight families settled in what would be known as Union, with one of the settlers, Jehu Cox, donating 10 acres for a fort. By 1854, 23 homes were housing 273 people. The population began to grow and by 1880, 484 people were living in the area. This trend continued with 602 people by 1890, and 757 people by 1900. Union, now part of Cottonwood Heights, Midvale, and Sandy, witnessed the establishment of Butler and Union Precincts in 1877, along with the Butler School District 57 and Union School District 23. Local industries at the time included the Cottonwood Paper Mill, sand and gravel pits, mining, and various types of farming. After World War II, the area transitioned from rural to suburban, with the first subdivisions built between 1953 and 1955, boosting the population to 5,000. The city of Cottonwood Heights was incorporated on January 14, 2005.

Climate

The city of Cottonwood Heights experiences a humid continental climate (Dfa Köppen classification) characterized by hot summers and cold winters with significant temperature variations throughout the year. Average highs range from the 80s to the low 90s°F in the summer and from the 20s to the low 40s°F in the winter. Rain each year is approximately 26.4 inches, and snowfall averages 52.4 inches.

Public Services

The city of Cottonwood Heights is served by the Canyons School District with Brighton High School and Butler Middle School being the primary public schools within the city limits.

Governing Body

Cottonwood Heights operates under a council/manger form of government featuring four council members and a mayor who chairs the council. Together, the council and the mayor appoint a city manager who serves as the chief administrative officer, implementing council policies and managing staff.

DRAFT

Development Trends

The city serves as a sub-regional market to the Greater Salt Lake Metropolitan area, providing class A office space, world-class outdoor recreational amenities, and well-established residential neighborhoods. Currently, the city's six largest employers are Jet Blue Airways Corporation (leisure, travel), INstructure Inc (learning technology), Canyons School District (education), Extra Space Management (retail storage), Regence Blue Cross Blue Shield (insurance), and Western Digital (technology). The city has a high concentration of office parks with limited industry users. As with many other communities in Salt Lake County, the city has not been immune from the effects of the domestic and international economic slowdown. Economic development in the city has been very active in recent years but still struggles in the highly competitive recruitment of some major businesses.

Jurisdiction-Specific Hazards and Risk

The Calculated Priority Risk Index (CPRI) is a comprehensive assessment tool for evaluating and prioritizing risks in a given context. It considers various factors, such as probability, impact, and urgency, to determine the level of risk associated with events or situations. The results for each hazard, including its risk factor (RF) value, are shown in Table 3. The results are based on the criteria in Table 4 and the equation that follows it. The CPRI helps organizations and individuals make informed decisions about risk management and mitigation strategies. It provides a systematic approach to identifying and addressing potential issues, allowing for a more efficient allocation of resources and proactive risk prevention. With the CPRI, stakeholders can prioritize their focus on the most critical risks, leading to more effective risk management and, ultimately, better outcomes.

Table 3: Calculated Priority Risk Index Values for the City of Cottonwood Heights

Type of Hazard Event	Probability of Future Events	Spatial Extent	Severity of Life/ Property Impact	Warning Time	Duration	Response Capacity	Risk Factor Value
Avalanche	4	1	2	4	2	1	2.6
Drought	4	4	2	1	4	1	2.8
Earthquake	3	4	4	4	3	2	3.4
Extreme Heat	4	4	3	1	3	1	3
Extreme Cold	3	4	2	1	3	1	2.4
Flooding	4	3	3	3	3	1	3.1
Landslide/ Slope Failure	2	1	2	4	1	2	2
Radon	4	4	2	1	4	2	2.9
Heavy Rain	4	3	2	3	1	1	2.6
High Wind	4	3	3	3	2	1	3
Lightning	4	2	2	4	1	1	2.6
Severe Winter Weather	4	3	2	2	2	1	2.6

DRAFT

Type of Hazard Event	Probability of Future Events	Spatial Extent	Severity of Life/ Property Impact	Warning Time	Duration	Response Capacity	Risk Factor Value
Tornado	2	2	3	4	1	2	2.4
Wildfire	4	3	3	4	3	1	3.2
Dam Failure	2	2	3	2	2	3	2.4
Civil Disturbance	2	1	2	4	2	2	2.1
Cyberattack	2	3	3	4	3	2	2.7
Hazardous Materials Incident (Transportation & Fixed Facility)	3	1	2	4	1	1	2.2
Public Health Epidemic/ Pandemic	3	4	3	1	4	1	2.8
Terrorism	2	1	3	4	2	1	2.3

Table 4: Criteria for the Calculated Priority Risk Index

Risk Index Factor	Degree of Risk Level		Criteria	Factor Weight for Degree of Risk Level
Probability of Future Events	1	Unlikely	Less than 1 percent probability of occurrence in the next year or a recurrence interval of greater than every 100 years.	30%
	2	Occasional	1 to 10 percent probability of occurrence in the next year or a recurrence interval of 11 to 100 years.	
	3	Likely	11 to 90 percent probability of occurrence in the next year or a recurrence interval of 1 to 10 years.	
	4	Highly Likely	91 to 100 percent probability of occurrence in the next year or a recurrence interval of less than 1 year.	
Spatial Extent	1	Limited	Less than 10% of the planning area could be impacted.	10%
	2	Small	10%–25% of the planning area could be impacted	
	3	Significant	25%–50% of the planning area could be impacted.	
	4	Extensive	50%–100% of the planning area could be impacted.	
	1	Negligible	Less than 5% of the affected area's critical and non-critical facilities and structures are	30%

DRAFT

Risk Index Factor	Degree of Risk Level		Criteria	Factor Weight for Degree of Risk Level
Severity of Life/Property Impact			damaged/destroyed. Only minor property damage and minimal disruption of life. Temporary shutdown of critical facilities.	
	2	Limited	More than 5% and less than 25% percent of property in the affected area is damaged/ destroyed. Complete shutdown of critical facilities for more than one day but less than one week.	
	3	Critical	More than 25% and less than 50% of property in the affected area was damaged/destroyed. Complete shutdown of critical facilities for over a week but less than one month.	
	4	Catastrophic	Over 50% of critical and non-critical facilities and infrastructures in the affected area are damaged/ destroyed. Complete shutdown of critical facilities for more than one month.	
Warning Time	1	Self-defined	More than 24 hours	10%
	2	Self-defined	12 to 24 hours.	
	3	Self-defined	6 to 12 hours.	
	4	Self-defined	Less than 6 hours.	
Duration	1	Brief	Up to 6 hours.	10%
	2	Intermediate	Up to one day.	
	3	Extended	Up to one week.	
	4	Prolonged	More than one week.	
Response Capacity	1	High	Significant resources and capability to respond to this kind of event; staff are trained, experienced, and ready.	10%
	2	Medium	Some resources and capability to respond to this kind of staff; some staff may be trained, experienced, and ready while others may need additional support.	
	3	Low	Limited resources and capability to respond to this kind of event; additional staff or staff training needed.	
	4	None	No resources and capability to respond this kind of event; additional outside support would be required.	

DRAFT

RISK FACTOR (RF) EQUATION

RF Value = [(Probability x 0.30) + (Spatial Extent x 0.10) + (Severity of Life/Property Impact x 0.30) + (Warning Time x 0.10) + (Duration x 0.10) + (Response Capacity x 0.10)]

Hazards with an RF value greater than or equal to 2.5 are considered high risk. Those with RF values of 2.0 to 2.4 are considered moderate risk hazards, and those with an RF value less than 2.0 are considered low risk. The highest possible RF value is 4.

Hazard Event History

Examining hazard event histories provides valuable insights to inform decision-making and help prioritize resources for risk prevention and response efforts. Table 5 lists the hazard events impacting the city of Cottonwood Heights planning area since the 2019 plan update, as recorded in the Storm Events Database from the National Centers for Environmental Information.

Table 5: History of Hazard Events in the City of Cottonwood Heights

Type of Hazard Event	FEMA Disaster #	Date(s)	Damage or Impacts	Description
Avalanche	N/A	N/A	N/A	N/A
Drought	N/A	Drought is a recurring problem in the region	Air quality issues, water restrictions.	The entire county faces risk of historic drought.
Earthquake	DR-4548-UT	A 5.7M earthquake was felt March 2020.	Some structural damage was reported, mostly near Magna. Tens of thousands lost power in the Salt Lake Valley.	The Wasatch Fault is considered overdue for a major earthquake, with a 57% chance of a 6.0M or greater earthquake in the next 50 years.
Extreme Heat	N/A	Summers of 2020, 2021, 2022, 2023, 2024	Reported 9 deaths in Northern Utah, an upward trend in heat exposure and heat-related deaths since 2015. Excessive heat can also affect infrastructure.	Specific impacts on Cottonwood Heights were not available, but general impacts include increased risk for heat-related illness and increased power demand for cooling systems.
Extreme Cold	N/A	Winter of 2022 & 2023	2022: 5 people experiencing homelessness died from cold-related exposure in Salt Lake City, but this threat could impact neighboring jurisdictions.	Specific impacts on Cottonwood Heights were not available but extreme cold can contribute to hypothermia and other cold-related illness/injury. Increased demand for heating systems. Potential for frozen pipes or other service disruptions.

DRAFT

Type of Hazard Event	FEMA Disaster #	Date(s)	Damage or Impacts	Description
Flooding[1]	N/A	August 1, 2021	Flash flooding caused around $2,000 in damage.	
Radon	N/A	Radon is present in the soils.	The specific impacts of radon in the area are not known (i.e., exact count of illnesses known to be caused by radon), but test results have indicated elevated radon levels in the area. 46% of households in Cottonwood Heights have radon test results at or above WHO's mitigation threshold.	As shown in Figures 147 and 148 in Volume 1, average radon test results in the Cottonwood Heights area have indicated elevated radon levels
High Wind	N/A	September 8, 2020	Extensive damage in neighborhoods with downed trees, debris in roads, and home damage. Unknown total damage, minor impacts on houses and yards to include downed trees. Reported partial damage estimates $45,525	Salt Lake County and surrounding areas experienced a severe windstorm with winds exceeding 100 mph in some areas. The impact was experienced in Cottonwood Heights mainly on the upper east bench of the city. Downed trees and tree limbs cause minor damage to residences and fences. No persons were displaced. City Public Works Crews responded to assist with debris removal.
Severe Winter Weather	N/A	N/A	N/A	There have been some significant winter storms but no major damage associated.
Public Health Epidemic/ Pandemic	DR-4525-UT	January 20, 2020 – May 11, 2023	The COVID-19 pandemic struck the United States in early 2020. The city of Cottonwood Heights suffered the same effects as cities across the US. The city responded by instituting changes to city staff schedules, which resulted in diminished	SARS-CoV-2 (also known as COVID-19) was responsible for a pandemic that killed millions and has many medical repercussions that are still being studied. There is no specific data on Cottonwood Heights residents who were affected medically or otherwise. The COVID virus infected countless residents of

DRAFT

Type of Hazard Event	FEMA Disaster #	Date(s)	Damage or Impacts	Description
			levels of service to residents.	Cottonwood Heights. The pandemic was felt across the city.
Civil Disturbance		8/2/2020	An estimated 130–150 civilians conducted an illegal march on residential roadways in the Mill Hollow Subdivision. Protesters occupied the roadway, disrupting traffic and causing a breach of the peace in a residential neighborhood.	Protestors met in a local park.to rally against police violence. At the conclusion of the event in the park, protestors marched on public roads in violation of city and state statutes. Police warned the protestors that continued violations would result in arrests. Protestors attacked police officers, resulting in a physical confrontation. Officers from surrounding jurisdictions responded to assist in stabilizing the situation.

National Flood Insurance Program Summary

The city of Cottonwood Heights participates in the National Flood Insurance Program (NFIP). Table 6 displays statistics related to the NFIP. The city of Cottonwood Heights does not participate in the Community Rating System (CRS).

Table 6: National Flood Insurance Program Status for the City of Cottonwood Heights[2]

Init FHBM Identified	Init FIRM Identified	Current Effective Map Date	Adopted Date	Date Joined NFIP	Tribal
8/30/77	12/18/85	9/25/09	2009	9/16/09	No

Table 7: National Flood Insurance Overview for the City of Cottonwood Heights

Community ID	Number of Losses	Total Net Payment	Active Policies	Total Coverage
490028	5	$3,554.26	124	$26,434,000

The city of Cottonwood Heights has designated the Community Development Director as the Floodplain Administrator. The current Flood Damage Prevention Ordinance was adopted in 2022. The current effective maps are dated 9/25/2009. Permits are issued through the permits team, including contract support. As a part of the storm water review checklist, permits are reviewed for their location in relation to

[2] FIRM = Flood Insurance Rate Map, FHBM = Flood Hazard Boundary Map

the floodplain/floodway. Substantial damage/substantial improvement determinations are made through the permitting process. Structures in the Special Flood Hazard Area are then required to come into compliance with current codes.

Jurisdiction-Specific Vulnerabilities and Impacts

Table 8 provides information on the vulnerable assets in the city of Cottonwood Heights, including its critical facilities, highlighting the city's vulnerability to identified hazards. By understanding the risks associated with these assets, local authorities can develop proactive strategies to mitigate vulnerabilities and ensure the safety and functionality of these important assets during hazard events. These data are invaluable for decision-making and prioritizing resources for emergency response and preparedness efforts, ultimately contributing to more effective risk management and greater resilience in the community.

In addition to the 32,984 residents in Cottonwood Heights, vulnerable assets in the city include critical facilities such as 1 EOC, 2 fire stations, 1 police station, and 7 schools. Crestwood Park and Pool, Butler Park, Cottonwood Heights Recreation Center, Old Mill Park, and several other parks provide outdoor recreation opportunities. I-215 runs along the north border of the city. Other major routes include Wasatch Boulevard, Big Cottonwood Canyon Road, Bengal Boulevard, Highland Drive, and Ft. Union Boulevard. Metropolitan Water District and Granite Hydroelectric Power Plant are critical infrastructure assets. The Granite Hydroelectric Plant is also a historical site. Other historic sites include Cottonwood Paper Mill, Butler School Teachers Dormitory, and the Alvin and Annie Green House. Outdoor recreation is significant to Cottonwood Heights, and the city includes access routes to major ski resorts, trailheads, and other amenities.

Table 8: Jurisdiction-Specific Vulnerabilities and Impacts in the City of Cottonwood Heights

Hazard	Vulnerable Assets	Description of Vulnerabilities and Impacts
Avalanche	People	*Vulnerability:* Residents and visitors in Cottonwood Heights who venture into the Wasatch foothills for skiing, snowboarding, or hiking are at risk during avalanche season. Homeowners living near steep slopes or canyon roads also face elevated risk, especially after heavy snowfall and rapid temperature changes. *Impacts:* Avalanche can injure or kill those caught in their path. Individuals unfamiliar with avalanche safety, who lack proper training or gear, may underestimate the danger in backcountry areas.
	Structures	*Vulnerability:* Homes and buildings near Little Cottonwood Canyon and other steep areas may be impacted by avalanches. Structures located at the base of slopes or in natural snow runout zones are more vulnerable. Poor slope management or deforestation can further increase the risk to development in these zones. *Impacts:* Structures may lack reinforcement to withstand the impact of heavy snow and may receive extensive damage.
	Economic Assets	*Vulnerability:* Tourism, recreation, and other businesses near foothills are vulnerable to avalanche activity. *Impacts:* Avalanche activity can close major routes like SR-210, disrupting tourism and commuting for local businesses. Resorts,

Hazard	Vulnerable Assets	Description of Vulnerabilities and Impacts
		outdoor gear retailers, and lodging facilities may experience financial losses during prolonged closures or dangerous conditions. Infrastructure repair and emergency services also incur additional costs during severe snow events.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Ecosystems, trails, historic structures are vulnerable to avalanches. *Impacts:* Snow slides can damage forest ecosystems, strip vegetation, and lead to erosion. Trails, scenic routes, and wildlife corridors near the canyons may be affected. Cultural or historic landmarks located near avalanche-prone areas may have access and structural integrity compromised.
	Critical Facilities and Infrastructure	*Vulnerability:* Power lines, the water treatment facility, and roads are vulnerable to avalanches. *Impacts:* Power lines and roads through canyon corridors may be damaged or temporarily shut down during avalanche incidents. Utility disruptions and blocked access routes can limit emergency response and affect the city's connectivity to nearby regions.
	Community Activities	*Vulnerability:* Outdoor recreation and commuting are vulnerable to avalanche risks. *Impacts:* Winter sports events and outdoor recreation in Cottonwood Heights may be canceled or delayed due to avalanche risk. Trail closures or restricted access to canyons can reduce participation in seasonal activities and place stress on emergency services during rescues or evacuations. Closures of Little Cottonwood Canyon Road could back up traffic into the city and contribute to delays.
Drought	People	*Vulnerability:* All Cottonwood Heights residents are vulnerable to drought conditions. *Impacts:* During prolonged dry periods, residents of Cottonwood Heights may face water use restrictions. Vulnerable populations, including seniors, families with limited income, and those relying on local agriculture, are particularly impacted by increased water costs and reduced supply. High temperatures during drought can also worsen air quality and increase heat-related illness risks.
	Structures	*Vulnerability:* All properties and structures in Cottonwood Heights are vulnerable to drought impacts. *Impacts:* Shrinking soil due to drought can cause foundations to shift or crack. Landscaping that requires high water usage may die off, affecting curb appeal and property value. New construction may be limited by water availability and conservation policies.
	Economic Assets	*Vulnerability:* Many businesses, particularly those in landscaping and recreation, are vulnerable to drought conditions. *Impacts:* Businesses relying on outdoor aesthetics, such as landscaping, nurseries, or recreation centers, may face revenue losses during drought. Water rate increases can strain small business budgets. Declines in tourism and event participation may affect local income during especially hot and dry seasons.
	Natural, Historic, and	*Vulnerability:* Local parks, natural trails, and native plant species are vulnerable to drought conditions. Historic sites and cultural events are also vulnerable.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerabilities and Impacts
	Cultural Resources	*Impacts:* Ecosystems can suffer during drought, reducing habitat availability and increasing wildfire risk. Historic sites with landscaping or water-dependent features may face deterioration. Cultural events requiring outdoor settings may be postponed or canceled due to fire restrictions or heat advisories.
	Critical Facilities and Infrastructure	*Vulnerability:* Water systems, sanitation, healthcare, and fire response are vulnerable to drought impacts. *Impacts:* Reduced water availability may strain Cottonwood Heights' infrastructure, particularly for emergency response, healthcare, and sanitation services. Fire departments may face challenges managing wildfires with limited water resources. Water treatment and supply systems must adapt to fluctuating demand and conservation requirements.
	Community Activities	*Vulnerability:* Outdoor recreation is vulnerable to drought conditions. *Impacts:* Outdoor recreational areas may be closed or restricted due to water shortages or fire danger. Pools and splash pads may operate on reduced schedules, and residents may encounter limits on lawn irrigation or garden use. Community events held in parks or open spaces could see decreased attendance during high heat and low-water conditions.
Earthquake	People	*Vulnerability*: With Cottonwood Heights located near the Wasatch Fault, earthquake risks are a pressing concern. All residents are vulnerable; however, residents in older homes or unreinforced masonry structures are at heightened risk. *Impacts:* A major earthquake could have significant impacts on all residents. Some may be injured or killed by falling objects or collapsed structures. Essential services and community lifelines may be disrupted. People may be displaced from their homes and need public shelter. Businesses may close and lost wages may cause financial hardship. Those without emergency plans or resources may struggle to evacuate or recover after a major seismic event.
	Structures	*Vulnerability:* All structures are vulnerable. Buildings constructed before modern seismic codes are more likely to suffer damage during a quake. Soft soils and slope-side construction further increase the potential for structural instability. Areas along the southwest border of the city have moderate liquefaction potential, which poses additional risk to structures. *Impacts:* Ground shaking can cause significant structural damage that may require extensive, costly repairs. Homes and businesses are likely to be damaged.
	Economic Assets	*Vulnerability:* All businesses in Cottonwood Heights are vulnerable to earthquake impacts. *Impacts:* Commercial districts, schools, and medical centers may experience serious disruption if earthquake damage renders buildings unusable. Retail and service-based businesses in Cottonwood Heights may close temporarily or permanently depending on the extent of the damage. Damage to roads or other infrastructure may further inhibit businesses from opening. Economic disruption from a major earthquake could result in years of recovery.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerabilities and Impacts
	Natural, Historic, and Cultural Resources	*Vulnerability:* Trails, parks, historic buildings, and community centers are vulnerable to earthquake impacts. *Impacts:* Landslides triggered by earthquakes may damage local trails, park areas, and canyon routes. Historic buildings that are without retrofitting are particularly vulnerable to structural collapse. Community centers or culturally significant buildings may be lost or closed for extended periods after a quake.
	Critical Facilities and Infrastructure	*Vulnerability:* Water lines, power systems, and road networks are vulnerable to earthquake impacts. *Impacts:* Utilities and infrastructure systems may be severely impacted by shaking. Bridges or overpasses leading in and out of the city could become impassable. Emergency response facilities that have not been seismically reinforced may be temporarily offline during critical periods.
	Community Activities	*Vulnerability:* School events, festivals, and public gatherings are vulnerable to earthquake impacts. *Impacts:* Outdoor events may be affected by damage to venues and transportation networks. The community may face long-term displacement or restricted access to recreational spaces as recovery efforts are underway.
Extreme Heat	People	*Vulnerability:* All Cottonwood Heights residents are vulnerable, but some populations are at higher risk. *Impacts:* Extreme heat can cause illness such as dehydration, heat exhaustion, or heat stroke, which can be deadly. Extreme heat events in Cottonwood Heights pose the highest risk to elderly residents, individuals with chronic health conditions, and low-income households without air conditioning. Children and outdoor workers are also at greater risk of heat-related illnesses. Extended heatwaves may increase emergency room visits and reduce productivity for those working outside. Low-income residents may face hardship from increased energy costs for cooling.
	Structures	*Vulnerability:* All structures in Cottonwood Heights are vulnerable to extreme heat impacts. *Impacts:* Buildings lacking proper insulation or reflective materials retain heat, driving up cooling costs. Urban heat island effects may be intensified in areas with limited green cover or exposed asphalt surfaces. Heating, ventilation, and air conditioning (HVAC) systems may become overworked, leading to malfunctions.
	Economic Assets	*Vulnerability:* All businesses are vulnerable to extreme heat impacts. *Impacts:* Increased demand for electricity can strain the energy grid, leading to blackouts or surges, which can disrupt business operations. Outdoor-based businesses and summer recreation programs may see declining participation. Water use restrictions and high temperatures may also impact gardening, agriculture, and landscaping businesses.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Environment, parks, and historic buildings are vulnerable to extreme heat impacts. *Impacts:* Wildlife and plant life may suffer from water scarcity and habitat stress. Historic buildings exposed to prolonged heat may experience material deterioration, such as fading, cracking, or

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerabilities and Impacts
		warping. Community parks may require more maintenance or face partial closures due to heat exposure.
	Critical Facilities and Infrastructure	*Vulnerability:* Healthcare and community centers are vulnerable to extreme heat impacts. *Impacts:* Healthcare facilities may see a rise in patients with heatstroke or dehydration. Schools, libraries, and other cooling shelters may become overcrowded during major heat events. Electricity infrastructure may falter under excessive demand.
	Community Activities	*Vulnerability:* Recreation and outdoor events are vulnerable to extreme heat impacts. *Impacts:* Summer events, sports leagues, and markets may need to shift schedules or provide additional cooling resources. Participation in outdoor programs may decline, especially during peak afternoon hours.
Extreme Cold	People	*Vulnerability:* Extreme cold affects the entire city, and all residents are vulnerable. *Impacts:* Cold weather poses health risks such as hypothermia or frostbite. Particularly vulnerable groups include seniors, children, and unhoused individuals in Cottonwood Heights, especially during sudden temperature drops. Residents relying on electric heating may be at risk if power outages occur. Individuals without winter gear or reliable transportation may face isolation or cold-related illness.
	Structures	*Vulnerability:* All structures are vulnerable to extreme cold impacts. Older homes may be more vulnerable. *Impacts:* Older homes or those with poor insulation are prone to burst pipes, frozen water lines, and indoor temperature drops. Prolonged cold can strain heating systems, and heavy snow accumulation can threaten the integrity of roofs on homes and garages.
	Economic Assets	*Vulnerability:* Businesses throughout the city are vulnerable to extreme cold impacts. *Impacts:* Retail activity and construction may slow significantly during deep freezes. Cold temperatures increase heating costs for homes and businesses. Damaged plumbing and HVAC systems can lead to expensive emergency repairs.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Vegetation, parks, and historic buildings are vulnerable to extreme cold impacts. *Impacts:* Cold and ice may damage trees, shrubs, and garden beds in city parks. If accompanied by heavy snow, branches may break under the load. Historic buildings may experience frost damage or roof collapse under snow weight. Community spaces like amphitheaters may remain unused until the weather improves.
	Critical Facilities and Infrastructure	*Vulnerability:* All city facilities and utilities are vulnerable to extreme cold impacts. *Impacts:* Frozen pipes at schools, clinics, or municipal buildings can disrupt services. Icy conditions may lead to vehicle accidents and impede public transit. Power and gas lines are vulnerable during freezing weather, impacting reliability.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerabilities and Impacts
	Community Activities	*Vulnerability:* Community events are vulnerable to extreme cold impacts. *Impacts:* Outdoor winter events may be canceled or postponed. Extreme cold may reduce attendance at recreational facilities and discourage participation in seasonal sports. Road closures or icy sidewalks can prevent residents from accessing key services or community resources.
Flooding (and Heavy Rain)	People	*Vulnerability:* Flooding primarily affects residents in low-lying areas near rivers and streams, especially during heavy rainfall or snowmelt. For Cottonwood Heights, this includes flood hazard areas along Big and Little Cottonwood Creek. *Impacts:* Individuals without reliable transportation may struggle to evacuate quickly, while low-income families often lack resources for flood-prevention measures. The elderly and those with disabilities may face mobility challenges, increasing their risk during emergencies. Overall, factors such as geographic location, economic status, and physical ability contribute to the community's varying levels of vulnerability to flooding.
	Structures	*Vulnerability:* Structures vulnerable to flooding primarily include those in low-lying areas or near Big and Little Cottonwood Creek. *Impacts:* Residential properties in flood plains and commercial buildings without proper drainage systems or flood-resistant designs face significant risks during heavy rain or snowmelt. Older structures may be more susceptible due to outdated construction standards. Overall, a combination of location and construction features contributes to their vulnerability to flooding.
	Economic Assets	*Vulnerability:* Commercial properties, especially retail centers and warehouses near rivers or low-lying areas, are at high risk during heavy rainfall or rapid snow runoff. *Vulnerability:* Businesses can have structures or inventory damaged by flooding. Residential developments in flood-prone zones can also suffer damage, impacting property values. Public infrastructure, such as roads and utilities, may experience disruptions, leading to costly repairs. Agricultural land can be affected by excess water, reducing crop yields.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Natural areas, parks, and historic structures are vulnerable to flooding impacts. *Impacts:* Natural areas like wetlands and streams are at risk of habitat destruction, while historic sites and landmarks may sustain structural damage. Cultural resources, such as parks and public spaces, can become unusable, affecting community events. Factors contributing to their vulnerability include inadequate flood management, urban development that alters water flow, and the increasing frequency of extreme weather events due to climate change.
	Critical Facilities and Infrastructure	*Vulnerability:* Healthcare facilities, schools, and transportation networks are vulnerable to flooding due to their proximity to rivers and low-lying areas. *Impacts:* Rivers can overflow during heavy rain or snowmelt. Flooding can disrupt emergency services, require schools to evacuate, block transportation routes, and isolate communities. In addition, inadequate

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerabilities and Impacts
		drainage systems and urban development encroaching on floodplains increase these risks.
	Community Activities	*Vulnerability:* Outdoor events and recreation are vulnerable to flooding impacts. *Impacts:* Due to the area's geography and infrastructure, outdoor events, sports, and farmers' markets are vulnerable to flooding. Parks and open spaces can quickly become inundated during heavy rainfall or rapid snowmelt. Residential neighborhoods near rivers, roads, and bridges are at risk of flash floods, which can disrupt transportation and emergency services.
Landslide/ Slope Failure	People	*Vulnerability:* Residents living along the steep foothills of the Wasatch Mountains in Cottonwood Heights are particularly susceptible to landslides and slope failures. *Impacts:* The city's location between Big and Little Cottonwood Canyons places many homes near unstable slopes, where rapid snowmelt or intense rainfall can saturate soils and trigger ground movement. Older homes constructed before modern geotechnical standards may lack the structural resilience needed to withstand such events. Additionally, limited public awareness about early warning signs can delay evacuation or mitigation efforts.
	Structures	*Vulnerability*: Buildings situated on or near steep inclines, primarily on the east side of the city, are vulnerable to landslides and slope failures. Those lacking proper drainage systems or built on unstable geological formations face heightened risks. *Impacts:* The combination of Cottonwood Heights' sloped terrain and seasonal precipitation increases the likelihood of soil saturation, which can undermine foundations and lead to structural damage. Infrastructure such as roads and bridges, particularly those near canyon mouths or on hillsides, is also vulnerable to erosion and collapse during slope failures.
	Economic Assets	*Vulnerability:* Businesses near slopes are vulnerable to damage and disruptions from landslides. *Impacts:* The economic implications of landslides in Cottonwood Heights are significant. Landslides can damage businesses directly and can also cause losses through impacts on infrastructure. Disruptions to transportation routes, like State Routes 190 and 210, can impede commerce and daily commutes. Damage to residential properties can lead to decreased property values and increased insurance premiums. Utility services, including water and power lines that traverse hilly areas, are at risk of damage, leading to costly repairs and service interruptions.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Landslides can have detrimental effects on the natural environment, destroying vegetation and wildlife habitats. *Impacts:* Sediment runoff into waterways can degrade water quality, affecting both ecosystems and human water sources. Historic sites, such as the Granite Hydroelectric Power Plant Historic District, may be threatened by soil movement and erosion, jeopardizing their structural integrity and cultural significance.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerabilities and Impacts
	Critical Facilities and Infrastructure	*Vulnerability:* No facilities were identified in landslide-susceptible areas. However, transportation and utilities are vulnerable, which indirectly disrupts critical facility services. *Impacts:* Essential services in Cottonwood Heights, including emergency response centers, schools, and healthcare facilities, may be compromised if access routes are blocked by landslides. Power and water infrastructure located on or near unstable slopes are susceptible to damage, potentially leading to extended service outages. The city's reliance on canyon roads for connectivity underscores the importance of maintaining slope stability to ensure uninterrupted access to critical services.
	Community Activities	*Vulnerability:* Community engagement in outdoor activities, such as hiking and biking on the city's numerous trails, can be impacted by landslide risks. *Impacts:* Trail closures due to slope instability not only affect recreational opportunities but also local tourism and associated economic benefits. Furthermore, community events held in parks or open spaces near vulnerable slopes may require contingency planning to ensure public safety during periods of increased landslide risk.
Radon	People	*Vulnerability:* According to utahradon.org, 46% of homes tested in Cottonwood Heights have dangerous levels of radon. *Impacts:* Radon is the leading cause of lung cancer in nonsmokers. Those with prolonged exposure to elevated radon levels are at risk for cancer. In Cottonwood Heights, residents in older homes built over radon-prone soils are more likely to be affected by radon exposure. Families with young children and older adults are especially vulnerable due to their heightened sensitivity to long-term respiratory health risks.
	Structures	*Vulnerability:* Buildings with basements or slab-on-grade foundations are at a higher risk of radon infiltration, especially those with cracks in flooring or foundation walls. *Impacts:* Radon does not directly affect structures, but weaknesses or cracks within structures can place occupants at greater risk for health impacts. Older homes without updated ventilation systems are particularly susceptible in this part of the Salt Lake Valley, where naturally occurring uranium in the underlying geology increases radon presence.
	Economic Assets	*Vulnerability:* Residential and commercial property values are vulnerable to radon impacts. *Impacts:* Properties in Cottonwood Heights may experience lower market value and increased maintenance costs due to radon remediation needs. Real estate transactions can be delayed or disrupted when radon is detected, and rental units may require costly mitigation to meet tenant safety expectations.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Radon may accumulate in subsurface soils and aquifers near Cottonwood Heights, particularly around older stone or concrete structures. Local landmarks or cultural buildings made of porous materials could retain radon. *Impacts:* Accumulation in older structures increases risk from long-term exposure for staff, residents, or visitors.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerabilities and Impacts
	Critical Facilities and Infrastructure	*Vulnerability:* Public buildings such as schools, clinics, and government offices may be vulnerable if built in radon-affected areas and not equipped with proper ventilation. *Impacts:* Radon can accumulate in public facilities with basements or slab on grade foundations and employees, students, or other occupants can be exposed to radon. Facilities with basements, like emergency operation centers, may require routine radon testing and mitigation to remain safe.
	Community Activities	*Vulnerability:* Indoor activities held in basements or poorly ventilated spaces are more likely to expose participants to radon. *Impacts:* Schools, daycares, and community centers in Cottonwood Heights could be exposed to dangerous levels of radon and facilities should consider regular testing to protect young children and staff.
High Wind	People	*Vulnerability:* High wind can occur anywhere in the city, and all residents are vulnerable. *Impacts:* Wind can cause injury or death to people hit by falling trees, blowing debris, or falling roofs or walls. Older adults, individuals with mobility limitations, and outdoor workers in Cottonwood Heights face elevated risk from wind-related hazards. Sudden gusts, especially in exposed areas or near open spaces, can lead to injuries or prevent timely access to safe shelter.
	Structures	*Vulnerability:* All structures in the city are vulnerable to high wind impacts. *Impacts:* High wind can damage roofs, shatter windows, uproot trees and cause extensive damage. Flat-roofed homes, unreinforced garages, and large commercial buildings with expansive glass windows are particularly at risk during high wind events. In Cottonwood Heights, homes in less sheltered locations or lacking wind-resistant design elements may experience roofing and siding damage.
	Economic Assets	*Vulnerability:* All businesses are at risk of high winds. *Impacts:* Retail centers and service-oriented businesses can suffer from broken windows, damaged signs, and temporary closures. Power outages from fallen lines may disrupt operations across multiple sectors, while costs for repairs and insurance claims rise significantly after windstorms.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Trees, parks, habitats, and historic buildings are vulnerable to high wind impacts. *Impacts:* Strong winds can topple mature trees along trails and parks in Cottonwood Heights, degrading habitats and increasing fire risks. Older landmarks or stone structures not built to modern standards are especially vulnerable to exterior damage.
	Critical Facilities and Infrastructure	*Vulnerability:* Windstorms may damage power poles, communications towers, traffic signals, and public facilities across the city. *Impacts:* Damage to power lines, communication towers, and traffic signals can cause disruptions to emergency services, businesses and other activities throughout the community. Schools, fire stations, and other public buildings could also suffer if not designed with structural reinforcements, impacting emergency response capacity.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerabilities and Impacts
	Community Activities	*Vulnerability:* Outdoor events and recreation activities are vulnerable to high wind impacts. *Impacts:* Public events held in open spaces, such as farmers' markets or school sports, are easily disrupted or canceled due to high winds. Portable shelters and equipment are especially vulnerable, posing injury risks if not secured properly.
Lightning	People	*Vulnerability:* Lightning presents a serious risk throughout Cottonwood Heights, particularly during summer thunderstorms. All residents are potentially vulnerable. Some populations may be at higher risk. *Impacts:* Lightning can cause injury or death to those in close proximity to a strike. Outdoor workers may not be able to reach shelter from lightning. Outdoor recreational users, such as trail hikers and cyclists in areas like Ferguson Canyon or Big Cottonwood Canyon, are at elevated risk during thunderstorms. Children at playgrounds or residents in open parks may lack the time or access to seek shelter quickly.
	Structures	*Vulnerability:* All structures are vulnerable to lightning. *Impacts:* Lightning can cause fire or damage to electrical systems. Structures with tall or exposed profiles, including communication towers and older barns, are at increased risk of lightning strikes. Homes near large trees may also be affected if a strike transfers energy through root systems or branches into nearby buildings.
	Economic Assets	*Vulnerability:* All businesses are vulnerable to lightning. *Impacts:* Critical equipment in data centers, retail stores, and manufacturing facilities can be damaged by power surges. Businesses may be unable to operate if power or other systems are not functional. Local infrastructure supporting tourism and outdoor activity can face temporary shutdowns due to safety hazards and inspection needs.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Lightning poses a wildfire risk. Historic buildings and outdoor installations are vulnerable to lightning. *Impacts:* Lightning poses a fire risk to forests and trails surrounding Cottonwood Heights and can damage historic homes or outdoor art installations if strikes occur. Community features such as pavilions and statues are also vulnerable without grounding systems.
	Critical Facilities and Infrastructure	*Vulnerability:* City facilities and healthcare facilities are vulnerable to lightning. *Impacts:* Public buildings like schools and clinics need adequate lightning protection to reduce the risk of power loss or fire. Lightning-related disruptions to power and communication systems may delay emergency response or affect citywide operations.
	Community Activities	*Vulnerability:* Outdoor events and recreation activities are vulnerable to lightning. *Impacts:* Summer events at local parks, outdoor concerts, and youth sports games may face cancellations due to lightning risk. Limited shelter options at recreational areas increase safety concerns, particularly during rapidly developing storms.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerabilities and Impacts
Severe Winter Weather	People	*Vulnerability:* Severe winter weather can occur throughout the city, so all residents are vulnerable. Some populations may be at increased risk. *Impacts:* Cottonwood Heights residents can be injured from slips and falls, or have health impacts from prolonged exposure to cold. People can be injured in car accidents while driving in severe winter weather conditions. The elderly or those with health conditions may struggle to stay warm or move safely during snowstorms. Individuals with limited access to transportation or those experiencing housing insecurity face increased hardship.
	Structures	*Vulnerability:* Older homes or weakened structures are vulnerable to severe winter weather. *Impacts:* Heavy snow accumulation on flat roofs can lead to structural strain or collapse, especially in older homes or commercial buildings. Ice dams from poor insulation or roof ventilation are a common concern, leading to water damage and long-term maintenance costs.
	Economic Assets	*Vulnerability:* All businesses are vulnerable to severe winter weather. *Impacts:* Storms can delay construction and logistics operations, while local shops and restaurants may experience customer shortages due to travel difficulties. Commutes may be delayed and impact worker productivity. Higher utility costs during extreme cold also increase operating expenses for many businesses.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Parks, trees, and historic buildings are vulnerable to severe winter weather. *Impacts:* Heavy snow and ice may damage trees and shrubs in community parks, affecting ecosystems and increasing debris cleanup needs. Older historic buildings may not be equipped to handle snow loads, risking deterioration or permanent damage.
	Critical Facilities and Infrastructure	*Vulnerability:* Transportation networks and utilities are vulnerable to severe winter weather. *Impacts:* Snow and ice can render key transportation corridors like Fort Union Boulevard and Wasatch Boulevard impassable, delaying emergency services. Utilities may also be impacted by frozen lines or fallen trees, affecting heating and communication systems.
	Community Activities	*Vulnerabilities:* Community events, schools, and commuting are vulnerable to severe winter weather. *Impacts:* Local events and city programs may be postponed due to impassable roads or unsafe venues. School closures and limited access to community centers can disrupt routines and isolate vulnerable populations.
Tornado	People	*Vulnerability:* Although tornadoes are rare in Cottonwood Heights, they can occur in the city, and all residents are vulnerable. *Impacts:* Tornadoes can cause serious injury or death to those caught in collapsed structures or struck by debris. Residents in older homes or mobile structures are most vulnerable as these are less able to withstand strong winds. Those with limited mobility, including seniors and people with disabilities, may have difficulty accessing safe shelter quickly during a warning.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerabilities and Impacts
	Structures	*Vulnerability:* All buildings can be damaged by a tornado. *Impacts:* Buildings not designed to withstand high winds, particularly older or lightweight structures, face higher damage risk. Roofs, garage doors, and large glass windows are especially susceptible during wind events, even from less intense tornadoes or strong microbursts.
	Economic Assets	*Vulnerability:* All businesses are vulnerable to tornadoes. *Impacts:* Businesses may face direct losses if in the path of the tornado. They can also experience indirect losses due to infrastructure disruptions. Power outages and structural damage can lead to lost revenue for local businesses. Transportation disruptions may affect commerce and deliveries, while damaged homes and infrastructure can generate long-term financial burdens for residents and city services.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Trees, parks, and historic markers are vulnerable to tornadoes. *Impacts:* Tornado-strength winds can uproot trees in natural areas and parks, leading to erosion or trail closures. Cultural assets like sculptures, historic markers, and open-air pavilions may also suffer irreparable damage.
	Critical Facilities and Infrastructure	*Vulnerabilities:* Schools, clinics, and public buildings are vulnerable to tornadoes.. *Impacts:* Essential buildings like schools and clinics that were not built to current wind-resistance codes may be compromised. Tornado-related damage to power lines, water systems, and communication hubs could disrupt emergency response and recovery operations.
	Community Activities	*Vulnerability:* Outdoor events are vulnerable to tornadoes. *Impacts:* Outdoor gatherings and seasonal events are highly vulnerable to unexpected tornado conditions or strong wind events. Tents, staging equipment, and bleachers used for local sports or performances pose risks if not properly secured.
Wildfire	People	*Vulnerability:* The eastern side of the city borders undeveloped, forested land. Potentially hundreds of homes and residents are in proximity to areas vulnerable to wildfire. *Impacts:* Residents near the wildland–urban interface (WUI), individuals with physical disabilities or health issues who may struggle to evacuate, and low-income families lacking resources for fire safety measures may be vulnerable. Older adults might have reduced mobility, making them more dependent on others for assistance. All residents can be affected by poor air quality from wildfire smoke.
	Structures	*Vulnerability:* All homes, businesses, and other structures in Cottonwood Heights near the WUI are vulnerable, particularly east of Wasatch Boulevard and near the mouth of Little Cottonwood Canyon. *Impacts:* Residential properties near wildland areas are at high risk, especially if they lack defensible space and fire-resistant landscaping or are made of easily flammable materials. Properties near the WUI are at higher risk due to surrounding flammable vegetation. Inadequate defensible space, such as insufficient clearing of dry grass and shrubs, increases susceptibility. Roofs made of combustible

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerabilities and Impacts
		materials and buildings that lack fire-resistant features are particularly at risk during wildfire events.
	Economic Assets	*Vulnerability:* Businesses on or near the benches are most vulnerable. *Impacts:* Commercial assets, such as retail centers close to forested regions, can suffer damage from flames and smoke, affecting the local economy. Agricultural lands are also susceptible, as wildfires can destroy crops and livestock, leading to financial losses. Vital infrastructure, such as power lines and water pipelines, can be disrupted, causing further economic repercussions. These vulnerabilities are heightened by dry conditions and high winds, which can facilitate the spread of fires.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Natural environment and historic sites are vulnerable to wildfire. *Impacts:* Natural resources like forests and grasslands are at risk because dry vegetation and accumulated brush can easily ignite. Waterways such as Big and Little Cottonwood Creek can be affected by increased runoff and erosion. Historic sites made of wood and cultural landmarks also can be affected, particularly when located near wildland areas. The increasing frequency of drought and extreme heat, exacerbated by climate change, heightens these vulnerabilities. In addition, urban development encroaching on wildland areas increases the risk to these essential resources.
	Critical Facilities and Infrastructure	*Vulnerability:* Transportation, utilities, and emergency response are vulnerable to wildfire. Fire Station 116 is within a short distance of the WUI. *Impacts:* Wildfire can place a strain on emergency responders. Evacuations can clog roads and may disrupt transportation throughout the city. Utilities like power lines and gas pipelines are also at risk, as sparks or falling trees can ignite fires. Water treatment facilities at the base of the canyons may be affected. Residential neighborhoods adjacent to natural landscapes are particularly susceptible to embers, making them vulnerable during dry conditions and high winds.
	Community Activities	*Vulnerability:* Outdoor events and recreation activities are vulnerable to wildfire. *Impacts:* Outdoor events like festivals and sports, especially during hot, windy conditions, may experience risk. Recreational activities, such as hiking and camping near wooded areas, also pose risks from open flames or sparks. In addition, landscaping with dry grasses and shrubs increases susceptibility during fire season, putting local infrastructure, such as schools and neighborhoods, at risk.
Dam Failure	People	*Vulnerability:* Residents of Cottonwood Heights could be affected by a dam failure from several dams upstream of the city. A failure of Twin Lakes and Lake Mary-Phoebe dams would affect areas along Big Cottonwood Creek in the northeast corner of the city. Failure of White Pine or Red Pine, or Sandy–Willow Creek dams would affect areas along Little Cottonwood Creek near the southern and eastern side of the city. Residents living downhill from key water retention structures face increased danger in the event of a dam breach. Those living in the lower elevations near Big Cottonwood Creek are especially at risk.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerabilities and Impacts
		Impacts: Dam failure can create dangerous conditions where fast-moving waters can injure or sweep away people. Individuals who may have limited mobility could struggle with timely evacuation, particularly if flooding occurs rapidly. Households with limited financial resources may lack access to transportation or emergency planning resources, heightening their vulnerability during a fast-moving flood emergency. Homes could be damaged, leaving residents displaced.
	Structures	*Vulnerability:* In Cottonwood Heights, homes located along the foothills and near stream corridors could suffer severe damage if a dam-related failure caused a downstream surge. *Impacts:* Critical structures such as Fort Union Boulevard bridges, nearby schools, and healthcare offices located near water channels could be exposed to inundation or indirect impacts. Older infrastructure that predates modern safety standards or floodplain management may be more susceptible to structural failure or flood damage. A lack of robust flood alert systems or limited spillway capacity upstream could amplify these risks.
	Economic Assets	*Vulnerability:* A dam failure could cause widespread impacts to Cottonwood Heights' transportation and utility systems. *Impacts:* Roads like Wasatch Boulevard and Highland Drive could experience closures or damage, disrupting business operations and commutes. Commercial zones near lower elevations, including the Fort Union area, could suffer property losses, temporary closures, and costly cleanup efforts. While the city doesn't rely on agricultural production, landscaping businesses, irrigation-dependent parks, and water-reliant services may experience significant disruptions.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Streamside habitats and greenways, including areas along Big Cottonwood Creek, may be washed out or degraded by sudden floodwaters. *Impacts:* A dam breach could lead to sediment deposition and erosion that threaten riparian ecosystems. Historic irrigation features or early infrastructure linked to the city's settlement era could be damaged, along with public parks or gathering areas that are vital to the community's identity and recreation. Trails and other recreation amenities could be damaged.
	Critical Facilities and Infrastructure	*Vulnerability:* Essential services such as water and transportation networks are vulnerable to dam failure. Cottonwood Heights could be affected by water supply interruptions or direct flood damage. *Impacts:* Failure involving upstream dams could disrupt flows to water treatment facilities or damage pipelines serving neighborhoods throughout the city. Critical response times could be delayed if bridges or main thoroughfares are blocked, further stressing emergency responders.
	Community Activities	*Vulnerability:* Community events and recreational activities are vulnerable to flood damage from dam failure. *Impacts:* Community events held near parks or green spaces along water corridors, like those in Crestwood Park or Bywater Park, may face cancellation or long-term disruption due to flood damage. Fishing, walking, and biking paths that follow local streams could be rendered unsafe. In addition, if key roads or bridges become impassable,

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerabilities and Impacts
		neighborhood connectivity and emergency access could be compromised, disrupting day-to-day life and local events.
Civil Disturbance	People	Low-income individuals may lack the resources for safety, while the elderly or disabled may struggle to navigate emergencies. Young people, particularly teenagers, may be drawn into unrest, influenced by social dynamics. In addition, marginalized individuals may feel targeted or compelled to participate. A lack of community cohesion and trust in authorities can further heighten tensions.
	Structures	Government buildings, commercial properties, and infrastructure, such as bridges and transportation hubs may be vulnerable. Government buildings may be targeted for their symbolic authority, while retail stores can attract crowds during protests. Residential neighborhoods also can be affected, especially in areas with heightened tensions. The vulnerability of these structures stems from their visibility and importance to the community, combined with factors such as location and ongoing social issues.
	Economic Assets	Retail establishments, especially shopping centers, are at risk as they often become focal points for protests. Transportation systems can be disrupted by blockades, hindering access to services. Financial institutions may face vandalism or theft, while critical service providers, such as hospitals, could experience strain during unrest. Several economic assets are vulnerable to civil disturbances, primarily due to their visibility and reliance on foot traffic.
	Natural, Historic, and Cultural Resources	Parks and open spaces may suffer from vandalism or destruction during uncontrolled events. Historic sites can become targets, as they symbolize authority or cultural significance. Cultural resources, such as community centers and places of worship, also may be affected, as they play a vital role in community identity. Their vulnerability lies in the potential for damage during protests.
	Critical Facilities and Infrastructure	Governmental buildings, schools, and healthcare facilities may be at risk, since they often symbolize authority and serve as community hubs, making them targets during unrest. Utility infrastructure, such as water and power facilities, is also at risk of disruption. Its visibility and essential services contribute to its vulnerability during civil disturbances.
	Community Activities	Public demonstrations, parades, and local government meetings are particularly vulnerable to civil disturbances. These events often attract large crowds and can become tense, especially around contentious social or political issues. Factors such as the local demographic, economic conditions, and recent events can heighten these vulnerabilities, making it easier for conflicts to arise during passionate public gatherings.
Cyberattack	People	Older adults often lack familiarity with technology and online security, making them easy targets for phishing scams. Individuals engaging in online banking or shopping without strong security measures also face heightened risks. Families with children may be less vigilant about internet safety, allowing cybercriminals to exploit personal information. In addition, small business owners without robust cybersecurity practices are prime targets for attacks that can disrupt operations.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerabilities and Impacts
	Structures	Critical infrastructure, such as power plants, water treatment facilities, and transportation systems, often lack robust cybersecurity measures. Commercial businesses, especially financial institutions and healthcare providers, also are at risk due to weaker data protection and employee training. Educational institutions may be vulnerable because of limited funding for cybersecurity and outdated software. Obsolete technology and insufficient training enhance the susceptibility of these structures to cyber threats.
	Economic Assets	Financial institutions, such as banks and credit unions, are at risk of data theft and service disruption. Small and medium-sized businesses often lack robust cybersecurity measures, making them attractive targets. In addition, local government agencies and critical infrastructure, such as water treatment facilities, might have outdated security protocols, posing threats to public safety. The rise of remote work further exacerbates vulnerabilities, as employees accessing networks from home can unintentionally expose systems to risks. Overall, the combination of outdated technology and insufficient cybersecurity practices increases the vulnerability of an area's economic assets.
	Natural, Historic, and Cultural Resources	Natural resources like water management systems and wildlife databases can be compromised, disrupting ecosystems. Historic sites and museums that digitize collections are at risk of losing valuable artifacts and data. In addition, cultural organizations managing events may face threats if their systems lack adequate security. The limited resources of smaller organizations further increase this vulnerability
	Critical Facilities and Infrastructure	Energy and utility services, such as electricity and water systems, which often rely on outdated technology, may be vulnerable. Transportation infrastructure, such as traffic management and public transit, is also at risk due to networked systems. Healthcare facilities that use electronic records and connected medical devices face vulnerabilities that can compromise patient safety.
	Community Activities	Online registration for events, local government services, and educational programs that rely on digital tools may be targeted due to inadequate security measures, outdated software, and insufficient staff training.
Hazardous Materials Incident (Transporta-tion & Fixed Facility)	People	Individuals with pre-existing health conditions, such as respiratory issues, and the elderly are at higher risk due to their compromised health. Children also are more susceptible. Those living near industrial areas or transport routes for hazardous materials face increased exposure risk, while low-income families may lack resources and information to effectively prepare for incidents.
	Structures	Industrial facilities, such as manufacturing plants and warehouses, often store hazardous chemicals which may leak. Residential buildings, schools, and healthcare facilities also are at risk, particularly if located along transportation routes for hazardous materials. Older buildings may lack modern safety features, increasing their vulnerability.
	Economic Assets	Industrial facilities, transportation infrastructure, and nearby commercial properties may be affected. Industrial facilities handling chemicals are at risk of spills or leaks, while roads and railways used

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerabilities and Impacts
		for transporting hazardous materials can lead to accidents and contamination. In addition, nearby commercial and residential areas face potential health risks and economic losses.
	Natural, Historic, and Cultural Resources	Waterways and habitats are vulnerable to hazardous materials incidents, which can disrupt ecosystems. Historic sites and structures may suffer damage from toxic exposure, leading to degradation over time. In addition, cultural landmarks risk losing their significance due to contamination events. The proximity of these resources to industrial areas or transport routes exacerbates their risk.
	Critical Facilities and Infrastructure	Chemical manufacturing plants, waste treatment facilities, and transportation networks, such as highways and railroads, may be at risk. Their vulnerability stems from factors such as proximity to residential areas, aging infrastructure, and inadequate safety measures. Natural hazards, such as flooding and earthquakes, can further increase risks by damaging containment systems.
	Community Activities	Local markets, school events, and outdoor gatherings are vulnerable to hazardous materials incidents if they are near industrial zones and transport corridors. This risk is heightened by inadequate emergency preparedness, lack of public awareness, and the potential for spills during transport. Large crowds at events can complicate evacuation efforts, increasing the risks for participants and nearby residents.
Public Health Epidemic/ Pandemic	People	Individuals with pre-existing health conditions like asthma and heart disease and adults over 65 may be vulnerable. Low-income families may struggle to access healthcare and vaccinations, increasing their risk. Marginalized communities with limited access to information and those living in high-density conditions also are at greater risk due to the rapid spread of diseases and the challenges in implementing preventive measures.
	Structures	Several structures are vulnerable to public health epidemics or pandemics, particularly due to their ability to facilitate the spread of disease. High-density residential areas, such as apartment complexes, are at risk, as close living quarters can lead to faster transmission. Public gathering spaces, such as schools and community centers, also pose significant threats because large groups are in confined spaces. Healthcare facilities can become hotspots for infections if infection control measures are insufficient. In addition, workplaces with high foot traffic, such as retail stores, contribute to vulnerability.
	Economic Assets	Small businesses in retail, hospitality, and food service are particularly vulnerable to public health epidemics or pandemics. These sectors face risks from fluctuating consumer demand and potential operational restrictions. The tourism industry also is affected, as travelers may avoid high-risk areas. Healthcare facilities can become overwhelmed, straining resources and impacting operations. In addition, local supply chains may experience disruptions, leading to shortages and inflation. Overall, the direct effects of illness, along with prolonged shutdowns and consumer hesitance, leave these economic assets exposed to significant downturns.
	Natural, Historic, and	Natural resources like wildlife and ecosystems can be disrupted by increased human activity, raising the risk of zoonotic diseases. Historic sites may deteriorate due to reduced visitor access and funding, while

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerabilities and Impacts
	Cultural Resources	cultural resources, such as community events, face cancelations, impacting social connections.
	Critical Facilities and Infrastructure	Public health epidemic or pandemic incidents can affect healthcare facilities, nursing homes, public transportation systems, schools, and food supply chains. Clinics may become overwhelmed with patients, while vulnerable populations in nursing homes are at higher risk. Public transportation can facilitate the spread of disease, and schools gather large groups, thereby increasing transmission potential. These facilities often lack adequate resources, including medical supplies and testing capabilities, making them more susceptible to the impacts of a health crisis.
	Community Activities	Large gatherings like festivals and sporting events can facilitate the rapid spread of diseases due to close contact. Public transportation also is at risk, as it serves many people in confined spaces. Schools and childcare facilities are particularly susceptible, given that children can easily transmit infections. In addition, food-related events, such as farmers' markets, can pose risks if hygiene practices are not followed. The interconnectedness of community members and varying adherence to health guidelines further exacerbate these vulnerabilities.
Terrorism	People	Young children and newcomers may lack awareness of potential threats, while the elderly and individuals with disabilities may struggle to respond quickly in emergencies. Marginalized communities often face bias, making them more susceptible to targeting. In addition, those with lower socioeconomic status may lack access to security measures and emergency preparedness resources.
	Structures	Government buildings, transportation hubs, commercial centers, and public spaces are particularly vulnerable to terrorism incidents. Government buildings are symbolic targets, while transportation hubs and commercial centers are attractive due to their potential for high casualties and crowd presence. Public spaces also are at risk due to their open nature and lack of security. Their vulnerability is heightened by inadequate security measures, high occupancy rates, and their locations in densely populated areas, which can amplify the impact of incidents.
	Economic Assets	Infrastructure, commercial establishments, and community facilities may be vulnerable. Critical infrastructure, such as transportation networks and power grids, could disrupt the economy if targeted. Commercial establishments, especially those with high foot traffic, and community facilities like schools and hospitals also are at risk, as they can provoke widespread concern and disruption. Their accessibility and interconnectivity increase vulnerability, meaning that damage to one asset can have a broader economic impact and hinder recovery efforts.
	Natural, Historic, and Cultural Resources	Natural resources like water supplies and parks could be targeted for their significance to the community. Historic sites and cultural resources, such as museums or community centers, also are at risk due to their accessibility and importance to local identity. Their vulnerability is often heightened by inadequate security measures.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerabilities and Impacts
	Critical Facilities and Infrastructure	Public transportation systems, healthcare facilities, schools, and utility services like water and power plants may be affected. Their vulnerability arises from high accessibility and the potential impact of an attack, as crowded transportation and public spaces can lead to mass casualties and panic. Attacking utility services could disrupt the town's essential functions, creating chaos.
	Community Activities	Festivals, parades, and sporting events are particularly vulnerable to terrorism incidents. These events attract large crowds, making it easier for perpetrators to inflict harm and instill fear. In addition, community centers and places of worship serve as social hubs, increasing their risk. Factors such as limited security measures and open access to public spaces, contribute to this vulnerability.

Jurisdiction-Specific Changes in Vulnerability

Hazard events can impact communities, infrastructures, and ecosystems. The severity of these impacts can be influenced by climate change, population patterns, and land use developments. Understanding these factors is crucial for the city of Cottonwood Heights to develop a resilient community and minimize the impacts of hazards. Table 9 displays the impacts each identified hazard has had on the city of Cottonwood Heights.

DRAFT

Table 9: Jurisdiction-Specific Changes in Vulnerability in the City of Cottonwood Heights

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
Avalanche	Higher temperatures can lead to more rain, destabilizing snowpack and increasing the risk of wet avalanches. In addition, changes in snowfall can cause denser snow layering on slopes, making them more prone to sliding.	Avalanches can influence population patterns by deterring people from moving to or remaining in high-risk areas, leading to decreased density in these locations. The threat of avalanches prompts many to seek safer environments in urban or lower-risk regions. In addition, when avalanches occur, they can disrupt infrastructure, causing residents to relocate.	The minor development that has occurred in Cottonwood Heights has not impacted avalanche risk in the city.	Decreased
Drought	Climate change affects drought incidents by altering precipitation patterns and increasing temperatures. Warmer weather can lead to longer dry periods and more severe droughts, while changes in rainfall can reduce snowpack in nearby mountains, crucial for summer water supply. Higher temperatures also increase evaporation rates, further straining local water resources.	Drought can significantly influence population patterns by impacting economic opportunities and the quality of life. Water scarcity often leads to reduced agricultural productivity, prompting residents to migrate to areas with more stable job prospects. Increased water costs can make living less affordable, driving some residents away. Conversely, efforts to address drought, such as sustainable development or improved water management, may attract newcomers, resulting in changes in the community's demographic composition over time.	While development, both residential and commercial, in Cottonwood Heights has increased slightly since the previous plan update, this development has not changed drought risk.	Increased
Earthquake	Rising temperatures can lead to glacial melting, which affects pressure on tectonic plates and may trigger	Earthquakes can significantly alter population patterns by prompting residents to leave for safer areas after a seismic event. This	While development, both residential and commercial, in Cottonwood Heights has increased slightly since the	Stayed the same

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	seismic activity through isostatic rebound. In addition, increased rainfall and flooding can erode soils, weakening structural integrity and heightening vulnerability during earthquakes. Although the direct links between climate change and earthquakes are still under investigation, environmental effects may impact the region's seismic risk.	migration can lead to changes in population density and attract new residents and businesses during the rebuilding process. The perception of the area as a safe place to live may shift, impacting long-term demographics, as some residents return to rebuild while others relocate permanently.	previous plan update, this development has not changed earthquake risk.	
Extreme Heat	Climate change significantly impacts extreme heat by increasing the frequency and intensity of heat waves. Rising global temperatures lead to longer and hotter summers, affecting residents and local infrastructure while heightening health risks, especially for vulnerable populations. Urban heat islands from reduced vegetation and extensive pavement further amplify these effects.	By causing residents to relocate due to damaged homes or safety concerns. Some may move to areas perceived as safer or seek better job opportunities elsewhere. The economic impact and infrastructure damage can also make certain neighborhoods less desirable, leading to shifts in demographics and the socioeconomic landscape as new residents with different backgrounds move in.	Although development in Cottonwood Heights has been minor, consisting of mostly small subdivisions, apartments, and office buildings, more structures can increase extreme heat risk by displacing vegetation and exacerbating the urban heat island effect.	Increased
Extreme Cold	By increasing the intensity of winter storms. Higher atmospheric temperatures allow for more moisture, resulting in heavier snowfall and potentially lower temperatures during these events. In addition,	By driving some residents to relocate to warmer areas. Harsh winters can hinder economic activities and deter new residents and businesses, influencing housing demand and the attractiveness of certain neighborhoods. This may	The slight increase in structures also leads to slightly more risk from heavy snow events.	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	fluctuations in weather patterns may disrupt seasonal cycles, leading to unpredictable periods of extreme cold mixed with warmer spells.	disproportionately affect lower-income families, leading to changes in demographics and socioeconomic stratification in the community.		
Flooding	Higher temperatures increase the frequency and intensity of extreme weather events and alter precipitation patterns. They lead to more intense rainstorms and accelerated snowmelt from nearby mountains, raising water levels in rivers and streams. This combination raises the risk of flooding, especially in areas with inadequate drainage and urban development in flood-prone zones, heightening the potential for damage to homes and infrastructure.	Flooding can significantly alter population patterns by displacing residents from affected areas, leading them to seek shelter elsewhere. This may cause a population decline where flooding occurs, as individuals might hesitate to return due to ongoing risks or property damage. As neighborhoods become less desirable, people may migrate to safer areas, changing demographic trends and putting pressure on housing in those regions. Over time, these shifts can influence urban planning and development, as local governments address flooding risks and changing population needs.	Development has not occurred in the 1% or the 0.2% annual chance flood zones.	Decreased
Landslide/ Slope Failure	Climate change increases the risk of landslides through heavier rainfall and temperature fluctuations. Intense rain saturates soil, destabilizing slopes, while freeze–thaw cycles weaken the ground. Changes in vegetation can also reduce	Landslides and slope failures can impact population patterns by making some areas unsafe, leading to displacement and lower property values. This prompts residents to move to safer regions, thereby increasing density in more stable areas. Concerns about future landslides may also deter newcomers from	A slight increase in development on the east side of the city, which abuts the Wasatch Mountains, has led to a slight increase in landslide risk.	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	stability, leading to a higher potential for landslides.	high-risk zones, shaping long-term demographic trends.		
Radon	Climate change can affect radon levels by altering soil temperatures and moisture conditions. Higher temperatures may increase radon emissions from the ground, while heavy rainfall can change groundwater and soil saturation, impacting radon migration into buildings.	Radon exposure can influence population patterns as increased health awareness may drive families to move away from areas with high radon levels. This shift could particularly affect vulnerable groups, changing demographics and demand in the housing market. Homes with lower radon levels may become more sought after, and public health campaigns can encourage community action, making previously undesirable areas more attractive once mitigation measures are implemented.	Changes in development and land use in Cottonwood Heights have not impacted radon risk.	Decreased
Heavy Rain	Climate change increases the frequency and intensity of heavy rain, as higher temperatures allow the atmosphere to hold more moisture. This leads to stronger storms, flash flooding, and overwhelmed drainage systems.	Heavy rain can shift population patterns by pushing residents out of flood-prone areas and attracting them to safer neighborhoods. Frequent flooding may lead to evacuations and economic disruptions, prompting relocations. Over time, ongoing heavy rains can affect housing demand and community stability, altering the town's population distribution.	There is a need for adequate stormwater systems in new areas. More structures in Cottonwood Heights may lead to slightly more pluvial flooding due to impervious surfaces.	Increased
High Wind	Climate change affects high winds by altering atmospheric patterns and increasing extreme weather events. Rising temperatures may lead to more substantial, unpredictable winds and more	High winds can alter population patterns by making certain areas less desirable. Frequent damage may drive residents to safer neighborhoods, deter newcomers, and slow growth in affected regions.	The increase in multistory office buildings slightly increases risk from high winds.	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	frequent thunderstorms, posing risks to infrastructure and air quality.			
Lightning	Climate change increases temperatures and alters precipitation, leading to more intense thunderstorms and frequent lightning strikes. Urbanization can enhance this effect, posing risks to public safety and infrastructure.	Lightning can influence population patterns by causing property damage and wildfires, leading some residents to relocate. Areas with higher lightning activity may deter new residents, while safer locations could increase migration as people seek protection from severe weather.	An increase in taller structures in Cottonwood Heights leads to slightly higher lightning strike risk.	Increased
Severe Winter Weather	Climate change impacts heavy snow and blizzards by altering precipitation patterns. Higher temperatures can lead to more rain than snow, affecting snowpack levels—additionally, increased storm intensity results in heavier, more unpredictable snowfall.	Increased population equals an increased number of people needing to get to work and quicker snow removal. Heavy snow or blizzards can impact population patterns by influencing where people live and work. Transportation disruptions may lead residents to seek housing closer to jobs, increasing density in some areas while depopulating others. Families might also avoid regions with frequent heavy snowfall, shifting demand to milder areas. Over time, these trends can alter community demographics and economic activity, prompting adjustments in town planning and resource allocation.	The increase in subdivisions means the city has more roads to plow and people to evacuate in the case of heavy snow.	Increased
Tornado	Climate change may increase the frequency and intensity of tornadoes. Higher temperatures lead to more	Tornadoes can influence population patterns by prompting residents to move to safer areas after damage occurs. This can	More structures in Cottonwood Heights mean more structures that could be damaged due to a tornado.	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	moisture in the air, creating conditions for severe thunderstorms. Changes in wind patterns and precipitation can also heighten tornado risks, resulting in more destructive storms and greater threats to infrastructure and communities.	decrease density in affected neighborhoods while increasing the demand for housing in safer regions. New residents may also move in for recovery opportunities, altering demographics. Over time, repeated tornado threats might push long-term residents to areas with better disaster preparedness, reshaping the town's population distribution.		
Wildfire	By raising temperatures and creating drier conditions, prolonged droughts lead to more dry vegetation, which serves as fuel for fires. Erratic seasons extend the growing period, while more lightning strikes can ignite wildfires. These factors heighten the threat to ecosystems and community safety.	Displaced individuals often seek safer areas, shifting demographics, while declining property values might deter newcomers. Conversely, some may be drawn to rebuilding efforts, impacting long-term growth and community dynamics.	The increase in subdivisions on the east side of the city, which is close to fire-prone areas, increases wildfire risk for the city.	Increased
Dam Failure	Climate change raises the risk of dam failure by causing heavier rainfall and rapid snowmelt. These changes can overwhelm dams and compromise their integrity, highlighting the need for urgent safety assessments and upgrades to protect communities downstream.	Dam failure tornadoes can impact population patterns by displacing residents and altering demographics. Evacuations can lead to an influx in safer areas, while destruction may deter new residents and contribute to population decline. Fear of future disasters may also prompt remaining individuals to relocate, changing the community's composition and affecting	Increased development in Cottonwood Heights has not changed dam failure risk.	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
		population density and economic activity.		
Civil Disturbance	Climate change can increase civil disturbances by intensifying environmental stresses and social tensions. Rising temperatures may lead to droughts, wildfires, and poor air quality, particularly affecting vulnerable communities. Resource scarcity, especially water, can spark conflicts and protests. In addition, an influx of migrants from harder-hit areas may strain local resources, further escalating tensions. This cycle of unrest is driven by the impacts of climate change on the environment and community dynamics.	By encouraging residents to move for safety, leading to outflows and new arrivals. These events can reveal social issues, impacting community dynamics, employment, and property values, ultimately reshaping demographics, and social cohesion.	Increased development in Cottonwood Heights has not changed civil disturbance risk.	Increased
Cyberattack	Possible attack on the industry, which is seen as producing large amounts of greenhouse gases and burning fossil fuels. Climate change can heighten cyberattack risk by increasing vulnerabilities during extreme weather. Disruptions like power outages offer cybercriminals opportunities, but focusing on emergency responses can weaken cybersecurity measures. As organizations adopt new	Cyberattacks can change population patterns by eroding trust in essential services. Compromised systems may cause residents to leave due to safety concerns, while high-profile incidents can deter businesses, leading to job losses. This perception of vulnerability may also make the town less appealing to newcomers, resulting in demographic shifts and affecting local development.	Increased development in Cottonwood Heights has not changed cyberattack risk.	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	technologies to cope with climate impacts, they may unintentionally introduce additional vulnerabilities.			
Hazardous Materials Incident (Transportation & Fixed Facility)	Climate change elevates the risk of hazardous materials incidents by increasing extreme weather events like heavy rain and wildfires. These events can breach storage tanks and heighten material volatility. Vulnerable infrastructure can lead to more spills or accidents, while climate shifts may also introduce new challenges for managing hazardous substances and public health.	By causing evacuations and temporary declines in density. In the long run, unsafe areas may deter new residents, affecting growth and diversity. In addition, negative perceptions can lower property values and economic prospects, leading families to relocate, which impacts local demographics.	Increased development in Cottonwood Heights has not changed hazardous materials risk.	Increased
Public Health Epidemic/ Pandemic	By increasing the spread of vector-borne diseases and raising the risk of waterborne illnesses due to flooding or drought. Worsening air quality can also exacerbate respiratory conditions like asthma, especially in vulnerable populations.	By prompting migration for safety and better healthcare. Vulnerable groups may move to areas with improved services, while economic instability can drive people to seek new employment opportunities. In addition, restrictions like quarantine measures can limit movement and social interactions, reshaping the community's demographics and impacting local economies.	Increased development in Cottonwood Heights has not changed pandemic/epidemic risk.	Increased
Terrorism	Terroristic activity is sometimes centered around climate change. Climate change impacts terrorism incidents by creating conditions of resource scarcity	Terrorism incidents can alter population patterns by instilling fear and prompting residents to relocate to perceived safer areas, resulting in demographic shifts and potential declines in property	Increased development in Cottonwood Heights has not changed terrorism risk.	Increased

DRAFT

Type of Hazard Event	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	and social unrest. Increased competition for essential resources, such as water, can fuel tensions, making communities more vulnerable to extremist ideologies. Extreme weather events may disrupt social order and infrastructure, offering terrorist groups opportunities to exploit crises. In addition, climate-driven population displacement can heighten tensions in receiving areas, raising the risk of domestic terrorism. Law enforcement's focus on climate-related challenges can also limit its capacity to address terrorism threats. Ultimately, while climate change may not directly cause terrorism, its effects can create an environment conducive to extremist activities.	values. Some neighborhoods may see an outflow of residents, while others could experience an influx of people seeking refuge from violence. In addition, increased security measures may deter businesses and residents from certain locations, leading to long-term changes in population density and urban development patterns.		

DRAFT

Additional Public Involvement

The city of Cottonwood Heights provided several opportunities for public participation. Figure 1 is an example of the city's public outreach.

Figure 1: Social Media Post for Public Participation

Plan Integration

Incorporating the underlying principles of the Hazard Mitigation Plan and its recommendations into other plans is a highly effective and low-cost way to expand their influence. All plan participants will use existing methods and programs to implement hazard mitigation actions where possible. As previously stated, mitigation is most successful when it is incorporated into the day-to-day functions and priorities of government and public service. This plan builds on the momentum developed through previous and related planning efforts and mitigation programs, and it recommends implementing actions where possible through these other program mechanisms. These existing mechanisms include the following:

- Regularity Capabilities
- Administrative Capabilities
- Fiscal Capabilities

Respective planning stakeholders will conduct implementation and incorporation into existing planning mechanisms and will be done through the routine actions of:

- Monitoring other planning/program agendas
- Attending other planning/program meetings

DRAFT

- Participating in other planning processes; and
- Monitoring community budget meetings for other community program opportunities.

The successful implementation of this plan will require constant and vigilant review of existing plans and programs for coordination and multi-objective opportunities that promote a safe, sustainable community. Regular efforts should be made to monitor the progress of mitigation actions implemented through other planning mechanisms. Where appropriate, priority actions should be incorporated into planning updates. Table 10 lists existing planning mechanisms in which the Hazard Mitigation Plan has been integrated.

Table 11 lists the opportunities for integrating elements of this plan into other plans.

Table 10: Previous Plan Integration by the City of Cottonwood Heights

Table 11: Future Plan Integration Opportunities for the City of Cottonwood Heights

Name	Description
General Plan	Overview of the city's long-term goals and guides land use ordinances and regulations.
Transportation Master Plan	This is comprehensive master plan for transportation in Cottonwood Heights addresses mobility, multi-modal transportation options, safety, and growth. The city also has a Bicycle and Trails Master Plan and the Bonneville Shoreline Trail Access Master Plan.
Parks, Trails, and Open Space Master Plan	This plan establishes goals, recommendations, and priorities for maintaining and improving parks, trails, and open spaces.
Mid-Valley Active Transportation Plan	This partnership with Taylorsville, Midvale, Murray, Millcreek, and Holladay proposes a "backbone network" of safe active transportation routes connecting all six cities. The plan was prepared by Avenue Consultants, sponsored by the Wasatch Front Regional Council, and adopted by resolution by the city in 2022.
For Union Area Master Plan	An addendum to the General Plan, this master plan guides future growth and development in and around Fort Union Boulevard and its planning area.
Interlocal Sustainability Action Plan	Cottonwood Heights, Holladay and Millcreek signed an interlocal agreement to collaborate on sustainability projects and agreed to write a sustainability plan to guide future sustainability efforts. This plan recommends best practices for sustainable development, energy use, landscaping, transportation, and waste management across the tri-city region.
Wasatch Boulevard Area Master Plan	The Wasatch Boulevard Master Plan is a project led by the city that guides the future evolution of Wasatch Boulevard and the communities it serves. The plan focuses on the corridor between Interstate 215 and the mouth of Little Cottonwood Canyon. It was adopted on July 2, 2019, and is "deemed to augment the General Plan."

Name	Description
Storm Drain Master Plan	Outlines existing system deficiencies and future projects required to bring storm drains to an acceptable level of service.
Pavement Management Plan	Plan to preserve the life of pavement on city streets.
Stormwater Management Plan	Manages 89 miles of storm drainpipes and drainage channels, 1,620 storm drain structures, and 104 outfalls.
Affordable Housing Plan	This report updates the 2005 Affordable Housing Plan and complies with Utah state code. It contains an analysis of current and projected affordable housing needs in the city. The plan was adopted Nov. 19, 2019, and is an element of the General Plan.

Capability Assessment

Local mitigation capabilities are existing authorities, policies, programs, and resources that reduce hazard impacts or could help carry out hazard mitigation activities.

Planning and Regulatory Capabilities

Planning and regulatory capabilities are the plans, policies, codes, and ordinances that prevent and reduce the impacts of hazards.

Table 12: Assessment of the Planning Capabilities of the City of Cottonwood Heights

Plan	Does it address hazards? (Y/N)	How can it be used to implement mitigation actions?	When was the last update? When is the next update?
General Plan	Y	Can inform mitigation actions over time	2005 – to be updated in 2025
Capital Improvement Plan	Y	Can provide information on funding sources	2024/2025
Climate Change Adaptation Plan	Y – Sustainability Plan	Can inform mitigation actions and climate-friendly initiatives	2021
Community Wildfire Protection Plan	Y	Can inform drought or wildfire mitigation actions	2020/2025
Economic Development Plan	Y – referenced in General Plan	Can provide information on funding sources for mitigation actions	2005
Land Use Plan	Y	Can inform mitigation actions for a variety of hazards as far as parks, trails, and open space	2021 – update TBD
Local Emergency Operations Plan	Y	Can inform operations and responsible parties for mitigation actions	2023

DRAFT

Plan	Does it address hazards? (Y/N)	How can it be used to implement mitigation actions?	When was the last update? When is the next update?

Administrative and Technical Capabilities

Administrative and technical capabilities include staff and their skills. They also include tools that can help carry out mitigation actions. If you do not have local staff, consider how state and regional partners can help.

Table 14: Assessment of the Administrative Capabilities of the City of Cottonwood Heights[3]

Administrative Capability	In Place? (Y/N)	Is staffing adequate?	Are staff trained on hazards and mitigation?	Is coordination between agencies and staff effective?
Chief Building Official	Y	Y	Y	Y
Civil Engineer	Y	Y	Y	Y
Community Planner	Y	Y	Y	Y
Emergency Manager	Y	Y	Y	Y
Floodplain Administrator	Y	Y	Y	Y

DRAFT

Administrative Capability	In Place? (Y/N)	Is staffing adequate?	Are staff trained on hazards and mitigation?	Is coordination between agencies and staff effective?
Active VOAD (Voluntary Agencies Active in Disasters)	Y	Y	Y	Y
Other? (Please describe.)				

Table 15: Assessment of the Technical Capabilities of the City of Cottonwood Heights

Technical Capability	In Place? (Y/N)	How has it been used to assess/mitigate risk in the past?	How can it be used to assess/mitigate risk in the future?
Mitigation Grant Writing	Y	Funded the development of plans, construction projects and road improvements	Can be used to fund mitigation projects
Hazard Data and Information	Y	Identify high risk areas to prioritize mitigation projects	Used to support mitigation projects as far as funding and the need for the work in the community
GIS	Y	Identify high risk areas to prioritize mitigation projects	Map and track mitigation projects over time
Mutual Aid Agreements	Y	Used to ensure response readiness	Established agreements in place to assist in known high risk areas
Other? (Please describe.)			

Financial Capabilities

Financial capabilities are the resources to fund mitigation actions. Talking about funding and financial capabilities is important to determine what kinds of projects are feasible, given their cost. Mitigation actions like outreach programs are lower cost and often use staff time and existing budgets. Other actions, such as earthquake retrofits, could require substantial funding from local, state, and federal partners. Partnerships, including those willing to donate land, supplies, in-kind matches, and cash, can be included.

Table 16: Assessment of the Financial Capabilities of the City of Cottonwood Heights

Funding Resource	In Place? (Y/N)	Has it been used in the past and for what types of activities?	Could it be used to fund future mitigation actions?	Can it be used as the local cost match for a federal grant?
Capital Improvement Project Funding	Y	Operational costs	Y	Y
General Funds	Y	Operational costs	Y	Y

DRAFT

Education and Outreach Capabilities

Education and outreach capabilities are programs and methods that could communicate about and encourage risk reduction. These programs may be run by a participant or a community-based partner.

DRAFT

Partners, especially those who work with underserved communities, can help identify additional education and outreach capabilities.

Table 17: Assessment of the Education and Outreach Capabilities of the City of Cottonwood Heights

Education and Outreach Capability	In Place? (Y/N)	Does it currently incorporate hazard mitigation?	Could it be used to support mitigation in the future?

Opportunities to Expand and/or Improve Capabilities

Actions that can expand and improve existing authorities, plans, policies, and resources for mitigation include budgeting for mitigation actions, passing policies and procedures for mitigation actions, adopting and implementing stricter mitigation regulations, approving mitigation updates, and making additions to existing plans as new needs are recognized. Table 18 lists the opportunities for the city of Cottonwood Heights.

DRAFT

Table 18: Opportunities to Expand or Improve the Capabilities of the City of Cottonwood Heights

Capability	Opportunity to Expand and/or Improve
Planning and Regulation	The city could benefit from updated evacuation plans and an updated Community Wildfire Protection Plan. These documents will help expand mitigation capabilities for reducing wildfire risk by revising current plans to include new risk data that takes into account current wildfire conditions and vulnerabilities.
Administrative and Technical	Providing ongoing training on hazards and mitigation for all relevant staff members will enhance their expertise and ability to implement effective mitigation strategies.
Financial	While the city itself has many positions and technical capabilities that can support mitigation actions, one area in which administrative and technical capabilities could be expanded is through partnership building. In particular, the city could expand current capabilities by establishing new memoranda of understanding (MOUs) and engaging with water districts, particularly through partnerships that support secondary water supply.
Education and Outreach	The city can expand funding for mitigation by applying for mitigation grants, including but not limited to FEMA's Hazard Mitigation Assistance grants (such as the Hazard Mitigation Grant Program or Flood Mitigation Assistance grant program) as well as post-disaster Public Assistance Mitigation (PA Mitigation/406) should a disaster impact the area.

Mitigation Strategy

Mitigation strategies provide proactive measures that are designed to minimize the impacts of hazards on the city of Cottonwood Heights. Table 19 shows mitigation action alternatives, and

Table 20 shows the status of previous mitigation activities. Table 21 is the 2025 mitigation action plan for the city of Cottonwood Heights.

Table 19: Mitigation Action Alternatives for the City of Cottonwood Heights

Action	Type of Action	Selected for inclusion in the plan?	If not selected, why not?
Public education	Education and awareness programs	Y – refined this mitigation action to be more specific.	
Security	Structure and infrastructure projects	Y – refined this mitigation action to be more specific.

City of Draper Annex

To participate in this multi-jurisdictional hazard mitigation plan (MJHMP) update for Salt Lake County (SLCo), the governing body of the city of Draper passed a formal resolution, a copy of which is maintained at the local government offices.

Planning Process Contact Information

Table 1 provides information on the point of contact during the updating of the MJHMP.

Table 1: Contact Information for the City of Draper

Name	Contact Information
Robert Lambert	**Phone:** 385-695-7199; **email:** Robert.lambert@draperutah.gov

The city of Draper has a fully integrated approach to hazard mitigation planning and program implementation. During the 2024 update process, the MJHMP participation roles in Table 2 were recorded.

DRAFT

Jurisdiction Profile

Date of Incorporation

February 27, 1978

Location and Description

The city of Draper is located 25 minutes south from downtown Salt Lake City in the southeast corner of the Salt Lake Valley. The city is approximately 30.1 square miles in area and is approximately 4,500 feet above sea level. Draper offers a blend of suburban life and metropolitan amenities with a strong sense of community and high quality of life. The city is known for its extensive trail systems, parks, and recreational opportunities, making it a great place for outdoor enthusiasts.

Population

The 2022 American Community Survey 5-Year Estimate from the U.S. Census Bureau records the population of the city of Draper at 50,635 people. The 2020 Census reported the total population as 51,017.

Demographics

Most of the 51,017 people are between the ages of 35 and 44, with a median age of 33.6; 26,525 are males (52.4%) and 24,110 are females (47.6%). English is the primary language in 83.2% of homes, with 7.6% Spanish, and 9.2% other languages.

Brief History

Initially known as South Willow Creek, the city of Draper was first settled in 1849 by Ebenezer Brown, his wife Phoebe, and their five children. Brown and his family cultivated the land and raised cattle to sell to those heading west for the gold rush. The first post office was established in 1854 and the settlement was named Draperville in honor of William Draper, the first Presiding Elder of the Mormon Church at the time. The name was later shortened to Draper. A fort was established in 1854 where settlers stayed during the winter of 1855–1856; they ventured out in the spring to build homes and irrigation systems. The city of Draper was officially incorporated on February 22, 1978.

Climate

The city of Draper experiences a humid continental climate (Dfb Köppen classification) characterized by warm summers and cold, snowy winters with significant temperature variations during the year. Average high temperatures are approximately 85.6°F in the summer and approximately 17.1°F in the winter. Rain each year is approximately 23.8 inches, and snowfall averages 34 inches annually.

DRAFT

Public Services

The city organized a Draper City Emergency Preparedness Committee to look at long-range planning and preparedness.

Governing Body

The city of Draper has a part-time Mayor and a City Council that act together as the Governing Body that adopts all ordinances and resolutions. They City Manager oversees operations day-to-day operations and programs of the city.

Development Trends

Draper has a mixture of land uses: commercial, industrial, residential, agricultural, and vacant land, with 4,500 acres of open space. The open space—which has many multi-use trails and areas—is used for recreational purposes by residents of Draper and the surrounding communities. Draper is home to the main customer service center and campus of eBay, the tech call center of PGP Corporation, the call center of Musician's Friend, and the headquarters of 1-800 Contacts. Draper is also home to Utah's first Ikea store in the intermountain west, which opened in spring 2007. The Church of Jesus Christ of Latter-day Saints (Mormons) constructed a temple in Draper that was dedicated on March 20, 2009. Since 1990, Draper has experienced its greatest growth in volume and geographic extent. During this time, the city changed quickly from a rural, agricultural town into a full-fledged suburban city. Its geographical growth has largely been in the southeastern part of the city, where 75% of the new housing units have been built.

New housing is increasingly built in the fringe areas, as the central city is nearing buildout. A very large portion of this growth has been focused on a series of medium to large master planned developments spread across the southern parts of the city. The growth in business facilities (office space, warehousing, retail, and manufacturing) has been concentrated in areas east and west of the I-15 freeway and along the 123rd south corridor. This growth has included greater diversity in users and building types, more expensive construction, the import of new businesses, and the growth of existing businesses. The strongest areas for future business growth are expected to be near the major north–south corridors (along the I-15 freeway corridor from Sandy to the Point of the Mountain), the major east–west corridors (114th South, 118th South State, 123rd South, and the Bangerter Highway), and the Town Center area. The mix of businesses will probably continue to diversify and the demand for more services to meet the needs of the local population and business communities will increase.

Jurisdiction-Specific Hazards and Risk

The Calculated Priority Risk Index (CPRI) is a comprehensive assessment tool for evaluating and prioritizing risks in a given context. It considers various factors, such as probability, impact, and urgency, to determine the level of risk associated with events or situations. The results for each hazard, including its risk factor (RF) value, are shown in Table 4. The results are based on the criteria in Table 5 and the equation that follows it. The CPRI helps organizations and individuals make informed decisions about risk

DRAFT

management and mitigation strategies. It provides a systematic approach to identifying and addressing potential issues, allowing for a more efficient allocation of resources and proactive risk prevention. With the CPRI, stakeholders can prioritize their focus on the most critical risks, leading to more effective risk management and, ultimately, better outcomes.

Table 4: Calculated Priority Risk Index Values for the City of Draper

Type of Hazard Event	Probability of Future Events	Spatial Extent	Severity of Life/ Property Impact	Warning Time	Duration	Response Capacity	Risk Factor Value
Avalanche	1	1	2	4	2	1	1.7
Drought	2	2	2	1	4	1	2
Earthquake	2	3	4	4	3	2	3
Extreme Heat	3	2	3	1	3	1	2.5
Extreme Cold	3	2	2	1	3	1	2.2
Flooding	2	2	3	3	3	1	2.4

Radon	3	0	2	1	4	2	2.2
Heavy Rain	3	3	2	3	1	1	2.3
High Wind	2	2	3	3	2	1	2.3
Lightning	1	1	2	4	1	1	1.6
Severe Winter Weather	4	3	2	2	2	1	2.6
Tornado	1	1	3	4	1	2	2
Wildfire	4	4	3	4	3	1	3.3
Dam Failure	1	3	3	2	2	3	2.2
Civil Disturbance	1	1	2	4	2	2	1.8
Cyberattack	2	2	3	4	3	2	2.6
Hazardous Materials Incident (Transportation & Fixed Facility)	2	2	2	4	1	1	2
Public Health Epidemic/ Pandemic	2	3	3	1	4	1	2.4
Terrorism	1	1	3	4	2	1	2

DRAFT

Table 5: Criteria for the Calculated Priority Risk Index

Risk Index Factor	Degree of Risk Level		Criteria	Factor Weight for Degree of Risk Level
Probability of Future Events	1	Unlikely	Less than 1 percent probability of occurrence in the next year or a recurrence interval of greater than every 100 years.	30%
	2	Occasional	1 to 10 percent probability of occurrence in the next year or a recurrence interval of 11 to 100 years.	
	3	Likely	11 to 90 percent probability of occurrence in the next year or a recurrence interval of 1 to 10 years.	
	4	Highly Likely	91 to 100 percent probability of occurrence in the next year or a recurrence interval of less than 1 year.	
Spatial Extent	1	Limited	Less than 10% of the planning area could be impacted.	10%
	2	Small	10%–25% of the planning area could be impacted	
	3	Significant	25%–50% of the planning area could be impacted.	
	4	Extensive	50%–100% of the planning area could be impacted.	
Severity of Life/Property Impact	1	Negligible	Less than 5% of the affected area's critical and non-critical facilities and structures are damaged/destroyed. Only minor property damage and minimal disruption of life. Temporary shutdown of critical facilities.	30%
	2	Limited	More than 5% and less than 25% percent of property in the affected area is damaged/ destroyed. Complete shutdown of critical facilities for more than one day but less than one week.	
	3	Critical	More than 25% and less than 50% of property in the affected area was damaged/destroyed. Complete shutdown of critical facilities for over a week but less than one month.	
	4	Catastrophic	Over 50% of critical and non-critical facilities and infrastructures in the affected area are damaged/ destroyed. Complete shutdown of critical facilities for more than one month.	
Warning Time	1	Self-defined	More than 24 hours	10%
	2	Self-defined	12 to 24 hours.	
	3	Self-defined	6 to 12 hours.	
	4	Self-defined	Less than 6 hours.	
Duration	1	Brief	Up to 6 hours.	10%
	2	Intermediate	Up to one day.	
	3	Extended	Up to one week.	

DRAFT

Risk Index Factor	Degree of Risk Level		Criteria	Factor Weight for Degree of Risk Level
	4	Prolonged	More than one week.	
Response Capacity	1	High	Significant resources and capability to respond to this kind of event; staff are trained, experienced, and ready.	10%
	2	Medium	Some resources and capability to respond to this kind of staff; some staff may be trained, experienced, and ready while others may need additional support.	
	3	Low	Limited resources and capability to respond to this kind of event; additional staff or staff training needed.	
	4	None	No resources and capability to respond this kind of event; additional outside support would be required.	

RISK FACTOR (RF) EQUATION

RF Value = [(Probability x 0.30) + (Spatial Extent x 0.10) + (Severity of Life/Property Impact x 0.30) + (Warning Time x 0.10) + (Duration x 0.10) + (Response Capacity x 0.10)]

Hazards with an RF value greater than or equal to 2.5 are considered high risk. Those with RF values of 2.0 to 2.4 are considered moderate risk hazards, and those with an RF value less than 2.0 are considered low risk. The highest possible RF value is 4.

Hazard Event History

Examining hazard event histories provides valuable insights to inform decision-making and help prioritize resources for risk prevention and response efforts. Table 6 lists the hazard events impacting the city of Draper since the 2019 plan update, as recorded in the Storm Events Database from the National Centers for Environmental Information.

Table 6: History of Hazard Events in the City of Draper

Type of Hazard Event	FEMA Disaster #	Date(s)	Damage or Impacts	Description
Avalanche		N/A		
Drought		N/A	Drought is a recurring problem in the region	Air quality issues, water restrictions
Earthquake	DR-4548-UT	03/18/2020	No significant damage in Draper	5.7 magnitude

DRAFT

Type of Hazard Event	FEMA Disaster #	Date(s)	Damage or Impacts	Description
Extreme Heat		N/A	Summers of 2020–2024	Reported 9 deaths in Northern Utah, an upward trend in heat exposure and heat-related deaths since 2015. Excessive heat can also affect infrastructure. General impacts include increased risk for heat-related illness and increased power demand for cooling systems.
Extreme Cold		N/A	Winter of 2022 and 2023	2022: 5 people experiencing homelessness died from cold-related exposure in Salt Lake City, but this threat could impact neighboring jurisdictions. Extreme cold can contribute to hypothermia and other cold-related illness/injury. Increased demand for heating systems. Potential for frozen pipes or other service disruptions.
Flooding		08/03/2023	Significant damage to drainage, creating several landslides Heavy flooding in multiple residential communities Undercutting of roadway leading to road collapse Estimated $5,500,000 in city, plus residential damage	Massive storm cell sat over Draper dropping 2+ inches of rain in approximately one hour
Landslide/ Slope Failure		04/22/2023	Two homes slid in during a landslide. Two neighboring homes were evacuated.	Heavy winter snow and water, and failure of retaining wall.
		06/18/2009, 06/21/2009	Post-fire mudslides in Corner Canyon area. The cost of damage to homes and yards is not available.	Two homes near Bear Mountain Drive were affected on the 18th, but a second mudflow was diverted between homes by a flood-prevention canal on the 21st. The second mudflow passed

DRAFT

Type of Hazard Event	FEMA Disaster #	Date(s)	Damage or Impacts	Description
				between the homes onto Bear Mountain Drive.
Radon		N/A	52% of homes in Draper are at or above WHO's mitigation threshold.	
Heavy Rain		08/03/2023	Significant damage to drainage, creating several landslides Heavy flooding in multiple residential communities Undercutting of roadway leading to road collapse Estimated $5,500,000 in city, plus residential damage	Massive storm cell sat over Draper dropping 2+ inches of rain in approximately one hour
High Wind		03/5/2017	$100,000 property damage.	68 mph winds
		03/13/2016	$500,000 property damage	59 mph winds
		04/22/2014		72 mph winds
		03/26/2012	Damage at shopping center. Large commercial windows blown out Extensive roof damage to several homes	$20,000 in property damage
		03/29/2009		???
Lightning		N/A		
Severe Winter Weather		01/21/2019	8 inches	
		01/19/2018	13.5 inches	
		12/13/2015	widespread power outages	
		12/19/2013	7 inches	
		3/22/2013	6 inches	
		01/27/2013	8 inches	
Tornado		N/A		
Wildfire		6/12/2014	Orson Smith Trailhead fire	
		8/15/2011	Bell Canyon Fire	
		8/8/2008	Corner Canyon Fire	680 acres burned, but no homes impacted
Dam Failure				
Civil Disturbance		N/A		
Cyberattack		N/A		

DRAFT

Type of Hazard Event	FEMA Disaster #	Date(s)	Damage or Impacts	Description
Hazardous Materials Incident (Transportation & Fixed Facility)		N/A		
Public Health Epidemic/ Pandemic	DR-4525-UT	03/2019	COVID-19	Temporary business closures, economic impacts
Terrorism		N/A		

National Flood Insurance Program Summary

The city of Draper participates in the National Flood Insurance Program (NFIP). Table 7 displays statistics related to the NFIP. The city of Draper does not participate in the Community Rating System (CRS).

Table 7: National Flood Insurance Program Status for the City of Draper[2]

Initial FHBM Identified	Initial FIRM Identified	Current Effective Map Date	Adopted Date	Date Joined NFIP	Tribal
N/A	12/18/85	11/19/21	2021	12/18/85	No

Table 8: National Flood Insurance Overview for the City of Draper

Community ID	Number of Losses	Total Net Payment	Active Policies	Total Coverage
490244	0	$0	5	Unknown

The city of Draper designated the senior engineer manager, or another engineer as designated by the city engineer, as the floodplain administrator. The city's Flood Damage Regulations were adopted on 10/19/2021. The current FIRM is dated 11/19/2021. The city requires floodplain development permits, referred to as land disturbance permits, in Draper. The Building Division is responsible for reviewing permits. Applicants are encouraged to coordinate with the city engineer before submitting a request for a land disturbance permit. Substantial damage/substantial improvements are assessed through the permitting process. In addition to submitting a permit application, Draper requires inspections before construction begins in any Special Flood Hazard Area. Permits may be denied if proper measures are not taken to mitigate risk, such as confirming with current relevant building codes in accordance with the NFIP requirements outlined in the City's Flood Damage Regulations.

[2] FHBM = Flood Hazard Boundary Map, FIRM = Flood Insurance Rate Map.

Jurisdiction-Specific Vulnerabilities and Impacts

Table 9 provides information on the vulnerable assets in the city of Draper, including its critical facilities, highlighting the city's vulnerability to identified hazards. It also describes the potential impacts on the community arising from those vulnerabilities. By understanding the risks associated with these assets, local authorities can develop proactive strategies to mitigate vulnerabilities and ensure the safety and functionality of these important assets during hazard events. These data are invaluable for decision-making and prioritizing resources for emergency response and preparedness efforts, ultimately contributing to more effective risk management and greater resilience in the community.

The Draper population of 50,017 individuals is potentially vulnerable to various hazards. Other community assets at risk include critical facilities such as 1 EOC, 3 fire stations, 1 police station, 1 hospital, and 14 schools. Community centers such as the Draper Library, Draper Senior Center, Draper Recreation Center, and outdoor recreation sites such as Whedon Farm Regional Park, South Mountain Park, Draper City Park, The Draper Outdoor Pool, South Mountain Golf Course, and Flight Park and numerous trailheads. Major transportation routes include I-15, Bangerter Highway, 12300 South, Highland Drive, Fort Street, and Traverse Ridge Road. Thirteen homes and three other historic sites in Draper are recognized on the National Register of Historic Places which are vulnerable to unique hazard impacts.

Table 9: Jurisdiction-Specific Vulnerabilities and Impacts in the City of Draper

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
Avalanche	People	*Vulnerability:* In Draper, several residential neighborhoods are located along the Wasatch Range foothills, where avalanche potential is not nonexistent. Households in these areas, particularly those with limited winter emergency preparedness, could be at risk during periods of heavy snowfall or rapid temperature fluctuations. *Impacts:* Avalanche can cause injury or death to those caught in its path. Residents who recreate in nearby backcountry terrain, including hikers and winter sports enthusiasts, may face increased danger if conditions shift unexpectedly and avalanche warnings go unheeded.
	Structures	*Vulnerability:* Homes constructed along steep slopes and in canyons within the eastern part of Draper may be exposed to avalanche risk under the right conditions. Continued development in hillside areas increases the potential for property impacts. *Impacts:* Residences with exposed elevations, poorly designed snow retention systems, or inadequate setback from natural chutes are especially vulnerable to damage from snow movement and structural loading.
	Economic Assets	*Vulnerability:* Property values and economic disruption from road closures are concerns for areas vulnerable to avalanches. *Impacts:* Properties located in or near avalanche-prone terrain could experience significant damage, reducing home values and increasing insurance premiums. Avalanches can also lead to temporary road closures on mountain access routes, such as Corner Canyon Road or other canyon trails, requiring debris removal and repairs that place

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		financial strain on city services and disrupt commuting and recreation-based economic activity.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Vegetation, habitat, and cultural sites are vulnerable to avalanches. *Impacts:* An avalanche in Draper's foothill areas could severely impact local vegetation, strip forested slopes, and damage sensitive wildlife habitats. These natural areas, which are part of the broader watershed feeding into Utah's urban corridor, may suffer long-term ecological damage. Additionally, scenic and culturally valued open spaces used by residents for outdoor activities could become inaccessible or permanently altered.
	Critical Facilities and Infrastructure	*Vulnerability:* Key infrastructure, including utility lines that cross or run along canyon corridors, could be damaged in an avalanche event. *Impacts:* Power outages, gas line ruptures, and interruptions to water delivery systems are possible if utility corridors lie within the runout zones of unstable slopes. These disruptions could affect large portions of Draper's residential areas and public services, especially those near the foothills.
	Community Activities	*Vulnerability:* Recreation opportunities are vulnerable to avalanche risk. *Impacts:* Draper residents frequently use the foothills for outdoor recreation, especially in areas like Corner Canyon and Suncrest. During or after heavy snowfall, these activities carry avalanche risk, particularly for individuals traveling off marked trails. Public trail closures and the potential for rescue operations may limit access and strain emergency response resources.
Drought	People	*Vulnerability:* All Draper residents are vulnerable to drought. *Impacts:* Drought may lead to water restrictions for residents and increased costs for water. Hundreds to thousands of residents and recreationists live and explore the foothills of Draper. High-drought seasons pose high risks of wildfires in these areas.
	Structures	*Vulnerability:* All homes are vulnerable to drought. *Impacts:* Drought increases the risk of wildfire. Hundreds of homes sit in the foothills of Draper, with estimated values in the hundreds of millions of dollars. Drought can cause the contraction of soils, which may damage walls or foundations of buildings.
	Economic Assets	*Vulnerability:* Property values are vulnerable to the impacts of drought. *Impacts:* The Draper foothills and Corner Canyon are significant attractions for building residential structures and vacationing for outdoor activities.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Vegetation and the risk of wildfire are vulnerable to drought conditions. *Impacts:* Drought stresses trees and other vegetation, which may increase the risk of wildfire in the foothills or river bottoms. Several water runoffs and retention basins surround the area.
	Critical Facilities and Infrastructure	*Vulnerability:* City water resources are vulnerable to drought. *Impacts:* Drought can reduce reservoir and groundwater levels, straining water supplies for homes, businesses, and emergency

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		services. Prolonged drought can lead to soil shrinkage and cracking, causing damage to roads, bridges, and pipelines.
	Community Activities	*Vulnerability:* Outdoor recreation activities are vulnerable to drought. *Impacts:* Drought can diminish the desirability of the outdoor environment, making it less inviting for hiking, mountain biking, running, and cross-country skiing. Fewer visitors may also affect the local economy.
Earthquake	People	*Vulnerability:* Approximately 50,000 residents and thousands of patrons could be affected if an earthquake of magnitude 7+ hits. *Impacts:* People can be injured by falling objects or trapped under collapsed structures. Residents may be displaced from their homes. Day-to day activities will likely be disrupted. Businesses may close, contributing to financial hardship for residents.
	Structures	*Vulnerability:* All Draper structures are vulnerable to earthquakes. Unreinforced masonry and other older structures are more susceptible to damage. Much of Northwest Draper has moderate liquefaction susceptibility, which increases the vulnerability of structures. *Impacts:* The 5.8 magnitude earthquake in Magna on March 18, 2020, caused minor damage to several city buildings and residential structures. In a large earthquake, structural damage could be widespread and may require costly repairs that can take months or years to complete.
	Economic Assets	*Vulnerability:* Large commercial shopping centers and restaurants located in Draper are vulnerable to earthquakes. *Impacts:* Many businesses may experience losses from building damage or damage to equipment or inventory. Businesses may be closed due to interruptions of power, utility, or other services.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Riparian ecosystems are vulnerable to earthquakes. *Impacts:* Earthquakes can potentially disrupt the Draper river bottom and its ecosystems.
	Critical Facilities and Infrastructure	*Vulnerability:* Most city facilities would be affected by an earthquake, including City Hall, fire stations, public works, and school facilities in Draper. *Impacts:* An earthquake is likely to cause physical damage to multiple critical facilities and damage infrastructure such as power, transportation, and utility systems.
	Community Activities	*Vulnerability:* All community events and activities are vulnerable to disruption from earthquakes. *Impacts:* Day-to-day activities, education, business, government operations, and recreational outdoor activities would be disrupted.
Extreme Heat	People	*Vulnerability:* All residents are vulnerable to extreme heat. Some groups face higher risks, such as 3,200 residents over 65; 16,000 under the age of 18; 2,200 with disability status; and 2,400 living below the poverty line. *Impacts:* Extreme heat can cause heat-related illnesses, such as dehydration, heat exhaustion, and heat stroke. Vulnerable groups may find it extremely difficult to access alternative means of cooling during

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		times of extreme heat. Residents may face financial hardship from increased costs associated with cooling.
	Structures	*Vulnerability:* All structures are vulnerable to extreme heat. *Impacts:* Prolonged heat exposure can weaken building materials, causing cracks in concrete, warping of wood, and deterioration of roofing materials.
	Economic Assets	*Vulnerability:* All businesses are vulnerable to the impacts of extreme heat. *Impacts:* Businesses may face increased energy costs and reduced worker productivity due to heat-related stress.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Vegetation, parks, forests, historical sites, and cultural sites are vulnerable to extreme heat. *Impacts:* Extreme heat can dry out vegetation, increasing wildfire risks that can destroy forests, parks, and historic sites. Outdoor events and supporting events may need to be postponed or canceled due to heat risks.
	Critical Facilities and Infrastructure	*Vulnerability:* Power systems, transportation networks, and water systems are vulnerable to extreme heat. *Impacts:* Increased use of air conditioning can overload the power grid. Extreme heat can cause roads to soften, crack, or buckle, creating transportation hazards. Prolonged extreme heat can also increase water demand while leading water reservoirs to evaporate faster, putting pressure on water systems.
	Community Activities	*Vulnerability:* Outdoor recreation and city events are vulnerable to extreme heat. *Impacts:* Outdoor activities may become more dangerous due to the risk of heat exhaustion, heatstroke, and dehydration. Parks, hiking trails, and outdoor facilities may see decreased activity. Summer markets, sports, and outdoor events may be canceled.
Extreme Cold	People	*Vulnerability:* All residents are vulnerable to extreme cold. Residents who face higher risks include 3,200 residents over 65; 16,000 under the age of 18; 2,200 with disability status; and 2,400 living below the poverty line. *Impacts:* Extreme cold can lead to hypothermia or frostbite. These groups may find it extremely difficult to access alternative means of heating during times of extreme cold.
	Structures	*Vulnerability:* All structures are vulnerable to extreme cold. Older buildings that have seen more wear may be more vulnerable. *Impacts:* Water in pipes can freeze and expand, causing pipes to burst. Heavy snow accumulation can also collapse roofs, especially on older/weaker structures. Freeze–thaw cycles can also weaken building foundations and cause cracks in roads, bridges, and sidewalks.
	Economic Assets	*Vulnerability:* All businesses are vulnerable to the impacts of extreme cold. *Impacts:* Extreme cold can lead to temporary closures of businesses and community activities. High heating demand can also raise energy costs for businesses and residents.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
	Natural, Historic, and Cultural Resources	*Vulnerability:* Wildlife is vulnerable to extreme cold conditions. *Impacts:* Extreme cold can impact local wildlife by reducing food sources.
	Critical Facilities and Infrastructure	*Vulnerability:* Power and heating, transportation systems, water systems. *Impacts:* Increased demand for electricity and natural gas for heating can overload systems. Transportation can also be disrupted due to secondary hazards, leading to closures, accidents, and delays. Lower temperatures can also freeze water infrastructure, leading to supply disruptions and costly repairs.
	Community Activities	*Vulnerability:* Community activities, schools, and public offices are vulnerable to extreme cold. *Impacts:* Extreme cold can cause schools and offices to close or delay their start. It can also reduce participation in outdoor sports/events and activities.
Flooding	People	Areas that may be impacted by thunderstorm and snowmelt flooding include the Bear Canyon Neighborhood, Springdale Way near the foothills, and Corner Canyon Creek. In addition, while the potential is small, the Jordan River, which runs west of I-15 from north to south on the west side of Draper, could overtop due to thunderstorms, severe weather, or rapid snowmelt. The following areas of mitigation interest were identified by the city of Draper and through FEMA's Geographic Information System (GIS) flood exposure analysis: • The Bear Canyon neighborhood encroaches into the natural floodplain. During high flows, certain parts of the neighborhood experience flooding along historic flow paths. • In 2011, houses along Springdale Way near the foothills experienced mudflows, flooding, and debris flow from small drainages coming off the foothills. • Along Corner Canyon Creek, downstream of I-15, commercial development in the Special Flood Hazard Area is planned. The city is considering flood detention and an irrigation facility as well as a culvert or channelization for Corner Canyon Creek at 1100 East. The Draper Elementary School is vulnerable to the 0.2% annual chance flood. *Vulnerability:* Four thousand residents might be affected during natural flooding, not including failure of storm drains and waterlines. Flooding may occur along the Jordan River, Corner Canyon Creek, Big Willow Creek, or other low-lying areas without adequate drainage. *Impacts:* Fast-moving floodwaters are dangerous and can sweep people away. Floodwaters can also spread waterborne contaminants.
	Structures	*Vulnerability:* Hundreds of residential homes, and some commercial buildings and schools, are vulnerable to flooding. *Impacts:* Flooding can cause extensive damage to foundations, walls, and contents of buildings, and in some cases can lead to complete destruction of structures.
	Economic Assets	*Vulnerability:* Businesses located in or near flood hazard zones are vulnerable to flooding.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		Impacts: Commercial buildings can be damaged and require costly repairs. Closures during the initial incident and throughout the recovery phase can contribute to lost revenue.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Habitats near waterways and areas prone to erosion are vulnerable to flooding. *Impacts:* Excessive water can erode soil, destabilize hillsides, and increase the risks of landslides in mountainous and foothill areas.
	Critical Facilities and Infrastructure	*Vulnerability:* School and commercial buildings, stormwater systems, roads, and utility systems are vulnerable to flooding. *Impacts:* Storm drains may be overwhelmed. Floodwater can damage roads and utilities and disrupt emergency response from police, fire, and EMS.
	Community Activities	*Vulnerability:* Community events, recreation, daily activities of work and school are vulnerable to flooding. *Impacts:* Flooding can cause extensive damage to roadways, homes, workplaces, and open spaces like parks. These disruptions may affect many events and day-to-day activities.
Landslide/ Slope Failure	People	*Vulnerability:* Moderate landslide susceptibility is found throughout the eastern and southern areas of Draper in the foothills of the Wasatch and Traverse Mountains. Some areas of high susceptibility are in the Traverse Mountains, near Suncrest. *Impacts:* Hundreds of potential residents could be affected. If landslides are fast-moving, residents can be injured or killed. Homes can be destroyed and residents displaced.
	Structures	*Vulnerability:* Hundreds of residential structures, as well as commercial and public buildings in the foothills, are vulnerable. Numerous geological hazards exist in Draper and throughout the Salt Lake Valley that could create an emergency situation or disaster. Steep mountains adjacent to the city create the potential for landslides, debris flows, rock falls, and snow avalanches. Draper has experienced landslide-debris flow in the past. Steep slopes on the eastern and southern sides of Draper also have a high potential for landslides and slope failure. Buildings along the ridgetops of some areas increase the potential for slides due to added weight and hill disturbance. Repairs to structures and roadways and stabilization of slopes can be costly. *Impacts:* Landslides and slope failures can cause extensive damage to structures, ranging from minor damage to complete loss.
	Economic Assets	*Vulnerability:* Property values and business operations are vulnerable to landslide impacts. *Impacts:* Landslides can decrease the values of residential properties near the site of landslides. Damage to businesses can contribute to overall economic losses. Damage to roads or other infrastructure may disrupt business functions if workers or customers cannot access workplaces. Damage or inaccessibility of outdoor recreation sites could also negatively impact the economy.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Recreation sites are vulnerable to landslides. *Impacts:* Landslides could block access to hiking and biking trails.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
	Critical Facilities and Infrastructure	*Vulnerability:* Roadways, drainages, retention basins, and catch basins are vulnerable to landslides. *Impacts:* Roads and other infrastructure could be damaged or blocked. Major roadways such as Traverse Ridge Road could impede access to other roads in the southeast area of the city.
	Community Activities	*Vulnerability:* Outdoor recreation businesses and leisure activities are vulnerable to landslides. *Impacts:* Corner Canyon activities, mountain biking, hiking, and cross-country skiing could be inaccessible.
Radon	People	*Vulnerability:* Draper is considered to be at moderate to high risk of radon exposure. According to utahradon.org 52% of homes tested in Draper had dangerous levels of radon. *Impacts:* Radon is the second-leading cause of lung cancer after smoking. There is a higher risk for certain populations such as children, the elderly, and those with respiratory conditions.
	Structures	*Vulnerability:* All structures in Draper are vulnerable. Structures with weaknesses are at higher risk for accumulating dangerous levels. *Impacts:* Radon enters buildings and homes through cracks in foundations, basements, and crawl spaces, exposing occupants to health risks.
	Economic Assets	*Vulnerability:* Healthcare costs are vulnerable to increases due to radon exposure. *Impacts:* Long-term exposure can lead to increased medical expenses for lung cancer treatment and respiratory issues.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Historic sites and older homes are vulnerable to radon exposure. *Impacts:* Older structures may lack modern radon-resistant designs, which makes mitigation more difficult and expensive.
	Critical Facilities and Infrastructure	*Vulnerability:* Water sources are vulnerable to radon exposure. *Impacts:* Radon can dissolve into groundwater, potentially affecting well water sources.
	Community Activities	None
Heavy Rain	People	*Vulnerability:* Heavy rain could occur anywhere in Draper. Those near waterways, alluvial fans, or low-lying areas may be at risk. *Impacts:* Ideally, few people are affected by heavy rains. The ones most likely to be affected are those in flood zones and those without the economic means to recover. Heavy rain can cause flash flooding, which can lead to bodily harm if people do not avoid fast-moving waters. It can also damage homes, leading to temporary displacement.
	Structures	*Vulnerability:* Several residential structures and commercial buildings are vulnerable to heavy rain in Draper. *Impacts:* Homes and contents can be damaged, and residents may be displaced during cleanup and repairs.
	Economic Assets	*Vulnerability:* Businesses in low-lying areas or near flood zones are vulnerable.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		Impacts: Flooding or water damage may close businesses or damage inventory, leading to financial losses.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Soil erosion and ecosystems are vulnerable to heavy rain. *Impacts:* Heavy rains can wash away topsoil, destabilize slopes, and damage local ecosystems in the foothills.
	Critical Facilities and Infrastructure	*Vulnerability:* Roads and stormwater systems are vulnerable to heavy rain. *Impacts:* Heavy rains can damage roadways, retention and catch basins, and storm drains, leading to significant recovery costs.
	Community Activities	*Vulnerability:* Outdoor recreation and sports are vulnerable to heavy rain. *Impacts:* Hiking, biking, and other outdoor activities could be dangerous due to muddy trails, landslides, or flash floods. Sporting events and other outdoor activities may be postponed or canceled.
High Wind	People	*Vulnerability:* Draper frequently experiences strong winds, particularly in areas near the Point of the Mountain, where gusts are often intensified due to local terrain. Residents in this area are exposed to sudden high wind events, including microbursts, which can pose safety risks. Outdoor workers, elderly individuals, and those without immediate access to shelter are especially vulnerable during these occurrences. *Impacts:* People can be injured or killed by blowing debris or falling trees. They can be affected by roads blocked by debris, damage to utility services, or other disruptions.
	Structures	*Vulnerability:* All structures are vulnerable to high winds. *Impacts:* Homes, businesses, and accessory structures such as carports and sheds are susceptible to wind-related damage, particularly those with older construction or lighter materials. In Draper's higher elevation neighborhoods, flying debris can break windows, damage roofing, and topple fences. Poorly anchored structures and those lacking wind-resistant features face increased risk during severe windstorms. The Mountain Shadows RV park and mobile homes may experience greater damage.
	Economic Assets	*Vulnerability:* All businesses are vulnerable to high winds. *Impacts:* Frequent wind events in Draper can disrupt local businesses by damaging signs, outdoor equipment, and storefronts. Extended power outages and structural repairs may lead to operational downtime and lost revenue. Recurrent wind-related damage can also drive up insurance premiums for both commercial and residential property owners.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Parks, trees, trails, and amenities are vulnerable to high winds. Habitats, historic sites, and cultural landmarks are also at risk. *Impacts:* Gusty conditions can uproot mature trees in Draper's parks and along popular trail systems such as those in Corner Canyon. Soil erosion and trail washouts may occur on exposed ridgelines and open spaces, affecting both recreational use and wildlife habitats. Historic structures and cultural landmarks, especially those not retrofitted for high wind events, may be subject to deterioration or surface damage.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
	Critical Facilities and Infrastructure	*Vulnerability:* Power and communication systems and transportation networks are vulnerable to high winds. *Impacts:* Strong winds can damage power poles, transformers, and overhead utility lines throughout Draper, causing electricity and communication outages. High-profile vehicles on I-15 and Bangerter Highway are vulnerable to tipping, while flights out of nearby airfields may be delayed or grounded. Critical roads may become hazardous or impassable due to downed trees or debris.
	Community Activities	*Vulnerability:* City events, sports, and recreation activities are vulnerable to high winds. *Impacts:* City-sponsored outdoor events, sports practices, and markets may be canceled or delayed when wind speeds reach unsafe levels. Damage to park facilities, stages, or tents may prevent use for days after a storm. Community engagement may be reduced if recurring wind events affect planned gatherings or recreation.
Lightning	People	*Vulnerability:* Lightning can occur anywhere in Draper, and all residents are at risk. Lightning presents a serious risk during summer thunderstorms, especially for individuals engaged in outdoor activities such as hiking, cycling, or team sports in Draper's foothills and open spaces. *Impacts:* Those caught in exposed areas without shelter face the risk of injury from direct strikes or ground currents. Children, seniors, and those unfamiliar with lightning safety may be more susceptible to harm.
	Structures	*Vulnerability:* Outbuildings, barns, and utility sheds in Draper's agricultural and rural zones are particularly vulnerable. *Impacts:* Lightning can strike buildings directly or cause fires through indirect contact, especially in homes with metal roofing or poor grounding. Surges caused by strikes can damage appliances and internal electrical systems if protective devices are not in place.
	Economic Assets	*Vulnerability:* Businesses throughout Draper are vulnerable to lightning impacts. *Impacts:* Power surges and outages resulting from lightning can interrupt business operations, damage electronic equipment, and result in costly repairs or data loss. Businesses that rely on uninterrupted power or internet access may suffer immediate financial setbacks. Outdoor attractions or venues may also face liability or cleanup costs after a strike.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Vegetation, trails, historical markers, parks, and wildfire-prone areas are vulnerable to lightning. *Impacts:* Draper's open lands and foothill vegetation, particularly during dry months, are susceptible to ignition from lightning. Trees struck directly may split or fall, blocking trails or damaging nearby structures. Cultural resources such as historical markers or art installations in public parks may also be damaged by heat, fire, or debris caused by a lightning strike.
	Critical Facilities and Infrastructure	*Vulnerability:* Power, communication, and public facilities are vulnerable to lightning strikes.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		Impacts: Lightning strikes on power substations, communication towers, or utility poles can lead to outages across large parts of Draper. Emergency communications may be disrupted if radio or cellular infrastructure is affected. Schools, healthcare facilities, and city offices can experience temporary shutdowns if backup systems fail to activate.
	Community Activities	*Vulnerability:* Outdoor events, sports, recreation activities are vulnerable to lightning. *Impacts:* Events held outdoors may be canceled or evacuated due to lightning. Sudden thunderstorms create hazardous conditions for public gatherings, especially in areas without nearby shelter. Continued lightning threats can delay recovery efforts or reduce participation in rescheduled events.
Severe Winter Weather	People	Corner Canyon and the Suncrest Area receive large amounts of snow, which can interrupt business, including city services, such as police, fire, and public works tasks. Winter weather systems and snowstorms over northern Utah can have a dramatic effect on regional commerce, transportation, and daily activity and are a major forecast challenge for local meteorologists. This challenge is heightened in the city of Draper because of the wide variety of local climatic features, such as significant elevation changes, atypical wind patterns, and mountainous slopes located immediately adjacent to city boundaries. These local features can impact the severity of winter storms. Winter Storms additionally bring lower temperatures which can adversely impact the elderly. Additionally. Draper has a number of community members without health insurance which would impact medical care.
	Structures	Heavy snow loads can cause roofs to collapse, especially for older buildings, barns, or poorly maintained structures. Prolonged freezing temperatures can cause pipes to burst, leading to water damage. Freeze–thaw cycles can crack foundations, driveways, and roads.
	Economic Assets	Severe winter weather may shut down businesses and schools. Retail and tourism industries may see fewer customers during extreme winter weather. There will also be an increased demand for heating and electricity, raising energy costs for homes and businesses. Severe winter weather can also delay or halt deliveries, affecting grocery stores, fuel, and other essential goods.
	Natural, Historic, and Cultural Resources	Heavy snow can break tree branches, damage parks and trails.
	Critical Facilities and Infrastructure	Heavy snow can weigh down power lines, causing widespread outages and leaving homes without heat. Roads might be impassable due to snowdrifts or accidents. Buses, trains, and flights may be delayed or canceled. Emergency services may be delayed due to road conditions.
	Community Activities	Severe winter weather may force schools to close, and outdoor activities like skiing, snow shoeing, may be too hazardous. Recreational facilities and city parks may close. Homeless shelters and warming centers may see increased demand as people seek protection from the extreme cold.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
Tornado	People	*Vulnerability:* Although tornadoes are relatively rare in Draper, the area is no stranger to strong wind events, especially near the Point of the Mountain, where wind speeds frequently exceed state and national averages. All residents are potentially vulnerable to tornadoes. *Impacts:* In the event of a tornado, residents could face serious risks from airborne debris, uprooted trees, and structural collapses. Individuals without access to basements or storm shelters, including seniors and families living in mobile or older homes, are especially vulnerable.
	Structures	*Vulnerability:* Homes and businesses in Draper could sustain heavy damage during a tornado. *Impacts:* Roofs may be lifted off, windows shattered, and walls compromised. Larger structures like shopping centers or restaurants may be at risk of partial or total collapse, resulting in extended closures and major repair costs.
	Economic Assets	*Vulnerability:* Businesses throughout Draper are vulnerable to tornado impacts. *Impacts:* Tornado damage in Draper could have long-lasting impacts on the local economy. Retail businesses, hotels, restaurants, and industrial sites may face significant operational downtime due to structural damage or power outages. Temporary closures can lead to layoffs, interrupted supply chains, and loss of revenue, especially for small businesses without the resources for quick recovery.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Draper's scenic parks, open spaces, and trail systems are vulnerable to tornado winds. *Impacts:* Mature trees and vegetation may be uprooted, leading to habitat destruction and increased erosion risk. Historic buildings and cultural landmarks may suffer irreparable harm.
	Critical Facilities and Infrastructure	*Vulnerability:* Essential services in Draper, including power distribution lines, substations, and communications systems, are susceptible to tornado damage. *Impacts:* Downed infrastructure can leave neighborhoods and business corridors without electricity, internet, or water service. Major roadways such as I-15 and Bangerter Highway could be blocked by debris, while traffic signals, public safety buildings, and schools may require emergency repairs to maintain functionality.
	Community Activities	*Vulnerability:* Tornado events can disrupt everyday life and halt scheduled activities. *Impacts:* Public schools and city-owned facilities may need to close for inspections or repairs, while parks and community centers could be temporarily unsafe. Events such as farmers markets, sports tournaments, and local festivals may be postponed or canceled, reducing opportunities for social engagement and community support.
Wildfire	People	*Vulnerability:* Perhaps the most likely and significant hazard in the city of Draper is the potential for damage and loss of life and property through fire events. The terrain of steep slopes adds to the dangers and difficulties of wildfire suppression. Many homes on the east and south sides of Draper have a high potential for being impacted by wildfires. Fires can occur in the urban fabric of the community or as

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		wildfires in the hillside areas of the community and mountainous areas adjacent to the city. Each incident may require a unique response from the city of Draper. The potential for structure and wildfires is increased by lightning events. *Impacts:* Residents could be displaced by evacuations. Individuals with disabilities or access and functional needs may have more difficulty evacuating and be more at risk of injury from wildfire. Wildfire smoke impacts air quality, which has negative health effects for individuals not near the fire, particularly people with other respiratory or cardiac conditions. Wildfires can remove necessary vegetation, which can make soils unstable for extended periods. Utah's fire season typically occurs during the warmer and drier months between May and October. Although traditionally a majority of wildfires have been caused naturally, mostly by lightning, as development encroaches on the hillsides and lower slopes of the Wasatch Mountains, wildfires caused by humans will likely increase.
	Structures	*Vulnerability:* Hundreds of structures are vulnerable, especially those near Corner Canyon, Suncrest, and other wooded areas. Homes without defensible space are most vulnerable. *Impacts:* Wildfires can burn entire neighborhoods, resulting in significant property loss.
	Economic Assets	*Vulnerability:* Businesses near foothills are vulnerable to wildfire impacts. *Impacts:* Stores, restaurants, and offices may be forced to shut down due to fire damage, evacuations, or power outages, leading to financial losses.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Vegetation and wildlife habitats are vulnerable to wildfires. *Impacts:* Wildfires can burn thousands of acres of forests, grasslands, and habitats, displacing wildlife. Loss of vegetation can lead to erosion, landslides, and long-term environmental damage.
	Critical Facilities and Infrastructure	*Vulnerability:* Power, water, and transportation infrastructure are vulnerable to wildfire damage. *Impacts:* Fire can damage electrical grids, transformers, and transmission lines. Roads may be closed due to flames, smoke, or fallen trees. If the water supply systems are damaged, firefighting efforts become more difficult. Emergency services and hospitals may be overwhelmed.
	Community Activities	*Vulnerability:* Community events/activities are vulnerable to disruption from wildfires. *Impacts:* Fairs, markets, or recreation events may be canceled or postponed. Schools may close due to damage. Workplaces may remain closed for days or weeks due to evacuation and/or damage.
Dam Failure	People	*Vulnerability:* The Draper Irrigation Company has a storage reservoir located at the mouth of Corner Canyon, which is classified as a high-hazard dam by the state of Utah. In addition, the Point of the Mountain Raw Water Reservoir poses risks. The failure of these reservoirs could have an impact on residential areas in the city.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
	Structures	*Vulnerability:* Homes and buildings in inundation areas are vulnerable to dam failure impacts. *Impacts:* Structures can be damaged; basements and lower floors of buildings may be completely submerged or filled with mud or debris.
	Economic Assets	*Vulnerability:* Businesses in inundation areas and property values are vulnerable to dam failure. *Impacts:* Homeowners, businesses, and the city may face millions in damage, leading to rising insurance premiums.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Ecosystems are vulnerable to dam failure impacts. *Impacts:* Floodwaters can wash away soil, trees, and plant life, resulting in damage to local ecosystems.
	Critical Facilities and Infrastructure	*Vulnerability:* No critical facilities were located within dam inundation boundaries. However, infrastructure such as power and transportation are vulnerable is vulnerable. *Impacts:* Flooding could damage electrical grids, substations, and transformers leading to power outages. Gas lines could be damaged, increasing the risk of fires and explosions, roads could be impassable, and emergency services may struggle to reach people due to these conditions and may become overwhelmed.
	Community Activities	*Vulnerability:* Community events are vulnerable to disruption from dam failure. *Impacts:* Community events and activities may be postponed or canceled.
Civil Disturbance	People	If demonstrations escalate, people could suffer injuries from physical altercations, tear gas, and projectiles.
	Structures	Businesses, government buildings, and public spaces could be targeted for graffiti, broken windows, arson, or other damage.
	Economic Assets	Civil unrest can force store closures, reducing revenue. Tourists and shoppers may avoid certain areas, affecting local businesses and restaurants. Businesses may struggle with costly repairs.
	Natural, Historic, and Cultural Resources	Demonstrations in parks or streets may result in environmental damage.
	Critical Facilities and Infrastructure	Protestors may block access to roads, delaying emergency response.
	Community Activities	Large community gatherings or activities may be postponed or canceled due to safety concerns.
Cyberattack	People	Cyberattacks could interrupt government work, public safety, and critical infrastructure operation. A data breach could result in cybercriminals stealing personal information, tax documents, and other critical records.
	Structures	Cyberattacks on government or private businesses could disable security systems, HVAC controls, and other infrastructure management systems, potentially causing significant damage

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
	Economic Assets	Cyberattacks can disrupt financial systems, causing delays in payroll and payment processing, licensing and permitting, and other essential services and records management.
	Natural, Historic, and Cultural Resources	A cyberattack on Draper's water supply or power grid could disrupt irrigation systems, impacting parks and other natural areas.
	Critical Facilities and Infrastructure	A cyberattack on Rocky Mountain Power or Enbridge gas could lead to power outages, gas shortages, and water system failures. A breach at Intermountain Healthcare could compromise patient records, delay medical treatment, and disrupt emergency services. Attacks on 911 dispatch systems could increase emergency response times.
	Community Activities	Cyberattacks can disrupt school and education, delay government services, and spread misinformation, which can lead to public distrust
Hazardous Materials Incident (Transporta-tion & Fixed Facility)	People	Exposure to toxic chemicals, fumes, or radiation can cause burns, respiratory issues, poisoning, and long-term diseases (cancer or organ damage). Immediate health effects include nausea, dizziness, difficulty breathing, and skin irritation. Residents and businesses near the spill or explosion site may need to evacuate, and people may need to temporarily shelter somewhere.
	Structures	A hazardous materials explosion at a gas station, industrial site, or transportation route could destroy nearby homes, businesses, and other critical infrastructure.
	Economic Assets	Businesses within hazard zones may be forced to close for weeks or months for cleanup. Road closures due to a spill on I-15, Bangerter, or nearby railways could disrupt supply chains and daily commutes. Government agencies and businesses may face millions of dollars in cleanup expenses and legal claims from affected residents.
	Natural, Historic, and Cultural Resources	Chemicals could seep into groundwater, rivers, and wetland areas, impacting Draper's water supply and local ecosystems
	Critical Facilities and Infrastructure	Firefighters, police, and local hospitals could be overwhelmed, delaying response times for other emergencies. Powerlines could be damaged, causing power outages. A train derailment or truck accident involving hazardous chemicals could close transportation routes.
	Community Activities	Community events and activities may be postponed or canceled due to air quality concerns or evacuation orders.
Public Health Epidemic/ Pandemic	People	A public Health Epidemic/Pandemic could infect thousands of residents, with elderly individuals, children, and immunocompromised people at higher risk. Fear of infection could cause panic, distrust, and social unrest. Isolation from quarantines, lockdowns, and social distancing can lead to depression, anxiety, and stress.
	Structures	Public buildings, public transportation systems, and shared public spaces may require frequent cleaning and modifications to prevent the spread of disease.
	Economic Assets	Retail stores, restaurants, and small businesses may suffer from reduced foot traffic, workforce shortages, or mandatory shutdowns.

DRAFT

Hazard	Vulnerable Asset	Description of Vulnerability and Impacts
		Increased demand for hospital care, medications, and vaccines could become costly.
	Natural, Historic, and Cultural Resources	Parks and natural hiking trails and events may close or have limited access to prevent gatherings and disease spread.
	Critical Facilities and Infrastructure	Hospitals and urgent care clinics may become overwhelmed, leading to long wait times and shortages of medical staff. Fewer people may use public transportation systems, if utility workers and emergency service providers get sick, critical services may slow down, leading to increased response times.
	Community Activities	Large gatherings like sports games, religious services, and community events may be canceled or restricted. Schools and workplaces may implement virtual classes and remote work.
Terrorism	People	A terrorist attack in a public area (such as a shopping center, school, or public event) could result in mass casualties and injuries.
	Structures	A terrorist attack could damage businesses, schools, government buildings, transportation hubs, and other public facilities.
	Economic Assets	Attacks on business, districts, bans, or commercial centers could result in closures and loss of revenue. Tourism and local businesses may suffer if people avoid public places out of fear. Businesses, schools, and government/public buildings may need to invest in security upgrades, increasing operational costs. Property and business owners may have higher insurance premiums and expensive rebuilding costs after an attack.
	Natural, Historic, and Cultural Resources	If an attack targeted churches or monuments it would be devastating for the community. A biological, chemical, or radiological attack could cause environmental damage.
	Critical Facilities and Infrastructure	Physical attacks on substations, transformers, and water treatment facilities could cause long-term power outages and water shortages. Disruptions in communications systems could delay emergency response efforts. A terrorist attack on a major highway like I-15 or public transit could shut down travel and disrupt supply chains. Hospitals and ERs can become overwhelmed, delaying care for other medical emergencies that do not just stop.
	Community Activities	Schools, shopping centers, and office buildings may close temporarily or indefinitely after an attack. Large community gatherings and events may be postponed or canceled due to safety concerns.

Jurisdiction-Specific Changes in Vulnerability

Hazard events can impact communities, infrastructures, and ecosystems. The severity of these impacts can be influenced by climate change, population patterns, and land use developments. Understanding these factors is crucial for the city of Draper in developing a resilient community and minimizing the impacts of hazards. Table 10 displays the changes within the city and the related effects of each hazard on the city of Draper.

Table 10: Jurisdiction-Specific Changes in Vulnerability in the City of Draper

Type of Hazard Event	Description of Potential Impacts	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
Avalanche	The likelihood of avalanches impacting the city of Draper is limited. The area on the east side of the city is adjacent to the Wasatch Mountains, but there has been no historical avalanche activity in that area of the city. Avalanches pose a threat to outdoor enthusiasts, leading to injuries and fatalities.	More-extreme winter storms and changes in temperature may increase the risk of avalanche in new areas or larger avalanches in expected areas. It is unknown if risk is greater in the city due to climate change.	Development may continue in the city, and may expand into the foothills, but no known avalanche paths are mapped in the area, and risk is not expected to increase.	Development in Draper has not been on the eastern side of the city where the avalanche risk is located and has not changed avalanche risk.	Stayed the Same
Drought	The city of Draper has large swings in temperature and in precipitation amounts during any year and is susceptible to drought. The city encourages landscaping that is friendly to the desert climate of Utah and when drought conditions occur the city would restrict the use of water for outdoor landscaping. Recreational activities may decline, harming tourism, while the risk of wildfires increases, threatening safety and property. In addition, lower water levels can lead to water quality issues and public health concerns.	Climate change affects drought incidents by altering precipitation patterns and increasing temperatures. Warmer weather can lead to longer dry periods and more severe droughts, while changes in rainfall can reduce snowpack in nearby mountains, crucial for summer water supply. Higher temperatures also increase evaporation rates, further straining local water resources.	Drought can significantly influence population patterns by impacting economic opportunities and the quality of life. Water scarcity often leads to reduced agricultural productivity, prompting residents to migrate to areas with more stable job prospects. Increased water costs can make living less affordable, driving some residents away. Conversely, efforts to address drought, such as sustainable development or improved water management, may attract newcomers, resulting in changes in the community's	The increase in residential and commercial facilities across Draper City will increase the demand for water.	Increased

DRAFT

Type of Hazard Event	Description of Potential Impacts	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
			demographic composition over time.		
Earthquake	Perhaps the most feared incident in Draper is the potential for a large earthquake. Reports indicate that thousands of deaths, billions of dollars of damage to private property, extended loss of utility services, overwhelmed medical facilities, and other catastrophic incidents will occur if a major earthquake occurs in the Salt Lake and/or Utah Valley. Fine-grained, lake-bottom sediments are common in western Draper and are susceptible to liquefaction-induced ground failure during a large earthquake. Each incident may require a unique response from the city of Draper and for a major earthquake, outside assistance will be necessary.	Increased rainfall and flooding can erode soils, weakening structural integrity and heightening vulnerability during earthquakes. Although the direct links between climate change and earthquakes are still under investigation, environmental effects may impact the region's seismic risk.	Earthquakes can significantly alter population patterns by prompting residents to leave for safer areas after a seismic event. This migration can lead to changes in population density and attract new residents and businesses during the rebuilding process. The perception of the area as a safe place to live may shift, impacting long-term demographics, as some residents return to rebuild while others relocate permanently.	Newly constructed homes and business do slightly increase the risk from earthquakes, but these new buildings are constructed according to the 2021 building codes, which provide advanced protection against earthquakes.	Stayed the Same

DRAFT

Type of Hazard Event	Description of Potential Impacts	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
Extreme Heat	Extreme heat can significantly affect public health, increasing the risk of heat-related illnesses, especially among vulnerable populations. It also strains energy resources due to the higher demand for air-conditioning, potentially leading to power outages. In addition, extreme temperatures worsen air quality by raising ozone levels, which poses respiratory risks. Urban infrastructure may also suffer damage, leading to increased maintenance costs and safety concerns.	Climate change significantly impacts extreme heat by increasing the frequency and intensity of heat waves. Rising global temperatures lead to longer and hotter summers, affecting residents and local infrastructure while heightening health risks, especially for vulnerable populations. Urban heat islands from reduced vegetation and extensive pavement further amplify these effects.	Extreme heat can lead residents to relocate due to damaged homes or safety concerns. Some may move to areas perceived as safer or seek better job opportunities elsewhere. The economic impact and infrastructure damage can also make certain neighborhoods less desirable, leading to shifts in demographics and the socioeconomic landscape as new residents with different backgrounds move in.	Higher density from increased development, particularly in the northern and central parts of the city, may lead to more frequent extreme heat events.	Unknown
Extreme Cold	Extreme cold can lead to health risks such as frostbite and hypothermia, especially among vulnerable populations. Transportation may be disrupted by icy conditions, affecting commutes and emergency services. Infrastructure is at risk, with water pipes potentially freezing and bursting, resulting in costly repairs. In addition, energy demands surge as residents rely on heating, straining the	By increasing the intensity of winter storms. Higher atmospheric temperatures allow for more moisture, resulting in heavier snowfall and potentially lower temperatures during these events. In addition, fluctuations in weather patterns may disrupt seasonal cycles, leading to unpredictable periods of extreme cold	By driving some residents to relocate to warmer areas. Harsh winters can hinder economic activities and deter new residents and businesses, influencing housing demand and the attractiveness of certain neighborhoods. This may disproportionately affect lower-income families, leading to changes in demographics and socioeconomic	New subdivisions mean the city has increased responsibility for plowing and evacuation during heavy snow events.	Unknown

DRAFT

Type of Hazard Event	Description of Potential Impacts	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	electrical grid and increasing utility costs. Low temperatures can also impact local agriculture and wildlife.	mixed with warmer spells.	stratification in the community.		
Flooding	The city of Draper is subject to thunderstorms and snowmelt flooding. Significant flooding occurred in the Salt Lake Valley in 1983 and to a lesser extent in 1984, and again in 2011 resulted in the construction of some sediment basins, installation of stream-bank protection, and the cleaning of stream channels to reduce flood hazards. Flood plains along the Jordan River and its tributaries have been rated for expected flood heights by the Federal Emergency Management Agency (FEMA) and areas susceptible to flooding have been delineated on the Federal Insurance Rate Maps (FIRM). These maps are updated as development occurs and channel obstructions, culvert modifications, and other changes alter potential flood heights and velocities.	Higher temperatures increase the frequency and intensity of extreme weather events and alter precipitation patterns. They lead to more intense rainstorms and accelerated snowmelt from nearby mountains, raising water levels in rivers and streams. This combination raises the risk of flooding, especially in areas with inadequate drainage and urban development in flood-prone zones, heightening the potential for damage to homes and infrastructure.	Flooding can significantly alter population patterns by displacing residents from affected areas, leading them to seek shelter elsewhere. This may cause a population decline where flooding occurs, as individuals might hesitate to return due to ongoing risks or property damage. As neighborhoods become less desirable, people may migrate to safer areas, changing demographic trends and putting pressure on housing in those regions. Over time, these shifts can influence urban planning and development, as local governments address flooding risks and changing population needs.	Several streams run through the City of Draper and converge with the Jordan River that runs along the western border. Thirty-seven (37) structures are vulnerable to the 1% annual chance event and there is additional development planned in the 1% annual chance floodplain.	Increased
Landslide/ Slope Failure	Steep mountains adjacent to the city create a potential for landslides, debris flows, rock	Climate change increases the risk of landslides through	Landslides and slope failures can impact population patterns by	The new developments have mostly not been in the eastern or	Stayed the Same

DRAFT

Type of Hazard Event	Description of Potential Impacts	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	falls, and snow avalanches. The town's steep terrain is vulnerable, especially during heavy rainfall or rapid snowmelt. Properties on slopes may suffer damage, resulting in displacement and economic losses. Transportation networks can be disrupted, complicating emergency responses. In addition, landslides can harm local ecosystems by displacing vegetation.	heavier rainfall and greater temperature fluctuations. Intense rain saturates soil, destabilizing slopes, while freeze–thaw cycles weaken the ground. Changes in vegetation can also reduce stability, leading to a higher potential for landslides.	making some areas unsafe, leading to displacement and lower property values. This prompts residents to move to safer regions, thereby increasing density in more stable areas. Concerns about future landslides may also deter newcomers from high-risk zones, shaping long-term demographic trends.	southeastern parts of the city, where landslides are most likely to occur.	
Radon	Radon poses significant health risks, particularly lung cancer, as it can enter homes through foundation cracks. Many residents may not test for radon, making them unaware of dangerous levels. Increased awareness and public health initiatives are vital for protection, especially with regard to population growth. Incorporating radon-resistant construction in new developments is also essential for safety.	Climate change can affect radon levels by altering soil temperatures and moisture conditions. Higher temperatures may increase radon emissions from the ground, while heavy rainfall can change groundwater and soil saturation, impacting radon migration into buildings.	Radon exposure can influence population patterns, as increased health awareness may drive families to move away from areas with high radon levels. This shift could particularly affect vulnerable groups, changing demographics and demand in the housing market. Homes with lower radon levels may become more sought after, and public health campaigns can encourage community action, making previously undesirable areas more attractive once mitigation	Changes in development have affected the risk from radon.	Unknown

DRAFT

Type of Hazard Event	Description of Potential Impacts	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
			measures are implemented.		
Heavy Rain	Heavy rain can cause flash floods, particularly in low-lying areas, disrupting traffic and emergency services. It may also lead to soil erosion, infrastructure damage, and increased landslide risk in hilly regions. In addition, heavy rainfall can overwhelm waterways, resulting in water quality issues from runoff, impacting public safety, local businesses, and agriculture.	Climate change increases the frequency and intensity of heavy rain, as higher temperatures allow the atmosphere to hold more moisture. This leads to stronger storms, flash flooding, and overwhelmed drainage systems.	Heavy rain can shift population patterns by pushing residents out of flood-prone areas and attracting them to safer neighborhoods. Frequent flooding may lead to evacuations and economic disruptions, prompting relocations. Over time, ongoing heavy rains can affect housing demand and community stability, altering the town's population distribution.	Higher density in the city, particularly in the northern and central areas, increases the risk of pluvial flooding due to more impervious surfaces.	Unknown
High Wind	High winds can cause property damage to roofs and windows, topple trees and power lines, and lead to power outages. They pose hazards for pedestrians and drivers and can worsen air quality by stirring up dust and pollutants, affecting residents' health.	Climate change affects high winds by altering atmospheric patterns and increasing extreme weather events. Rising temperatures may lead to more substantial, unpredictable winds and more frequent thunderstorms, posing risks to infrastructure and air quality.	High winds can alter population patterns by making certain areas less desirable. Frequent damage may drive residents to safer neighborhoods, deter newcomers, and slow growth in affected regions.	Increased development has not altered the risks associated with high winds.	
Lightning	Lightning can have several impacts, primarily posing risks to public safety with the potential for injuries or fatalities. It can spark wildfires	Climate change increases temperatures and alters precipitation, leading to more intense thunderstorms and	Lightning can influence population patterns by causing property damage and wildfires, leading some residents to	Increased development has not affected the risk associated with lightning.	

DRAFT

Type of Hazard Event	Description of Potential Impacts	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	in nearby areas, threatening property and the environment. In addition, lightning strikes can damage infrastructure, leading to electrical surges that cause power outages and service disruptions. This phenomenon also affects outdoor activities and tourism, while the economic burden includes increased insurance claims and repair costs.	frequent lightning strikes. Urbanization can enhance this effect, posing risks to public safety and infrastructure.	relocate. Areas with higher lightning activity may deter new residents, while safer locations could increase migration as people seek protection from severe weather.		
Severe Winter Weather	Heavy snow or blizzards can disrupt transportation, hinder emergency services, and cause infrastructure damage, such as roof collapses. These conditions can lead to increased municipal costs for snow removal and have a substantial economic impact on businesses, particularly in retail and tourism. Power outages may also occur, affecting heating during cold months.	Climate change impacts heavy snow and blizzards by altering precipitation patterns. Higher temperatures can lead to more rain than snow, affecting snowpack levels—additionally, increased storm intensity results in heavier, more unpredictable snowfall.	Increased population means more people need to get to work and snow removal must be quicker. Heavy snow or blizzards can impact population patterns by influencing where people live and work. Transportation disruptions may lead residents to seek housing closer to jobs, increasing density in some areas while depopulating others. Families might also avoid regions with frequent heavy snowfall, shifting demand to milder areas. Over time, these trends can alter community demographics and economic activity,	New development increases Draper City's responsibility for plowing and evacuating residents from new subdivisions.	

DRAFT

Type of Hazard Event	Description of Potential Impacts	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
			prompting adjustments in town planning and resource allocation.		
Tornado	Tornadoes can cause serious damage to property and infrastructure, leading to injuries and economic challenges. Urban areas are especially vulnerable, complicating emergency responses and disrupting essential services. The psychological impact can affect community well-being, potentially leading to changes in demographics and land use as residents seek safer locations.	Climate change may increase the frequency and intensity of tornadoes. Higher temperatures lead to more moisture in the air, creating conditions for severe thunderstorms. Changes in wind patterns and precipitation can also heighten tornado risks, resulting in more destructive storms and greater threats to infrastructure and communities.	Tornadoes can influence population patterns by prompting residents to move to safer areas after damage occurs. This can decrease density in affected neighborhoods while increasing the demand for housing in safer regions. New residents may also move in for recovery opportunities, altering demographics. Over time, repeated tornado threats might push long-term residents to areas with better disaster preparedness, reshaping the town's population distribution.	New development has not affected the risk associated with tornadoes.	
Wildfire	Wildfires pose serious risks, including habitat damage, degraded air quality, and health issues for vulnerable populations. They can also lead to economic losses, property damage, and increased erosion that affects water quality.	By raising temperatures and creating drier conditions, prolonged droughts lead to more dry vegetation, which serves as fuel for fires. Erratic seasons extend the growing period, while more lightning strikes can ignite wildfires. These factors	Displaced individuals often seek safer areas, shifting demographics, while declining property values or perceived risk might deter newcomers. Conversely, some may be drawn to rebuilding efforts, impacting long-term growth and community dynamics.	A few developments have been constructed in southeastern Draper, where wildfire risk is highest.	

DRAFT

Type of Hazard Event	Description of Potential Impacts	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
		heighten the threat to ecosystems and community safety.			
Dam Failure	The Draper Irrigation Company has a storage reservoir located at the mouth of Corner Canyon, which is classified as a dam by the State of Utah. The impacts of the failure of this storage reservoir could have impacts on residential areas in the city. Any dam failures in other areas of Utah would have little impact on Draper, except for the potential impact on water supplies. Dam failure could lead to severe flooding, damaging homes and infrastructure, isolating communities, and hindering emergency responses. This may cause loss of life, especially among vulnerable groups, and trigger economic losses for local businesses and property values. Long-term effects could affect community stability and public health, while floodwaters may contaminate local waterways and disrupt ecosystems.	Climate change raises the risk of dam failure by causing heavier rainfall and rapid snowmelt. These changes can overwhelm dams and compromise their integrity, highlighting the need for urgent safety assessments and upgrades to protect communities downstream.	Dam failure can impact population patterns by displacing residents and altering demographics. Evacuations can lead to an influx in safer areas, while destruction may deter new residents and contribute to population decline. Fear of future disasters may also prompt individuals to relocate, changing the community's composition and affecting population density and economic activity.	New development has not affected the risk associated with dam failure.	Stayed the Same
Civil Disturbance	Civil disturbances can cause economic losses for	Climate change can increase civil	By encouraging residents to move for safety,	New development has not affected the risk	Increased

Type of Hazard Event	Description of Potential Impacts	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	businesses, create social division, and increase tensions among community groups. They may overwhelm law enforcement, leading to fear and mistrust among residents. Essential services could be disrupted, affecting quality of life, while long-term impacts may include changes in community dynamics and public policy.	disturbances by intensifying environmental stresses and social tensions. Rising temperatures may lead to droughts, wildfires, and poor air quality, particularly affecting vulnerable communities. Resource scarcity, especially water, can spark conflicts and protests. In addition, an influx of migrants from harder-hit areas may strain local resources, further escalating tensions. This cycle of unrest is driven by the impacts of climate change on the environment and community dynamics.	leading to outflows and new arrivals. These events can reveal social issues, impacting community dynamics, employment, and property values, ultimately reshaping demographics, and social cohesion.	associated with civil disturbances.	

DRAFT

Type of Hazard Event	Description of Potential Impacts	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
Cyberattack	Cyberattacks can disrupt critical infrastructure like power and water services, complicating emergency responses. Businesses may face financial losses from downtime and data breaches, eroding consumer trust. The public sector's essential services, including law enforcement and public health, could be compromised, leading to fear and reduced community confidence.	Possible attack on the industry, which is seen as producing large amounts of greenhouse gases and burning fossil fuels. Climate change can heighten cyberattack risk by increasing vulnerabilities during extreme weather. Disruptions like power outages offer cybercriminals opportunities, but focusing on emergency responses can weaken cybersecurity measures. As organizations adopt new technologies to cope with climate impacts, they may unintentionally introduce additional vulnerabilities.	Cyberattacks can change population patterns by eroding trust in essential services. Compromised systems may cause residents to leave due to safety concerns, while high-profile incidents can deter businesses, leading to job losses. This perception of vulnerability may also make the town less appealing to newcomers, resulting in demographic shifts and affecting local development.	New development has not affected the risk associated with cyberattacks.	Increased

DRAFT

Type of Hazard Event	Description of Potential Impacts	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
Hazardous Materials Incident (Transportation & Fixed Facility)	Hazardous materials incidents can severely impact public health, the environment, and the economy. Health risks include serious illnesses from exposure, while environmental damage may lead to soil and water contamination. Economically, incidents can cause property damage, lower property values, and disrupt businesses. The community also faces stress from evacuations and anxiety over safety.	Climate change elevates the risk of hazardous materials incidents by increasing extreme weather events like heavy rain and wildfires. These events can breach storage tanks and heighten material volatility. Vulnerable infrastructure can lead to more spills or accidents, while climate shifts may also introduce new challenges for managing hazardous substances and public health.	By causing evacuations and temporary declines in density. In the long run, unsafe areas may deter new residents, affecting growth and diversity. In addition, negative perceptions can lower property values and economic prospects, leading families to relocate, which impacts local demographics.	New development has not affected the risk associated with hazardous materials incidents.	Increased
Public Health Epidemic/ Pandemic	Epidemics and pandemics can disrupt healthcare by overwhelming facilities and leading to resource shortages, diminishing care for all patients. Economic impacts may include business closures and job losses, particularly in hospitality and retail. The strain on public health services can affect routine care, while mental health issues may arise due to isolation and uncertainty. Shifts to remote learning can	By increasing the spread of vector-borne diseases and raising the risk of waterborne illnesses due to flooding or drought. Worsening air quality can also exacerbate respiratory conditions like asthma, especially in vulnerable populations.	By prompting migration for safety and better healthcare. Vulnerable groups may move to areas with improved services, while economic instability can drive people to seek new employment opportunities. In addition, restrictions like quarantine measures can limit movement and social interactions, reshaping the community's	New development has not affected the risk associated with epidemics/pandemics.	Increased

Type of Hazard Event	Description of Potential Impacts	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	hinder student development, and vulnerable populations face heightened risks. Erosion of public trust in health authorities might reduce compliance with guidelines.		demographics and impacting local economies.		
Terrorism	Terrorism incidents can have significant impacts, including loss of life and emotional trauma for the community. Economically, they disrupt local businesses and tourism while creating fear and anxiety that affect social cohesion. Emergency services might be overwhelmed, requiring additional support, and increased security measures can alter daily life and raise concerns about civil liberties. Damage to critical infrastructure necessitates long-term repairs, and such incidents may deepen social divisions and prompt changes in security policies, highlighting the need for effective preparedness and response strategies.	Terroristic activity is sometimes centered around climate change. Climate change impacts terrorism incidents by creating conditions of resource scarcity and social unrest. Increased competition for essential resources, such as water, can fuel tensions, making communities more vulnerable to extremist ideologies. Extreme weather events may disrupt social order and infrastructure, offering terrorist groups opportunities to exploit crises. In addition, climate-driven population displacement can heighten tensions in receiving areas, raising the risk of domestic	Terrorism incidents can alter population patterns by instilling fear and prompting residents to relocate to perceived safer areas, resulting in demographic shifts and potential declines in property values. Some neighborhoods may see an outflow of residents, while others could experience an influx of people seeking refuge from violence. In addition, increased security measures may deter businesses and residents from certain locations, leading to long-term changes in population density and urban development patterns.	New development has not affected the risk associated with terrorism incidents.	Increased

		terrorism. Law enforcement's focus on climate-related challenges can also limit its capacity to address terrorism threats.			

DRAFT

Additional Public Involvement

The city of Draper provided several opportunities for public participation. Figure 1 is an example of public outreach.

Figure 1: Social Media Post for Public Participation

Plan Integration

Incorporating the underlying principles of the Hazard Mitigation Plan and its recommendations into other plans is a highly effective and low-cost way to expand their influence. All plan participants will use existing methods and programs to implement hazard mitigation actions where possible. As previously stated, mitigation is most successful when it is incorporated into the day-to-day functions and priorities of government and public service. This plan builds on the momentum developed through previous and related planning efforts and mitigation programs, and it recommends implementing actions where possible through these other program mechanisms. These existing mechanisms include the following:

- Regularity Capabilities
- Administrative Capabilities
- Fiscal Capabilities

Respective planning stakeholders will conduct implementation and incorporation into existing planning mechanisms and will be done through the routine actions of:

- Monitoring other planning/program agendas
- Attending other planning/program meetings
- Participating in other planning processes; and

DRAFT

- Monitoring community budget meetings for other community program opportunities.

The successful implementation of this plan will require constant and vigilant review of existing plans and programs for coordination and multi-objective opportunities that promote a safe, sustainable community. Regular efforts should be made to monitor the progress of mitigation actions implemented through other planning mechanisms. Where appropriate, priority actions should be incorporated into planning updates. Table 11 lists existing planning mechanisms in which the Hazard Mitigation Plan has been integrated. Table 12 lists the opportunities for integrating elements of this plan into other plans.

Table 11: Integration of Previous Plans by the City of Draper

Plan	Description
None	N/A

Table 12: Opportunities to Integrate into Future Plans of the City of Draper

Plan	Description
General Plan	Overview of the city's long-term goals and strategies.
Comprehensive Emergency Management Plan	Future update of the Emergency Operations Plan—a framework for mitigation, preparedness, response, and recovery from disasters in the city.
Suncrest and Traverse Mountain Community Wildfire Protection Plan	Identifies wildfire hazards, education, and mitigation actions needed to reduce risk in areas of Draper.
Active Transportation Plan	A collaborative effort between Draper, Sandy City, and the Wasatch Front Regional Council to enhance transportation options for pedestrians, bicycles, and transit.
Drinking Water System Master Plan	Identifies water use needs, growth projections, source and storage requirements, and distribution system needs.
Master Transportation Plan	Addresses transportation goals and future development needs to address growth. Anticipates traffic impacts as a result of development.
Storm Drain Master Plan	Presents activities and public policies to manage and regulate stormwater runoff caused by development to help mitigate flooding and environmental impacts.
Stormwater Pollution Prevention Plan	Identifies potential pollutant sources, procedures to prevent spills/leaks, erosion and sediment control, runoff management, employee training, and inspection procedures.
Town Center Station Area Plan	Guides the future of the area surrounding the Draper Town Center TRAX Station.
Parks, Recreation, and Trails Master Plan	Addresses existing conditions, priorities, levels of service, and other considerations of the city's comprehensive parks, recreation, and trail system.
Open Space Plan	Provides an analysis and detailed description of the natural resource and recreation issues, strategies and recommendations for management, and potential funding opportunities.

Capability Assessment

Local mitigation capabilities are existing authorities, policies, programs, and resources that reduce hazard impacts or could help carry out hazard mitigation activities.

Planning and Regulatory Capabilities

Planning and regulatory capabilities are the plans, policies, codes, and ordinances that prevent and reduce the impacts of hazards.

Table 13: Assessment of the Planning Capabilities of the City of Draper

Plan	Does it address hazards? (Y/N)	How can it be used to implement mitigation actions?	When was the last update? When is the next update?

Other? (Please describe.)			

Financial Capabilities

Financial capabilities are the resources to fund mitigation actions. Talking about funding and financial capabilities is important to determine what kinds of projects are feasible, given their cost. Mitigation actions like outreach programs are lower cost and often use staff time and existing budgets. Other actions, such as earthquake retrofits, could require substantial funding from local, state, and federal partners. Partnerships, including those willing to donate land, supplies, in-kind matches, and cash, can be included.

DRAFT

Table 17: Assessment of the Financial Capabilities of the City of Draper

Funding Resource	In Place? (Y/N)	Has it been used in the past and for what types of activities?	Could it be used to fund future mitigation actions?	Can it be used as the local cost match for a federal grant?
Capital Improvement Project Funding	Y	Wildfire mitigation	Can be used to mitigation actions	Wildfire mitigation
General Funds	Y	Identify at-risk areas	Identify at-risk areas and determine priority of mitigation projects	Identify at-risk areas
Hazard Mitigation Grant Program (HMGP/404)	Y	Used to map and track mitigation efforts	Can be used to track mitigation projects over time	Used to map and track mitigation efforts
Building Resilient Infrastructure & Communities (BRIC)	Y	Used to complete mitigation projects	Established agreements in place to assist in completing mitigation actions over time	Used to complete mitigation projects
Flood Mitigation Assistance (FMA)	Y	Wildfire mitigation	Can be used for mitigation actions	Wildfire mitigation

Education and Outreach Capabilities

Education and outreach capabilities are programs and methods that could communicate about and encourage risk reduction. These programs may be run by a participant or a community-based partner. Partners, especially those who work with underserved communities, can help identify additional education and outreach capabilities.

Table 18: Assessment of the Education and Outreach Capabilities of the City of Draper

Education and Outreach Capability	In Place? (Y/N)	Does it currently incorporate hazard mitigation?	Could it be used to support mitigation in the future?
Community Newsletter(s)	Y	Wildfire mitigation	Can be used to track mitigation actions
Hazard Awareness Campaigns (such as Firewise, Storm Ready, Severe Weather Awareness Week, School Programs)	Y	Identify at-risk areas	Identify at-risk areas and determine priority of mitigation projects

DRAFT

Education and Outreach Capability	In Place? (Y/N)	Does it currently incorporate hazard mitigation?	Could it be used to support mitigation in the future?
Public Meetings/Events (Please describe.)	Y	Used to map and track mitigation efforts	Can be used to track mitigation projects over time
Emergency Management Listserv		Used to complete mitigation projects	Established agreements in place to assist in completing mitigation actions over time
Local News	Y	Wildfire mitigation	Can be used to track mitigation actions
Distributing Hard Copies of Notices (e.g., public libraries, door-to-door outreach)	Y	Identify at-risk areas	Identify at-risk areas and determine priority of mitigation projects
Insurance Disclosures/ Outreach	Y	Used to map and track mitigation efforts	Can be used to track mitigation projects over time
Organizations that Represent, Advocate for, or Interact with Underserved and Vulnerable Communities (Please describe.)	N	Used to complete mitigation projects	Established agreements in place to assist in completing mitigation actions over time
Social Media (Please describe.)	Y	Wildfire mitigation	Can be used to track mitigation actions
Other? (Please describe.)		Identify at-risk areas	Identify at-risk areas and determine priority of mitigation projects

Opportunities to Expand and/or Improve Capabilities

Actions that can expand and improve existing authorities, plans, policies, and resources for mitigation include budgeting for mitigation actions, passing policies and procedures for mitigation actions, adopting and implementing stricter mitigation regulations, approving mitigation updates, and making additions to existing plans as new needs are recognized. Table 19 lists the opportunities for the city of Draper.

Table 19: Opportunities to Expand or Improve the Capabilities of the City of Draper

Capability	Opportunity to Expand and/or Improve
Planning and Regulation	The city can expand current wildfire planning capabilities by developing and publicizing evacuation plans. Evaluating and designating clear evacuation routes can help reduce the risk of loss of life from hazards like wildfire. These activities can also be aligned with future Community Wildfire Protection Plan updates for high-risk areas.
Administrative and Technical	The city could expand its early warning systems and technical capabilities. Acquiring an enhanced emergency notification communications system would help reduce the loss of life.
Financial	Developing sources for local match, including through impact fees or other private/nonprofit partners, could help expand the city's mitigation financial capabilities. Additionally, Draper has experience in developing wildfire mitigation grants. This capability could be expanded to other types of grant applications, which could be utilized for other types of hazards as well, such as addressing flooding

DRAFT

Capability	Opportunity to Expand and/or Improve
	through Flood Mitigation Assistance or earthquakes through the Hazard Mitigation Grant Program.
Education and Outreach	In addition to sharing local progress on mitigation, Draper can expand current public education and outreach capabilities by promoting a deeper understanding of how the public can take steps to mitigate their own risk as well as what local resources are available to support their efforts. Stakeholders, including community organizations such as the Community Emergency Response Team (CERT), can help spread the mitigation message. An improved understanding of local resources and mitigation opportunities will help improve overall understanding of hazard risk and what to do about it.

Mitigation Strategy

Mitigation strategies provide proactive measures that are designed to minimize the impacts of hazards on the city of Draper. Table 20 shows mitigation action alternatives, and

Table 21 shows the status of previous mitigation activities. Table 22 is the 2025 mitigation action plan for the city of Draper

Table 20: Mitigation Action Alternatives for the City of Draper

Action	Type of Action	Selected for inclusion in the plan?	If not selected, why not?
Improve regulations for development to reduce damage from landslides.	Planning and Regulatory	Yes

DRAFT

Table 22: 2025 Mitigation Action Plan for the City of Draper[4]

#	Action	Hazard(s)	Lead Agency	Potential Partners	Benefits (Losses Avoided)	Cost Estimate	Funding Source(s)	Timeframe	Priority	Comments
1	Develop an enhanced emergency notification communications system.	Avalanche, Civil Disturbance, Dam Failure, Drought, Wildfire, Earthquake, Extreme Heat, Extreme Cold, Flooding, Hazardous Materials Incident, Heavy Rain, High Wind, Landslide, Lightning, Public Health Epidemic, Radon, Severe Winter Weather, Terrorism, Tornado, Wildfire	Draper PIO	Draper EM, SLCo EM, Draper FD, Draper PD, Civic Plus/ Ready	Early notification of impending disasters to decrease loss of life. Improved relationships with the public and stakeholders. Faster delivery of information with plans ready to go.	Medium	Draper City General Fund	Short term	Medium	
2	Design or update wildfire evacuation plan and route designations.	Wildfire	Draper FD	Draper EM, Draper PD, GIS, SLCo EM, FFSL	Improve Fire safety in the WUI areas, Cut fire breaks into the mountain side also functioning as trails.	Medium	Draper City General Fund, CWDG grant, WUIPPM	Medium	High	Currently working on and completing a prior 3-year grant commitment
3	Enhance security at critical infrastructure locations to prevent potential for terrorist acts.	Terrorism (including Cyberattacks)	Draper EM	Draper IT, Draper PD, Draper Public Works, SIAC, SLCo EM	Increased security protocols (both in technology and policy) for staff/first responders, clear expectations/understanding for the public.	Medium	Draper City General Fund, Draper EM, SHSP Grant	Short term	Medium	
4	Promote the Firewise initiative and regularly review/update the Community Wildfire Protection Plans (CWPP) for at-risk communities.	Wildfire	Draper FD	Draper EM, Draper Fuels Crew, SLCo EM, FFSL	Increased awareness of plans (for the public and stakeholders), improved eligibility for grants/other funding sources, and regular review of CWPP.	Medium	Draper City General Fund, Draper EM, CWDG grant	Short term	Medium	
5	Partner with SLCo EM to develop a city-wide single source of information sharing/ gathering for intelligence.	Civil Disturbance, Terrorism	Draper EM	Other Draper City departments, SLCo EM, Draper PD, SLCo Sheriff's Office, SIAC, local jurisdictions	Improve communication and coordination between Draper City agencies and SLCo.	Medium	Draper City General Fund, Draper EM, SHSP grant.	Short term	Medium	One platform to report and share information
6	Install xeriscaping on government-owned buildings.	Drought	Draper Facilities	Draper Water, Water Pro, State of Utah, SLCo EM, local utility companies	Decrease the cost of landscape irrigation, decrease water use.	Low	Water districts, Draper Facilities, Draper Parks and Recreation	Short term	Low	
7	Complete seismic retrofitting for critical facilities and other community assets.	Earthquake	Draper City Building and Engineering	Draper City, MSD, Draper EM	Decrease the potential for building collapse and catastrophic injury to occupants.	High	Draper City General Fund, BRIC grant, HMGP grant	Medium	Low

#	Action	Hazard(s)	Lead Agency	Potential Partners	Benefits (Losses Avoided)	Cost Estimate	Funding Source(s)	Timeframe	Priority	Comments
8	Improve communication to the public and stakeholders on resources available when Code Blue is in effect during severe winter weather.	Severe Winter Weather, Extreme Cold	Draper EM	Draper City PIO, Draper EM, SLCo EM, The Office of Homeless and Criminal Justice Reform	Prevents further damage to critical infrastructure, ensures that homeless individuals have warming resources available, offloads some of the pressure on local homeless resource providers with standard protocols to follow with Code Blue.	Low	Draper City General Fund, Draper EM	Short term	Low	
9	Determine potential flood impacts and identify areas in need of additional flood control structures.	Flooding and Heavy Rain	Draper Public Works	Draper City, Draper EM, SLCo. Flood Control Engineering, Water Districts	Improve understanding of where flood mitigation is a priority.	High	Draper City General Fund, Draper Public Works, SLCo, FMA, HMGP grant, EMPG grant	Long term	Medium	
10	Address identified problems through construction of debris basins, flood retention ponds, energy dissipaters, or other flood control structures.	Flooding, Heavy Rain, Dam Failure	City of Draper	Public Works Engineering	Reduce risk of damage or injury from flooding.	High	Draper City General Fund, Draper Capital Improvement Fund, HMGP grant	Medium	Medium	
11	Identify and assess structures for deficiencies.	Flooding, Heavy Rain, High Wind, Lightning, Tornado, Severe Winter Weather	City of Draper	Engineering/Building	Identify and prioritize facilities for hardening to reduce damage and loss of functionality during hazard events.	Low	Draper City General Fund	Medium	Medium	
12	Modify structures as needed to address deficiencies.	Flooding, Heavy Rain, High Wind, Lightning, Tornado, Severe Winter Weather	City of Draper	Engineering/Building	Hardening facilities can reduce damage and maintain functionality during hazard events.	High	Draper City General Fund, Draper Capital Improvement Fund, HMGP grant	Long term	Medium	
13	Reinforce or rebuild existing culverts and bridges, and add new culverts and bridges in newly identified hazard areas.	Flooding and Heavy Rain	Draper Public Works	Draper City, Draper EM, SLCo. Flood Control Engineering, Water Districts	Allow for greater handling of heavy rain and spring melt runoff, and decrease potential debris buildup.	High	Draper City General Fund, Draper Public Works, SLCo, FMA, HMGP grant, EMPG grant	Long term	Medium	
14	Establish maintenance and repair programs to remove debris, improve resistance, and otherwise maintain the effectiveness of stormwater and flood control systems.	Flooding and Heavy Rain	Draper Public Works	Draper City, Draper EM, SLCo. Flood Control Engineering, Water Districts	Allow for greater handling of spring melt runoff and a decrease in the potential debris buildup.	High	Draper City General Fund, Draper Public Works, SLCo, FMA, HMGP grant, EMPG grant	Long term	Medium	
15	Conduct a public awareness campaign on Tier 2 reporting software for chemical reporting.	Hazardous Materials incident	Draper Fire Marshal	Draper FD, Draper EM, Draper PD, SLCo EM, LEPC	Improved understanding of tier 2 reporting and how local agencies/jurisdictions can find and submit information. A common operating platform for hazardous materials reporting.	Low	Draper City General Fund LEPC	Long term	Medium	
16	Enact city regulations and codes for development to reduce damage to critical infrastructure and buildings from landslides and slope failure.	Landslide and Slope Failure	SLCo Office of Regional Development	Draper Building and Engineering, MSD, SLCo EM	Reduce the likelihood of landslides and critical infrastructure/building damage. Ensure that future development is up to code and follows policy to avoid repetitive loss properties.	Low	Draper City General Fund	Long term	Medium	

DRAFT

#	Action	Hazard(s)	Lead Agency	Potential Partners	Benefits (Losses Avoided)	Cost Estimate	Funding Source(s)	Timeframe	Priority	Comments
17	Develop and implement public education programs on disaster awareness and mitigation.	Avalanche, Civil Disturbance, Dam Failure, Drought, Wildfire, Earthquake, Extreme Heat, Extreme Cold, Flooding, Hazardous Materials Incident, Heavy Rain, High Wind, Landslide, Lightning, Public Health Epidemic, Radon, Severe Winter Weather, Terrorism, Tornado, Wildfire	Draper EM	Draper City, Draper FD, Draper PD, Draper Public Works, SLCo EM, NWS, UDEM	Improve understanding of local resources, improve relationships with the public and stakeholders. City of Emigration Canyon Annex

To participate in this multi-jurisdictional hazard mitigation plan (MJHMP) update for Salt Lake County (SLCo), the governing body of the city of Emigration Canyon passed a formal resolution, a copy of which is maintained at the local government offices.

Planning Process Contact Information

Table 1 provides information on the point of contact during the updating of the MJHMP.

Table 1: Contact Information for the City of Emigration Canyon

Name	Contact Information
Joe Smolka	**Phone: 801-560-3543 email:** smolka@ecmetro.org
Brian Buckhout	**Phone:** 925-315-1671 **email:** bbuckhout@unifiedfire.org

The city of Emigration Canyon has a fully integrated approach to hazard mitigation planning and program implementation. During the 2024 update process, the MJHMP participation roles in Table 2 were recorded.

Table 2: Participant List for the City of Emigration Canyon

Name	Title	Jurisdiction
Brian Buckhout	Municipal Emergency Planner	Unified Fire Authority
Brian Hartsell	Associate General Manager	Municipal Services District
Joe Smolka	Mayor	Emigration Canyon

Jurisdiction Profile

Date of Incorporation

Emigration Canyon became a metro township in January 2017.On May 1, 2024, it was converted to a city.

Location and Description

The city of Emigration Canyon is located east of Salt Lake City in the Wasatch Range. The city is approximately 18.22 square miles in area and is approximately 6,500 feet above sea level. Emigration Canyon is known for its historical significance, especially its role in the Mormon migration of the 19th century.

DRAFT

Population

The 2022 American Community Survey 5-Year Estimate from the U.S. Census Bureau records the population of the city of Emigration Canyon as 1,465 people.

Demographics

Most of the 1,465 people are between the ages of 65 and 74, with a median age of 50;1. 737 are males (50.3%) and 728 are females (49.7%). English is the primary language in 84% of homes,, with 6.4% Spanish, and 9.6% other languages.

Brief History

Emigration Canyon has a rich historical significance, due primarily to its role along a critical route during the westward migration of Mormon pioneers in the mid-19th century. The canyon was used by Mormon pioneers led by Brigham Young as they journeyed toward the Salt Lake Valley, making it an integral part of their trek. Eventually, Emigration Canyon developed into a community that reflects its historical roots while evolving with modern amenities and attractions. It is known for its scenic beauty and historical landmarks.

Climate

The city of Emigration Canyon experiences a continental climate (Dsa Köppen classification) characterized by dry, hot summers and cold winters. Average high temperatures are approximately 85°F in the summer and approximately 40°F in the winter. Rain each year is approximately 18 inches, and snowfall averages 67 inches.

Public Services

The city of Emigration Canyon offers a wide range of public services through the Greater Salt Lake Municipal Services District (MSD). The MSD oversees services including public works which encompasses the construction and maintenance of roads, snow removal, and street lighting. The MSD also handles planning and zoning, business licensing, inspections, emergency planning, and other municipal services.

Governing Body

The governing body of the city of Emigration Canyon consists of a Mayor and a five-member Council, who have the power to create and enforce laws including the authority to levy taxes.

Development Trends

Emigration Canyon has observed notable development trends. The adoption of the first General Plan in 2022 provided a strategic guide for planning and development, emphasizing key areas such as land use, transportation, economic growth, environmental resilience, and infrastructure enhancement.

DRAFT

The area has experienced a steady increase in population, with a mix of full-time and part-time residents, with an average residency length of approximately 18 years. Economic development in Emigration Canyon is closely linked to the Salt Lake City area, with job growth reflecting this connection. Notably, rental costs have declined between 2010 and 2017, a pattern that is expected to persist.

Jurisdiction-Specific Hazards and Risk

The Calculated Priority Risk Index (CPRI) is a comprehensive assessment tool for evaluating and prioritizing risks in a given context. It considers various factors, such as probability, impact, and urgency, to determine the level of risk associated with events or situations. The results for each hazard, including its risk factor (RF) value, are shown in Table 3. The results are based on the criteria in

Table 4 and the equation that follows it. The CPRI helps organizations and individuals make informed decisions about risk management and mitigation strategies. It provides a systematic approach to identifying and addressing potential issues, allowing for a more efficient allocation of resources and proactive risk prevention. With the CPRI, stakeholders can prioritize their focus on the most critical risks, leading to more effective risk management and, ultimately, better outcomes.

Table 3: Calculated Priority Risk Index Values for the City of Emigration Canyon

Type of Hazard Event	Probability of Future Events	Spatial Extent	Severity of Life/ Property Impact	Warning Time	Duration	Response Capacity	Risk Factor Value
Avalanche	4	1	2	4	2	1	2.6
Drought	4	4	2	1	4	1	2.8
Earthquake	3	4	4	4	3	2	3.4
Extreme Heat	4	4	3	1	3	1	3
Extreme Cold	3	4	2	1	3	1	2.4
Flooding	4	3	3	3	3	1	3.1
Landslide/ Slope Failure	2	1	2	4	1	2	2
Radon	4	4	2	1	4	2	2.9
Heavy Rain	4	3	2	3	1	1	2.6
High Wind	4	3	3	3	2	1	3
Lightning	4	2	2	4	1	1	2.6
Severe Winter Weather	4	3	2	2	2	1	2.6
Tornado	2	2	3	4	1	2	2.4
Wildfire	4	3	3	4	3	1	3.2
Dam Failure	2	2	3	2	2	3	2.4
Civil Disturbance	2	1	2	4	2	2	2.1

DRAFT

Type of Hazard Event	Probability of Future Events	Spatial Extent	Severity of Life/ Property Impact	Warning Time	Duration	Response Capacity	Risk Factor Value
Cyberattack	2	3	3	4	3	2	2.7
Hazardous Materials Incident (Transportation & Fixed Facility)	3	1	2	4	1	1	2.2
Public Health Epidemic/ Pandemic	3	4	3	1	4	1	2.8
Terrorism	2	1	3	4	2	1	2.3

Table 4: Criteria for the Calculated Priority Risk Index

Risk Index Factor	Degree of Risk Level		Criteria	Factor Weight for Degree of Risk Level
Probability of Future Events	1	Unlikely	Less than 1 percent probability of occurrence in the next year or a recurrence interval of greater than every 100 years.	30%
	2	Occasional	1 to 10 percent probability of occurrence in the next year or a recurrence interval of 11 to 100 years.	
	3	Likely	11 to 90 percent probability of occurrence in the next year or a recurrence interval of 1 to 10 years.	
	4	Highly Likely	91 to 100 percent probability of occurrence in the next year or a recurrence interval of less than 1 year.	
Spatial Extent	1	Limited	Less than 10% of the planning area could be impacted.	10%
	2	Small	10%–25% of the planning area could be impacted	
	3	Significant	25%–50% of the planning area could be impacted.	
	4	Extensive	50%–100% of the planning area could be impacted.	
Severity of Life/Property Impact	1	Negligible	Less than 5% of the affected area's critical and non-critical facilities and structures are damaged/ destroyed. Only minor property damage and minimal disruption of life. Temporary shutdown of critical facilities.	30%
	2	Limited	More than 5% and less than 25% percent of property in the affected area is damaged/	

DRAFT

Risk Index Factor	Degree of Risk Level		Criteria	Factor Weight for Degree of Risk Level
			destroyed. Complete shutdown of critical facilities for more than one day but less than one week.	
	3	Critical	More than 25% and less than 50% of property in the affected area was damaged/ destroyed. Complete shutdown of critical facilities for over a week but less than one month.	
	4	Catastrophic	Over 50% of critical and non-critical facilities and infrastructures in the affected area are damaged/ destroyed. Complete shutdown of critical facilities for more than one month.	
Warning Time	1	Self-defined	More than 24 hours	10%
	2	Self-defined	12 to 24 hours.	
	3	Self-defined	6 to 12 hours.	
	4	Self-defined	Less than 6 hours.	
Duration	1	Brief	Up to 6 hours.	10%
	2	Intermediate	Up to one day.	
	3	Extended	Up to one week.	
	4	Prolonged	More than one week.	
Response Capacity	1	High	Significant resources and capability to respond to this kind of event; staff are trained, experienced, and ready.	10%
	2	Medium	Some resources and capability to respond to this kind of staff; some staff may be trained, experienced, and ready while others may need additional support.	
	3	Low	Limited resources and capability to respond to this kind of event; additional staff or staff training needed.	
	4	None	No resources and capability to respond this kind of event; additional outside support would be required.	

RISK FACTOR (RF) EQUATION

RF Value = [(Probability x 0.30) + (Spatial Extent x 0.10) + (Severity of Life/Property Impact x 0.30) + (Warning Time x 0.10) + (Duration x 0.10) + (Response Capacity x 0.10)]

Hazards with an RF value greater than or equal to 2.5 are considered high risk. Those with RF values of 2.0 to 2.4 are considered moderate risk hazards, and those with an RF value less than 2.0 are considered low risk. The highest possible RF value is 4.

DRAFT

Hazard Event History

Examining hazard event histories provides valuable insights to inform decision-making and help prioritize resources for risk prevention and response efforts. Table 5 lists the hazard events impacting the city of Emigration Canyon planning area since the 2019 plan update, as recorded in the Storm Events Database from the National Centers for Environmental Information.

Table 5: History of Hazard Events in the City of Emigration Canyon

Type of Hazard Event	FEMA Disaster #	Date(s)	Damage or Impacts	Description
Avalanche		February 2023	Smaller, animal-triggered slides.	
Drought		2023	Emigration Creek is getting drier.	Emigration Improvement District dug more wells to keep up with residential demands and there hasn't been enough water to sustain needs.
Earthquake	DR-4548-UT	March 18, 2020	M 5.7 earthquake that caused extensive damage throughout the county including downed trees, buildings, and debris on roads. Damage was primarily centered in Magna, but shaking was felt throughout the county.	The state received a major disaster declaration on July 9, 2020.
Extreme Heat		2020–2024	Increased temperatures in the summer months	Contributes to drought conditions
Extreme Cold			Code blue days in Emigration Canyon	Shelters throughout the county expanded capacity for unsheltered groups
Flooding	DR-4752-UT	04/13/2023	Snowpack melt from warm weather caused flooding. Local emergency was declared.	A few homes were damaged along with roadways.
Landslide/ Slope Failure	DR-4752-UT	04/13/2023	Warm weather and snowpack melt caused flooding and a number of landslides.	A few homes were damaged along with roadways. Local emergency was declared.
Radon			Medium household radon levels.	There are medium household radon levels in Emigration Canyon.
Heavy Rain	DR-4752-UT	04/13/2023	Flooding at Emigration Creek in June 2023.	Led to landslides from record snowpack and higher temperatures.

DRAFT

Type of Hazard Event	FEMA Disaster #	Date(s)	Damage or Impacts	Description
High Wind	4578-DR-UT	09/07/2020	High winds throughout the county	100+ mph winds caused extensive property and road damage.
Lightning				
Severe Winter Weather		2023 and 2024	Heavy snow loads from record snowpack caused roofs to collapse.	Property damage, downed trees, and access to essential services disrupted.
Tornado		August 11, 1999	Tornado in Salt Lake City that impacted access to Emigration Canyon.	Emigration Canyon was impacted as far as access to the city.
Wildfire		2019	Wildfire at the top of the canyon.	Helicopters with buckets and a tanker used.
Dam Failure			No dams within city boundaries but do have three high hazard dams surrounding the city.	There is concern that flooding from the dam near the entrance of Emigration Canyon could affect the road and other services to the city.
Civil Disturbance		May 2020	Civil disturbance, protests in Salt Lake City. No direct impacts, but this occurred in neighboring city.	
Cyberattack				
Hazardous Materials Incident (Transporta-tion & Fixed Facility)				
Public Health Epidemic/ Pandemic		2020–2023	COVID-19 pandemic	Impacted local residents and businesses as far as the local economy and ability to access resources.
Terrorism				

DRAFT

National Flood Insurance Program Summary

The city of Emigration Canyon participates in the National Flood Insurance Program (NFIP). Table 6 displays statistics related to the NFIP. The city of Emigration Canyon does not participate in the Community Rating System (CRS).

Table 6: National Flood Insurance Program Status for the City of Emigration Canyon[1]

Initial FHBM Identified	Initial FIRM Identified	Current Effective Map Date	Adopted Date	Date Joined NFIP	Tribal
12/18/1985	12/18/1985	09/25/2009	2009	06/03/2020	No

Table 7: National Flood Insurance Overview for the City of Emigration Canyon

Community ID	Number of Losses	Total Net Payment	Active Policies	Total Coverage
490268	0	$0.00	1	$350,000

The city of Emigration Canyon has designated the Director of Planning and Development Services as the Floodplain Administrator. The duties of the Floodplain Administrator are supported by the Greater Salt Lake Municipal Services District (MSD). The current Flood Damage Prevention and Control Ordinance was adopted on 9/28/2021. The current Flood Insurance Rate Map (FIRM) became effective 9/25/2009. In addition to the FIRM, Emigration Canyon acquired separate flood mapping data, which is considered the best available data and is currently used in the permitting process. It is in the process of being incorporated into the FEMA flood maps. The MSD is responsible for issuing floodplain permits in MSD Member Communities, including Emigration Canyon. The permits include a description of all work, including the kind and type of construction, proposed intent, and location. Substantial damage/substantial improvement structures are identified through the permitting process. Structures that are determined to be substantially damaged or substantial improvements are required to come into compliance with current codes. The MSD Building Department provides guidance on how to build in accordance with existing building codes.

Jurisdiction-Specific Vulnerabilities and Impacts

Table 8 provides information on the vulnerable assets in the city of Emigration Canyon, including its critical facilities, highlighting the city's vulnerability to identified hazards. By understanding the risks associated with these assets, local authorities can develop proactive strategies to mitigate vulnerabilities and ensure the safety and functionality of these important assets during hazard events. These data are invaluable for decision-making and prioritizing resources for emergency response and preparedness efforts, ultimately contributing to more effective risk management and greater resilience in the community.

The primary assets in Emigration Canyon are the 1,465 residents and their homes. One fire station is located within Emigration Canyon, but the remaining critical facilities and infrastructure are located in neighboring jurisdictions. Emigration Canyon Road is the primary transportation route, connecting to Salt Lake City at the mouth of the canyon on the west, and at the upper end connects to State Route 65 near Little Dell Reservoir. This route also provides connectivity to I-80. Several markers for historic sites and monuments are located in Emigration Canyon, such as Donner Hill and Last Campsite, acknowledging pioneers who traveled through the canyon.

[1] FIRM = Flood Insurance Rate Map, FHBM = Flood Hazard Boundary Map

DRAFT

Table 8: Jurisdiction-Specific Vulnerabilities and Impacts in the City of Emigration Canyon

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
Avalanche	People	*Vulnerability:* There are no avalanche paths mapped in Emigration Canyon, so the risk to the population is not well defined. Residents may be at risk under certain snow accumulation conditions. Residents living near canyon slopes or in isolated mountainous areas are also exposed to avalanche threats. *Impacts:* Avalanches can lead to injury or death for those caught in their path. In Emigration Canyon, outdoor enthusiasts face the highest risk from avalanches, particularly during the winter months when snowpack accumulates along steep terrain. Limited awareness of avalanche risks, inadequate safety gear, and lack of routine monitoring of weather and snow conditions increase susceptibility.
	Structures	*Vulnerability:* Homes and cabins situated near avalanche paths or steep inclines, especially at the base of canyon walls, face a heightened risk of damage or burial from snow slides. *Impacts:* Structures without reinforced foundations or roofs designed to withstand heavy snow loads are particularly vulnerable to damage. Poor vegetation cover, slope instability, and building orientation all contribute to structural risk in Emigration Canyon.
	Economic Assets	*Vulnerability:* Property values and local businesses are at risk from avalanches. *Impacts:* Homes located along slopes may suffer significant property damage, potentially lowering home values and affecting insurability. Local tourism businesses that support winter recreation may be disrupted by avalanche-related closures or safety concerns. Canyon roads and utility infrastructure, including electrical lines and access routes, may be blocked or damaged by snow movement, disrupting services and local economies.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Vegetation and wildlife habitat are at risk from avalanches. *Impacts:* Avalanches can damage alpine habitats and affect wildlife corridors. Forested slopes may lose tree cover, increasing erosion. If historic trailheads, cabins, or interpretive signs lie in potential slide areas, they risk damage or total loss.
	Critical Facilities and Infrastructure	*Vulnerability:* Roads, power, and water systems are vulnerable to avalanches. *Impacts:* Transportation through the canyon, including Emigration Canyon Road, may be shut down during high-risk periods, impacting residents, emergency services, and visitors. Power lines and water delivery systems near slopes may be disrupted by snow slides or debris flow triggered by avalanches.
	Community Activities	*Vulnerability:* Recreation opportunities are vulnerable to avalanches. *Impacts:* Community and recreational use of canyon trails, ski runs, and winter events may be limited or postponed during avalanche season. These interruptions impact local participation and outdoor tourism.
Drought	People	*Vulnerability:* Drought occurs over large regions, and all Emigration Canyon residents are vulnerable.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		Impacts: During dry periods, Emigration Canyon residents, especially those on private wells, may experience water scarcity. Older adults, young children, and those with limited income may have difficulty coping with restrictions, rising water costs, and lack of water-efficient appliances or irrigation options.
	Structures	*Vulnerability:* All Emigration Canyon structures are vulnerable to drought. *Impacts:* Extended drought conditions can cause soil shrinkage, which may shift foundations and damage aging infrastructure. Landscape watering limits may result in browning lawns or dead vegetation around homes and public buildings, affecting aesthetics and fire risk.
	Economic Assets	*Vulnerability:* Local businesses and recreation amenities are at risk from drought. *Impacts:* Rising water costs and scarcity can challenge residents and local service providers. Recreational businesses may be impacted by fire closures or degraded trail conditions. Infrastructure maintenance costs can also rise due to erosion and fire-related damage during dry seasons.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Ecosystems and historical sites are vulnerable to drought. *Impacts:* Local plant communities, already adapted to a semi-arid climate, may face die-off or a shift in species distribution under prolonged drought, impacting the local ecosystem. Historic structures or public buildings may face increased maintenance costs due to water restrictions affecting cooling and vegetation.
	Critical Facilities and Infrastructure	*Vulnerability:* Fire response and water systems are vulnerable to drought. *Impacts:* Drought may limit available water for emergency response, including firefighting efforts. Systems that rely on surface or shallow groundwater sources may experience drops in output. Aging infrastructure is especially susceptible to damage due to dry soil conditions.
	Community Activities	*Vulnerability:* Recreation activities are vulnerable to drought. *Impacts:* Recreational activities like gardening, picnics, and local trail use may be affected by poor air quality, fire risk, and reduced access to water. Drought awareness campaigns may be needed to promote conservation and mitigate risk.
Earthquake	People	*Vulnerability:* All Emigration Canyon's residents are at risk due to its proximity to the Wasatch Fault. *Impacts:* Those living in older homes not designed for seismic resistance, especially households with children, seniors, or individuals with limited mobility, may have difficulty responding quickly during a quake. A lack of preparedness supplies or knowledge about earthquake response further increases vulnerability.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
	Structures	*Vulnerability:* All structures in Emigration Canyon are at risk from earthquakes. *Impacts:* Homes and buildings constructed prior to modern seismic standards are most likely to sustain damage. Structures on soft soils or near fault traces are at greater risk of foundational cracking or collapse.
	Economic Assets	*Vulnerability:* Businesses, property loss, and devaluation are vulnerable to earthquakes. *Impacts:* Damage to homes, roadways, and hillside retaining walls can result in high repair costs and long-term recovery expenses. Businesses that depend on pass-through traffic or trail-based tourism may see economic disruptions if access routes are compromised. Any disruption in utility service can further strain economic activity in the canyon.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Natural habitats and historical markers are vulnerable to earthquakes. *Impacts:* Rockslides or soil movement triggered by seismic activity can degrade natural habitats and water quality. Historic cabins or interpretive features not designed to endure ground shaking are particularly vulnerable.
	Critical Facilities and Infrastructure	*Vulnerability:* Transportation and utility systems are vulnerable to earthquakes. *Impacts:* Emigration Canyon's limited transportation routes, including its main road, are at risk of rockfall or collapse in the event of an earthquake. Utility systems, including water lines and electrical infrastructure, may be damaged by ground movement or slope failure, delaying recovery.
	Community Activities	*Vulnerability:* All city events and activities are vulnerable to earthquakes. *Impacts:* Community meetings, trail gatherings, and outdoor recreation could be interrupted by earthquakes and their aftermath. Public safety communications and mutual aid access are essential in such scenarios due to the canyon's relative isolation.
Extreme Heat	People	*Vulnerability:* All residents are potentially vulnerable to extreme heat. Adults over 65, individuals with pre-existing health conditions, young children, outdoor workers, and low-income households are at greater risk. *Impacts:* Extreme heat can cause illness such as dehydration, heat exhaustion, and heat stroke. Older, younger, and health-compromised individuals have higher risk because they struggle to regulate body temperature. Socioeconomically disadvantaged individuals may lack access to cooling resources, while outdoor workers are at higher risk of heat-related illnesses due to physical labor without adequate hydration and rest. Extreme heat can hinder students' learning.
	Structures	*Vulnerability:* All structures are potentially at risk from extreme heat. *Impacts:* Residential buildings with inadequate insulation and ventilation and commercial buildings lacking reflective roofing and proper shading may be vulnerable. Materials like metal and glass can

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		amplify heat retention, while areas with limited green space typically experience higher temperatures.
	Economic Assets	*Vulnerability:* Agriculture and recreation businesses are vulnerable to extreme heat. *Impacts:* Agricultural operations can have reduced yields and higher water demand due to heat stress. The outdoor recreation industry may see decreased participation during heat waves, affecting local businesses that rely on visitors. In addition, the energy infrastructure could face strain from increased cooling demands, leading to outages.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Plants, wildlife, recreation amenities, and historic markers are vulnerable to extreme heat. *Impacts:* Local plant species and wildlife habitats can suffer from extreme heat conditions, leading to reduced biodiversity. Historic buildings may degrade due to high temperatures, causing materials to deteriorate and paint to peel. In addition, parks and recreational areas may experience overuse and risk of their preservation, as residents seek relief from the heat.
	Critical Facilities and Infrastructure	*Vulnerability:* Transportation and power systems are vulnerable to extreme heat. *Impacts:* Homes and businesses can suffer from the strain on cooling resources. Power grids may be strained by higher demands for electricity for cooling, leading to potential outages. Transportation systems are at risk of damage, such as buckling roads and warped train tracks.
	Community Activities	*Vulnerability:* Outdoor events and recreation are vulnerable to extreme heat. *Impacts:* Activities like outdoor sports, fairs, and agricultural practices are vulnerable to extreme heat. These events can pose risks, particularly for participants such as youth athletes and elderly residents who may suffer from heat-related illnesses. In addition, high temperatures can stress crops, impacting local farming.
Extreme Cold	People	*Vulnerability:* All residents are vulnerable to extreme cold, but some groups may have more severe risks. *Impacts:* Extreme cold can lead to hypothermia or frostbite. The elderly face increased risks due to health issues and mobility challenges, while children may be susceptible if they lack proper winter clothing. Individuals experiencing homelessness or financial hardship often lack access to heated shelters and resources for protection against the cold. Those with pre-existing health conditions may experience worsened symptoms at low temperatures.
	Structures	*Vulnerability:* All residential homes, commercial buildings, and unheated spaces like sheds may be vulnerable to extreme cold. *Impacts:* Homes with poor insulation or inadequately sealed windows and doors are prone to significant heat loss. Older buildings lacking modern energy efficiency standards may also suffer from freezing pipes and structural damage. Public infrastructure, such as bridges and roads, also can be impacted.
	Economic Assets	*Vulnerability:* Agriculture, infrastructure, and energy-related businesses are at risk from extreme cold.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		Impacts: Agricultural operations, such as greenhouses and livestock farms, may experience crop and livestock losses, impacting revenue. Icy roads can disrupt transportation networks, affecting logistics and supply chains, while power lines risk outages from ice accumulation, impacting local businesses. Energy-intensive facilities may face higher operational costs due to increased heating needs.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Plants, wildlife, and historic and cultural sites are vulnerable to extreme cold. *Impacts:* Due to prolonged cold, local vegetation and wildlife habitats may suffer from plant stress and reduced food availability. Historic structures, especially those not built for severe weather, can deteriorate due to below-freezing temperatures and ice. Culturally significant sites, including monuments and public art, also may be damaged, while infrastructure such as water pipes and roadways may be compromised during extreme cold events, leading to service disruptions and safety hazards.
	Critical Facilities and Infrastructure	*Vulnerability:* Water systems and roads are vulnerable to extreme cold. *Impacts:* Water treatment plants can face frozen pipes and equipment failures. Icy conditions may increase accident risks on transportation infrastructure, and power generation facilities may struggle to meet heating demands. Residential and commercial buildings lacking proper insulation are also at risk of heating system failures, endangering occupants.
	Community Activities	*Vulnerability:* Outdoor recreation activities are vulnerable to extreme cold. *Impacts:* Youth sports, festivals, and outdoor markets are vulnerable to extreme cold. Harsh temperatures can deter participation, impacting community engagement. At-risk groups, such as the elderly and young children, face health risks like frostbite and hypothermia, further limiting outdoor involvement. In addition, poorly insulated buildings or inadequate heating in community centers can make gatherings uncomfortable.
Flooding (and Heavy Rain)	People	*Vulnerability:* Flooding primarily affects residents in low-lying areas near rivers and streams, especially during heavy rainfall or snowmelt. Homes along Emigration Creek are at risk. *Impacts:* Flooding can lead to injury or death for individuals swept away in fast moving water. Residents may be displaced from their homes. Individuals without reliable transportation may struggle to evacuate quickly, while low-income families often lack resources for flood-prevention measures. The elderly and those with disabilities may face mobility challenges, increasing their risk during emergencies. Overall, factors such as geographic location, economic status, and physical ability contribute to the community's varying levels of vulnerability to flooding.
	Structures	*Vulnerability:* Homes and other structures near Emigration Creek are vulnerable. High runoff and heavy rain may affect other areas as well, near smaller canyon mouths or in low-lying areas. *Impacts:* Residential properties in floodplains and commercial buildings without proper drainage systems or flood-resistant designs

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		face significant risks during heavy rain or snowmelt. Older structures may be more susceptible due to outdated construction standards. Overall, a combination of location and construction features contributes to their vulnerability to flooding.
	Economic Assets	*Vulnerability:* Businesses near waterways are at risk from flooding, and property values may be affected. *Impacts:* Emigration Canyon does not have many large commercial properties, retail centers, or warehouses near rivers or low-lying areas, but the town relies on businesses in neighboring jurisdictions that may be at risk. Residential developments in flood-prone zones can also suffer damage, impacting property values. Public infrastructure, such as roads and utilities, may experience disruptions, leading to costly repairs. Agricultural land can be affected by excess water, reducing crop yields.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Natural habitats and historic markers are vulnerable to flooding. *Impacts:* Natural areas like wetlands and streams are at risk of habitat destruction, while historic sites and landmarks may sustain structural damage. Cultural resources, such as parks and public spaces, can become unusable, affecting community events. Factors contributing to their vulnerability include inadequate flood management, urban development that alters water flow, and the increasing frequency of extreme weather events due to climate change.
	Critical Facilities and Infrastructure	*Vulnerability:* Transportation networks, including Emigration Canyon Road, and water systems are vulnerable to flooding. *Impacts:* Transportation networks are vulnerable to flooding due to their proximity to rivers and low-lying areas, which can overflow during heavy rain or snowmelt. Flooding could damage Emigration Canyon Road, which is the primary route to and from Emigration Canyon. Flooding can disrupt emergency services, block transportation routes, and isolate communities. In addition, inadequate drainage systems and urban development encroaching on floodplains increase these risks.
	Community Activities	*Vulnerability:* Community activities are vulnerable to flooding. *Impacts:* Due to the area's geography and infrastructure, outdoor events, sports, and farmers' markets are vulnerable to flooding. Parks and open spaces can quickly become inundated during heavy rainfall or rapid snowmelt. Residential neighborhoods near rivers, roads, and bridges are at risk of flash floods, which can disrupt transportation and emergency services.
Landslide/ Slope Failure	People	*Vulnerability:* Most of Emigration Canyon has moderate landslide susceptibility. Residents living along the steep inclines of Emigration Canyon are particularly susceptible to landslides and slope failures. *Impacts:* Residents can be injured or displaced from homes due to landslides. The area's geological makeup, combined with factors like heavy rainfall and rapid snowmelt, can destabilize slopes. Older homes, especially those constructed without modern engineering standards, may lack adequate protection against such events. Limited awareness about early warning signs and insufficient emergency preparedness further heighten the risk for these communities.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
	Structures	*Vulnerability:* Nearly all structures in Emigration Canyon are vulnerable to landslides. *Impacts:* Buildings situated on or near the canyon's slopes, including homes and essential infrastructure, face significant threats from potential landslides. The combination of loose soil, inadequate drainage, and historical construction practices without modern slope stabilization techniques increases vulnerability. Roads and bridges, vital for daily commutes and emergency responses, are also at risk, especially during periods of intense precipitation.
	Economic Assets	*Vulnerability:* Property values and business losses are vulnerable to landslides. *Impacts:* Properties perched on hillsides may experience devaluation due to the looming threat of slope instability. Damage to infrastructure, such as roads and utility lines, can disrupt daily life and incur substantial repair costs. Local businesses might suffer from accessibility issues, leading to economic downturns in the community.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Waterways, habitats, and historic sites are vulnerable to landslides. *Impacts:* The natural beauty of Emigration Canyon, characterized by its diverse ecosystems, can be compromised by landslides that alter habitats and watercourses. Historic sites, reflecting the area's rich heritage, may be endangered by soil movements that threaten their structural integrity. Cultural landmarks and community gathering spots could also be affected, impacting the social fabric of the region.
	Critical Facilities and Infrastructure	*Vulnerability:* Water supply systems, power systems, and roads are vulnerable to landslides. *Impacts:* Essential services, including water supply systems and power lines, are vulnerable to disruptions caused by slope failures. The canyon's topography can hinder repair efforts, prolonging outages and affecting residents' quality of life. Emergency response times may be delayed if access routes are compromised, emphasizing the need for proactive infrastructure planning.
	Community Activities	Recreational pursuits, such as hiking and mountain biking, are integral to life in Emigration Canyon. However, trails and outdoor facilities located on unstable slopes pose risks to enthusiasts. Community events held in areas prone to landslides may face cancellations or relocations, affecting local traditions and economies.
Radon	People	*Vulnerability:* Residents of Emigration Canyon, particularly those in older homes, may be exposed to elevated radon levels due to the area's geological characteristics. According to utahradon.org, 39% of homes near Emigration Canyon have dangerous radon levels. *Impacts:* Families with young children and elderly members are especially at risk, as prolonged exposure to radon can lead to serious health issues. Awareness and regular testing are crucial to mitigate these risks.
	Structures	*Vulnerability:* All structures in the area may have elevated levels of radon. *Impacts:* Homes with basements or built on certain soil types prevalent in the canyon are more susceptible to radon infiltration. Cracks in

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		foundations and inadequate ventilation can exacerbate the problem, allowing radon gas to accumulate indoors. Implementing mitigation systems can significantly reduce exposure levels.
	Economic Assets	*Vulnerability:* Property values are vulnerable to radon levels. *Impacts:* Properties with high radon levels may face decreased market value and potential challenges during real estate transactions. The cost of installing mitigation systems, while necessary for health, can be a financial burden for homeowners. Moreover, public awareness of radon risks can influence property desirability in the area.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Water systems and historic structures are vulnerable to radon. *Impacts:* Radon, emanating from the natural decay of uranium in the soil, can affect underground water sources and soil quality. Historic buildings, often constructed without modern ventilation systems, may trap radon, posing health risks to occupants and visitors. Preserving these structures requires careful consideration of radon mitigation strategies.
	Critical Facilities and Infrastructure	*Vulnerability:* Public buildings, including one fire station, are vulnerable to radon. *Impacts:* Public buildings such as schools, daycare centers, and healthcare facilities in Emigration Canyon are limited. Residents may be exposed to radon in these facilities in neighboring jurisdictions. Emigration Canyon must ensure regular radon testing and implement necessary mitigation measures in public buildings. Protecting vulnerable populations, such as children and the elderly, is paramount. Infrastructure planning should incorporate radon-resistant construction techniques.
	Community Activities	*Vulnerability:* Community activities are vulnerable to radon, though radon risk is more commonly associated with long-term exposures. *Impacts:* Indoor community events, especially those held in basements or ground-level rooms, may inadvertently expose participants to higher radon levels. Ensuring that public buildings are tested and, if necessary, equipped with radon mitigation systems is essential for community health and safety.
High Wind	People	*Vulnerability:* The unique topography of Emigration Canyon can channel and intensify wind speeds, posing risks to all residents. *Impacts:* High winds can cause injury or death to individuals who do not have proper shelter. Blowing debris, broken windows, and collapsing roofs or structures can injure residents, especially the elderly, children, and individuals with mobility challenges. Sudden gusts can lead to injuries from flying debris or falling branches. Outdoor workers and recreational enthusiasts should be particularly cautious during high wind events.
	Structures	*Vulnerability:* Buildings with older construction or those not designed to withstand strong winds are vulnerable to damage from high winds. *Impacts:* Roofs, windows, and siding can be compromised, leading to costly repairs. Outbuildings, sheds, and other auxiliary structures may be at higher risk due to their lighter construction.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
	Economic Assets	*Vulnerability:* All businesses are vulnerable to high winds. *Impacts:* High winds can disrupt power lines and communication networks, affecting businesses and daily life. Agricultural operations may suffer losses due to damaged crops or infrastructure. Repair and maintenance costs following wind events can strain local economies.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Trees, ecosystems, and landmarks are vulnerable to high winds. *Impacts:* Strong winds can uproot trees and damage natural landscapes, affecting local ecosystems. Historic landmarks and cultural sites may suffer structural damage, threatening their preservation. Community parks and outdoor art installations are also susceptible to wind-related harm.
	Critical Facilities and Infrastructure	*Vulnerability:* Roads, power systems, and fire station response are vulnerable to high winds. *Impacts:* Essential services, including emergency response centers and utilities, must be fortified against high wind events. Power outages and blocked roads can impede emergency services, highlighting the need for resilient infrastructure planning.
	Community Activities	*Vulnerability:* Outdoor events and recreation activities are vulnerable to high winds. *Impacts:* Outdoor events, such as festivals and markets, are at risk during high wind conditions. Temporary structures like tents and stages can become hazardous if not properly secured. Event organizers should have contingency plans to ensure public safety.
Lightning	People	*Vulnerability:* Lightning can strike anywhere in the city, and all populations are potentially at risk. *Impacts:* Lightning can cause injury or death to those in close proximity to a strike. Outdoor enthusiasts, including hikers and campers, are at heightened risk of lightning strikes, especially during sudden summer storms. Children and the elderly may be less able to seek shelter promptly. Education on lightning safety and awareness of weather forecasts are vital for all residents and visitors.
	Structures	*Vulnerability:* Homes and communication facilities are vulnerable to lightning. *Impacts:* Tall structures, such as communication towers and buildings with metal components, are more likely to attract lightning. Homes without proper grounding systems are at risk of electrical surges, which can damage appliances and pose fire hazards.
	Economic Assets	*Vulnerability:* Businesses and electrical systems are vulnerable to lightning. *Impacts:* Lightning can cause significant damage to electrical systems, leading to costly repairs and business interruptions. Agricultural operations may experience losses due to fires ignited by lightning strikes. Insurance claims following such events can impact local economies.
	Natural, Historic, and	*Vulnerability:* Vegetation, wildlife, historic markers, and wildfire risk are vulnerable to lightning.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
	Cultural Resources	*Impacts:* Lightning-induced fires can devastate natural landscapes and wildlife habitats. Historic buildings, often constructed with flammable materials, are particularly vulnerable. Protecting these resources requires proactive measures, such as installing lightning rods and fire suppression systems.
	Critical Facilities and Infrastructure	*Vulnerability:* Power distribution, water systems, and the fire station are vulnerable to lightning. *Impacts:* Power stations, water treatment plants, and emergency services facilities must be equipped with lightning protection systems to ensure continuity of operations during storms. Disruptions to these services can have cascading effects on community well-being.
	Community Activities	*Vulnerability:* Outdoor events are vulnerable to lightning. *Impacts:* Outdoor gatherings, including sports events and festivals, should have lightning safety protocols in place. Organizers must monitor weather conditions and have plans to evacuate or shelter attendees if necessary.
Severe Winter Weather	People	*Vulnerability:* All residents are vulnerable to severe winter weather. Emigration Canyon often receives higher snow accumulations than communities in the valley due to its elevation and topography near the Wasatch Mountains. *Impacts:* Residents, especially the elderly and those with mobility issues, face challenges during heavy snowfall and icy conditions. Limited access to medical care and essential services can exacerbate health risks. Preparedness plans, including emergency supplies and heating alternatives, are crucial.
	Structures	*Vulnerability:* All buildings are vulnerable, and older structures may be more susceptible to damage from severe winter weather. *Impacts:* Buildings with flat or aging roofs are susceptible to collapse under heavy snow loads. Frozen pipes and inadequate insulation can lead to property damage and increased heating costs. Regular maintenance and weatherproofing are essential to mitigate these risks.
	Economic Assets	*Vulnerability:* Businesses and supply chains are vulnerable to severe winter weather. *Impacts:* Severe winter storms can disrupt transportation, affecting local businesses and supply chains. Snow removal and infrastructure repairs impose financial burdens on municipalities. Tourism, a vital part of the local economy, may decline during prolonged adverse weather conditions.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Trees, habitats, and historic markers are vulnerable to severe winter weather. *Impacts:* Heavy snowfall can damage trees and natural habitats, impacting local ecosystems. Historic structures may suffer from moisture infiltration and freeze–thaw cycles, leading to deterioration. Preservation efforts must account for winter weather impacts.
	Critical Facilities and Infrastructure	*Vulnerability:* Roads, utilities, and emergency response systems are vulnerable to severe winter weather. *Impacts:* Emigration Canyon Road, which provides the main access to and from the community, may become impassable during heavy snow or other severe winter weather. Utilities such as power and water

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		supply systems are at risk of disruptions from damaged lines. Communications signals may be impeded.
	Community Activities	*Vulnerability:* All community activities are vulnerable to severe winter weather. *Impacts:* Mobility around town can be limited during severe winter weather. Community activities may be delayed or canceled due to travel difficulties.
Tornado	People	*Vulnerability:* Tornadoes are rare in the area, and the terrain contributes to low likelihood of tornado. However, even a weak tornado or microburst could affect residents. *Impacts:* In Emigration Canyon, individuals living in manufactured or lightweight housing are particularly susceptible to tornado-related damage, as these structures offer limited protection against strong winds. Older adults, people with disabilities, and families with young children may encounter difficulties reaching safe shelter in time. Residents who are new to the area or unfamiliar with Utah's weather patterns may not recognize warning signs or have access to timely alerts. Additionally, individuals with limited financial resources may reside in areas without designated safe rooms or sufficient emergency planning in place, increasing their vulnerability during such events.
	Structures	*Vulnerability:* Weaker or older structures are vulnerable to tornado damage. *Impacts:* Structures in Emigration Canyon that are not built to modern wind-resistant standards—especially older homes and those with flat or lightweight roofs—face increased risk during tornadoes. Mobile homes, given their lighter construction and less secure anchoring, are especially prone to severe damage. Commercial properties built decades ago without structural reinforcements may also be impacted, particularly large-span buildings with wide roof areas that can lift under pressure. The steep terrain may offer some natural protection in places, but wind funneling through canyons can amplify localized impacts.
	Economic Assets	*Vulnerability:* Businesses and property values are vulnerable to tornadoes. *Impacts:* Damage to Emigration Canyon's homes, small businesses, and local infrastructure such as overhead power lines or communication systems can result in economic setbacks. Tornadoes that knock down trees or power poles may disrupt utility services and road access, impacting both emergency response and daily operations. Property values could be affected in areas where storm damage occurs repeatedly or where protective infrastructure is lacking.
	Natural, Historic, and Cultural Resources	*Vulnerability:* Vegetation, habitats, and historic markers are vulnerable to tornadoes. *Impacts:* Emigration Canyon's forested areas and natural drainage systems may be affected by high winds, leading to tree falls, habitat disturbance, and increased erosion. Emigration Canyon's historic cabins and heritage sites, often built with traditional materials, may not be resilient to tornadic winds. Parks, trailheads, and other cultural

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		gathering places are also at risk of structural and environmental damage.
	Critical Facilities and Infrastructure	*Vulnerability:* Water, electricity, communication systems, and the fire station are vulnerable to tornado damage. *Impacts:* Essential systems in and around Emigration Canyon—including water infrastructure, electrical lines, and emergency communications—are vulnerable to outages or failures during a tornado. Facilities not constructed or retrofitted to withstand high winds, especially those on exposed ridgelines or near open spaces, may experience structural damage. Disruption to these systems can isolate residents, delay emergency services, and strain local resources during recovery efforts.
	Community Activities	*Vulnerability:* Community events are vulnerable to tornadoes. *Impacts:* Community activities that take place in open-air environments can be disrupted or may pose safety risks if a tornado occurs. Temporary structures like tents and event canopies are especially prone to wind damage. Additionally, buildings with large windows or aging roofs used for public meetings or educational purposes may not provide sufficient shelter during severe weather.
Wildfire	People	*Vulnerability:* All of Emigration Canyon is at moderate to high risk of wildfire. *Impacts:* Wildfire can injure or kill residents who are unable to get away from spreading flames. Residents may be temporarily displaced by evacuations or permanently if homes are destroyed by fire. Residents near the wildland–urban interface (WUI), individuals with physical disabilities or health issues who may struggle to evacuate, and low-income families lacking resources for fire safety measures may be vulnerable. Older adults might have reduced mobility, making them more dependent on others for assistance.
	Structures	*Vulnerability:* All structures in Emigration Canyon are vulnerable to wildfire. *Impacts:* Residential homes, especially those made of wood or in heavily vegetated areas may be vulnerable. Properties near the WUI are at higher risk due to surrounding flammable vegetation. Inadequate defensible space, such as insufficient clearing of dry grass and shrubs, increases susceptibility. Roofs made of combustible materials and buildings that lack fire-resistant features are particularly at risk during wildfire events.
	Economic Assets	*Vulnerability:* Businesses and property values are vulnerable to wildfire. *Impacts:* Residential properties near wildland areas are at high risk, especially if they lack defensible space and fire-resistant landscaping. Commercial assets, such as retail centers close to forested regions, can suffer damage from flames and smoke, affecting the local economy. Agricultural lands are also susceptible, as wildfires can destroy crops and livestock, leading to financial losses. Vital infrastructure, such as power lines and water pipelines, can be disrupted, causing further economic repercussions. These vulnerabilities are heightened by dry conditions and high winds, which can facilitate the spread of fires.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
	Natural, Historic, and Cultural Resources	*Vulnerability:* Vegetation, wildlife, and historic sites are vulnerable to wildfire. *Impacts:* Natural resources like forests and grasslands are at risk because dry vegetation and accumulated brush can easily ignite. Historic sites made of wood and cultural landmarks can also be affected, particularly when located near wildland areas. The increasing frequency of drought and extreme heat, exacerbated by climate change, heightens these vulnerabilities. In addition, urban development encroaching on wildland areas increases the risk to these essential resources.
	Critical Facilities and Infrastructure	*Vulnerability:* Utility and gas lines, as well as fire response capabilities, are vulnerable to wildfire. *Impacts:* Utilities like power lines and gas pipelines are also at risk, as sparks or falling trees can ignite fires. Residential neighborhoods adjacent to natural landscapes are particularly susceptible to embers, making them vulnerable during dry conditions and high winds. A wildfire could quickly exceed the capability of the single fire station and support from neighboring jurisdictions would be required.
	Community Activities	*Vulnerability:* Community events and day-to-day activities are vulnerable to wildfire. *Impacts:* Outdoor events like festivals and sports, especially during hot, windy conditions, may be at risk. Recreational activities, such as hiking and camping near wooded areas, are also at risk from open flames or sparks. In addition, landscaping with dry grasses and shrubs increases susceptibility during fire season, putting local infrastructure and neighborhoods at risk.
Dam Failure	People	*Vulnerability:* Dam failure risk in Emigration Canyon is low. No significant or high hazard dams are within the city, and mapped inundation boundaries from dam failure do not intersect the town. However, dam failure could affect Emigration Canyon Road to the west of the Emigration Canyon border, which would affect resident access. *Impacts:* Residents may face risks in the event of a dam breach in neighboring communities. They may be cut off from services. Families with limited mobility may find it challenging to navigate via alternate routes. Populations with fewer resources may also lack access to transportation, alerts, or temporary shelter, further increasing their exposure to harm during a sudden flood event.
	Structures	*Vulnerability:* No Emigration Canyon structures were identified within potential inundation zones. *Impacts:* Emigration Canyon could experience indirect impacts of damage to structures downstream of the canyon. Resident workplaces or county facilities that serve the city could be affected.
	Economic Assets	*Vulnerability:* Businesses are vulnerable to dam failure. Impacts: Many residents travel to neighboring jurisdictions for services, shopping, work, etc.; structures located in or near potential inundation zones are particularly at risk. Bridges crossing Emigration Creek and any emergency access routes along narrow canyon roads could be severely impacted or impassable. Aging water control infrastructure or inadequate emergency notification systems can

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		worsen the situation, delaying protective actions and threatening both life and property.
	Natural, Historic, and Cultural Resources	Flooding triggered by a dam failure could harm riparian zones, disturb wildlife habitats, and degrade water quality in Emigration Creek and downstream areas. Historic cabins and early settlement sites along the canyon may be damaged or lost. Recreational and cultural assets such as trailheads, parks, and community gathering spots could also be impacted, diminishing both ecological and cultural values.
	Critical Facilities and Infrastructure	*Vulnerability:* Transportation, water systems, and utility lines are vulnerable to dam failure. *Impacts:* While Emigration Canyon does not host large-scale critical infrastructure, essential utilities such as private wells, septic systems, and community roads remain vulnerable. A dam breach could compromise water quality and disrupt emergency access routes, particularly on Emigration Canyon Road. Other utility lines that run through the entrance of the canyon could be damaged or disrupted. Recovery may be difficult due to the canyon's geographic isolation and reliance on a small number of entry and exit points.
	Community Activities	*Vulnerability:* Activities near mouth of Emigration Canyon are vulnerable to dam failure. *Impacts:* Outdoor recreation in and around Emigration Creek could be disrupted or made hazardous by flooding. Sudden water surges from a structural failure could threaten anyone in or near affected zones. In addition, road closures following such an event would limit access to key community spaces and delay rescue or recovery operations.
Civil Disturbance	People	Low-income individuals may lack the resources for safety, while the elderly or disabled may struggle to navigate emergencies. Young people, particularly teenagers, may be drawn into unrest, influenced by social dynamics. In addition, marginalized individuals may feel targeted or compelled to participate. A lack of community cohesion and trust in authorities can further heighten tensions.
	Structures	Government buildings, commercial properties, and infrastructure, such as bridges and transportation hubs may be vulnerable. Government buildings may be targeted for their symbolic authority, while retail stores can attract crowds during protests. Residential neighborhoods also can be affected, especially in areas with heightened tensions. The vulnerability of these structures stems from their visibility and importance to the community, combined with factors such as location and ongoing social issues.
	Economic Assets	Retail establishments, especially shopping centers, are at risk as they often become focal points for protests. Transportation systems can be disrupted by blockades, hindering access to services. Financial institutions may face vandalism or theft, while critical service providers could experience strain during unrest. Several economic assets are vulnerable to civil disturbances, primarily due to their visibility and reliance on foot traffic.
	Natural, Historic, and	Parks and open spaces may suffer from vandalism or destruction during uncontrolled events. Historic sites can become targets, as they symbolize authority or cultural significance. Cultural resources such as community centers and places of worship also may be affected, as

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
	Cultural Resources	they play a vital role in community identity. Their vulnerability lies in the potential for damage during protests.
	Critical Facilities and Infrastructure	Governmental facilities may be at risk, since they often symbolize authority and serve as community hubs, making them targets during unrest. Utility infrastructure, such as water and power facilities, is also at risk of disruption. Its visibility and essential services contribute to its vulnerability during civil disturbances.
	Community Activities	Public demonstrations, parades, and local government meetings are particularly vulnerable to civil disturbances. These events often attract large crowds and can become tense, especially around contentious social or political issues. Factors such as the local demographic, economic conditions, and recent events can heighten these vulnerabilities, making it easier for conflicts to arise during passionate public gatherings.
Cyberattack	People	Older adults often lack familiarity with technology and online security, making them easy targets for phishing scams. Individuals engaging in online banking or shopping without strong security measures also face heightened risks. Families with children may be less vigilant about internet safety, allowing cybercriminals to exploit personal information. In addition, small business owners without robust cybersecurity practices are prime targets for attacks that can disrupt operations.
	Structures	Critical infrastructure, such as power plants, water treatment facilities, and transportation systems, often lack robust cybersecurity measures. Commercial businesses, especially financial institutions and healthcare providers, also are at risk due to weaker data protection and employee training. Educational institutions may be vulnerable because of limited funding for cybersecurity and outdated software. Obsolete technology and insufficient training enhance the susceptibility of these structures to cyber threats.
	Economic Assets	Financial institutions, such as banks and credit unions, are at risk of data theft and service disruption. Small and medium-sized businesses often lack robust cybersecurity measures, making them attractive targets. In addition, local government agencies and critical infrastructure, such as water treatment facilities, might have outdated security protocols, posing threats to public safety. The rise of remote work further exacerbates vulnerabilities, as employees accessing networks from home can unintentionally expose systems to risks. Overall, the combination of outdated technology and insufficient cybersecurity practices increases the vulnerability of an area's economic assets.
	Natural, Historic, and Cultural Resources	Natural resources like water management systems and wildlife databases can be compromised, disrupting ecosystems. Historic sites and museums that digitize collections are at risk of losing valuable artifacts and data. In addition, cultural organizations managing events may face threats if their systems lack adequate security. The limited resources of smaller organizations further increase this vulnerability.
	Critical Facilities and Infrastructure	Energy and utility services, such as electricity and water systems, which often rely on outdated technology, may be vulnerable. Transportation infrastructure, such as traffic management and public transit, is also at risk due to networked systems. Facilities that use

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		electronic records and connected medical devices face vulnerabilities that can compromise patient safety.
	Community Activities	Online registration for events, local government services, and educational programs that rely on digital tools may be targeted due to inadequate security measures, outdated software, and insufficient staff training.
Hazardous Materials Incident (Transporta-tion & Fixed Facility)	People	Individuals with pre-existing health conditions, such as respiratory issues, and the elderly are at higher risk due to their compromised health. Children also are more susceptible. Those living near industrial areas or transport routes for hazardous materials face increased exposure risk, while low-income families may lack resources and information to effectively prepare for incidents.
	Structures	Industrial facilities, such as manufacturing plants and warehouses, often store hazardous chemicals which may leak. Residential buildings are at risk, particularly if located along transportation routes for hazardous materials. Older buildings may lack modern safety features, increasing their vulnerability.
	Economic Assets	Industrial facilities, transportation infrastructure, and nearby commercial properties may be affected. Industrial facilities handling chemicals are at risk of spills or leaks, while roads and railways used for transporting hazardous materials can lead to accidents and contamination. In addition, nearby commercial and residential areas face potential health risks and economic losses.
	Natural, Historic, and Cultural Resources	Waterways and habitats are vulnerable to hazardous materials incidents, which can disrupt ecosystems. Historic sites and structures may suffer damage from toxic exposure, leading to degradation over time. In addition, cultural landmarks risk losing their significance due to contamination events. The proximity of these resources to industrial areas or transport routes exacerbates their risk.
	Critical Facilities and Infrastructure	Chemical manufacturing plants, waste treatment facilities, and transportation networks, such as highways and railroads may be at risk. Their vulnerability stems from factors such as proximity to residential areas, aging infrastructure, and inadequate safety measures. Natural hazards, such as flooding and earthquakes, can further increase risks by damaging containment systems.
	Community Activities	Local markets and outdoor gatherings are vulnerable to hazardous materials incidents if they are near industrial zones and transport corridors. This risk is heightened by inadequate emergency preparedness, lack of public awareness, and the potential for spills during transport. Large crowds at events can complicate evacuation efforts, increasing the risks for participants and nearby residents.
Public Health Epidemic/ Pandemic	People	Individuals with pre-existing health conditions like asthma and heart disease and adults over 65 may be vulnerable. Low-income families may struggle to access healthcare and vaccinations, increasing their risk. Marginalized communities with limited access to information and those living in high-density conditions also are at greater risk due to the rapid spread of diseases and the challenges in implementing preventive measures.

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
	Structures	Several structures are vulnerable to public health epidemics or pandemics, particularly due to their ability to facilitate the spread of disease. High-density residential areas, such as apartment complexes, are at risk, as close living quarters can lead to faster transmission. Public gathering spaces, such as community centers, also pose significant threats because large groups are in confined spaces. , Workplaces with high foot traffic, such as retail stores, contribute to vulnerability.
	Economic Assets	Small businesses in retail, hospitality, and food service are particularly vulnerable to public health epidemics or pandemics. These sectors face risks from fluctuating consumer demand and potential operational restrictions. The tourism industry also is affected, as travelers may avoid high-risk areas. Healthcare facilities can become overwhelmed, straining resources and impacting operations. In addition, local supply chains may experience disruptions, leading to shortages and inflation. Overall, the direct effects of illness, along with prolonged shutdowns and consumer hesitance, leave these economic assets exposed to significant downturns.
	Natural, Historic, and Cultural Resources	Natural resources like wildlife and ecosystems can be disrupted by increased human activity, raising the risk of zoonotic diseases. Historic sites may deteriorate due to reduced visitor access and funding, while cultural resources, such as community events, face cancellations, impacting social connections.
	Critical Facilities and Infrastructure	Public health epidemic or pandemic incidents can affect nursing homes, public transportation systems, and food supply chains. Vulnerable populations in nursing homes are at higher risk. Public transportation can facilitate the spread of disease, thereby increasing transmission potential. These facilities often lack adequate resources, including medical supplies and testing capabilities, making them more susceptible to the impacts of a health crisis.
	Community Activities	Large gatherings like festivals and sporting events can facilitate the rapid spread of diseases due to close contact. Public transportation also is at risk, as it serves many people in confined spaces. Childcare facilities are particularly susceptible, given that children can easily transmit infections. In addition, food-related events, such as farmers' markets, can pose risks if hygiene practices are not followed. The interconnectedness of community members and varying adherence to health guidelines further exacerbate these vulnerabilities.
Terrorism	People	Young children and newcomers may lack awareness of potential threats, while the elderly and individuals with disabilities may struggle to respond quickly in emergencies. Marginalized communities often face bias, making them more susceptible to targeting. In addition, those with lower socioeconomic status may lack access to security measures and emergency preparedness resources.
	Structures	Government buildings, transportation hubs, commercial centers, and public spaces are particularly vulnerable to terrorism incidents. Government buildings are symbolic targets, while transportation hubs and commercial centers are attractive due to their potential for high casualties and crowd presence. Public spaces also are at risk due to their open nature and lack of security. Their vulnerability is heightened

DRAFT

Hazard	Vulnerable Assets	Description of Vulnerability and Impacts
		by inadequate security measures, high occupancy rates, and their locations in densely populated areas, which can amplify the impact of incidents.
	Economic Assets	Infrastructure, commercial establishments, and community facilities may be vulnerable. Critical infrastructure, such as transportation networks and power grids, could disrupt the economy if targeted. Commercial establishments, especially those with high foot traffic, and community facilities are at risk, as they can provoke widespread concern and disruption. Their accessibility and interconnectivity increase vulnerability, meaning that damage to one asset can have a broader economic impact and hinder recovery efforts.
	Natural, Historic, and Cultural Resources	Natural resources like water supplies and parks could be targeted for their significance to the community. Historic sites and cultural resources, such as museums or community centers, also are at risk due to their accessibility and importance to local identity. Their vulnerability is often heightened by inadequate security measures.
	Critical Facilities and Infrastructure	Public transportation systems and utility services like water and power plants may be affected. Their vulnerability arises from high accessibility and the potential impact of an attack, as crowded transportation and public spaces can lead to mass casualties and panic. Attacking utility services could disrupt the town's essential functions, creating chaos.
	Community Activities	Festivals, parades, and sporting events are particularly vulnerable to terrorism incidents. These events attract large crowds, making it easier for perpetrators to inflict harm and instill fear. In addition, community centers and places of worship serve as social hubs, increasing their risk. Factors such as limited security measures and open access to public spaces, contribute to this vulnerability.

Jurisdiction-Specific Impacts Changes in Vulnerability

Hazard events can impact communities, infrastructures, and ecosystems. The severity of these impacts can be influenced by climate change, population patterns, and land use developments. Understanding these factors is crucial for the city of Emigration Canyon to develop a resilient community and minimize the impacts of hazards. Table 9 displays the unique changes within the community and the related effects on each identified hazard affecting the city of Emigration Canyon.

DRAFT

Table 9: Jurisdiction-Specific Changes in Vulnerability in the City of Emigration Canyon

Type of Hazard Event	Description of Potential Impacts	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
Avalanche	Avalanches pose a direct threat to outdoor enthusiasts, leading to injuries or fatalities. Property damage can occur at ski resorts and along transportation routes, disrupting emergency response and logistics. The local economy may suffer, especially businesses reliant on winter tourism, and there can be a psychological toll on the community, along with increased insurance costs.	Higher temperatures can lead to more rain, destabilizing snowpack and increasing the risk of wet avalanches. In addition, changes in snowfall can cause denser snow layering on slopes, making them more prone to sliding.	Avalanches can influence population patterns by deterring people from moving to or remaining in high-risk areas, leading to decreased density in these locations. The threat of avalanches prompts many to seek safer environments in urban or lower-risk regions. In addition, when avalanches occur, they can disrupt infrastructure, causing residents to relocate.	Burying power lines has reduced the risk of power outages due to avalanches.	Decreased
Drought	Drought can cause water scarcity, impacting agriculture and reducing crop yields. Recreational activities may decline, harming tourism, while the risk of wildfires increases, threatening safety and property. In addition, lower water levels can lead to water quality issues and public health concerns.	Climate change affects drought incidents by altering precipitation patterns and increasing temperatures. Warmer weather can lead to longer dry periods and more severe droughts, while changes in rainfall can reduce snowpack in nearby mountains, crucial for summer water supply. Higher temperatures also increase evaporation rates, further straining local water resources.	Drought can significantly influence population patterns by impacting economic opportunities and the quality of life. Water scarcity often leads to reduced agricultural productivity, prompting residents to migrate to areas with more stable job prospects. Increased water costs can make living less affordable, driving some residents away. Conversely, efforts to address drought, such	Development since the previous hazard mitigation plan has not changed drought risk.	Increased

DRAFT

Type of Hazard Event	Description of Potential Impacts	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
			as sustainable development or improved water management, may attract newcomers, resulting in changes in the community's demographic composition over time.		
Earthquake	The impacts of earthquakes can be substantial. Immediate damage to infrastructure may disrupt essential services such as water, electricity, and transportation, complicating recovery efforts. Homes and businesses might sustain significant structural damage, posing safety risks. In addition, psychological effects, such as increased anxiety, can affect the community. Economically, repairs can lead to high costs, potential declines in property values, and disruptions to local businesses, ultimately impacting job availability and the overall economy.	Rising temperatures can lead to glacial melting, which affects pressure on tectonic plates and may trigger seismic activity through isostatic rebound. In addition, increased rainfall and flooding can erode soils, weakening structural integrity and heightening vulnerability during earthquakes. Although the direct links between climate change and earthquakes are still under investigation, environmental effects may impact the region's seismic risk.	Earthquakes can significantly alter population patterns by prompting residents to leave for safer areas after a seismic event. This migration can lead to changes in population density and attract new residents and businesses during the rebuilding process. The perception of the area as a safe place to live may shift, impacting long-term demographics, as some residents return to rebuild while others relocate permanently.	Burying power lines in Emigration Canyon has reduced the risk of losing power during an earthquake.	Stayed the same
Extreme Heat	Extreme heat can significantly affect public health, increasing the risk	Climate change significantly impacts extreme heat by	By causing residents to relocate due to damaged homes or safety	Development has not affected extreme heat	Increased

Type of Hazard Event	Description of Potential Impacts	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	of heat-related illnesses, especially among vulnerable populations. It also strains energy resources due to the higher demand for air-conditioning, potentially leading to power outages. In addition, extreme temperatures worsen air quality by raising ozone levels, which poses respiratory risks. Urban infrastructure may also suffer damage, leading to increased maintenance costs and safety concerns.	increasing the frequency and intensity of heat waves. Rising global temperatures lead to longer and hotter summers, affecting residents and local infrastructure while heightening health risks, especially for vulnerable populations. Urban heat islands from reduced vegetation and extensive pavement further amplify these effects.	concerns. Some may move to areas perceived as safer or seek better job opportunities elsewhere. The economic impact and infrastructure damage can also make certain neighborhoods less desirable, leading to shifts in demographics and the socioeconomic landscape as new residents with different backgrounds move in.	risk in Emigration Canyon.	
Extreme Cold	Extreme cold can lead to health risks such as frostbite and hypothermia, especially among vulnerable populations. Transportation may be disrupted due to icy conditions, affecting commutes and emergency services. Infrastructure is at risk, with water pipes potentially freezing and bursting, resulting in costly repairs. In addition, energy demands surge as residents rely on heating, straining the electrical grid and increasing utility costs. Cold temperatures can	By increasing the intensity of winter storms. Higher atmospheric temperatures allow for more moisture, resulting in heavier snowfall and potentially lower temperatures during these events. In addition, fluctuations in weather patterns may disrupt seasonal cycles, leading to unpredictable periods of extreme cold mixed with warmer spells.	By driving some residents to relocate to warmer areas. Harsh winters can hinder economic activities and deter new residents and businesses, influencing housing demand and the attractiveness of certain neighborhoods. This may disproportionately affect lower-income families, leading to changes in demographics and socioeconomic stratification in the community.	Development has not affected extreme cold risk in Emigration Canyon.	Increased

DRAFT

Type of Hazard Event	Description of Potential Impacts	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	also impact local agriculture and wildlife.				
Flooding	Damaging infrastructure, such as roads and utilities, disrupts transportation and essential services. Homes and businesses may experience costly water damage, causing potential displacement. Environmental effects include erosion and contamination of local waterways, impacting wildlife and recreation. Economically, flooding can cause lost income for businesses, increased insurance costs, and declining property values. Public health may also be compromised due to waterborne diseases and stress-related issues.	Higher temperatures increase the frequency and intensity of extreme weather events and alter precipitation patterns. They lead to more intense rainstorms and accelerated snowmelt from nearby mountains, raising water levels in rivers and streams. This combination raises the risk of flooding, especially in areas with inadequate drainage and urban development in flood-prone zones, heightening the potential for damage to homes and infrastructure.	Flooding can significantly alter population patterns by displacing residents from affected areas, leading them to seek shelter elsewhere. This may cause a population decline where flooding occurs, as individuals might hesitate to return due to ongoing risks or property damage. As neighborhoods become less desirable, people may migrate to safer areas, changing demographic trends and putting pressure on housing in those regions. Over time, these shifts can influence urban planning and development, as local governments address flooding risks and changing population needs.	By making some areas unsuitable for construction due to flood risks, planners may prioritize higher ground and impose stricter zoning laws, such as requiring elevated structures. This results in a more resilient urban landscape but may also limit growth and raise property values in safer areas.	Decreased
Landslide/ Slope Failure	The town's steep terrain is vulnerable, especially during heavy rainfall or rapid snowmelt. Properties on slopes may suffer damage, resulting in	Climate change increases the risk of landslides through heavier rainfall and temperature fluctuations. Intense rain saturates	Landslides and slope failures can impact population patterns by making some areas unsafe, leading to displacement and lower	Burying power lines in Emigration Canyon has reduced the risk of losing power during a landslide. 	displacement and economic losses. Transportation networks can be disrupted, complicating emergency responses. In addition, landslides can harm local ecosystems by displacing vegetation.	soil, destabilizing slopes, while freeze–thaw cycles weaken the ground. Changes in vegetation can also reduce stability, leading to a higher potential for landslides.	property values. This prompts residents to move to safer regions, thereby increasing density in more stable areas. Concerns about future landslides may also deter newcomers from high-risk zones, shaping long-term demographic trends.		
Radon	Radon poses significant health risks, particularly lung cancer, as it can enter homes through foundation cracks. Many residents may not test for radon, making them unaware of dangerous levels. Increased awareness and public health initiatives are vital for protection, especially with regard to population growth. Incorporating radon-resistant construction in new developments is also essential for safety.	Climate change can affect radon levels by altering soil temperatures and moisture conditions. Higher temperatures may increase radon emissions from the ground, while heavy rainfall can change groundwater and soil saturation, impacting radon migration into buildings.	Radon exposure can influence population patterns as increased health awareness may drive families to move away from areas with high radon levels. This shift could particularly affect vulnerable groups, changing demographics and demand in the housing market. Homes with lower radon levels may become more sought after, and public health campaigns can encourage community action, making previously undesirable areas more attractive once mitigation measures are implemented.	Development has not changed risk to radon.	Decreased
Heavy Rain	Heavy rain can cause flash floods, particularly in low-	Climate change increases the frequency	Heavy rain can shift population patterns by	Development has not affected the risk of heavy	Increased

Type of Hazard Event	Description of Potential Impacts	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	lying areas, disrupting traffic and emergency services. It may also lead to soil erosion, infrastructure damage, and increased landslide risk in hilly regions. In addition, heavy rainfall can overwhelm waterways, resulting in water quality issues from runoff, impacting public safety, local businesses, and agriculture.	and intensity of heavy rain, as higher temperatures allow the atmosphere to hold more moisture. This leads to stronger storms, flash flooding, and overwhelmed drainage systems.	pushing residents out of flood-prone areas and attracting them to safer neighborhoods. Frequent flooding may lead to evacuations and economic disruptions, prompting relocations. Over time, ongoing heavy rains can affect housing demand and community stability, altering the town's population distribution.	rain in Emigration Canyon.	
High Wind	High winds can cause property damage to roofs and windows, topple trees and power lines, and lead to power outages. They pose hazards for pedestrians and drivers and can worsen air quality by stirring up dust and pollutants, affecting residents' health.	Climate change affects high winds by altering atmospheric patterns and increasing extreme weather events. Rising temperatures may lead to more substantial, unpredictable winds and more frequent thunderstorms, posing risks to infrastructure and air quality.	High winds can alter population patterns by making certain areas less desirable. Frequent damage may drive residents to safer neighborhoods, deter newcomers, and slow growth in affected regions.	Burying power lines in Emigration Canyon has reduced the risk of losing power during a high wind event.	Increased
Lightning	Lightning can have several impacts, primarily posing risks to public safety with the potential for injuries or fatalities. It can spark wildfires in nearby areas, threatening property and the environment. In addition, lightning strikes	Climate change increases temperatures and alters precipitation, leading to more intense thunderstorms and frequent lightning strikes. Urbanization can enhance this effect,	Lightning can influence population patterns by causing property damage and wildfires, leading some residents to relocate. Areas with higher lightning activity may deter new residents, while safer locations	Development has not affected the risk of lightning in Emigration Canyon.	Increased

DRAFT

Type of Hazard Event	Description of Potential Impacts	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	can damage infrastructure, leading to electrical surges that cause power outages and service disruptions. This phenomenon also affects outdoor activities and tourism, while the economic burden includes increased insurance claims and repair costs.	posing risks to public safety and infrastructure.	could increase migration as people seek protection from severe weather.		
Severe Winter Weather	Heavy snow or blizzards can disrupt transportation, hinder emergency services, and cause infrastructure damage, such as roof collapses. These conditions can lead to increased municipal costs for snow removal and have a substantial economic impact on businesses, particularly in retail and tourism. Power outages may also occur, affecting heating during cold months.	Climate change impacts heavy snow and blizzards by altering precipitation patterns. Higher temperatures can lead to more rain than snow, affecting snowpack levels—additionally, increased storm intensity results in heavier, more unpredictable snowfall.	Increased population equals an increased number of people needing to get to work and quicker snow removal. Heavy snow or blizzards can impact population patterns by influencing where people live and work. Transportation disruptions may lead residents to seek housing closer to jobs, increasing density in some areas while depopulating others. Families might also avoid regions with frequent heavy snowfall, shifting demand to milder areas. Over time, these trends can alter community demographics and economic activity,	Burying power lines in Emigration Canyon has reduced the risk of losing power during a heavy snow event.	Increased

DRAFT

Type of Hazard Event	Description of Potential Impacts	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
			prompting adjustments in town planning and resource allocation.		
Tornado	Tornadoes can cause serious damage to property and infrastructure, leading to injuries and economic challenges. Urban areas are especially vulnerable, complicating emergency responses and disrupting essential services. The psychological impact can affect community well-being, potentially leading to changes in demographics and land use as residents seek safer locations.	Climate change may increase the frequency and intensity of tornadoes. Higher temperatures lead to more moisture in the air, creating conditions for severe thunderstorms. Changes in wind patterns and precipitation can also heighten tornado risks, resulting in more destructive storms and greater threats to infrastructure and communities.	Tornadoes can influence population patterns by prompting residents to move to safer areas after damage occurs. This can decrease density in affected neighborhoods while increasing the demand for housing in safer regions. New residents may also move in for recovery opportunities, altering demographics. Over time, repeated tornado threats might push long-term residents to areas with better disaster preparedness, reshaping the town's population distribution.	Development has not affected the risk of tornadoes in Emigration Canyon.	Increased
Wildfire	Wildfires pose serious risks, including habitat damage, degraded air quality, and health issues for vulnerable populations. They can also lead to economic losses, property damage, and increased erosion that affects water quality.	By raising temperatures and creating drier conditions, prolonged droughts lead to more dry vegetation, which serves as fuel for fires. Erratic seasons extend the growing period, while more lightning strikes can ignite wildfires. These factors heighten	Displaced individuals often seek safer areas, shifting demographics, while declining property values might deter newcomers. Conversely, some may be drawn to rebuilding efforts, impacting long-term growth and community dynamics.	Burying power lines in Emigration Canyon has reduced the risk of losing power during a wildfire.	Increased

DRAFT

Type of Hazard Event	Description of Potential Impacts	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
		the threat to ecosystems and community safety.			
Dam Failure	Dam failure could lead to severe flooding, damaging homes and infrastructure, isolating communities, and hindering emergency responses. This may cause loss of life, especially among vulnerable groups, and trigger economic losses for local businesses and property values. Long-term effects could affect community stability and public health, while floodwaters may contaminate local waterways and disrupt ecosystems.	Climate change raises the risk of dam failure by causing heavier rainfall and rapid snowmelt. These changes can overwhelm dams and compromise their integrity, highlighting the need for urgent safety assessments and upgrades to protect communities downstream.	Dam failure tornadoes can impact population patterns by displacing residents and altering demographics. Evacuations can lead to an influx in safer areas, while destruction may deter new residents and contribute to population decline. Fear of future disasters may also prompt remaining individuals to relocate, changing the community's composition and affecting population density and economic activity.	Development has not affected the risk of dam failure in Emigration Canyon.	Increased
Civil Disturbance	Civil disturbances can cause economic losses for businesses, create social divisions, and increase tensions among community groups. They may overwhelm law enforcement, leading to fear and mistrust among residents. Essential services could be disrupted, affecting quality of life, while long-term impacts may include	Climate change can increase civil disturbances by intensifying environmental stresses and social tensions. Rising temperatures may lead to droughts, wildfires, and poor air quality, particularly affecting vulnerable communities. Resource scarcity, especially water, can spark	By encouraging residents to move for safety, leading to outflows and new arrivals. These events can reveal social issues, impacting community dynamics, employment, and property values, ultimately reshaping demographics, and social cohesion.	Development has not affected the risk of civil disturbance in Emigration Canyon.	Increased

DRAFT

	changes in community dynamics and public policy.	conflicts and protests. In addition, an influx of migrants from harder-hit areas may strain local resources, further escalating tensions. This cycle of unrest is driven by the impacts of climate change on the environment and community dynamics.			
Cyberattack	Cyberattacks can disrupt critical infrastructure like power and water services, complicating emergency responses. Businesses may face financial losses from downtime and data breaches, eroding consumer trust. The public sector's essential services, including law enforcement and public health, could be compromised, leading to fear and reduced community confidence.	Possible attack on the industry, which is seen as producing large amounts of greenhouse gases and burning fossil fuels. Climate change can heighten cyberattack risk by increasing vulnerabilities during extreme weather. Disruptions like power outages offer cybercriminals opportunities, but focusing on emergency responses can weaken cybersecurity measures. As organizations adopt new technologies to cope with climate impacts, they may unintentionally introduce additional vulnerabilities.	Cyberattacks can change population patterns by eroding trust in essential services. Compromised systems may cause residents to leave due to safety concerns, while high-profile incidents can deter businesses, leading to job losses. This perception of vulnerability may also make the town less appealing to newcomers, resulting in demographic shifts and affecting local development.	Development has not affected the risk of cyberattacks in Emigration Canyon.	Increased

DRAFT

Type of Hazard Event	Description of Potential Impacts	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
Hazardous Materials Incident (Transportation & Fixed Facility)	Hazardous materials incidents can severely impact public health, the environment, and the economy. Health risks include serious illnesses from exposure, while environmental damage may lead to soil and water contamination. Economically, incidents can cause property damage, lower property values, and disrupt businesses. The community also faces stress from evacuations and anxiety over safety.	Climate change elevates the risk of hazardous materials incidents by increasing extreme weather events like heavy rain and wildfires. These events can breach storage tanks and heighten material volatility. Vulnerable infrastructure can lead to more spills or accidents, while climate shifts may also introduce new challenges for managing hazardous substances and public health.	By causing evacuations and temporary declines in density. In the long run, unsafe areas may deter new residents, affecting growth and diversity. In addition, negative perceptions can lower property values and economic prospects, leading families to relocate, which impacts local demographics.	Widened roads in Emigration Canyon have reduced the risk of transportation accidents involving hazardous materials.	Increased
Public Health Epidemic/ Pandemic	Epidemics and pandemics can disrupt healthcare by overwhelming facilities and leading to resource shortages, diminishing care for all patients. Economic impacts may include business closures and job losses, particularly in hospitality and retail. The strain on public health services can affect routine care, while mental health issues may arise due to isolation and uncertainty. Shifts to remote learning can hinder student	By increasing the spread of vector-borne diseases and raising the risk of waterborne illnesses due to flooding or drought. Worsening air quality can also exacerbate respiratory conditions like asthma, especially in vulnerable populations.	By prompting migration for safety and better healthcare. Vulnerable groups may move to areas with improved services, while economic instability can drive people to seek new employment opportunities. In addition, restrictions like quarantine measures can limit movement and social interactions, reshaping the community's demographics and	Development has not affected the risk of epidemics/pandemics in Emigration Canyon.	Increased

DRAFT

Type of Hazard Event	Description of Potential Impacts	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
	development, and vulnerable populations face heightened risks. Erosion of public trust in health authorities might reduce compliance with guidelines.		impacting local economies.		
Terrorism	Terrorism incidents can have significant impacts, including loss of life and emotional trauma for the community. Economically, they disrupt local businesses and tourism while creating fear and anxiety that affect social cohesion. Emergency services might be overwhelmed, requiring additional support, and increased security measures can alter daily life and raise concerns about civil liberties. Damage to critical infrastructure necessitates long-term repairs, and such incidents may deepen social divisions and prompt changes in security policies, highlighting the need for effective preparedness and response strategies.	Terroristic activity is sometimes centered around climate change. Climate change impacts terrorism incidents by creating conditions of resource scarcity and social unrest. Increased competition for essential resources, such as water, can fuel tensions, making communities more vulnerable to extremist ideologies. Extreme weather events may disrupt social order and infrastructure, offering terrorist groups opportunities to exploit crises. In addition, climate-driven population displacement can heighten tensions in receiving areas, raising the risk of domestic terrorism. Law enforcement's focus on climate-related	Terrorism incidents can alter population patterns by instilling fear and prompting residents to relocate to perceived safer areas, resulting in demographic shifts and potential declines in property values. Some neighborhoods may see an outflow of residents, while others could experience an influx of people seeking refuge from violence. In addition, increased security measures may deter businesses and residents from certain locations, leading to long-term changes in population density and urban development patterns.	Development has not affected the risk of terrorism in Emigration Canyon.	Increased

DRAFT

Type of Hazard Event	Description of Potential Impacts	Effects of Climate Change	Changes in Population Patterns	Changes in Land Use and Development	Overall Vulnerability
		challenges can also limit its capacity to address terrorism threats. Ultimately, while climate change may not directly cause terrorism, its effects can create an environment conducive to extremist activities.			

DRAFT

Additional Public Involvement

The city of Emigration Canyon provided several opportunities for public participation. Figure 1 displays examples of public outreach.

Figure 1: Social Media Posts for the Mitigation Survey and Draft Plan Review

Plan Integration

Incorporating the underlying principles of the Hazard Mitigation Plan and its recommendations into other plans is a highly effective and low-cost way to expand their influence. All plan participants will use existing methods and programs to implement hazard mitigation actions where possible. As previously stated, mitigation is most successful when it is incorporated into the day-to-day functions and priorities of government and public service. This plan builds on the momentum developed through previous and related planning efforts and mitigation programs, and it recommends implementing actions where possible through these other program mechanisms. These existing mechanisms include the following:

- Regularity Capabilities
- Administrative Capabilities
- Fiscal Capabilities

Respective planning stakeholders will conduct implementation and incorporation into existing planning mechanisms and will be done through the routine actions of:

- Monitoring other planning/program agendas
- Attending other planning/program meetings
- Participating in other planning processes; and

DRAFT

- Monitoring community budget meetings for other community program opportunities.

The successful implementation of this plan will require constant and vigilant review of existing plans and programs for coordination and multi-objective opportunities that promote a safe, sustainable community. Regular efforts should be made to monitor the progress of mitigation actions implemented through other planning mechanisms. Where appropriate, priority actions should be incorporated into planning updates. Table 10 lists existing planning mechanisms in which the Hazard Mitigation Plan has been integrated. Table 11 lists the opportunities for integrating elements of this plan into other plans.

Table 10: Previous Plan Integration by the City of Emigration Canyon

Plan	Description
Continuity of Operations (COOP) Plan	Describes operations for the city if a major event or disaster were to occur that disrupted daily operations
Community Wildfire Protection Plan	Provides information on wildfire mitigation and response efforts

Table 11: Opportunities for Integration with Future Plans of the City of Emigration Canyon

Plan	Description
General Plan	Overview of resident/municipal concerns, priorities, and long-term goals
Comprehensive Emergency Management Plan	Overall framework for preparedness, mitigation, response to and recovery from disaster.

Capability Assessment

Local mitigation capabilities are existing authorities, policies, programs, and resources that reduce hazard impacts or could help carry out hazard mitigation activities.

Planning and Regulatory Capabilities

Planning and regulatory capabilities are the plans, policies, codes, and ordinances that prevent and reduce the impacts of hazards.

Table 12: Assessment of the Planning Capabilities of the City of Emigration Canyon[2]

Plan	Does it address hazards? (Y/N)	How can it be used to implement mitigation actions?	When was the last update? When is the next update?
General Plan	Y	Long-term goals and resident concerns can be incorporated into mitigation actions and funding sources.	2022.

[2] CEMP = Comprehensive Emergency Management Plan, CWPP = Community Wildfire Protection Plan, MSD = Municipal Services District.

DRAFT

Plan	Does it address hazards? (Y/N)	How can it be used to implement mitigation actions?	When was the last update? When is the next update?
Capital Improvement Plan (CIP)	N – this was identified as a need in the 2022 General Plan	As Emigration Canyon develops into a city, a plan would help them start outlining projects and priorities for leadership in coordination with MSD. The CIP can inform the funding sources.	To be accomplished in the MSD 2024 Strategic Plan
Climate Change Adaptation Plan	N	N/A	N/A
Community Wildfire Protection Plan	Y	CWPP outlines mitigation efforts that would be applicable to wildfire.	2021
Economic Development Plan	Y – in General Plan	Highlights economic development to inform funding for mitigation actions.	2022
Land Use Plan	Y – in General Plan	Highlights land use to inform mitigation actions.	2022
Local Emergency Operations Plan	Y	Emigration Canyon adopted the MSD CEMP.	2024
Stormwater Management Plan	Y – MSD's plan	Stormwater management can inform flooding/heavy rain mitigation actions.	2020
Transportation Plan	Y – in General Plan	Can inform mitigation strategies and funding sources related to transportation.	2022
Substantial Damage Plan	N	N/A	N/A
Other? (Describe)			

Table 13: Assessment of the Regulations and Ordinances of the City of Emigration Canyon

Regulation/ Ordinance	Does it effectively reduce hazard impacts?	Is it adequately administered and enforced?	When was the last update? When is the next update?
Building Code	Yes, building codes ensure that structures are built to standard and brought up to code when remodeling occurs. Emigration Canyon has several commercial buildings and many residential homes. The city adopted the state's building codes, including the International Building Code (IBC 2021) and International Residential Code (IRC 2021), with amendments such as	Y	2022

DRAFT

Regulation/ Ordinance	Does it effectively reduce hazard impacts?	Is it adequately administered and enforced?	When was the last update? When is the next update?

Natural Hazard-Specific Ordinance (Stormwater, Steep Slope, Wildfire)	Y – defensible space/building materials for wildfire	Y	2023
Acquisition of Land for Open Space and Public Recreation Use	Y	Y	2018
Prohibition of Building in At-Risk Areas	Y	Y	2018
Other? (Describe)			

Administrative and Technical Capabilities

Administrative and technical capabilities include staff and their skills. They also include tools that can help carry out mitigation actions.

Table 14: Assessment of the Administrative Capabilities of the City of Emigration Canyon[3]

Administrative Capability	In Place? (Y/N)	Is staffing adequate?	Are staff trained on hazards and mitigation?	Is coordination between agencies and staff effective?
Chief Building Official	Y	No, need more building inspectors.	Yes, but could always use more training.	Yes
Civil Engineer	Y – through MSD	Yes	Yes, but could always use more training.	Yes
Community Planner	Y – through MSD	Yes	Yes, but could always use more training.	Yes
Emergency Manager	Y – designated by MSD	No	Very minimal – a dedicated Emergency Manager is needed as it is currently the mayor who is the	Yes

[3] MSD =Municipal Services District, SLCo = Salt Lake County, UFA = Unified Fire Authority.

DRAFT

Administrative Capability	In Place? (Y/N)	Is staffing adequate?	Are staff trained on hazards and mitigation?	Is coordination between agencies and staff effective?
			appointed Emergency Manager.	
Floodplain Administrator	Y – through SLCo	Yes	Yes, but could always use more training.	Yes
Geographic Information System (GIS) Coordinator	Y – through MSD	Yes	Yes, but could always use more training.	Yes
Planning Commission	Y	Yes	Yes, but could always use more training.	Yes
Fire Safe Council	N – UFA contracted for fire service	N/A	N/A	N/A
CERT (Community Emergency Response Team)	N	N/A	N/A	N/A
Active VOAD (Voluntary Agencies Active in Disasters)	Y	Yes	Yes, but could always use more training.	Yes
Other? (Please describe.)				

Table 15: Technical Capabilities of the City of Emigration Canyon[4]

Technical Capability	In Place? (Y/N)	How has it been used to assess/mitigate risk in the past?	How can it be used to assess/mitigate risk in the future?
Mitigation Grant Writing	Y – through MSD	Used for funding to support mitigation projects in Emigration Canyon	Can be used to fund future mitigation projects
Hazard Data and Information	Y – through MSD	Used to identify hazards that the city is vulnerable to	Can inform mitigation strategies
GIS	Y – through MSD	Can be used to prioritize areas of concern as far as hazards	Can be used for mitigation project tracking and planning efforts
Mutual Aid Agreements	Y	Agreements in place to support mitigation actions	Outlines funding sources and organizations

[4] MSD =Municipal Services District.

DRAFT

Technical Capability	In Place? (Y/N)	How has it been used to assess/mitigate risk in the past?	How can it be used to assess/mitigate risk in the future?
			responsible for mitigation actions
Other? (Please describe.)			

Financial Capabilities

Financial capabilities are the resources to fund mitigation actions. Talking about funding and financial capabilities is important to determine what kinds of projects are feasible, given their cost. Mitigation actions like outreach programs are lower cost and often use staff time and existing budgets. Other actions, such as earthquake retrofits, could require substantial funding from local, state, and federal partners. Partnerships, including those willing to donate land, supplies, in-kind matches, and cash, can be included.

Table 16: Assessment of the Financial Capabilities of the City of Emigration Canyon

Funding Resource	In Place? (Y/N)	Has it been used in the past and for what types of activities?	Could it be used to fund future mitigation actions?	Can it be used as the local cost match for a federal grant?
Capital Improvement Project Funding	Y	Slope stabilization	Yes	Yes
General Funds	Y	Operating expenses	Yes	Yes
Hazard Mitigation Grant Program (HMGP/404)	Y	No, could be used.	Yes	No
Building Resilient Infrastructure & Communities (BRIC)	Y	No, could be used.	Yes	No
Flood Mitigation Assistance (FMA)	Y	No, could be used.	Yes	No
Public Assistance Mitigation (PA Mitigation/406)	Y	No, could be used.	Yes	No
Community Development Block Grant (CDBG)	Y	No, could be used.	Yes	No
Natural Resources Conservation Services (NRCS) Programs	N	No, could be used.	Yes	No

DRAFT

Funding Resource	In Place? (Y/N)	Has it been used in the past and for what types of activities?	Could it be used to fund future mitigation actions?	Can it be used as the local cost match for a federal grant?
U.S. Army Corps (USACE) Programs	N	No, could be used.	Yes	No
Property, Sales, Income, or Special Purpose Taxes	Y	Operating costs	Yes	Yes
Stormwater Utility Fee	Y	Stormwater management	Yes	Yes
Fees for Water, Sewer, Gas, or Electric Services	Y	Maintenance	Yes	Yes
Impact Fees from New Development and Redevelopment	Y	Road overlays, fire management	Yes	Yes
General Obligation or Special Purpose Bonds	Y	No, could be used.	Yes	Yes
Federal-funded Programs (Please describe)	N	No, could be used.	Yes	No
Private Sector or Nonprofit Programs	N	No, could be used.	Yes	Yes
Other?				

Education and Outreach Capabilities

Education and outreach capabilities are programs and methods that could communicate about and encourage risk reduction. These programs may be run by a participant or a community-based partner. Partners, especially those who work with underserved communities, can help identify additional education and outreach capabilities.

Table 17: Assessment of the Education and Outreach Capabilities of the City of Emigration Canyon[5]

Education and Outreach Capability	In Place? (Y/N)	Does it currently incorporate hazard mitigation?	Could it be used to support mitigation in the future?
Community Newsletter(s)	Y	Community council newsletter.	Yes

[5] EM = Emergency Management, MSD = Municipal Services District, PIO = Public Information Officer, SLCo EM = Salt Lake County Emergency Management, UFA = Unified Fire Authority, UPD = Unified Police Department, VOAD = Voluntary Agencies Active in Disasters.

DRAFT

Education and Outreach Capability	In Place? (Y/N)	Does it currently incorporate hazard mitigation?	Could it be used to support mitigation in the future?
Hazard Awareness Campaigns (such as Firewise, Storm Ready, Severe Weather Awareness Week, School Programs)	Y	Through UFA and UPD's outreach. SLCo EM has monthly valley EM meeting to get all Emergency Managers together.	Yes
Public Meetings/Events (Please describe.)	Y	Community council meetings.	Yes
Emergency Management Listserv	Y – through MSD/UFA	PIO for SLCo EM assists.	Yes
Local News	Y	Work with SLCo EM PIO to get feedback on outreach strategies.	Yes
Distributing Hard Copies of Notices (e.g., public libraries, door-to-door outreach)	Y	Posted on website, local buildings.	Yes
Insurance Disclosures/ Outreach	N	Could be used	Yes
Organizations that Represent, Advocate for, or Interact with Underserved and Vulnerable Communities (Please describe.)	Y	Through VOAD and community council.	Yes
Social Media (Please describe.)	Y	Facebook, Instagram, and X	Yes
Other? (Please describe.)			

Opportunities to Expand and/or Improve Capabilities

Actions that can expand and improve existing authorities, plans, policies, and resources for mitigation include budgeting for mitigation actions, passing policies and procedures for mitigation actions, adopting and implementing stricter mitigation regulations, approving mitigation updates, and making additions to existing plans as new needs are recognized. Table 18 lists the opportunities for the city of Emigration Canyon.

Table 18: Opportunities to Expand and/or Improve the Capabilities of the City of Emigration Canyon

Capability	Opportunity to Expand and/or Improve
Planning and Regulation	The city can adopt a new regulation incorporating higher standards for developing critical infrastructure in high-risk areas in order to reduce landslide risk.
Administrative and Technical	The city can expand its Geographic Information System (GIS) capabilities, particularly for tracking hazard risks like pandemics. In addition to response and recovery, data collected can be utilized when demonstrating benefits and historic costs during a mitigation grant application.

DRAFT

Capability	Opportunity to Expand and/or Improve
Financial	The city can pursue new grant programs, such as the Flood Mitigation Assistance grant program.
Education and Outreach	The city can expand its outreach to the public on how to mitigate risk, such as programs for radon and tree maintenance which reduces the risks of wind damage. Empowering the public with tools to implement mitigation projects through new hazard-specific public outreach programs will increase the odds of mitigation being successfully accomplished.

Mitigation Strategy

Mitigation strategies provide proactive measures that are designed to minimize the impacts of hazards on the city of Emigration Canyon. Table 19 shows mitigation action alternatives, and Table 20 shows the status of previous mitigation activities. Table 21 is the 2025 mitigation action plan for the city of Emigration Canyon.

Table 19: Mitigation Action Alternatives for the City of Emigration Canyon

Action	Type of Action	Selected for inclusion in the plan?	If not selected, why not?
Continue slope stability program.	Structure and Infrastructure Projects	Yes	
Continue replacing power lines with insulated power lines that reduce risk of fire, reduce power line exposure by routing lines underground.	Structure and Infrastructure Projects	No	This action is performed by local utilities.
Continue fire fuel debris removal community awareness program.	Local Plans and Regulations	Yes	
Increase water storage for fire suppression.	Structure and Infrastructure Projects	Yes	

Table 20: Status of Prior Mitigation Actions of the City of Emigration Canyon

Action	Hazard(s)	Agency Lead	Support Agency(ies)	Status Update
Conduct a slope stabilization Study.	Landslides, Avalanche, Earthquake	Emigration Canyon	Municipal Services District	Completed. Work is ongoing to stabilize slopes – two slopes have been completed so far.
Bury powerlines to mitigate power outages and mitigate wildfires.	All hazards	Emigration Canyon	Utilities	Ongoing – some power lines were put underground in 2019.

DRAFT

Table 21: 2025 Mitigation Action Plan for the City of Emigration Canyon[6]

#	Action	Hazard(s)	Lead Agency	Potential Partners	Benefits (Losses Avoided)	Cost Estimate	Funding Source(s)	Time-frame	Priority	Comments
1	Enhance security at critical infrastructure locations to prevent potential for terrorist acts.	Terrorism, Civil Disturbance	SLCo EM	Emigration Canyon, UPD, UFA, MSD, SLCo IT, SLCo Public Works, SLCo Clerk's Office, SLCo Sheriff's Office	Increased security protocols (both in technology and policy) for staff/first responders, clear expectations/understanding for Emigration Canyon and the public.	Medium	SLCo EM general funds, Emigration Canyon general funds, UPD general funds, SLCo Sheriff's Office general funds, UFA general funds, MSD general funds, HSGP grant	Short-term	Medium	
2	Develop and implement public education programs on disaster awareness and mitigation.	Avalanche, Civil Disturbance, Dam Failure, Drought, Earthquake, Extreme Heat, Extreme Cold, Flooding, Hazardous Materials Incident, Heavy Rain, High Wind, Landslide/ Slope Failure, Lightning, Public Health Epidemic/Pandemic, Radon, Severe Winter Weather, Terrorism, Tornado, Wildfire	SLCo EM	Emigration Canyon, UFA, UPD, SLCo Sheriff's Office, SLCo Public Works, MSD, NWS	Increased understanding of local resources, improved relationships with the public and stakeholders. Outlined plans/SOPs for programs. For example, share posts on how to identify avalanche conditions and what to do to reduce risk (avalanche), how to elevate utilities and structures in high-risk flood zones and dam inundation areas (flooding, heavy rain, dam failure), and structural and non-structural retrofit measures for homes (earthquake).	Low	Emigration Canyon general funds, MSD general funds, BRIC grant, HSGP grant	Short-term	Medium	
3	Integrate WebEOC, Crisis Track, GIS, and other technological enhancements throughout Emigration Canyon.	Avalanche, Civil Disturbance, Dam Failure, Drought, Earthquake, Extreme Heat, Extreme Cold, Flooding, Hazardous Materials Incident, Heavy Rain, High Wind, Landslide/ Slope Failure, Lightning, Public Health Epidemic/Pandemic, Radon, Severe Winter Weather, Terrorism, Tornado, Wildfire	MSD	Emigration Canyon, SLCo EM, UFA, UPD, SLCo Public Works, SLCo Health Department	Common operating platform for stakeholders, increased situational awareness, improved response time.	Low	SLCo EM general funds, UFA general funds, Emigration Canyon general funds, MSD general funds, EMPG grant	Medium-term	Medium	Emigration Canyon already has this software; training and documentation need improvement.
4	Enhance and continue to promote the implementation of CERT and SAFE Hubs.	Avalanche, Civil Disturbance, Dam Failure, Drought, Earthquake, Extreme Heat, Extreme Cold, Flooding, Hazardous Materials Incident, Heavy Rain, High Wind, Landslide/ Slope Failure, Lightning, Public Health Epidemic/Pandemic,	SLCo EM	Emigration Canyon	Increased awareness of local resources.	Low	SLCo EM general funds, EMPG grant, Emigration Canyon general funds, MSD general funds	Short-term	Medium	SAFE Hubs (previously S.A.F.E. Neighborhoods) are rebranding, with a new public awareness campaign and information for all partners.
