To whom it may concern,

The City of La Verkin is proud to express its support for the application of SR-9 to the National Scenic Byway Program. Our community serves as the westernmost gateway to the proposed Zion Scenic Byway. As visitors exit Zion National Park through its Southern Entrance, they parallel the Virgin River along Route 9 for 22 miles before arriving in La Verkin.

The entirety of our city sits perched on the edge of a canyon carved by the confluence of the Virgin River and La Verkin Creek. Guests can hike up the La Verkin Overlook Trail, drink locally roasted coffee on the rim, or venture down into Confluence Park for a picnic. We've always considered our region special. National Scenic Byway designation would confirm our suspicions.

Our commitment to this program dates back to 2008 with the formation of the Zion Canyon Corridor Council (ZC3). The ZC3 acted as the initial driving force behind an application towards National Scenic Byway designation. The City of La Verkin joined this regional organization soon after its establishment. In 2015, a new group, the Zion Regional Collaborative, absorbed the ZC3. La Verkin remained involved, sending city representatives to the group's quarterly meetings. Our community has always seen the value in nomination to the National Scenic Byway Program. We look forward to the economic development, increased visitation, and sense of pride that this designation could bring.

Over a decade following our initial efforts to pursue National Scenic Byway designation, the City of La Verkin is thrilled to be on the path towards recognition once again. We appreciate the FHWA's support for our nation's most spectacular roads and hope to join this remarkable group. Thank you for your consideration.

Sincerely,

Mayor Richard M. Hirschi

Dear Grant Selection Committee:

As Mayor of the City of LaVerkin and Chairman of the Confluence Park Executive Board, it is my privilege to write in support of the proposed \$150,000 **Utah Outdoor Recreation Grant** for the construction and improvement of a proposed bridge over the Virgin River in the Confluence Nature Park, providing a needed access and connection between the Park trails located along the River in the communities of LaVerkin and Hurricane—in the vicinity of the historic Power Plant, the Power Plant access trail, and the current picnic area and swimming area situated near southwest entrance to the Park from Center Street.

Much of this amazing Park is located within the boundaries of LaVerkin and is available for the enjoyment of many of our residents and visitors. One of the most beautiful areas of the Park are those immediately surrounding the historic power plant and referenced picnic area. This area would be accessible to hikers from the Hurricane side with the construction of the desired bridge. Likewise, the bridge would make areas of interest on the Hurricane side more accessible to hikers from the LaVerkin side of the River.

It is the hope of the Board and our City that the bridge over the Virgin River, and its associated abutments and trail construction approaches thereto and connecting the two cities' trail systems, will facilitate (a) greater and safer use of and access to the entire Park—by hikers coming from either of the two communities—and (b) less direct and potentially-negative impact on the River by Park users (since most would use the bridge to cross the River rather than ford it on foot).

It is our understanding that the desired grant is to help provide funding for the cost of the construction and improvement of the proposed bridge. It is also our understanding that the desired grant requires a local dollar-for-dollar match, which can be satisfied through cash, in-kind services, and/or materials to be provided.

The City does not own the property within the Confluence Nature Park, nor has it currently budgeted to provide funding for the construction of the needed bridge; but it is willing—subject to and consistent with the City's priorities and fiscal/manpower constraints—to entertain the possibility of partnering with the Park, to some degree, in this bridge construction/improvement effort by:

- Providing certain nonmonetary, manpower, and/or other in-kind assistance towards the efforts to construct and/or improve the proposed bridge, and
- Contributing (as and if needed) a fair, equitable, and affordable portion of the matching share of the Project costs that cannot be covered through nonmonetary, manpower, and/or other in-kind assistance.

The Vision Statement of the *Confluence Park Nature Park Final Plan* (2007) indicates that the Park is a “special place set aside for enjoyment and use by people and for preservation, protection and enhancement of the area’s rich cultural history, wildlife and natural resources.” The mission statement of the Plan promoted the preservation, protection, and conservation of the natural, cultural and historical resources of the Park, while fostering visitor use. Among the top priorities identified in the Plan were the construction of amenities (for visitor use) and the installation of accesses consistent with the Park Plan and conservation easements on the property.

The proposed bridge is consistent with—and in furtherance of—the Plan and its vision, mission, and priorities; and the City Council and I support its construction and maintenance, and the current and proposed efforts to obtain the funding required to make it a reality.

Sincerely yours,

Richard M. Hirschi

Dear Grant Selection Committee:

As Mayor of the City of LaVerkin and Chairman of the Confluence Park Executive Board, it is my privilege to write in support of the proposed \$100,000 ***Recreational Trails Grant for Utah*** for the needed abutments and trail construction approaches to the proposed bridge over the Virgin River in the Confluence Nature Park, which will provide a needed access and connection between the Park trails located along the River in the communities of LaVerkin and Hurricane—in the vicinity of the historic Power Plant, the Power Plant access trail, and the current picnic area and swimming area situated near southwest entrance to the Park from Center Street.

Much of this amazing Park is located within the boundaries of LaVerkin and is available for the enjoyment of many of our residents and visitors. One of the most beautiful areas of the Park are those immediately surrounding the historic power plant and referenced picnic area. This area would be accessible to hikers from the Hurricane side with the construction of the desired bridge. Likewise, the bridge would make areas of interest on the Hurricane side more accessible to hikers from the LaVerkin side of the River.

It is the hope of the Board and our City that the bridge over the Virgin River, and its associated abutments and trail construction approaches thereto and connecting the two cities' trail systems, will facilitate (a) greater and safer use of and access to the entire Park—by hikers coming from either of the two communities—and (b) less direct and potentially-negative impact on the River by Park users (since most would use the bridge to cross the River rather than ford it on foot).

MOSQUITO CONTROL METHODS

COLLECTION AND TESTING

- **Larvae** are collected using a dipper (a cup on a long pole), then brought to the lab and identified or reared to adults.
- **Adults** are collected using special traps designed to attract female mosquitoes looking for a blood meal or the ones that are ready to lay eggs.
- Collected mosquitoes are taken to the lab, sorted, identified, and processed to determine if they are carrying West Nile virus.

**If you see a mosquito trap,
Please DON'T TOUCH IT!**

ABATEMENT

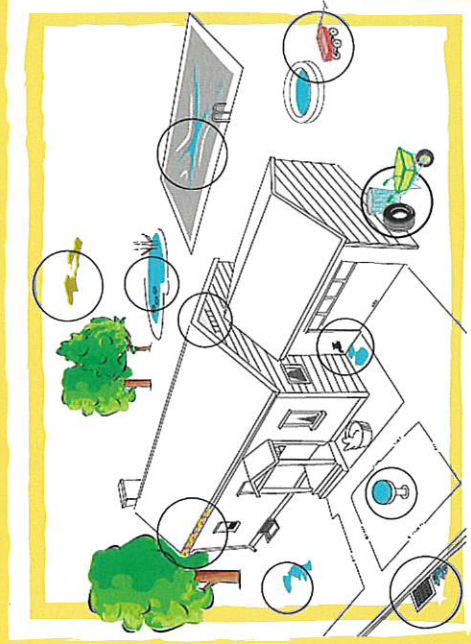

- **Larvicides** are pesticides added to the water to kill mosquito larvae before they emerge as adults.
- **Adulticides** are liquid pesticides used to kill adult mosquitoes. Ultra low volume (ULV) "fogging" is done when mosquitoes are most active, usually in the evenings, from trucks or ATVs.

FUN FACTS ABOUT MOSQUITOES

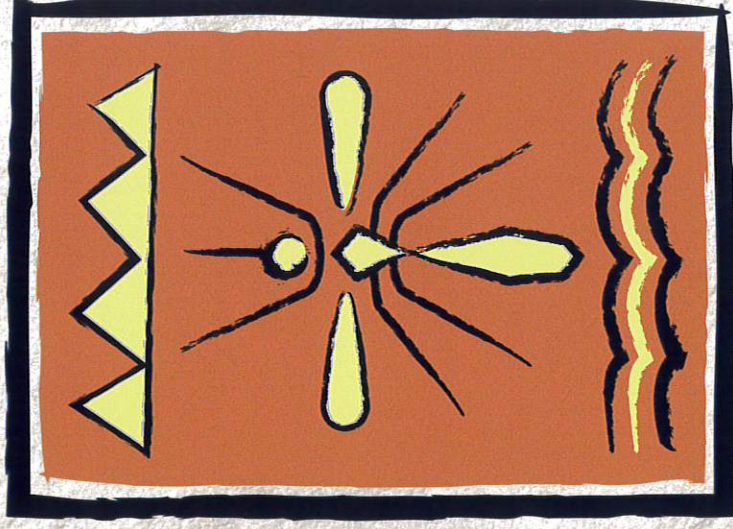

- **Over 3000 species in the world**
- **Almost 200 in U.S., 50 in Utah, 20 in Washington County**
- Some mosquito eggs can stay viable for more than 10 years in the ground under right conditions.
- Mosquitoes typically live from two to four weeks.
- Mosquito bites itch because of an allergic reaction to the mosquito saliva injected while biting to thin the blood.
- Some mosquitoes prefer to bite reptiles and amphibians rather than birds or mammals (including humans).
- Mosquitoes carry more human diseases than any other organism on earth and cause more human deaths than any other.
- Mosquitoes have been around more than 300 million years.

ELIMINATE MOSQUITO HABITATS

- ☐ Empty or cover anything outside that can hold water
- ☐ Filter permanent ponds regularly or put fish in them
- ☐ Keep pools chlorinated or drained completely
- ☐ Clean clogged rain gutters and storm drains regularly
- ☐ Manage irrigation water effectively
- ☐ Store old tires inside or cover them
- ☐ Report other mosquito breeding sites to the Southwest Mosquito District

WHO ARE WE?

Mosquitoes are a nuisance as well as potential carriers of deadly diseases. For these reasons, in 2002, SWMACD was approved as a special service district (SSD) of Washington County. The District is funded through property taxes (the cost is less than one can of repellent per year). The district is managed by a board of trustees consisting of representatives from each incorporated city in the County.

WHAT WE DO

SWMACD provides safe, effective, and economical mosquito control to improve the quality of life and protect the health of all citizens of the County.

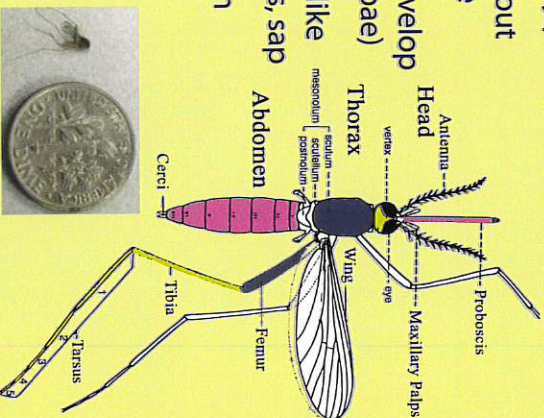

HOW WE DO THIS?

- Our main concern is the safety and protection of human and animal health.
- We conduct on-going surveillance for the West Nile virus (WNV) and other potential mosquito-borne diseases.
- We work with local, state, and national health institutions to track human and equine mosquito - borne infections.
- We conduct on-going mosquito collections to determine areas to treat.
- We are committed to the protection of the environment.
- We use an Integrated Mosquito Management (IMM) plan to safely control each stage of the mosquito life cycle.
- We cooperate with other organizations, agencies, and individuals as necessary to fulfill our mission.
- We cooperate with landowners to minimize our impact on private lands.
- We are committed to educating the public through schools, organizations, and events.

ABOUT MOSQUITOES

Mosquitoes belong to the insect order called *Diptera*, meaning two-winged fly.

- Six legs and 3 body parts (head, thorax, abdomen)
- Body and legs about the size of a dime
- Need water to develop (eggs, larvae, pupae)
- Eat plant liquids like nectar, fruit juices, sap
- Are pests and can transmit deadly diseases
- **Only female** mosquitoes bite

MOSQUITO LIFE CYCLE

Mosquitoes need water for their development. The speed of development can take as long as a few months or as short as a few days depending on the environment, temperatures, and water conditions.

- 1 Eggs** are laid on or near standing water. Eggs can hatch within a few days after contact with water.

- 2 Larvae** eat bacteria and algae in the water. They go through 4 growth phases called "instars". They breathe at the surface of the water through a tube called a siphon.

- 3 Pupae** do not feed. They breathe through tubes from their head called "trumpets". They only move when they are disturbed.

- 4 Adults** emerge from the pupae within about five minutes and rest on the water surface until their wings are dry. Females will mate within their first few days, then search for a blood meal needed for egg development.

WEST NILE VIRUS

WNV is a viral infection carried in the blood of birds (the main reservoir of the virus) and then can be transferred by mosquitoes to humans and horses.

- West Nile was accidentally introduced into the U.S. in 1999 and detected first in New York City.
- By 2003 it had spread to almost every state with thousands of cases per year.

- Symptoms may include fever, headache, vomiting, and rash. Other more severe symptoms include neck stiffness, stupor, disorientation, tremor, coma, vision loss, paralysis, and even death.

- There is no specific treatment right now for humans but there is a reliable vaccine for horses.

© Utah Department of Health ©2016

PROTECTING YOURSELF

- Avoid unnecessary outdoor activities when mosquitoes are active, such as at (1) **Dawn** and (2) **Dusk**.
- (3) **Dress** properly; Wear long-sleeved shirts pants when going into mosquito-infested area
- Apply an insect repellent that contains (4) **DEET** (up to 30%).
- (5) **Drain** standing water on your property where mosquitoes may breed.
